We are grateful for the expertise at the law firm of Shute, Mihaly and Wineberger retained by CFROG regarding CEQA. We have appreciated their past comments. We join them in continuing to request the following:

1. Count ALL GHGs that result from activity in our county: Count all burning of oil and gas originating in our county and count all fugitive methane from wells in our county and from methane entering our county that was not counted at the jurisdiction of origin. Do the math on the GHG footprint for heavy exports. We want to mitigate our fair share of all climate impacts from activities within Ventura County. We have to know what they are. Worrying about double counting is not acceptable. Just worry that you haven’t counted every cause of climate impacts that we are morally and legally responsible to mitigate with a comprehensive inventory and a systematic plan.
2. Use the latest science to calculate GWP of methane: The global warming potential of GWP is nearly 40 percent greater than what you are using. The International Panel on Climate Change states that over a 20 year period, methane has a GWP of 84 compared to carbon dioxide (up from their previous estimate of 72). The US EPA estimates it at 87 and recent scientific experts put the estimate at 96. We must know the true environmental impact of

methane emissions. A complete and scientifically valid GHG inventory is required for a CEQA-compliant Climate Action Plan.

3. Use the emissions reduction goal from Governor Brown's Executive Order B-18-55 "to achieve carbon neutrality as soon as possible, and no later than 2045, and achieve and maintain net negative emissions thereafter. This goal is in addition to the existing statewide targets of reducing greenhouse gas emissions." It is an inadequate compromise, but not as much as the SB 32 goal of 80% below 1990 levels by 2050. City of LA plans to stay within a net zero carbon budget between now and 2045. The proposed GHG reductions in the VC2040 Draft of 41 percent below 2015 levels by 2030, 61 percent by 2040, and 80 percent by 2050 are not ambitious enough for us to do our part to mitigate the climate chaos happening faster than scientists have predicted.

4. Policies and programs must meet the goal: It does not take an in-depth analysis to see that this plan will not achieve the 2030 goal of 40% reduction in GHGs below 1990 levels. A new report Insights from the California Energy Policy Simulator shows that the State of California will fall short of that goal by at least 15 and as much as 45 MMT CO₂e. We have and continue to advocate for a goal aligned with Governor Brown's Executive Order to achieve carbon neutrality as soon as possible and no later than 2045.

B. Some Comments about Impacts and Mitigation

The environmental impacts that concern us are those resulting from governments not making and carrying out plans to mitigate climate change. Your draft analysis does not include most of them. Table B in the Executive Summary is not even half finished. Some of the more serious impacts are missing from the draft analysis. Here are a few of our concerns:

1. Aesthetics, Scenic Resources and Light Pollution and Agriculture and Forest Resources: Mitigation programs are needed to protect our resources from degradation from significant climate impacts. The loss of soil in particular is associated with the downfall of civilizations.

2. Air Quality: The emissions impacts from exceeding criteria pollutant thresholds and also greenhouse gases seem significant and can be mitigated.

3. Biological Resources: The new implementation program is a good start to "update the Initial Study Assessment Guidelines, Biological Resources Assessment report criteria and evaluate discretionary development that could potentially impact sensitive biological resources". Two kinds of impacts are missing. 1) Climate Change. A major mitigation is the restoration of wetlands which should be at a 2:1 or greater ratio. Stormwater management is another mitigation that reverses the loss of vegetation from drought and floods and supports the restoration of all of the indigenous biology that makes an ecosystem function to maintain the small water cycles. 2) Toxic Pesticide and Herbicide Use and Drift. This must be part of the agenda of a Program for Protection of Sensitive Biological Resources to promulgate the mitigations provided by Integrated Pest Management. Pest management policy must align with the recommendations of the California Department of Pesticide Regulation Roadmap for Integrated Pest Management some of which have climate mitigation co-benefits.

4. Energy: We want a workshop to learn how it is deemed less than significant to allow wasteful, inefficient, or unnecessary consumption of energy resources.

5. Greenhouse Gas Emissions: The climate change impacts are so dire that the mitigations need to be benchmarked to be achieved before it is too late to reverse runaway climate chaos.

At minimum we demand a systematic plan for decarbonization of county facilities and electrification of the transportation system.

6. Hazards, Hazardous Materials, and Wildfire: The impacts of toxic explosions, leaks, and spills and the drift of regulated materials and the ignorance of the public about toxic impacts must be addressed where feasible through mitigations that regulate the use and transport of hazardous materials. We have recommended feasible mitigations for people being exposed to the risk of wildfires that have not been accepted by decision-makers.

7. Hydrology and Water Quality: Impacts from climate change and poor land management have led to grave threats to water supply and water quality. These are highly significant--ground water overdraft, overuse and degradation of water quality, erosion, flooding, and siltation. (Impact 4.10-12) The failure to restore small water cycles to keep stormwater in the uplands and maintain forest health is one of the most serious impacts being mitigated in many places through a paradigm shift about stormwater management. Mitigation is essential--water is life. It requires an integrated water management plan that involves every sector working on every mitigation of which we are aware.

8. Land Use and Planning We want an analysis of incompatible land uses and new development with negative health implications. Closing wells near sensitive sites is a mitigation. Environmental Justice is not examined in the draft EIR.

9. Mineral and Petroleum Resources: We want an analysis of the impact of the scenario in which wells have been put on hold and the operator cannot close the wells for lack of funds. We have no choice. The wells must be closed properly. Fields must be restored to functioning ecosystems to help mitigate climate change impacts. We need insurance as well as bigger bonds.

10. Traffic and Transportation: Tailpipe emissions is an extremely significant environmental impact. The mitigation aimed for in the CTM-C: Vehicle Miles Traveled (VMT) Reduction Program needs assurances of effectiveness via a clear description of what "conditions warrant providing additional mitigations and programs"? This is far too vague to be a mitigation for this significant impact. We have no alternative but to reliably cut GHGs in the transportation sector.

11. Utilities: Failure to develop wholesale and commercial scale renewable energy generation and microgrids is a significant environmental impact because it has forced us to have to get our electricity from fossil fuels via transmission lines that spark wildfires. Community microgrids are a feasible mitigation.

12. Waste Management: Failure to properly manage waste has a highly significant environmental impact, especially when it produces methane super-emitter landfills that is driving climate change, but also the failure to reuse and recycle consumer goods and the materials and equipment discarded by commercial enterprises. We need a more comprehensive approach for mitigation of these impacts.

C. The following policy recommendations for the Draft Plan could help the Plan achieve the GHG reduction goals to mitigate climate change impacts and help the EIR be more relevant to the climate crisis.

Land Use and Community Character: We endorse the comments submitted by Bruce Smith to more firmly assure preservation of agricultural land and open space. We point out the lack of analysis of Environmental Justice policy issues.

Circulation, Transportation, and Mobility:

1. No overriding considerations should allow a project to NOT reduce VMT unless all of the vehicles have zero emissions that will use the proposed project.
2. CTM 3-9 to widen SR 118 has a significant environmental impact.
3. Benchmarks to reduce VMT need to be more clear and the plan needs a review with public input every two years until 2028 and then no longer than every five years.
4. Parking programs should be included in ways that reduce single-occupancy car trips.

Public Facilities, Services, and Infrastructure:

1. Enroll residents in a program to reduce CO2 emissions in their neighborhoods. Ex: Cool Block or Transition Streets.
2. PFS 2.1 must be revised to say include rather than encourage 'Sustainable Plans and Operations' in order to be considered a mitigation of climate change impacts from greenhouse gas emissions.
3. Policy PFS 7.1 should be revised to delete the need for access to gas. The environmental impact from use of natural gas requires carbonizing buildings beginning with no gas connections to new residences . It is therefore contradictory to ensure access to gas.
4. Local renewable energy generation must be part of the mitigation plan for reducing transmission facility fire hazard risk. This is not the same as "Smart Grid Technology". You need experts who know the cutting edge of this field to help write coherent policy on this topic.
5. Zero Waste The County shall achieve zero waste (via a suite of policies to reduce, reuse, and recycle) with no organic waste going to landfills by 2023
6. Zero Waste Policy for Meetings and Events Design and implement a zero waste policy for meetings and events sponsored or permitted by the County to minimize waste and rescue surplus edible food
7. Compostable Take-Out Foodware Require that take-out foodware be made with material compostable in solid waste processing facilities within 60 days
8. Reduce Solid Waste by Phasing Out Single-Use Plastic Evaluate how to best reduce solid waste generation per capita by at least 15% by 2030 including phasing out single-use plastics including but not limited to plastic straws, plastic utensils, plastic take-out containers, and expanded polystyrene
9. Ban Expanded Polystyrene

Conservation and Open Space:

1. Reduce oil and gas production by 40% by 2025 via higher monitoring standards and 2500 ft buffer zones near sensitive sites; reduce production to zero by no later than 2040.
2. Phase-Out of Oil and Gas Production The County shall prohibit new drilling and shall regulate existing wells to assure steady closing of wells beginning near residential and commercial areas.
3. Maintain Policy COS-7.8 as recommended by the Board of Supervisors, so that all newly permitted discretionary oil wells are required to collect gases and use or remove them for sale or proper disposal instead of flaring or venting. Flaring should be allowed only in cases of emergency or for testing purposes.
4. Maintain Policy COS-7.7 as recommended by the Board of Supervisors, so that all newly permitted discretionary oil wells are required to convey oil and produced water via pipelines instead of trucking.
5. Detect and curb methane emissions from "super-emitter" sites as identified by NASA.
6. Tax oil and gas production, and related uncaptured methane to raise the needed revenues to fund urgent climate programs to replace high-emission vehicles with a priority on trucking and freight companies, fishing businesses, general contractors and K-12 schools.
7. Require a fully accountable performance bond for all new wells to cover cost of closure Cite

LAT article (maybe put on website and link to it).

8. Establish an insurance fund that oil and gas producers contribute to that will cover accidents and closing wells if the producer goes bankrupt.
9. Ban gas-fueled lawn and garden equipment. (Ex: City of Ojai)
10. Accelerate capture of legacy HFCs Enlist the public and private to find and destroy existing stocks of HFC's (refrigerant gases with extremely high Global Warming Potential).
11. Develop and adopt building codes based on best practices for use of low embodied carbon concrete and set targets for use of low GHG concrete alternatives. Ex: Bay Area Air Quality Management District and King Co, WA.
12. Encourage climate-safe and climate-resilient development through zoning reform and removal of limits on height, density, and minimum parking requirements to enable and promote walkability and a mix of uses for homes and businesses, parks and transit.
13. Create a master local clean energy siting and funding plan for wholesale distributed solar energy plus storage in commercial scale projects producing energy needs by 2030.
14. Provide energy efficiency benchmarking and rebates for low-income housing and renters as well as low-interest loans for small businesses to reduce energy use; assist owners of existing buildings to switch from natural gas to electricity.
15. Prepare sustainable building, siting, landscaping and passive heating and cooling practice guidelines, with a priority on low-income housing, that reduce consumption of non-renewable resources and that include climate and fire-safety in pre-approved plans.
16. Energy Efficiency to Reduce Electricity Use Use Energy Efficiency to Deliver 15% of Projected Needs for electricity in the county by 2023; and 30% by 2030.
17. Efficiency Building Standards for Retrofits Prioritize energy and water efficiency building standards and work to retrofit existing buildings.
18. Decarbonize County Buildings Develop a county building electrification plan eliminating natural gas use in County-owned facilities.
19. Decarbonize All Building Types Develop an electrification plan with goals for GHG emission reductions through renewable energy that evaluates and prioritizes programs for local solar, energy storage and demand response (DR) that disconnects all buildings from gas service by 2050. Include incentives for deep retrofits of inefficient buildings.

Agriculture:

1. Integrated Pest Management where toxic pesticides are a last resort. Create a program that promotes the principles (systems approach, building trust, and effective communication) and pursues the recommendations of the Roadmap for Integrated Pest Management from the University of California and CA Department of Pesticide Regulation. Environmental impacts from toxic pesticides are not described in the Background Report. The Roadmap to an Organic California Policy Report by CCOF Foundation offers information for mitigations and climate action. A workshop is needed.
2. Inorganic Nitrogen Based Fertilizers Set benchmarks for reducing use of inorganic N fertilizer and encourage optimized use of organic and inorganic fertilizer for greatest efficiency in closed nutrient cycles, monitor for nutrient runoff from fields and encourage the use of cover crops and green manure crops to reduce or avoid nitrous oxide (N₂O) emissions and nutrient runoff.
3. Diversified Cropping Systems Encourage farmers to include 1 – 5% of beneficial insect attracting plants in a planted crop, and other methods, such as crop rotation, perennial mowed cover crop in orchards, and integrating multiple species or varieties to enhance the biological and economic stability by spreading economic risk and buffering against pest invasions and extreme weather events, and increase carbon sequestration.
4. Reward Regenerative Farmers with Digestate and Compost from Food Waste Research feasibility of a program for composting food waste for use by farmers and landscapers who use regenerative practices that sequester certified amounts of CO₂.

Water Resources:

1. At least 30,000 acre-feet per year must come from storm water capture by 2035
2. All rainfall must be retained onsite in soil and reservoirs.
3. Slow It. Spread It. Sink It! The County shall enforce Best Management Practices (BMP) and Low Impact Development (LID) for new developments.
4. Recycle all wastewater for beneficial reuse by 2035.
5. Reduce potable water use per capita by 22% by 2025 and 25% by 2035: Offer incentives for water conservation features, including drought tolerant landscaping, permeable materials in standard parkway design guidelines, street trees, infiltration, greywater, and water-saving plumbing.
6. Close oil and gas wells and injection wells near aquifers as a top priority.
7. Create a Master Plan to develop the full potential of integrated water management to infiltrate the ground and recharge aquifers; support reforestation and restoration of watershed ecosystems; conserve and protect groundwater resources, and clean up creeks, streams, and estuaries.
8. Support Santa Clara River Loop Trail and Ventura River Trail Development

Economic Vitality:

1. Agricultural Diversification should include reference to regenerative practices to create biodiversity with opportunities for community members to visit farms.
2. Small Business Promotion. Support approval of caretaker residential space on business property to reduce VMT and more financial strength for small businesses.
3. Green Economy. Prioritize youth and immigrants for workforce development in industries that promote and enhance environmental sustainability, including GHG reductions, climate adaptation, resiliency and local renewable energy generation, storage and distribution, including solar power, wind power, wave energy, regenerative organic farming and value-added agriculture-related activities, and other appropriate renewable sources.
4. Maritime Economy. Facilitate a sustainable maritime economy using restorative aquaculture techniques that restore ocean health and biodiversity while reviving pre-human fisheries abundance. For example, restore sand-bottom kelp forests and increase kelp forests with flexible floating fishing reefs where the seafloor is otherwise too deep for kelp.
5. Promote Fire-Resistant Infill and Revitalization. Encourage infill development that serves as firebreak rather than as additional fuel for wildfires.
6. Create a Collaborative Structure for Innovation for a Resilient Future. The structure should be able to make decisions and create a way forward for zoning, building and materials and environmental health to allow options for a resilient future, include government officials, innovators and public as described in submissions from Sustainable Living Research Initiative.
7. Parking Infrastructure. Develop parking policies to reduce single occupancy trips associated with employees and business activity to reduce Vehicle Miles Traveled.
8. Master Plan for Distributed Energy Resources and Community Microgrids. Prepare a map of siting options for renewable energy generation and storage facilities and coordinate the identification of financing options for renewable energy resource development, including solar, wind, wave, storage and community microgrids both in front of and behind the meter.

In summary, with the accelerating tipping points, we cannot go half-way in our vision. We need extraordinary courage to set goals we can hang our hopes and efforts on. We want completeness and clarity so we can see how the emissions reduction plan adds up. We want respect for climate science to tell us the truth. We want more ambition. A 2016 decision of the state legislature in SB32 is just not good enough as a goal. We want to see a systematic plan that will assure carbon neutrality no later than 2045.

You can view each petition signer and the comments they left you below.

Thank you,

Christopher Tull

Thank you,

Leicy

72. Michelle Cabrera (*ZIP code: 93001*)

73. Jack Weber (*ZIP code: 93023*)

Climate policy must be a priority; cease all fossil fuels and witch to renewables and make biking more safe! Thank you...

74. Jackson Piper (ZIP code: 91320)

This general plan will shape how development occurs in Ventura County in the near future and will affect the lives of County residents beyond the timeframe of the plan. It is essential that the plan acknowledges and does everything possible to prepare Ventura County and its residents for the dangers that we face due to climate change - whether or not some of our fellow residents wish to acknowledge that danger or our agency as a society in working to minimize its impact. Please improve upon the Draft General Plan by incorporating the suggestions of the Climate Hub into the final document, so that Ventura County and its residents can more effectively protect this place that is special to all of us.

75. Judy Duerr (ZIP code: 93004-1228)

76. Jaira Farala (ZIP code: 93030)

Dear Ventura County Supervisors,

Please consider the impact of global warming effecting our climate and the area we live in. Please consider our effective climate solutions that would benefit our humanity and biodiversity.

Sincerely,

Jaira

102. Kathleen Wheeler (*ZIP code: 93003*)

103. Kaysha Farala (ZIP code: 93033)

Dear Ventura County Supervisors,

Please care about the effects of climate change and the negative impact it has been making on our global warming. Please consider our effective solutions to benefit our humanity and biodiversity.

Sincerely,

Kaysha

104. Keith Nieves (ZIP code: 93001)

105. Kristen Kessler (ZIP code: 93004)

106. Katharine Merrill (ZIP code: 93033-7965)

We need to create a climate plan that is grounded in good science, and that means counting all the green house gas emissions from all sources.

107. Katherine Mack (ZIP code: 03023)

108. Kathleen Nolan (ZIP code: 93023)

109. Layla White (ZIP code: 93030)

Dear Ventura County Supervisors,

Please consider taking care of our climate and reducing the effects of global warming.

Sincerely,

Layla

110. Krystal Anderson (ZIP code: 92071)

Dear Ventura County Supervisors,

Please consider the impact of global warming effecting our climate and the area we live in. Please consider our effective climate solutions that would benefit our humanity and biodiversity.

Sincerely,

Krystal

111. Diana Kubilos (ZIP code: 93004)

112. Kevin Ward (ZIP code: 93036)

The time is now for transitioning to non-fossil fuel products, all of them.

Solar, permaculture and voting for Bernie is a good defense against global warming already evident in fires, floods and, like Coronavirus, microbes. Any delay will make the US complicit with chosen

extinction. Think Green New Deal or nada.

113. Kristofer Young (ZIP code: 93023)

The climate portions of the general plan lacks specific, critical goals and mechanisms to ensure achieving them. We do not have time to waste.

114. Kyle Pobirs (ZIP code: 93004)

115. Lauren Mendez (ZIP code: 93030)

116. Lorren Carter (ZIP code: 92064)

Dear Ventura County Supervisors,

Global warming is happening right now we would like for you to consider our climate solutions, so we can live and breathe in a healthier and cleaner environment.

Sincerely,

Starsha

117. LeeAnne Christensen (ZIP code: 93021)

118. Leopoldo Lopez (ZIP code: 93003)

119. Leslie Purcell (ZIP code: 93001)

120. Yusef Kilea (ZIP code: 93035)

121. Liz Campos (ZIP code: 93002)

122. Sio Arden (ZIP code: 9303p)

Dear Ventura County Supervisors,

Please care about the effects of climate change and its negative impact towards global warming.

Sincerely,

Sio

123. Willard Lubka (ZIP code: 91362)

124. Lupe Anguiano (ZIP code: 93033-3449)

I continue expressing strong support for the recommendations made by CFROG and Climate Hub to the Ventura Country's 2040 DraftvGeneral Plan and EIR.

125. Madalitso Kalinde (ZIP code: 2461)

Dear Ventura County Supervisors,

Please consider the impact of global warming effecting our climate and the area we live in. Please consider our effective climate solutions that would benefit our humanity and biodiversity.

Sincerely,

Madalitso

126. Mary Ann Krause (ZIP code: 93060)

127. Mary Nelson (ZIP code: 93036)
It is way past time to take action. Step up!

157. Paul Aist (ZIP code: 93004)

158. Margaret (Peg) Strobel (*ZIP code: 93003*)

The General Plan must take into account rapid, serious changes--drought and wildfires being the most obvious--from climate change. Since agriculture is a critical part of our economy, attention must be paid to that industry. Also important will be funding a way to seriously reduce oil and gas production, since it contributes to climate change. Plans to train workers to transition to new economic opportunities from climate-friendly industries must be planned. New and existing housing needs to be considered (weatherization to reduce electrical use from air conditioning). Climate change will impact everything that county government does.

159. Phil McGrath (*ZIP code: 93010*)

160. Rachelle Feria (*ZIP code: 93030*)

Dear Ventura County Supervisors,

Please consider the impact of global warming effecting our climate and the area we live in. Please consider our effective climate solutions that would benefit our humanity and biodiversity.

Sincerely,

Rachelle

161. Randall Edwards (*ZIP code: 91362*)

162. Ray Powers (*ZIP code: 93023*)

A thorough analysis and comprehensive climate action needs to be part of the general plan update. What's is currently being proposed is not sufficient.

163. Ricardo Lopez (*ZIP code: 93030*)

Dear Ventura County Supervisors,

Please care about the effects of climate change and its negative impact towards global warming.

Sincerely,

Ricardo

164. Robert Dodge (*ZIP code: 93023*)

Climate change and its effects are one of our greatest existential threats and we must move away from a carbon based extractive economy as soon as possible. We urge you on behalf of the health and wellbeing of Ventura County and all of our citizens to adopt the strongest possible environmental protection in the Draft General Plan.

165. Ron Whitehurst (*ZIP code: 93001*)

We need to move to regenerative organic farming and landscaping to re-establish the small water cycles.

166. Ron Merkord (*ZIP code: 93015*)

Rising CO2 levels will soon have consequences for everyone, and Ventura County will see the first of

some of these effects, like increased wildfires and rising sea levels. We need to quit waiting for someone else to do something about it. Our own General Plan update is a great place to start.

167. Rominck Callo (*ZIP code: 93033*)

Dear Ventura County Supervisors,

Please consider taking care of our climate and reducing the effects of global warming.

Sincerely,

Romnick

168. rosemary fields (*ZIP code: 93004*)

Climate change affects the entire world all animals and humans.

169. Siomara Ardon (*ZIP code: 93033*)

Dear Ventura County Supervisors,

Please care about the effects of climate change and its negative impact towards global warming.

Sincerely,

Siomara

170. Scott eckersley (*ZIP code: 93023*)

171. Karen Karayan (*ZIP code: 93060*)

This is one of my top concerns! I worry about our children and their children's world if we don't do as much as we can to protect and heal our world! Ventura County can be one of the leaders in this effort!

172. Sarah Fleury (*ZIP code: 93060*)

173. Sasha Phan (*ZIP code: 93033*)

Dear Ventura County Supervisors,

Please consider taking care of our climate and reducing the effects of global warming.

Sincerely,

Sasha

174. Sonia Kroth (*ZIP code: 93001*)

175. Sharon Ray (*ZIP code: 93105*)

176. Starsha Farala (*ZIP code: 93033*)

Dear Ventura County Supervisors,

Please care about the effects of climate change as it is currently happening. Please strongly do something about the impact towards global warming in our environment.

Sincerely,

Starsha Farala

177. steve nipper (*ZIP code: 93023*)

Because it's the right thing to do!

178. Steve Pinsky (*ZIP code: 93001*)

179. Kristin Storey (*ZIP code: 93023*)

180. Susan Williamson (*ZIP code: 93023*)

Get with you guys! Ventura is a coastal city! Duhhh. You need to host a climate convention to get input on what needs to be done in VC!

181. Susan Curtis (*ZIP code: 91361*)

182. Francesa Gonzales (*ZIP code: 93033*)

Dear Ventura County Supervisors,

Please care about the effects of climate change and the negative impact it has been making on our global warming. Please consider our effective solutions to benefit our humanity and biodiversity.

Sincerely,

Francesa

183. Arthur Snyder (*ZIP code: 93036*)

Global warming is an existential threat.

184. Paul Burke (*ZIP code: 93012*)

185. Tessa Salzman (*ZIP code: 93001*)

186. Tina Frugoli (*ZIP code: 91362*)

187. Catherine Myers (*ZIP code: 93004*)

188. theresa hartigan (*ZIP code: ?93022*)

189. thomas miller (*ZIP code: 93004*)

190. Thomas Seigner (ZIP code: 91361)

Each new climate study outlines a more dire situation than the previous study. Even if we went carbon neutral today, future generations will still experience hardships we have not. NO MORE NEW FOSSIL FUEL PRODUCTION IN VENTURA COUNTY.

191. Tamara Hoyt (ZIP code: 93001)

Please address the climate crisis now

192. Todd Shuman (ZIP code: 93010)

I endorse this petition! It is time that Ventura County increase its commitment to reduce GHG emissions ...

193. Christine Samusick (ZIP code: 93001)

We need a desalination plant. Yesterday.

Water recycling must be encouraged and accommodated.

All styrofoam must be banned.

This is a partial list of actions that will help Ventura through this continual drought and help ease the burden on our landfill.

194. Vicki DeBear (ZIP code: 91311)

195. Vilma Pineda (ZIP code: 93033)

Dear Ventura County Supervisors,

Please care about the effects of climate change and its negative impact towards global warming.

Sincerely,

Vilma

196. Lori Bates (ZIP code: 93035)

197. Margot Davis (ZIP code: 93001)

The planning commission, or whoever it was that drafted the DEIR , I don't understand how they could have so missed the boat? I hope the board of supervisors will not miss the boat entirely and OK this general plan update the way it stands

198. Wilson Altice (ZIP code: 92128)

Dear Ventura County Supervisors,

Please care about the effects of climate change and the negative impact it has been making on global warming. Please consider our effective solutions to benefit our humanity and biodiversity.

Sincerely,

Wilson

Ventura County Board of Supervisors
Attn: RMA Planning Division
General Plan Update
800 Victoria Avenue L#1740
Ventura, California 93009-1740

Dear Board of Supervisors and Staff:

We are writing this letter to urge the Board of Supervisors to reconsider moving forward with the Draft General Plan EIR. The draft EIR has been accelerated to the point that too many issues and impacts have not been properly addressed or studied. These impacts and the corresponding mitigation measures will have severe impacts to land owners and especially those, like us in the agricultural industry and other productive economic segments.

Our family has been involved in the agricultural industry for more than 100 years in Ventura County. We have owned numerous land holdings that remain in the family to this date. We have farmed throughout Ventura County and hope to continue to do so in the future.

The Draft EIR is deficient on many levels. CEQA requires that all mitigation measures must be technically and economically feasible. Numerous proposed mitigation measures are neither. We have in the past attempted to identify land and any owners that would be open to sell their development rights for land that was converting from agricultural to commercial use. Not only did we not find anyone that would do so, no one would even quote a price. The only positive response from numerous land owners were that you can buy my property for full market value and then you can do what you want. There is not a project that can be built by adding double land cost to the equation. This was very recently experienced based on proposed policies at LAFCo. These policies were eventually not enacted due to the inability to purchase development rights in an economical feasible manner. This was when LAFCo was contemplating an acre for acre ag preserve. The new policy that is proposed in the 2040 General Plan is requiring 2 acres for every 1 acre of land converted from ag to any other use. This will eliminate the ability to add any new required ag buildings or even farm worker housing. The Draft EIR must study these impacts, since they are not feasible.

The Draft EIR also deals with water in a manner that is not properly studied. There is no analysis on increased water costs and diminishing availability of water. Without reasonable water costs and supply, there is no agricultural industry.

The General Plan indicates that agriculture is a high priority in the County. However, new policies and requirements in the General Plan add additional mitigation measures that will make ag virtually impossible. These include new setbacks, limiting types of fumigants pesticides and fertilizers. The General Plan also requires the conversion of all farm equipment to be all electric. Again, not feasible. The costs to purchase new pumps, farm equipment and other existing fuel using equipment will increase operational costs to a point that the County crops will not be competitive in the open market. These new mitigation measures are not sufficiently studied and again are not economically feasible.

The Draft EIR is extremely difficult to read and understand. The background reports are lacking in depth of what has been studied other than numerous general statements and very poor mapping. Detailed studies must be added to sufficiently identify impacts and the related mitigation measures for both direct and indirect impacts on the agricultural industry. It is our understanding that reports and studies need to be timely prepared. However numerous studies are older than 5 years. Not timely.

After numerous devastating wildfires over the last few years, which significantly impacted ag, the General Plan continues to lay out limiting mitigation measures for fire prevention. The Wildlife corridor eliminates any ag operation or fire prevention in the proposed corridor areas. This is also a major concern not studied in the Draft EIR.

The Draft EIR for the 2040 General plan does not provide adequate analysis for the expansion of permanent bike paths and pedestrian walking trails throughout the County. These impacts are very severe due to constant conflicts from trail users and ag operations. Spraying, dust, odors from ag operations, along with impacts created by the trail users. These are usually theft, vandalism, litter and pet waste. The proposed mitigation measures require additional setbacks from these trails which renders additional land unusable for ag operations.

In addition to the above comments on the agricultural aspects and related land use concerns of the DEIR, the undersigned is also a mineral owner directly interested in the impacts on oil and gas production of the DEIR and related General Plan 2040 proposed provisions. In these documents there is a total failure to address the economic impacts of the various policies proposed in violation of the requirements for this process, including but not limited to the loss of royalty income to a large group of County residents. I join in the detailed comments on the various deficiencies and concerns identified in the DEIR as described in the concurrent submissions on behalf of Aera Energy and other operators delivered this week to the County.

Please look at the long-term consequences of these General Plan policies and mitigation measures. We formally request additional studies and a revised Draft EIR that will properly look at these and many more issues. The DEIR must be corrected with details of the revisions. Then it can be recirculated.

Sincerely,

A handwritten signature in blue ink, appearing to read "Diane Diedrich". The signature is fluid and cursive, with a large loop at the end.

Ventura County Board of Supervisors
Attn: Susan Curtis, Manager, General Plan Update Section
800 South Victoria Avenue, L#1740
Ventura, CA 93009-1740

I'm writing to you as a concerned resident of the County regarding the viability of the oil and gas industry in Ventura County.

The 2040 General Plan Draft EIR fails to give proper analysis to oil and gas mineral resources.

Neither the EIR nor the Background report provide a complete and thorough description of the existing, current regulatory setting that oversees the management and production of mineral resources in the County and the State of California. The EIR and the Background Report only disclose federal and state agencies that regulate pipelines and flaring, which is not applicable to all mineral resources that must be analyzed in an EIR under CEQA guidelines. The EIR should be revised to include an overview and description of all potential regulations, regulatory bodies, and programs that regulate mineral resources in Ventura County.

The EIR fails to actually analyze for direct and indirect impacts to mineral resource zones that will occur as a result of the 2040 General Plan. The County admits that Land Use Designation changes in the 2040 General Plan will result in changes to land uses OVER known and important mineral reserves. But neither the EIR nor the Background Report provide any information regarding estimated and anticipated "buildout" in terms of acreage, actual location, number of dwelling units, and development density and intensity. These incompatible land uses will significantly impact future mineral resource production and must be evaluated and mitigated for in the EIR.

The EIR never addresses indirect impacts to mineral resource development that will occur under the 2040 General Plan. As incompatible land uses (such as residential development) occur on or adjacent to mineral production and mineral reserves, compatibility conflicts will increase. Reasonably foreseeable indirect impacts include nuisance complaints, traffic conflicts, theft, vandalism and attempted trespass on mineral production sites. The EIR must analyze and evaluate these impacts on the ability to produce mineral resources in the County.

The Draft EIR is lacks critical analysis and must be corrected and recirculated to ensure a fair process for Ventura County residents.

Thank you,

Simmons, Carrie

RE: County of Ventura – Draft 2040 General Plan Update EIR

Dear Ms. Curtis,

Southern California Gas Company appreciates the opportunity to submit comments on the Draft 2040 General Plan EIR (“DEIR”) and believes the document will provide valuable direction for the County to pursue effective, long-term development goals, as well as enhance local sustainability objectives. In particular, we support proposed policies that encourage beneficial reuse of County-generated waste for energy generation. Such policies have great potential to help reduce County GHG emissions, especially from agriculture and human waste streams.

However, SoCalGas is concerned by one of the County’s proposed mitigation measures: MM GHG-1: New Implementation HAZ-X: Prohibit Natural Gas Infrastructure in New Residential Development:

Implementation Program HAZ-X: Prohibit Natural Gas Infrastructure in New Residential Development – To support the proposed reach codes under COS-S, the 2040 General Plan shall include a new program in the Hazards and Safety element that prohibits the installation of new natural gas infrastructure in new residential construction through amendments to the Ventura County Building Code. This program shall also be extended to include commercial building types such as offices, retail buildings, and hotels where the use of natural gas is not critical to business operations and contain appliances that can be feasibility substituted with electricity powered equivalents.” (pg. 4.8-45-46).

While we support the County’s attempt to reduce emissions associated with buildings, this mitigation measure is technology-restrictive, may actually increase emissions and will limit the County’s ability to explore other innovative approaches to achieve emissions reductions in the future without deleveraging residents and businesses to hedge themselves against climate risks such as wildfires and household rising energy costs.

This type of ban would contravene California state law and policy as it relates to the availability of natural gas as a resource for residents and to the provision of a reliable and resilient energy supply. In addition, such a ban raises concerns under federal law.

Further, the DEIR's analysis and treatment of MM GHG-1 is legally flawed under the California Environmental Quality Act ("CEQA"). First, the DEIR fails to consider, discuss or analyze the environmental effects of implementing MM GHG-1. Second, the County cannot rely on MM GHG-1 to mitigate GHG impacts caused by the 2040 General Plan because MM GHG-1 is "infeasible" under CEQA. Lastly, by finding that climate change impacts would remain significant and unavoidable even with implementation of MMs GHG-1 through GHG-3, the County has neglected to consider other GHG emission reduction strategies as potential mitigation in the DEIR.

1. The DEIR Fails to Analyze the Environmental Impacts Associated with MM GHG-1

CEQA Guidelines section 15126.4(a)(1)(D) provides that, if a mitigation measure would itself cause significant environmental impacts, those impacts must be discussed in the EIR.¹ Here, the DEIR discusses what MM GHG-1 would consist of (*i.e.*, implementation of programs to prohibit natural gas infrastructure in new residential development, otherwise known as "Reach Codes"), notes that MM GHG-1 would implement Policy COS-8.6, which "will encourage zero net carbon emissions building design, which was assumed for quantifying GHG reduction benefits of the program", and states that implementation of a Reach Code will be predicated on a "cost-effectiveness study" by the California Energy Commission ("CEC").² However, the DEIR fails to discuss the potential environmental effects from implementing a Reach Code that bans or restricts natural gas in residential and/or commercial buildings.

Substantial evidence indicates that adopting and implementing MM GHG-1 and Reach Codes could lead to the following significant environmental impacts under CEQA.

- ***Utilities and Service Systems*** – In the CEQA Guidelines Appendix G checklist,³ section "XIX. Utilities and Service Systems" asks whether proposed projects would "[r]equire or result in the relocation or construction of new or expanded water, wastewater treatment or storage drainage, *electric power*, ... facilities, the construction or relocation of which *could* cause significant environmental effects."

¹ 14 Cal Code Regs. § 15126.4(a)(1)(D); *see also Sacramento Old City Assn. v. City Council* (1991) 229 Cal.App.3d 1011, 1027; *Stevens v. Montecito Water Dist.* (2004) 116 Cal.App.4th 396, 400 (mitigation measures employed to prevent downstream flooding associated with reservoir project may themselves have a significant environmental impact, but was not analyzed); *Gray v. Cty. of Madera* (2008) 167 Cal.App.4th 1099, 1118 (EIR did not address potentially significant impacts associated with water quality mitigation measures).

² DEIR at 4.8-47.

³ *See* Governor's Office of Planning and Research, Final Adopted Text of Revisions for CEQA Guidelines, http://resources.ca.gov/ceqa/docs/2018_CEQA_FINAL_TEXT_122818.pdf.

Adoption and implementation of a Reach Code would require new buildings to either be all-electric or, if mixed-fuel, likely subject to higher levels of energy efficiency than all-electric buildings. It is reasonably foreseeable that some developers will choose to develop buildings with all-electric energy, which will increase the demand for electricity; however, there is no analysis in the DEIR as to whether (i) the local grid has the generating resources and capacity to meet such increased demand for electricity, or (ii) whether the local public utility or load-serving entity has sufficient distribution or transmission assets to provide increased service in a safe and reliable manner.⁴ The DEIR fails to quantify increased electricity demand, how many additional generation, distribution or transmission assets may be needed to facilitate this increased demand, or how the construction or relocation of such assets could impact the environment.⁵

The need to substantially overbuild local power systems when natural gas is not used as a base load means that a much greater amount of land, habitat and related physical resources will be impacted by solar and wind generation facilities. In a scenario where natural gas is banned across the state, new solar arrays and wind farms will need to be fabricated, transported to, and installed throughout California at more than five times the historical rate of deployment every year for the next 25 years.⁶ This deployment will significantly impact the physical environment across California. The fabrication, transportation and construction of the required generation facilities will also generate GHG emissions that would have cumulative climate change impacts.

In addition, as more electric energy is utilized new transmission capacity must be fabricated, transported to and installed throughout the state to connect with thousands of miles of new nationwide transmission lines. Additional transmission facilities will have significant impacts to the physical environment and result in aesthetic and potentially cultural impacts. The fabrication, transportation, and construction of new transmission equipment and capacity will also generate GHG emissions.

Because renewable generation is intermittent, California will also be required to increase power storage capacity to unprecedented levels if natural gas is banned. Additionally, California would need to dramatically increase hydropower capacity by increasing the size of state reservoirs by as much as 100 times above current levels. Battery storage on this scale would have significant hazardous materials, human health,

⁴ See, e.g., Pub. Res. Code § 451 (“Every public utility shall furnish and maintain such adequate, efficient, just, and reasonable service, instrumentalities, equipment, and facilities, including telephone facilities, as defined in Section 54.1 of the Civil Code, as are necessary to promote the safety, health, comfort, and convenience of its patrons, employees, and the public.”).

⁵ Cf. *California Clean Energy Comm. v. City of Woodland* (2014) 225 Cal.App.4th 173, 208 (EIR for shopping center lacked required energy analysis despite stating, among other things, that existing facilities were sufficient to serve the project: “In addition, a substation, multiple utility lines (60 kV, 115 kV, and 230 kV), and gas transmission lines exist in the area to serve the buildout of the proposed project.”).

⁶ Clean Air Task Force, Comments On SB 100 Joint Agency Report - Charting a Path to a 100% Clean Energy Future, September 19, 2019, <https://efiling.energy.ca.gov/GetDocument.aspx?tn=229800&DocumentContentId=61244> (CATF 2019).

fire, fire suppression, and policing services, GHG emissions, and physical impacts. The construction of new hydropower storage would similarly have significant air quality, aquatic plant, animal and habitat, land, GHG emissions, water and hydrology, public safety, and other impacts.

CEQA caselaw holds that EIRs must consider the effects of changes to the environment that can result from an expansion of facilities, services, or utilities to serve the project.⁷ Here, DEIR Chapter 4.17 does not cross-reference MM GHG-1 and fails to discuss how implementation of MM GHG-1 may lead to expanded facilities, services or utilities that would be necessary in the future when a Reach Code is adopted.

- **Greenhouse Gas (GHG) Impacts** – Implementation of a Reach Code under MM GHG-1 is predicated on the assumption that 100% electrified buildings are more energy-efficient and have a smaller carbon footprint than buildings with gas-powered appliances. Yet, multiple, independent studies demonstrate that such an assumption is not accurate.
 - In May 2019, the U.S. Department of Commerce, National Institute of Standards and Technology (“NIST”) published a study of the energy use, environmental impacts, and economic performance of residential buildings using either electricity or natural gas for space and domestic water heating. The analysis was based on a single-family home meeting all applicable building code requirements in Maryland. The NIST research concluded that a natural gas-heated home is more economical, results in “lower environmental impacts across numerous impact categories,” including lower GHG emissions, has a faster heating response time and generates a greater level of indoor comfort than an all-electric residence. In particular, GHG emissions were found to be higher because of the greater amount of fuels required to produce electricity for home use compared with the use of natural gas equipment in a residence.⁸
 - Although California has a larger proportion of renewable utility-scale energy than Maryland, consistent with the NIST study the CEC has also shown that, on average, natural gas generates substantially lower GHG emissions than electrical building use in California. As shown below, in 2018 the CEC estimated that electricity use in buildings produces a greater level of GHG emissions than natural gas about 60 percent of the year in California.⁹ Natural gas results in lower GHG emissions during a significant majority of all morning and evening hours in all months, the periods of highest residential energy demand. The significantly lower GHG emissions from natural gas use in California buildings

⁹ CEC, Building Decarbonization, 2018 Update – Integrated Energy Policy Report, Presentation by M. Brook at June 14 2018 IEPR Workshop at 16, <https://efiling.energy.ca.gov/GetDocument.aspx?tn=223817>.

reflects the fact that, except during daytime hours from about March to June, intermittent solar and wind is insufficient to meet in-state building energy demand. When intermittent renewable energy is not available, electrical generation is less efficient and produces a greater level of GHG emissions than natural gas use in California buildings.

- Other researchers have also questioned whether requiring all electric buildings might, however unintentionally, result in higher GHG emissions. Household energy demand tends to peak in the morning and evening hours, when residents are preparing to leave for or returning from work, school or other activities and when intermittent renewable power, particularly solar, is unavailable. At these times, electric supplies must be produced from other sources, including natural gas-fired power plants. Converting fuels, such as natural gas, to electricity to meet home demands is less efficient than directly using natural gas. As a result, a Stanford University researcher has estimated that when renewable power is unavailable, such as during the evening hours, residential electricity consumption produces *three times* more GHG emissions than natural gas.¹⁰
- The County cannot assume that, over time, GHG emissions from electrical generation will be reduced during peak morning and evening periods when natural gas is currently a lower emission energy source in the state. Recent studies indicate that even if additional intermittent wind and solar generation capacity is deployed, gas-fired electrical facilities will almost certainly remain essential to stabilize the state's power grid. The gas-fired generators serving the state, however, may be forced to increasingly operate as short-term inefficient

¹⁰ See Anthony R. Kavscek, *Is a natural gas ban an 'antidote to climate change'?*, San Jose Mercury News (Nov. 12, 2019), https://mercurynews-ca.newsmemory.com/?publink=754c8d2e3_13411ac. Professor Kavscek is a member of the Energy Resources Engineering faculty at Stanford University.

“peaker plants” which are known to emit more GHG emissions.¹¹ Thus, it is far from clear that an all-electric building mandate will reduce GHG emissions.

The DEIR must disclose and acknowledge potential GHG impacts that could occur from shifting building energy use from natural gas to electric power given reasonably foreseeable conditions in which electrical energy consumption would produce more GHG emissions than natural gas building use.

- **Energy Impacts** – Under the CEQA Appendix G Checklist, a project may involve a significant environmental impact if it would result in “wasteful” or “inefficient” energy consumption. MM GHG-1 seeks to prohibit the installation of new natural gas infrastructure in new residential construction. But nowhere does the DEIR discuss how that may result in either (i) a failure to use already captured natural gas, or (ii) the expenditure of additional energy to transport or divert natural gas elsewhere. Studies have shown that low carbon natural gas may continue to be a viable resource in assisting the state with reaching its climate goals, and should continue to be utilized in typically hard to electrify thermal applications in residential, commercial and industrial uses.¹² Specifically, Renewable Natural Gas (“RNG”), or biomethane, can be produced from biomass wastes (e.g. forest, agriculture, waste water and food and green waste) and then processed to inject into existing pipelines. Because its production removes more potent greenhouse gas from the air (methane) compared to what is produced when used (carbon dioxide), RNG production can be carbon negative from a lifecycle perspective. The County cannot determine whether full electrification policies will have unintended consequences of “wasteful” or “inefficient” energy use, without first analyzing these impacts in the DEIR.
- **Public Health and Safety** – In an era of increasingly dry and warm climates, and increased population in the wildfire urban interface along with build out of electrical infrastructure that could be an ignition source to serve population growth, California wildfires are occurring at increased frequencies and severities. Each of the three California investor-owned utilities adhere to wildfire mitigation plans (“WMP”) submitted to and approved by the California Public Utilities Commission (“CPUC”) — which establish internal mechanisms and protocols for de-energization events, also known as Public Service Power Shutoffs (“PSPS”). PG&E’s most recent PSPS event (occurring on October 6, 2019) impacted over 728,980 customers in 35 counties across the Sacramento Valley, Sierra Foothills, North Bay, South Bay, East Bay, Central Coast,

¹¹ See, e.g., Mark Thurber, *Gas-fired generation in a high-renewables world*, Stanford University School of Earth, Energy & Environmental Sciences and Precourt Institute for Energy Natural Gas Initiative, NGI Research Brief (June 2018), https://ngi.stanford.edu/sites/g/files/sbiybj14406/f/NGI_Brief_2018-06_R3_Thurber.pdf.

¹² Energy + Environmental Economics, *Decarbonizing Pipeline Gas to Help Meet California’s 2050 Greenhouse Gas Reduction Goal* (Jan. 2005), https://www.ethree.com/wp-content/uploads/2017/02/E3_Decarbonizing_Pipeline_01-27-2015.pdf.

and parts of Southern California.¹³ Southern California Edison (“SCE”)— the investor-owned utility whose service territory includes the County — is likewise obligated to implement PSPS protocols in certain circumstances giving risk to wildfires and has done so on numerous occasions in 2019 and 2020. For example, on November 15-17, 2019, SCE instituted a PSPS event that was initially estimated to impact 31,975 customers on 48 circuits across four counties (including the County), although had a much smaller impact than originally considered.

It is evident that increasing the amount of power needed from the electrical grid, such as by reducing the use of natural gas and increasing the use of electricity, will only exacerbate these problems. Until that time, however, PSPS events will be the “new norm,” both in Northern and Southern California. In addition to the large-scale economic losses that customers suffer as a result of a PSPS event, public safety issues can also arise due to several factors. These include loss of power at critical medical facilities, added strain on first responder services (such as local police departments and EMTs), loss of school days, and disruption of critical city infrastructure during emergency responses (such as traffic lights). Although MM GHG-1 will contribute to an overloaded grid and exacerbate the economic and safety implications from future, likely PSPS events; the DEIR mentions none of these issues.

The County should consider how increased deployment of other technologies, such as microgrids and energy storage projects, can help achieve decarbonization and resiliency goals. A 2018 CEC report found that microgrid projects offer a number of “value propositions,” including renewable energy integration, grid resiliency, and carbon reductions.¹⁴ The CEC report concluded that microgrid projects align with the state’s Renewables Portfolio Standard and GHG reduction mandates.¹⁵ The County should analyze the effectiveness of these mitigation options instead of a ban on natural gas.

- ***Impacts on Biological Resources, Water Quality and Noise Stemming From Additional Renewable Generating Resources*** – As stated above, the County has not demonstrated how adopting and implementing MM GHG-1 will impact existing electricity demand. In other words, no evidence exists to support the notion that existing or future electricity load could meet energy demands if natural gas infrastructure is banned for all future residential construction. Rather, it is reasonably foreseeable that new renewable energy resources will be needed, in addition to those required under the California Renewables Portfolio Standard (“RPS”), to meet new building electrification policies. The CEC’s 2019 *California Energy Efficiency Action Plan Staff Report* acknowledges that statewide

¹⁵ *Id.* at ii.

building electrification efforts “will seek to increase the share of renewable generation on the electricity grid...”¹⁶

The DEIR does not analyze how development of foreseeable additional renewable generating resources will impact the environment. Because it is likely that the County can determine with particularity the amount of MW or MWh that will be needed to fully implement MM GHG-1 in years to come, an accompanying analysis of generating resources and their potential environmental impacts must be provided. These renewable resource facilities are known to have their own environmental impacts associated with construction and operation, including but not limited to, impacts on federal and California sensitive species, water quality and quantity, nearby noise receptors, and project-related air quality impacts.

Because such commercial-scale facilities might be located outside the County does not insulate the County from its obligation to consider the indirect environmental impacts from MM GHG-1. Indeed, “the purpose of CEQA would be undermined if the appropriate governmental agencies went forward without an awareness of the effects a project will have on areas outside of the boundaries of the project area.”¹⁷ It is well-settled that “the project area does not define the relevant environment for purposes of CEQA when a project's environmental effects will be felt outside the project area.”¹⁸

- **Environmental Justice** – “Environmental justice” is defined as “the fair treatment of people of all races, cultures, and incomes with respect to the development, adoption, implementation, and enforcement of environmental laws, regulations, and policies.” Gov. Code § 65040.12(e). An Attorney General report defines “fairness” in this context to mean that “the benefits of a healthy environment should be available to everyone, and the burdens of pollution should not be focused on sensitive populations or on communities that already are experiencing its adverse effects.” “In addition, though CEQA’s main purpose is to evaluate whether a project may have a significant effect on the physical environment, “human beings are an integral part of the environment.”

The CEQA Guidelines state that “[e]conomic or social effects of a project may be used to determine the significance of physical changes caused by the project. For example, if the construction of a new freeway or rail line divides an existing community, the construction would be the physical change, but the social effect on the community would be the basis for determining that the effect would be significant.” Here, MM GHG-1 would require the construction of new electric infrastructure, including within the County, to supply the electricity necessary to support a natural gas ban. This

physical change to the environment will lead to cost increases for ratepayers, an economic impact which must be considered under CEQA.

Before the County can adopt MM GHG-1, the DEIR must consider the impact it will have on customer affordability and ratepayers. About 90 percent of residential energy consumers in Southern California use natural gas for space and water heating, and ratepayers prefer a choice in how they heat their homes and cook their food. Further, according to a 2018 study produced by Navigant Consulting on behalf of the California Building Industry Association, switching to all-electric appliances could cost single-family homeowners in Southern California “over \$7,200 and increase energy costs by up to \$388 per year.” Low-income customers would be the most burdened by the costs of building electrification.

Thus, as a result of adopting MM GHG-1, the County will have effectively established an unnecessary energy policy that will disproportionately impact its disadvantaged communities. Under CEQA, the County cannot gloss over this potential impact.

Given the substantial evidence that adopting and implementing MM GHG-1 will result in potential significant environmental impacts, the County is required to undertake proper CEQA review of such impacts, including both the direct and indirect environmental impacts stemming therefrom.

2. MM GHG-1 is Not “Feasible” under CEQA

Pursuant to CEQA Guidelines section 15126.4(a)(1), an EIR must “describe feasible measures which could minimize significant adverse impacts, including where relevant, inefficient and unnecessary consumption of energy.” “Feasible” means “capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social, and technological factors.”¹⁹ Courts do not defer to an agency’s determination that mitigation measures will work when their efficacy is not apparent and there is no evidence in the record showing they will be effective.²⁰ Here, there is no evidence that MM GHG-1 is feasible as a means to mitigate GHG-related impacts associated with the 2040 General Plan. In fact, evidence demonstrates that natural gas bans are environmentally, economically and technologically infeasible.

Intermittent Renewable Generation Inhibits Feasibility of a Natural Gas Ban

Since 2015, several studies have evaluated the results of multiple assessments of national and California decarbonization strategies and options.²¹ Other studies have considered the power

system and costs associated with relying solely on intermittent renewable power for decarbonization, in contrast with approaches that also utilize fossil fuels with CCS or renewable natural gas (“RNG”).²² These studies consistently conclude that renewable generation without a reliable baseload power source cannot achieve deep carbonization, will require installing massive amounts of additional generation and distribution facilities, and will be unaffordable.

- Relying on variable renewable sources such as wind, hydroelectric and solar to decarbonize will require the fabrication, installation and operation of approximately 3 to 10 times the level of solar and wind facilities that would be required if a reliable lower-carbon energy source was also utilized.²³ This overbuilding is required as intermittent power cannot achieve its nominal nameplate capacity—100 megawatts of solar or wind power will produce approximately 20-40 percent of capacity per year compared with approximately 90 percent capacity rates for natural gas. Thus, a much larger power system must be built to produce enough energy.
- As the percentage of intermittent renewable power serving a community increases, the amount of energy that is “curtailed” or wasted because it is not produced when needed can approach 40 percent of total generation.²⁴ Due to the timing mismatch between demand and the availability of solar and wind power, wind and solar would be unable to meet about 30 percent of California’s annual energy demand.²⁵ As a result, massive electrical power storage must be constructed, installed and operated

²⁵ CATF 2019.

to capture a community's surplus intermittent power generation. In California alone, storing surplus generation would require batteries with an instantaneous capacity "larger than the generating capacity of the entire US electric grid." Even assuming battery storage costs fall dramatically to \$80 per megawatt, California communities would be required to pay about \$2.9 trillion to secure the necessary power storage.²⁶

- To increase the reliability of intermittent renewable energy, significant new large-scale transmission will be required to "knit together diverse wind, sun and hydro resources" including as much as "a twenty-fold increase in US transmission capacity and interties for very high renewable energy scenarios, according to the National Renewable Energy Laboratory."²⁷
- Due to the need for overbuilding, energy storage increases, and new transmission capacity, decarbonization using intermittent renewables without reliable low-carbon power sources would be unattainably expensive. The cost of electricity generation in California has been estimated to rise from about \$58 per megawatt hour with 60 percent renewable generation to \$389 using 80 percent renewable power, and an astonishing \$1,402 per megawatt hour at 100 percent renewable levels even assuming that the cost of wind, solar and storage falls substantially.²⁸ Other studies have estimated that California communities would pay more than \$1,600 per megawatt hour using 100 percent renewable power.²⁹

A Natural Gas Ban is Economically Infeasible for Customers

According to 2019 survey data published by the U.S. Energy Information Agency, the average household in California currently consumes about 7 megawatt hours of energy at a cost of approximately \$1,000 (\$0.14 per kilowatt hour). Published estimates indicate that California electrical generation costs could rise by 8 to 24 times current levels with 60 percent renewable power, higher utilization of renewables than at present. California households would also use more electrical power over time for transportation and other needs under a 100 percent renewable power scenario. Assuming that the average household electrical demand increases to 10 megawatt hours per year,³⁰ and that prices do not significantly increase until renewable use reaches 80 to 100 percent of total generation, the average California household electric bill

²⁶ CATF 2019.

²⁹ J. Temple, The \$2.5 trillion reason we can't rely on batteries to clean up the grid, MIT Technology Review, July 27, 2018, <https://www.technologyreview.com/s/611683/the-25-trillion-reason-we-cant-rely-on-batteries-to-clean-up-the-grid/>.

³⁰ EIA, *How much electricity does an American home use?* (Oct. 2, 2019), <https://www.eia.gov/tools/faqs/faq.php?id=97&t=3> (explaining that in 2018, the average annual electricity consumption for a U.S. residential utility customer was 10,972 kWh).

would increase to about \$8,000 per year at 80 percent renewable use, and to about \$24,000 per year with 100 percent renewable use.

Annual cost increases of this magnitude could be expected to stimulate significant population relocation to lower cost communities. Physical relocation, including the use of larger, high emission vehicles, could have significant impacts on air quality, population and housing. High household energy costs would also have significant health and safety impacts, including higher mortality and illness rates for vulnerable populations due to the inability to heat or cool homes. Direct relocation GHG emissions, and additional emissions that could occur from the movement of large amounts of households to lower cost communities with higher average household emission rates could also generate significant cumulative climate change impacts.

Higher electrical power costs could also result in the relocation, or failure to open and operate businesses in the state and the relocation of these activities to lower cost, higher-emission communities. As discussed in a January 2020 report by the California Legislative Analyst's Office, California communities already have disproportionately higher energy costs than most of the U.S. compared with marginal generation expenses. Consequently, higher costs associated with 100 percent renewable energy could generate significant GHG impacts.

3. The DEIR Finds that GHG Impact 4.8-1 Will Remain Significant and Unavoidable, but Does So Without Considering Other Feasible and Effective GHG Mitigation

Under CEQA, a lead agency may not adopt a project unless it has eliminated or substantially lessened all significant effects on the environment, or determined that remaining significant effects are acceptable due to overriding considerations.³¹ Here, the County concluded that, with the implementation of all identified GHG mitigation measures, Impact 4.8-1 would remain significant and unavoidable.³² However, the County cannot adopt this finding without implementation all feasible mitigation measures.³³ While it is true that "an EIR need not analyze 'every imaginable alternative or mitigation measure' ...," it "must respond to specific suggestions for mitigating a significant environmental impact unless the suggested mitigation is facially infeasible."³⁴

SoCalGas urges the County to consider other GHG emission-reduction strategies that are scalable and easier to implement, more resilient and more affordable. Specifically, the use of renewable gases such as hydrogen and renewable natural gas (RNG), are low carbon to negative fuels that can dramatically reduce county greenhouse gas emissions and provide optionality and flexibility for the energy system.

³¹ Pub. Res. Code. § 15092(b).

³² DEIR at 4.8-49.

³³ Guidelines §§ 15043(a), 15092(b).

³⁴ *Los Angeles Unified Sch. Dist. v. City of Los Angeles* (1997) 58 Cal. App. 4th 1019, 1029; citing *San Francisco Ecology Center v. City and County of San Francisco* (1975) 48 Cal.App.3d 584, 596 (EIR did not respond to School District's suggestion that air conditioning and filtering might prove feasible means of reducing air quality impacts under proposed plan).

As stated in our prior comment letter for the General Plan Update (attached), RNG, or biomethane, can be produced from a variety of waste resources (e.g. agricultural waste, forest biomass, waste water, and landfills) and then processed to meet pipeline specifications. Further, green hydrogen can be produced from excess solar and wind power generated when demand is low. The hydrogen can then be stored for later use in hydrogen fueling stations, be used for electric generation in fuel cells, and/or blended into the gas pipeline system to decarbonize gas supply which benefits all sectors. This technology, called Power-to-Gas, has been demonstrated in numerous pilot projects, including UC Irvine.³⁵

Carbon Intensity Values of Current Certified Pathways (2020)

36

Renewable Gases Can Achieve Numerous Co-Benefits

Because most production of renewable natural gas removes methane from the air and converts it to carbon dioxide when used, RNG production can be significantly carbon negative from a

³⁵ UCI Samueli School of Engineering. UCI and SoCalGas Partner to Design "Advanced Energy Community." December 2017. Available at: <https://engineering.uci.edu/news/2017/12/uci-and-socalgas-partner-design-advanced-energy-community>

³⁶ California Air Resources Board. LCFS Certified Pathway Carbon Intensities. February 2020. Available at: <https://ww2.arb.ca.gov/resources/documents/lcfs-pathway-certified-carbon-intensities>

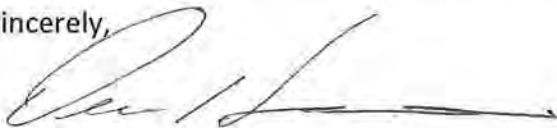

lifecycle perspective. Renewable gases can also achieve numerous co-benefits by helping the energy system be more flexible and work across sectors. For example, conversion of dead trees or other forest waste to renewable gases can dramatically reduce wildfire risks. The Power to Gas concept that can convert excess renewable electricity to hydrogen and store it for months instead of hours as in the case with batteries enables extension of the renewable energy for long durations to meet demand. Finally, renewable gases can reduce greenhouse gases in hard to decarbonize sectors such as agriculture and industry which form the economic engine of California. As the County is aware, SoCalGas is working towards the goal of replacing 5% of our natural gas supply with RNG by 2022, and 20% by 2030.

The CPUC is evaluating the levels of hydrogen that can be blended into the natural gas system. Just last month, Lawrence Livermore National Labs issued a study of how California can get to carbon neutrality by leveraging the gas pipelines and their rights-of-way to convey hydrogen and carbon dioxide.³⁷ In fact, the most cost-effective carbon negative solution is to convert biomass waste to hydrogen and sequester the carbon via pipelines using the rights-of-ways of the natural gas system. In addition, studies show that replacing roughly 16% of SoCalGas throughput with RNG achieves the same emissions reductions as electrifying the entire building sector by 2030.³⁸

Inclusion of RNG as a mitigation strategy also aligns with policies already included in the Draft General Plan. In particular, policies PFS-5.4, PFS-5.5, PFS-5.6, and COS-8.1 all support reuse of waste resources for energy generation as well as replacement of fossil fuels with renewable energy resources, including bioenergy. Accordingly, the use of renewable gases as a mitigation measure seems a natural complement to these policies, whereas a ban on gas infrastructure seems counterproductive. Therefore, we encourage the County to replace Mitigation Measure GHG-1: Prohibit Natural Gas in New Residential Construction, with an alternative mitigation measure that is performance-based, technology neutral and allows for flexibility in use of renewable fuels to help achieve emissions reductions.

We appreciate the opportunity to submit comments on the DEIR and look forward to working with the County as a valuable energy partner to achieve their environmental goals. If you have any questions, please do not hesitate to reach out via telephone or email.

Sincerely,

Deanna Haines
Director Policy, Strategy and Environment

To: Susan Curtis-

County failed to evaluate mitigation measure for feasibility- 500' set back for "sensitive receptors" from freeways and high traffic roads.

Mitigation Measure AQ-3 (Policy HAZ10-X) creates a minimum 500' set back for "sensitive receptors" from freeways and high traffic roads. Yet the County states in the Land Use section of the EIR that "the majority of the anticipated build out will be within the freeway corridors."

Has the County completed a "buildout study" to ensure that the establishment of this set back still leaves enough room for development to occur? Will this mitigation measure be economically feasible?

Subject: Petition (205 signers): Count and Mitigate Impacts of Climate Change - Comments and Recommendations

CAUTION: If this email looks suspicious, DO NOT click. Forward to Spam.Manager@ventura.org

Dear Susan Curtis,

Our policy team compiled and began sharing the attached petition five and a half days ago. Today is our second largest day of signing with a current total of 205 from diverse sectors, mostly West Ventura County. It would not be eight pages long if more of our intelligent recommendations from last year had been adopted and retained by staff. The process would be more efficient and the plan more germane to the many serious impacts of the climate and ecological crisis if you would consult with our team of topical experts before you release the next drafts.

There could be over 500 signatures if we continue asking people to read it.

Please confirm that you received the petition and the 204 signatures and comments emailed via Action Network.

Yours,

Jan Dietrick, Policy Team
350 Ventura County Climate Hub

Petition

Count and Mitigate Impacts of Climate Change in Draft EIR and General Plan Comments and Recommendations

To: Ventura County Board of Supervisors
From: Jan Dietrick and 204 Signatories

With worsening climate change impacts, we reiterate and amplify the concerns the people expressed in January of last year about “climate change and GHGs, and the effects of continued oil and gas extraction including secondary effects related to climate change, air quality, water quality, water supply, traffic, noise, odors, aesthetics, and hazards.”

Our county is warming faster than any other in the nation, our ocean is becoming more hostile to marine life, our last drought was the most intense and lasted longest, and our history of costly floods will be dwarfed when future atmospheric rivers pour over our valleys. Our house is on fire. We need a thorough plan and environmental impacts analysis based on the latest science.

Ventura County’s plan matters. Our larger cities are making climate action plans and look for your example of leadership. The environmental impact from what we do to mitigate climate impacts at the global scale is profoundly influential in trying to stop runaway climate change. This is explained in a new report Insights from the California Energy Policy Simulator about the role of the State of California in the world. Ventura County as a local government hit hardest by climate impacts must step up and meet serious goals. “Insights about California’s climate policies are at the forefront of global efforts to battle climate change. The state’s leadership and success so far have helped maintain momentum despite political headwinds. If California faltered, global efforts to reduce GHG emissions would be dealt a major setback. Meanwhile, the severe risks from runaway global warming are becoming more tangible as the state suffers from wildfires supercharged by climate change.”

A. Four Overall Comments:

We are grateful for the expertise at the law firm of Shute, Mihaly and Wineberger retained by CFROG regarding CEQA. We have appreciated their past comments. We join them in continuing to request the following:

1. Count ALL GHGs that result from activity in our county: Count all burning of oil and gas originating in our county and count all fugitive methane from wells in our county and from methane entering our county that was not counted at the jurisdiction of origin. Do the math on the GHG footprint for heavy exports. We want to mitigate our fair share of all climate impacts from activities within Ventura County. We have to know what they are. Worrying about double counting is not acceptable. Just worry that you haven't counted every cause of climate impacts that we are morally and legally responsible to mitigate with a comprehensive inventory and a systematic plan.

2. Use the latest science to calculate GWP of methane: The global warming potential of GWP is nearly 40 percent greater than what you are using. The International Panel on Climate Change states that over a 20 year period, methane has a GWP of 84 compared to carbon dioxide (up from their previous estimate of 72). The US EPA estimates it at 87 and recent scientific experts put the estimate at 96. We must know the true environmental impact of methane emissions. A complete and scientifically valid GHG inventory is required for a CEQA-compliant Climate Action Plan.

3. Use the emissions reduction goal from Governor Brown's Executive Order B-18-55 "to achieve carbon neutrality as soon as possible, and no later than 2045, and achieve and maintain net negative emissions thereafter. This goal is in addition to the existing statewide targets of reducing greenhouse gas emissions." It is an inadequate compromise, but not as much as the SB 32 goal of 80% below 1990 levels by 2050. City of LA plans to stay within a net zero carbon budget between now and 2045. The proposed GHG reductions in the VC2040 Draft of 41 percent below 2015 levels by 2030, 61 percent by 2040, and 80 percent by 2050 are not ambitious enough for us to do our part to mitigate the climate chaos happening faster than scientists have predicted.

4. Policies and programs must meet the goal: It does not take an in-depth analysis to see that this plan will not achieve the 2030 goal of 40% reduction in GHGs below 1990 levels. A new report Insights from the California Energy Policy Simulator shows that the State of California will fall short of that goal by at least 15 and as much as 45 MMT CO₂e. We have and continue to advocate for a goal aligned with Governor Brown's Executive Order to achieve carbon neutrality as soon as possible and no later than 2045.

B. Some Comments about Impacts and Mitigation

The environmental impacts that concern us are those resulting from governments not making and carrying out plans to mitigate climate change. Your draft analysis does not include most of them. Table B in the Executive Summary is not even half finished. Some of the more serious impacts are missing from the draft analysis. Here are a few of our concerns:

1. Aesthetics, Scenic Resources and Light Pollution and Agriculture and Forest Resources: Mitigation programs are needed to protect our resources from degradation from significant climate impacts. The loss of soil in particular is associated with the downfall of civilizations.

2. Air Quality: The emissions impacts from exceeding criteria pollutant thresholds and also greenhouse gases seem significant and can be mitigated.

3. Biological Resources: The new implementation program is a good start to “update the Initial Study Assessment Guidelines, Biological Resources Assessment report criteria and evaluate discretionary development that could potentially impact sensitive biological resources”. Two kinds of impacts are missing. 1) Climate Change. A major mitigation is the restoration of wetlands which should be at a 2:1 or greater ratio. Stormwater management is another mitigation that reverses the loss of vegetation from drought and floods and supports the restoration of all of the indigenous biology that makes an ecosystem function to maintain the small water cycles. 2) Toxic Pesticide and Herbicide Use and Drift. This must be part of the agenda of a Program for Protection of Sensitive Biological Resources to promulgate the mitigations provided by Integrated Pest Management. Pest management policy must align with the recommendations of the California Department of Pesticide Regulation Roadmap for Integrated Pest Management some of which have climate mitigation co-benefits.

4. Energy: We want a workshop to learn how it is deemed less than significant to allow wasteful, inefficient, or unnecessary consumption of energy resources.

5. Greenhouse Gas Emissions: The climate change impacts are so dire that the mitigations need to be benchmarked to be achieved before it is too late to reverse runaway climate chaos. At minimum we demand a systematic plan for decarbonization of county facilities and electrification of the transportation system.

6. Hazards, Hazardous Materials, and Wildfire: The impacts of toxic explosions, leaks, and spills and the drift of regulated materials and the ignorance of the public about toxic impacts must be addressed where feasible through mitigations that regulate the use and transport of hazardous materials. We have recommended feasible mitigations for people being exposed to the risk of wildfires that have not been accepted by decision-makers.

7. Hydrology and Water Quality: Impacts from climate change and poor land management have led to grave threats to water supply and water quality. These are highly significant--ground water overdraft, overuse and degradation of water quality, erosion, flooding, and siltation. (Impact 4.10-12) The failure to restore small water cycles to keep stormwater in the uplands and maintain forest health is one of the most

serious impacts being mitigated in many places through a paradigm shift about stormwater management. Mitigation is essential--water is life. It requires an integrated water management plan that involves every sector working on every mitigation of which we are aware.

8. Land Use and Planning We want an analysis of incompatible land uses and new development with negative health implications. Closing wells near sensitive sites is a mitigation. Environmental Justice is not examined in the draft EIR.

9. Mineral and Petroleum Resources: We want an analysis of the impact of the scenario in which wells have been put on hold and the operator cannot close the wells for lack of funds. We have no choice. The wells must be closed properly. Fields must be restored to functioning ecosystems to help mitigate climate change impacts. We need insurance as well as bigger bonds.

10. Traffic and Transportation: Tailpipe emissions is an extremely significant environmental impact. The mitigation aimed for in the CTM-C: Vehicle Miles Traveled (VMT) Reduction Program needs assurances of effectiveness via a clear description of what "conditions warrant providing additional mitigations and programs"? This is far too vague to be a mitigation for this significant impact. We have no alternative but to reliably cut GHGs in the transportation sector.

11. Utilities: Failure to develop wholesale and commercial scale renewable energy generation and microgrids is a significant environmental impact because it has forced us to have to get our electricity from fossil fuels via transmission lines that spark wildfires. Community microgrids are a feasible mitigation.

12. Waste Management: Failure to properly manage waste has a highly significant environmental impact, especially when it produces methane super-emitter landfills that is driving climate change, but also the failure to reuse and recycle consumer goods and the materials and equipment discarded by commercial enterprises. We need a more comprehensive approach for mitigation of these impacts.

C. The following policy recommendations for the Draft Plan could help the Plan achieve the GHG reduction goals to mitigate climate change impacts and help the EIR be more relevant to the climate crisis.

Land Use and Community Character: We endorse the comments submitted by Bruce Smith to more firmly assure preservation of agricultural land and open space. We point out the lack of analysis of Environmental Justice policy issues.

Circulation, Transportation, and Mobility:

1. No overriding considerations should allow a project to NOT reduce VMT unless all of the vehicles have zero emissions that will use the proposed project.
2. CTM 3-9 to widen SR 118 has a significant environmental impact.
3. Benchmarks to reduce VMT need to be more clear and the plan needs a review with public input every two years until 2028 and then no longer than every five years.
4. Parking programs should be included in ways that reduce single-occupancy car trips.

Public Facilities, Services, and Infrastructure:

1. Enroll residents in a program to reduce CO2 emissions in their neighborhoods. Ex: Cool Block or Transition Streets.
2. PFS 2.1 must be revised to say include rather than encourage 'Sustainable Plans and Operations' in order to be considered a mitigation of climate change impacts from greenhouse gas emissions.
3. Policy PFS 7.1 should be revised to delete the need for access to gas. The environmental impact from use of natural gas requires carbonizing buildings beginning with no gas connections to new residences . It is therefore contradictory to ensure access to gas.
4. Local renewable energy generation must be part of the mitigation plan for reducing transmission facility fire hazard risk. This is not the same as "Smart Grid Technology". You need experts who know the cutting edge of this field to help write coherent policy on this topic.
5. Zero Waste The County shall achieve zero waste (via a suite of policies to reduce, reuse, and recycle) with no organic waste going to landfills by 2023
6. Zero Waste Policy for Meetings and Events Design and implement a zero waste policy for meetings and events sponsored or permitted by the County to minimize waste and rescue surplus edible food
7. Compostable Take-Out Foodware Require that take-out foodware be made with material compostable in solid waste processing facilities within 60 days
8. Reduce Solid Waste by Phasing Out Single-Use Plastic Evaluate how to best reduce solid waste generation per capita by at least 15% by 2030 including phasing out single-use plastics including but not limited to plastic straws, plastic utensils, plastic take-out containers, and expanded polystyrene
9. Ban Expanded Polystyrene

Conservation and Open Space:

1. Reduce oil and gas production by 40% by 2025 via higher monitoring standards and 2500 ft buffer zones near sensitive sites; reduce production to zero by no later than 2040.
2. Phase-Out of Oil and Gas Production The County shall prohibit new drilling and shall regulate existing wells to assure steady closing of wells beginning near residential and commercial areas.
3. Maintain Policy COS-7.8 as recommended by the Board of Supervisors, so that all newly permitted discretionary oil wells are required to collect gases and use or remove

them for sale or proper disposal instead of flaring or venting. Flaring should be allowed only in cases of emergency or for testing purposes.

4. Maintain Policy COS-7.7 as recommended by the Board of Supervisors, so that all newly permitted discretionary oil wells are required to convey oil and produced water via pipelines instead of trucking.

5. Detect and curb methane emissions from “super-emitter” sites as identified by NASA.

6. Tax oil and gas production, and related uncaptured methane to raise the needed revenues to fund urgent climate programs to replace high-emission vehicles with a priority on trucking and freight companies, fishing businesses, general contractors and K-12 schools.

7. Require a fully accountable performance bond for all new wells to cover cost of closure Cite LAT article (maybe put on website and link to it).

8. Establish an insurance fund that oil and gas producers contribute to that will cover accidents and closing wells if the producer goes bankrupt.

9. Ban gas-fueled lawn and garden equipment. (Ex: City of Ojai)

10. Accelerate capture of legacy HFCs Enlist the public and private to find and destroy existing stocks of HFC’s (refrigerant gases with extremely high Global Warming Potential).

11. Develop and adopt building codes based on best practices for use of low embodied carbon concrete and set targets for use of low GHG concrete alternatives. Ex: Bay Area Air Quality Management District and King Co, WA.

12. Encourage climate-safe and climate-resilient development through zoning reform and removal of limits on height, density, and minimum parking requirements to enable and promote walkability and a mix of uses for homes and businesses, parks and transit.

13. Create a master local clean energy siting and funding plan for wholesale distributed solar energy plus storage in commercial scale projects producing energy needs by 2030.

14. Provide energy efficiency benchmarking and rebates for low-income housing and renters as well as low-interest loans for small businesses to reduce energy use; assist owners of existing buildings to switch from natural gas to electricity.

15. Prepare sustainable building, siting, landscaping and passive heating and cooling practice guidelines, with a priority on low-income housing, that reduce consumption of non-renewable resources and that include climate and fire-safety in pre-approved plans.

16. Energy Efficiency to Reduce Electricity Use Use Energy Efficiency to Deliver 15% of Projected Needs for electricity in the county by 2023; and 30% by 2030.

17. Efficiency Building Standards for Retrofits Prioritize energy and water efficiency building standards and work to retrofit existing buildings.

18. Decarbonize County Buildings Develop a county building electrification plan eliminating natural gas use in County-owned facilities.

19. Decarbonize All Building Types Develop an electrification plan with goals for GHG emission reductions through renewable energy that evaluates and prioritizes programs for local solar, energy storage and demand response (DR) that disconnects all buildings from gas service by 2050. Include incentives for deep retrofits of inefficient buildings.

Agriculture:

1. Integrated Pest Management where toxic pesticides are a last resort. Create a program that promotes the principles (systems approach, building trust, and effective communication) and pursues the recommendations of the Roadmap for Integrated Pest Management from the University of California and CA Department of Pesticide Regulation. Environmental impacts from toxic pesticides are not described in the Background Report. The Roadmap to an Organic California Policy Report by CCOF Foundation offers information for mitigations and climate action. A workshop is needed.
2. Inorganic Nitrogen Based Fertilizers Set benchmarks for reducing use of inorganic N fertilizer and encourage optimized use of organic and inorganic fertilizer for greatest efficiency in closed nutrient cycles, monitor for nutrient runoff from fields and encourage the use of cover crops and green manure crops to reduce or avoid nitrous oxide (N₂O) emissions and nutrient runoff.
3. Diversified Cropping Systems Encourage farmers to include 1 – 5% of beneficial insect attracting plants in a planted crop, and other methods, such as crop rotation, perennial mowed cover crop in orchards, and integrating multiple species or varieties to enhance the biological and economic stability by spreading economic risk and buffering against pest invasions and extreme weather events, and increase carbon sequestration.
4. Reward Regenerative Farmers with Digestate and Compost from Food Waste Research feasibility of a program for composting food waste for use by farmers and landscapers who use regenerative practices that sequester certified amounts of CO₂.

Water Resources:

1. At least 30,000 acre-feet per year must come from storm water capture by 2035
2. All rainfall must be retained onsite in soil and reservoirs.
3. Slow It. Spread It. Sink It! The County shall enforce Best Management Practices (BMP) and Low Impact Development (LID) for new developments.
4. Recycle all wastewater for beneficial reuse by 2035.
5. Reduce potable water use per capita by 22% by 2025 and 25% by 2035: Offer incentives for water conservation features, including drought tolerant landscaping, permeable materials in standard parkway design guidelines, street trees, infiltration, greywater, and water-saving plumbing.
6. Close oil and gas wells and injection wells near aquifers as a top priority.
7. Create a Master Plan to develop the full potential of integrated water management to infiltrate the ground and recharge aquifers; support reforestation and restoration of watershed ecosystems; conserve and protect groundwater resources, and clean up creeks, streams, and estuaries.
8. Support Santa Clara River Loop Trail and Ventura River Trail Development

Economic Vitality:

1. Agricultural Diversification should include reference to regenerative practices to create biodiversity with opportunities for community members to visit farms.
2. Small Business Promotion. Support approval of caretaker residential space on business property to reduce VMT and more financial strength for small businesses.
3. Green Economy. Prioritize youth and immigrants for workforce development in

industries that promote and enhance environmental sustainability, including GHG reductions, climate adaptation, resiliency and local renewable energy generation, storage and distribution, including solar power, wind power, wave energy, regenerative organic farming and value-added agriculture-related activities, and other appropriate renewable sources.

4. Maritime Economy. Facilitate a sustainable maritime economy using restorative aquaculture techniques that restore ocean health and biodiversity while reviving pre-human fisheries abundance. For example, restore sand-bottom kelp forests and increase kelp forests with flexible floating fishing reefs where the seafloor is otherwise too deep for kelp.

5. Promote Fire-Resistant Infill and Revitalization. Encourage infill development that serves as firebreak rather than as additional fuel for wildfires.

6. Create a Collaborative Structure for Innovation for a Resilient Future. The structure should be able to make decisions and create a way forward for zoning, building and materials and environmental health to allow options for a resilient future, include government officials, innovators and public as described in submissions from Sustainable Living Research Initiative.

7. Parking Infrastructure. Develop parking policies to reduce single occupancy trips associated with employees and business activity to reduce Vehicle Miles Traveled.

8. Master Plan for Distributed Energy Resources and Community Microgrids. Prepare a map of siting options for renewable energy generation and storage facilities and coordinate the identification of financing options for renewable energy resource development, including solar, wind, wave, storage and community microgrids both in front of and behind the meter.

In summary, with the accelerating tipping points, we cannot go half-way in our vision. We need extraordinary courage to set goals we can hang our hopes and efforts on. We want completeness and clarity so we can see how the emissions reduction plan adds up. We want respect for climate science to tell us the truth. We want more ambition. A 2016 decision of the state legislature in SB32 is just not good enough as a goal. We want to see a systematic plan that will assure carbon neutrality no later than 2045.

RE: Action for Change in Changing Times Comment Letter on the *Draft Environmental Impact Report (EIR) for the County of Ventura Draft 2040 General Plan*

Dear Ms. Curtis,

Action for Change in Changing Times (ACCT) has reviewed portions of the draft EIR and have serious concerns with what we see as a lack of completeness, an entirely inadequate Climate Action Plan, and *a failure to recognize the role of the County in the production of oil and gas*. Lacking and needed are policies and environmental mitigations that ensure we do our share of addressing the climate crisis. On these issues the draft General Plan and the draft EIR, unfortunately, fail.

When this process started in 2015, Ventura County did not realize that we are on the front lines of the Climate Crisis. The current 2.6 degree Celsius rise above pre-industrial levels, major wildfires, droughts and analysis of climate impacts on our County demonstrate that a significant, if not the most significant, land use issue facing this county over the next 20 years is the climate crisis and how we respond through the planning process.

We could not find a clear indication in either of these documents of the total greenhouse gas (GHG) potential produced annually in the county. In fact, the role of the industry in this county appears to be missing in the documents. On an annual basis what is the BTU value of the liquid and gas products extracted by our oil & gas industry? What is the GHG emission from the ultimate production and use of those fossil fuels?

On a planetary scale we need to plan now for the systematic and rapid phase out of oil and gas extraction and shift rapidly to development and use of cleaner renewable fuels -- on that the planet depends.

We cannot find a schedule within the county documents for the systematic and cost-effective winding down of this industry along with a just transition for our workers in the oil field, many of whom will be employed throughout the closing out of production and restoration of land. Others have skills that are directly transferable to clean industries of commercial and residential solar and wind energy.

In summary, ACCT finds the current county drafts unacceptable for planning over the next twenty years with too many unanswered issues in the draft EIR.

We, the undersigned residents of Ventura County, respectfully call for the above concerns to be fully addressed.

RE: Action for Change in Changing Times Comment Letter on the *Draft Environmental Impact Report (EIR)* for the *County of Ventura Draft 2040 General Plan*

Dear Ms. Curtis,

Action for Change in Changing Times (ACCT) has reviewed portions of the draft EIR and have serious concerns with what we see as a lack of completeness, an entirely inadequate Climate Action Plan, and a *failure to recognize the role of the County in the production of oil and gas*. Lacking and needed are policies and environmental mitigations that ensure we do our share of addressing the climate crisis. On these issues the draft General Plan and the draft EIR, unfortunately, fail.

When this process started in 2015, Ventura County did not realize that we are on the front lines of the Climate Crisis. The current 2.6 degree Celsius rise above pre-industrial levels, major wildfires, droughts and analysis of climate impacts on our County demonstrate that a significant, if not the most significant, land use issue facing this county over the next 20 years is the climate crisis and how we respond through the planning process.

We could not find a clear indication in either of these documents of the total greenhouse gas (GHG) potential produced annually in the county. In fact, the role of the industry in this county appears to be missing in the documents. On an annual basis what is the BTU value of the liquid and gas products extracted by our oil & gas industry? What is the GHG emission from the ultimate production and use of those fossil fuels?

On a planetary scale we need to plan now for the systematic and rapid phase out of oil and gas extraction and shift rapidly to development and use of cleaner renewable fuels -- on that the planet depends.

We cannot find a schedule within the county documents for the systematic and cost-effective winding down of this industry along with a just transition for our workers in the oil field, many of whom will be employed throughout the closing out of production and restoration of land. Others have skills that are directly transferable to clean industries of commercial and residential solar and wind energy.

In summary, ACCT finds the current county drafts unacceptable for planning over the next twenty years with too many unanswered issues in the draft EIR.

We, the undersigned residents of Ventura County, respectfully call for the above concerns to be fully addressed.

Susan Curtis,

Dear Ventura County Board of Supervisors and Planning Department,

Climate issues are something I feel worried about. Ventura County is warming faster than any county in the nation. Our ocean is acidifying faster. Drought and floods have hit us worse, and we can expect more extreme weather.

My family and community are counting on you to assure analysis of the full scope of environmental impacts and mitigations in the Draft EIR.

First, it is necessary that all greenhouse gas emissions be counted based on the most current science.

There are many ways to mitigate climate impacts, like a sunset plan for oil and gas production, decarbonization of transportation and buildings, zero waste, incentives for regenerative agriculture and water management, and reducing emissions from tailpipes.

I want an EIR that covers major climate impacts via a systematic plan.

Thank you for listening to the people and doing what's right for the health of your constituents, the ones you represent.

Remember this: we ALL live downstream.

Thank you—

Kari Aist

Re: 2040 General Plan Environmental Impact Report (EIR)

Dear Mr. Hedrick and Honorable Members of APAC:

Thank you for the opportunity to provide comments following today's presentation by Ventura County Planning staff on the 2040 General Plan EIR.

There are several issues with the 2040 General Plan EIR that CoLAB believes will negatively impact the viability of local agriculture.

Proposed mitigation measure AG-2: The County proposes that any project that either directly or indirectly results in the loss of farmland must obtain and place into perpetual agricultural preservation twice the total of the farmland loss. This mitigation measure is infeasible. Contrary to statements made by County Planning staff today at the APAC meeting, the California Environmental Quality Act (CEQA)

requires that all mitigation proposed in an EIR be feasible. CEQA Section 21061.1 defines feasible as “capable of being accomplished in a successful manner within a reasonable period of time, ” (*emphasis added*). All mitigation measures proposed in an EIR must be shown to reduce impacts and an infeasible mitigation measure, by definition, cannot and will not reduce impacts.

The EIR does not provide evidence of any of the following:

1. 1) Whether there is sufficient land available for purchase/conservation easement for each farmland category;
2. 2) The cost per acre to purchase each category of farmland;
3. 3) The anticipated cost of establishing a conservation easement for each category of farmland;
4. 4) The anticipated cost associated with managing each category of farmland under a conservation easement;
5. 5) The anticipated cost associated with monitoring these mitigation parcels scattered throughout the County and who will bear that cost;
6. 6) Any information that could constitute a “plan” for management of farmland in conservation easements;

February 19, 2020

[Ventura County Coalition of Labor, Agriculture and Business / 1672 Donlon Street, Ventura, CA 93003 / 805-633-2260 / info@colabvc.org](#)

Page 2 of 4

7. 7) An analysis of direct and indirect impacts caused by this mitigation measure (including impacts associated with LU compatibility conflicts and increased urban-ag-interface);
8. 8) Whether the smallest possible mitigation acreage required will achieve the minimum to ensure viability of agriculture on the parcel; and
9. 9) Whether the proposed mitigation is in conflict with other ordinances and regulations, such as the County’s Zoning Ordinance and the County’s minimum lot sizes.

The County is already aware that this proposed mitigation measure is infeasible. On March 24, 2016, at a Local Agency Formation Commission (LAFCo) hearing, Supervisor Linda Parks attempted to establish an “Agricultural Mitigation Measure” through the LAFCo project approval process. The mitigation measure would have required the 1-to-1 purchase of local farmland (half of what is proposed in the 2040 General Plan EIR) to replace farmland that would be impacted by any proposed development. Ventura County Counsel, Michael Walker, informed both LAFCo and Supervisor Parks that the proposed

mitigation measure did not meet the standard for economic feasibility, and, for that and other reasons, LAFCo could not adopt Supervisor Park's proposed mitigation measure. He referenced a 2015 legal decision, *City of Irvine v. County of Orange*, in which the Court stated, "the sheer astronomical expense of land supports the finding of the EIR that the purchase of an agricultural conservation easement is a non-starter."

In addition to being infeasible, CoLAB does not believe that this mitigation measure will reduce impacts on agricultural land, as it does not address the actual issues that will impact farmland under the 2040 General Plan: lack of economic sustainability, the increasing regulatory demands on agriculture, increased competition for water resources, and increased compatibility conflicts from development.

Indirect Impacts

The EIR dismisses "indirect impacts" that will occur as a result of implementing the 2040 General Plan as "less than significant."

Page 4.2-13 of the EIR states "AG-2.3 maintains the Right-to-Farm Ordinance to protect agricultural land uses from conflicts with non-agricultural uses, as well as to help land purchasers and residents understand the potential for nuisance, (e.g., dust, noise, odors) that may occur as the natural result of living in or near agricultural areas...These sections of the code protect farmers engaged in agricultural activity from public nuisance claims...This protects the farming community, including Important Farmlands and farms less than 10 acres, from developments that would inhibit their ability to continue agricultural production."

Page 4.2-17 of the EIR states: "Residential growth in areas nearby agricultural lands has the potential to result in land use conflicts. Residential land uses are generally more sensitive and prone to conflict with adjacent agricultural land uses than commercial or industrial land uses. The placement of sensitive land uses, such as residences and schools, nearby classified farmland can negatively impact both uses due to conflict including odor nuisances and noise from agriculture machinery. The countywide Right-to-Farm Ordinance protects existing agricultural and farming operations from conflicts attributed to residential development...Therefore, the potential for conflicts would be minimal. This impact would be less than significant" (*emphasis added*).

This is simply not true. Historic and recent County actions have shown that the County has and will continue to create new restrictions and ordinances that have a significant impact on existing agricultural

[Ventura County Coalition of Labor, Agriculture and Business / 1672 Donlon Street, Ventura, CA 93003 / 805-633-2260 / info@colabvc.org](http://www.colabvc.org)

Page 3 of 4

and farming operations because of conflicts attributed to residential development. The recent interim urgency ordinance restricting hemp cultivation is one such example.

Contrary to statements made today by Ventura County Planning staff, an EIR, whether it is labeled as "programmatic" or "project", must analyze all reasonably foreseeable consequences of the action that is proposed. For the 2040 General Plan EIR, the action proposed is the implementation of all policies and programs within. Therefore, if the implementation of a policy in the 2040 General Plan will result in an impact, that impact must be analyzed. For example, the 2040 General Plan contains land use designation changes that will increase allowable housing density near agricultural land. It is reasonably foreseeable

that more houses will create more compatibility conflicts with normal farming operations. The impact of these compatibility conflicts must be addressed in the EIR.

In 2014, the California Court of Appeal stated in a ruling that “[T]he fact that this EIR is labeled a ‘project’ rather than a ‘program’ EIR matters little....Designating an EIR as a program EIR ... does not by itself decrease the level of analysis otherwise required in the EIR. All EIRs must cover the same general content. The level of specificity of an EIR is determined by the nature of the project and the “rule of reason,” rather than any semantic label accorded to the EIR.”

It is CoLAB’s opinion that indirect impacts from increasing urban-ag interface are SIGNIFICANT and cannot be dismissed in the EIR.

Direct and indirect impacts of increased costs

The 2040 General Plan has policies that will increase the costs of normal farming operations. CoLAB believes that the most effective way to minimize conversion of agricultural land to non-agricultural uses is to take active measures to allow farming to remain profitable. And even the County admits that reducing the cost of farming reduces conversion of agricultural land in their discussion of the Williamson Act in Chapter 4.2 of the EIR.

But the County fails to analyze direct and indirect impacts of 2040 General Plan policies that will increase the cost of normal farming operations, such as:

- Policy AG-5.2: Electric- or Renewable-Powered Agricultural Equipment. The County shall encourage and support the transition to electric- or renewable-powered or lower emission agricultural equipment in place of fossil fuel-powered equipment when feasible.
- Policy AG-5.3: Electric- or Renewable-Powered Irrigation Pumps. The County shall encourage farmers to convert fossil fuel-powered irrigation pumps to systems powered by electric or renewable energy sources, such as solar power, and encourage electric utilities to eliminate or reduce standby charges.

Direct and indirect impacts of increased competition for water resources

The County fails to evaluate the impact of increased competition for water resources caused by development allowed in the 2040 General Plan on either the conversion of agricultural land or the loss of agricultural lands through the loss of topsoil.

The EIR states on page 4.2-3 that “...a reduction in available water resources for irrigation” is an example of indirect impacts on agricultural land due to loss of topsoil from increased wind and water erosion.

But the County fails to analyze or propose mitigation measures to address this significant impact.

[Ventura County Coalition of Labor, Agriculture and Business / 1672 Donlon Street, Ventura, CA 93003 / 805-633-2260 / info@colabvc.org](http://www.colabvc.org)

Page 4 of 4

APAC is the expert charged with advising County decision-makers on agricultural issues in Ventura County. And the County should be seeking guidance from APAC about the actual issues that will impact farmland under the 2040 General Plan: lack of economic sustainability, the increasing regulatory

demands on agriculture, increased competition for water resources, and increased compatibility conflicts from development.

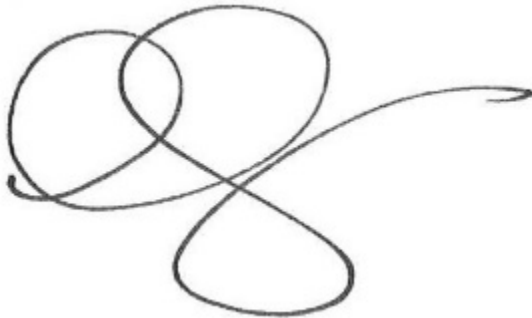

CoLAB encourages APAC to provide guidance to the County on appropriate and effective mitigation measures to prevent the conversion of agricultural land to non-agricultural uses. These may include:

1. 1) Strengthen the Right-to-Farm ordinance to prevent nuisance complaints from being used to justify the creation or expansion of setbacks or regulatory restrictions on normal farming practices;
2. 2) Expand the Land Conservation Act Program to include Open Space zoned properties that are engaged in farming (including grazing); and
3. 3) Protect agricultural land from urban-ag interface encroachment and compatibility conflicts by establishing setbacks on NON-AE-zoned land that will restrict the construction of bike paths, public trails, and sensitive receptors within 2000' of any land zoned A/E.

Thank you again for the opportunity to provide comments on this issue. We appreciate your consideration and leadership at this time.

Sincerely,

Louise Lampara Executive Director

Subject: 2040 General Plan Draft EIR Comment

Dear Ms. Curtis:

-

I am writing to call your attention to significant flaws in the process, data, and conclusions of the Ventura County General Plan, Draft EIR, and supplemental documents.

-

My great grandfather, Mark McLoughlin (1843-1914), was a true Ventura County pioneer, purchasing his first 318 acres of undeveloped land in Ventura County in 1875. He was a hard-working visionary, revered by his community. With his son—my grandfather, James Patrick McLoughlin—he raised livestock and farmed the land, providing jobs and feeding the growing towns of Oxnard and Ventura.

-

Our land, in a vitally important location on Olivas Park Drive across from the Ventura Marina, has been in the family, and part of the economic fabric of the community, for 100 years. And we want it to be part

of the future of this community, with a flourishing economy, a thriving job market, and unsurpassed quality of life for its residents.

-

But the General Plan and DEIR do not describe a viable path for us as landowners going forward.

-

I will begin with some specific issues regarding language in the Coastal Area Plan, 4-82-83 and 4-94-95. Part of our land is located in the Central Coastal Zone, adjacent to the Ventura Marina, on Olivas Park Drive at Harbor Blvd. The only conclusion the Plan draws about our land is the statement that, “unlike the Preble area, services are not readily available to the Olivas lands.” This is false. Our property has access to all utilities, water, main roads, and the freeway. Indeed, easements on our property serve surrounding areas with utilities.

-

The Plan also claims that our property is “not included in the City’s sanitation district because of problems with water pressure.” This language is irrelevant and incorrect. There is no evidence that there are water pressure issues, and the sanitation district’s pipelines actually traverse our property.

-

While we do not know the original source of these misstatements, such misrepresentations—now repeated in the Plan—threaten to diminish the value of our land in relation to the Preble property. And, of course, they undermine the goal and the value of the Plan itself.

-

The General Plan also speaks of the widening of Olivas Park Drive, our southern boundary. This would have a direct impact on our property. But the Plan does not address how this would happen or how it would affect our land.

-

Damaging misstatements about our property also appear in the DEIR. Contrary to the portrayal in the DEIR, our property has significant infrastructure in place, as well as prime accessibility to the highway and the harbor. In fact, with easy access to the marina and beach community, and with the railroad as part of our eastern boundary, our land is uniquely suited to be an important part of future economic development in the area. We are entitled to have all these matters corrected.

-

I would also like to raise some additional concerns:

-

1. The General Plan and DEIR continue to ignore the 28% increase in the homeless population in our community.

-

2. According to the General Plan, if we were to build an acre of low income / worker housing we would need to buy two replacement acres of same Ag land to be placed into perpetual agricultural preservation. This is unrealistic and infeasible, and certainly not in line with the State government's housing policies.

-

3. The EIR does not adequately address the enormous "indirect impacts" that will occur as a result of implementing the General Plan, calling them "less than significant."

-

4. The General Plan contains policies that will increase the costs of normal farming operations, making it difficult for farming to remain profitable.

-

5. The Plan does not adequately evaluate the impacts of increased competition for water in our community.

-

The EIR is a flawed document, full of errors, that does not disclose all impacts, direct and indirect, caused by the General Plan. It was obviously rushed—completed in six weeks. It is inaccurate and incomplete, and fails to provide members of the community with the information that they are legally entitled to. This EIR should be corrected and reconsidered, and a reasonable time period should be allowed for meaningful and thoughtful community input.

-

Sincerely,

John Chambers

VIA ELECTRONIC MAIL: GeneralPlanUpdate@ventura.org

Ventura County Board of Supervisors
Attn: RMA Planning Division
General Plan Update
800 Victoria Avenue L#1740
Ventura, California 93009-1740

Dear Board of Supervisors and Staff:

We are writing this letter to urge the Board of Supervisors to reconsider moving forward with the Draft General Plan EIR. The draft EIR has been accelerated to the point that too many issues and impacts have not been properly addressed or studied. These impacts and the corresponding mitigation measures will have severe impacts to land owners and especially those, like us in the agricultural industry and other productive economic segments.

Our family has been involved in the agricultural industry for more than 100 years in Ventura County. We have owned numerous land holdings that remain in the family to this date. We have farmed throughout Ventura County and hope to continue to do so in the future.

The Draft EIR is deficient on many levels. CEQA requires that all mitigation measures must be technically and economically feasible. Numerous proposed mitigation measures are neither. We have in the past attempted to identify land and any owners that would be open to sell their development rights for land that was converting from agricultural to commercial use. Not only did we not find anyone that would do so, no one would even quote a price. The only positive response from numerous land owners was that you can buy my property for full market value and then you can do what you want. There is not a project that can be built by adding double land cost to the equation. This was very recently experienced based on proposed policies at LAFCo. These policies were eventually not enacted due to the inability to purchase development rights in an economically feasible manner. This was when LAFCo was contemplating an acre for acre ag preserve. The new policy that is proposed in the 2040 General Plan is requiring 2 acres for every 1 acre of land converted from ag to any other use. This will eliminate the ability to add any new required ag buildings or even farm worker housing. The Draft EIR must study these impacts, since they are not feasible.

The Draft EIR also deals with water in a manner that is not properly studied. There is no analysis on increased water costs and diminishing availability of water. Without reasonable water costs and supply, there is no agricultural industry.

The General Plan indicates that agriculture is a high priority in the County. However, new policies and requirements in the General Plan add additional mitigation measures that will make ag virtually impossible. These include new setbacks, limiting types of fumigants pesticides and fertilizers. The General Plan also requires that all farm equipment be converted to electric. Again, not feasible. The costs to purchase new pumps, farm equipment and other existing fuel using equipment will increase operational costs to a point that the County crops will not be competitive in the open market. These new mitigation measures are not sufficiently studied and again are not economically feasible.

The Draft EIR is extremely difficult to read and understand. The background reports are lacking in depth of what has been studied other than numerous general statements and very poor mapping. Detailed studies must be added to sufficiently identify impacts and the related mitigation measures for both direct and indirect impacts on the agricultural industry. It is our understanding that reports and studies need to be timely prepared. However numerous studies are older than 5 years. Not timely.

After devastating wildfires over the last few years, which significantly impacted ag, the General Plan continues to lay out limiting mitigation measures for fire prevention. The Wildlife corridor eliminates any ag operation or fire prevention in the proposed corridor areas. This is also a major concern not studied in the Draft EIR.

The Draft EIR for the 2040 General plan does not provide adequate analysis for the expansion of permanent bike paths and pedestrian walking trails throughout the County. These impacts are very severe due to constant conflicts from trail users and ag operations. Spraying, dust, odors from ag operations, along with impacts created by the trail users. These are usually theft, vandalism, litter and pet waste. The proposed mitigation measures require additional setbacks from these trails which renders additional land unusable for ag operations.

In addition to the above comments on the agricultural aspects and related land use concerns of the DEIR, the undersigned is also a mineral owner directly interested in the impacts on oil and gas production of the DEIR and related General Plan 2040 proposed provisions. In these documents there is a total failure to address the economic impacts of the various policies proposed in violation of the requirements for this process, including but not limited to the loss of royalty income to a large group of County residents. I join in the detailed comments on the various deficiencies and concerns identified in the DEIR as described in the concurrent submissions on behalf of Aera Energy and other operators delivered this week to the County.

Furthermore, for the good of the County, its employees, and its citizens should not the implications to land values, therefore assessed values, therefore property tax collections be considered an unmitigated impact? I would think that Ventura County is a wonderful example of government for the people, all of its people, taxpayers and beneficiaries of government services alike. I would also think that it is irresponsible for the Board of Supervisors to ignore this impact. I have not seen an analysis of economic impacts in the body of the proposed 2040 General Plan DEIR. I think this is a serious omission.

Please look at the long-term consequences of these General Plan policies and mitigation measures. We formally request additional studies and a revised Draft EIR that will properly look at these and many more issues. The DEIR must be corrected with details of the revisions. Then it can be recirculated.

Sincerely,

John W. Borchard, Jr.

February 27, 2020

Ventura County Board of Supervisors
Attn: Susan Curtis, Manager, General Plan Update Section
800 South Victoria Avenue, L#1740
Ventura, CA 93009-1740

I'm writing to you as a concerned resident of the County regarding the viability of the oil and gas industry in Ventura County.

The 2040 General Plan Draft EIR fails to give proper analysis to oil and gas mineral resources.

Neither the EIR nor the Background report provide a complete and thorough description of the existing, current regulatory setting that oversees the management and production of mineral resources in the County and the State of California. The EIR and the Background Report only disclose federal and state agencies that regulate pipelines and flaring, which is not applicable to all mineral resources that must be analyzed in an EIR under CEQA guidelines. The EIR should be revised to include an overview and description of all potential regulations, regulatory bodies, and programs that regulate mineral resources in Ventura County.

The EIR fails to actually analyze for direct and indirect impacts to mineral resource zones that will occur as a result of the 2040 General Plan. The County admits that Land Use Designation changes in the 2040 General Plan will result in changes to land uses OVER known and important mineral reserves. But neither the EIR nor the Background Report provide any information regarding estimated and anticipated "buildout" in terms of acreage, actual location, number of dwelling units, and development density and intensity. These incompatible land uses will significantly impact future mineral resource production and must be evaluated and mitigated for in the EIR.

The EIR never addresses indirect impacts to mineral resource development that will occur under the 2040 General Plan. As incompatible land uses (such as residential development) occur on or adjacent to mineral production and mineral reserves, compatibility conflicts will increase. Reasonably foreseeable indirect impacts include nuisance complaints, traffic conflicts, theft, vandalism and attempted trespass on mineral production sites. The EIR must analyze and evaluate these impacts on the ability to produce mineral resources in the County.

The Draft EIR is lacks critical analysis and must be corrected and recirculated to ensure a fair process for Ventura County residents.

Thank you,

Simmons, Carrie

RE: APAC Comments Regarding the VC 2040 General Plan EIR

The Ventura County Agricultural Policy Advisory Committee (APAC), so states that, after a unanimous vote of the quorum present at the 19 February 2020 APAC meeting, finds flaws with the Ventura County 2040 General Plan EIR. As such, the APAC requests an extension to the comment period and submits the following comments regarding the EIR and the Draft General Plan:

First and foremost, the mitigating measures proposed in the EIR have not been sufficiently evaluated for efficacy or feasibility. For example, Mitigating Measure AG-1 has previously been rejected by LAFCo as infeasible due to the high cost associated with purchasing conservation easements. Additionally, the APAC strongly believes that Mitigation Measure AG-1 would lead to vacant land, as the General Plan does not include policies or programs that would increase the long-term viability of agriculture in Ventura County and the Mitigating Measure places land into conservation easements in effective perpetuity. Some ways to improve the mitigation of the impact would include:

- Creation of a Conservation Easement Bank for agricultural conservation easements to facilitate both the full-value sale of and ease of purchase of said easements
- The allowance of conservation easements to be sold on portions of a parcel or for legal-nonconforming parcels to be formed as part of the sale
- Policies or programs that would reduce anti-agricultural pressures on lands within conservation easements, such as improved water access/rights, exemptions for agricultural operations from overlay and corridor requirements, and/or an improved and codified Ag/Urban Buffer Policy

AGRICULTURAL POLICY ADVISORY COMMITTEE (APAC)
Advisory Letter to the VC BOS

Furthermore, Impact 4.2-2 is found to be "Less than Significant" with no need for additional mitigating measures solely on the basis of existing policy, ordinances, etc without an evaluation of the effectiveness of those policies at reducing impact under the existing General Plan. As recently demonstrated by Board action in enacting Ventura County Urgency Ordinance No. 4558, at least one of the cited protections does not provide the protection assumed in the General Plan and EIR, and as such should not be considered so strongly in mitigating the Impacts of allowing development near agricultural operations and soils.

Further support for the assertions made here is included with this letter is the letter to APAC by Ventura County CoLAB. The letter provides further detail on the omissions and failures of the EIR, as well as some suggestions for improvement.

Agriculture is unique, as an industry it is the only one so specifically regulated by the General Plan. It is also a primary part of Ventura County historically, economically, aesthetically, culturally, and in many other ways. The EIR fails to identify impacts of the General Plan to agriculture in the county, impacts that would allow the continued reduction in agricultural lands and agricultural viability. For agriculture to be a part of Ventura County's future, please take these observations and recommendations into careful consideration when revising both the EIR and General Plan itself.

Re: 2040 General Plan Environmental Impact Report (EIR)

Dear Mr. Hedrick and Honorable Members of APAC:

Thank you for the opportunity to provide comments following today's presentation by Ventura County Planning staff on the 2040 General Plan EIR.

There are several issues with the 2040 General Plan EIR that CoLAB believes will negatively impact the viability of local agriculture.

Proposed mitigation measure AG-2: The County proposes that any project that either directly or indirectly results in the loss of farmland must obtain and place into perpetual agricultural preservation twice the total of the farmland loss. This mitigation measure is infeasible. Contrary to statements made by County Planning staff today at the APAC meeting, the California Environmental Quality Act (CEQA) requires that all mitigation proposed in an EIR be feasible. CEQA Section 21061.1 defines feasible as "capable of being accomplished in a successful manner within a reasonable period of time, **taking into account economic, environmental, social, and technological factors**" (*emphasis added*). All mitigation measures proposed in an EIR must be shown to reduce impacts and an infeasible mitigation measure, by definition, cannot and will not reduce impacts.

The EIR does not provide evidence of any of the following:

- 1) Whether there is sufficient land available for purchase/conservation easement for each farmland category;
- 2) The cost per acre to purchase each category of farmland;
- 3) The anticipated cost of establishing a conservation easement for each category of farmland;
- 4) The anticipated cost associated with managing each category of farmland under a conservation easement;
- 5) The anticipated cost associated with monitoring these mitigation parcels scattered throughout the County and who will bear that cost;
- 6) Any information that could constitute a "plan" for management of farmland in conservation easements;

- 7) An analysis of direct and indirect impacts caused by this mitigation measure (including impacts associated with LU compatibility conflicts and increased urban-ag-interface);
- 8) Whether the smallest possible mitigation acreage required will achieve the minimum to ensure viability of agriculture on the parcel; and
- 9) Whether the proposed mitigation is in conflict with other ordinances and regulations, such as the County's Zoning Ordinance and the County's minimum lot sizes.

The County is already aware that this proposed mitigation measure is infeasible. On March 24, 2016, at a Local Agency Formation Commission (LAFCo) hearing, Supervisor Linda Parks attempted to establish an "Agricultural Mitigation Measure" through the LAFCo project approval process. The mitigation measure would have required the 1-to-1 purchase of local farmland (half of what is proposed in the 2040 General Plan EIR) to replace farmland that would be impacted by any proposed development. Ventura County Counsel, Michael Walker, informed both LAFCo and Supervisor Parks that the proposed mitigation measure did not meet the standard for economic feasibility, and, for that and other reasons, LAFCo could not adopt Supervisor Park's proposed mitigation measure. He referenced a 2015 legal decision, *City of Irvine v. County of Orange*, in which the Court stated, "the sheer astronomical expense of land supports the finding of the EIR that the purchase of an agricultural conservation easement is a non-starter."

In addition to being infeasible, CoLAB does not believe that this mitigation measure will reduce impacts on agricultural land, as it does not address the actual issues that will impact farmland under the 2040 General Plan: lack of economic sustainability, the increasing regulatory demands on agriculture, increased competition for water resources, and increased compatibility conflicts from development.

Indirect Impacts

The EIR dismisses "indirect impacts" that will occur as a result of implementing the 2040 General Plan as "less than significant."

Page 4.2-13 of the EIR states "AG-2.3 maintains the Right-to-Farm Ordinance to protect agricultural land uses from conflicts with non-agricultural uses, as well as to help land purchasers and residents understand the potential for nuisance, (e.g., dust, noise, odors) that may occur as the natural result of living in or near agricultural areas...These sections of the code protect farmers engaged in agricultural activity from public nuisance claims...This protects the farming community, including Important Farmlands and farms less than 10 acres, from developments that would inhibit their ability to continue agricultural production."

Page 4.2-17 of the EIR states: "Residential growth in areas nearby agricultural lands has the potential to result in land use conflicts. Residential land uses are generally more sensitive and prone to conflict with adjacent agricultural land uses than commercial or industrial land uses. The placement of sensitive land uses, such as residences and schools, nearby classified farmland can negatively impact both uses due to conflict including odor nuisances and noise from agriculture machinery. The countywide Right-to-Farm Ordinance protects existing agricultural and farming operations from conflicts attributed to residential development...**Therefore, the potential for conflicts would be minimal. This impact would be less than significant**" (*emphasis added*).

This is simply not true. Historic and recent County actions have shown that the County has and will continue to create new restrictions and ordinances that have a significant impact on existing agricultural

and farming operations because of conflicts attributed to residential development. The recent interim urgency ordinance restricting hemp cultivation is one such example.

Contrary to statements made today by Ventura County Planning staff, an EIR, whether it is labeled as “programmatic” or “project”, must analyze all reasonably foreseeable consequences of the action that is proposed. For the 2040 General Plan EIR, the action proposed is the implementation of all policies and programs within. Therefore, if the implementation of a policy in the 2040 General Plan will result in an impact, that impact must be analyzed. For example, the 2040 General Plan contains land use designation changes that will increase allowable housing density near agricultural land. It is reasonably foreseeable that more houses will create more compatibility conflicts with normal farming operations. The impact of these compatibility conflicts must be addressed in the EIR.

In 2014, the California Court of Appeal stated in a ruling that “[T]he fact that this EIR is labeled a ‘project’ rather than a ‘program’ EIR matters little....Designating an EIR as a program EIR ... does not by itself decrease the level of analysis otherwise required in the EIR. All EIRs must cover the same general content. The level of specificity of an EIR is determined by the nature of the project and the “rule of reason,” rather than any semantic label accorded to the EIR.”

It is CoLAB’s opinion that indirect impacts from increasing urban-ag interface are SIGNIFICANT and cannot be dismissed in the EIR.

Direct and indirect impacts of increased costs

The 2040 General Plan has policies that will increase the costs of normal farming operations. CoLAB believes that the most effective way to minimize conversion of agricultural land to non-agricultural uses is to take active measures to allow farming to remain profitable. And even the County admits that reducing the cost of farming reduces conversion of agricultural land in their discussion of the Williamson Act in Chapter 4.2 of the EIR.

But the County fails to analyze direct and indirect impacts of 2040 General Plan policies that will increase the cost of normal farming operations, such as:

- Policy AG-5.2: Electric- or Renewable-Powered Agricultural Equipment. The County shall encourage and support the transition to electric- or renewable-powered or lower emission agricultural equipment in place of fossil fuel-powered equipment when feasible.
- Policy AG-5.3: Electric- or Renewable-Powered Irrigation Pumps. The County shall encourage farmers to convert fossil fuel-powered irrigation pumps to systems powered by electric or renewable energy sources, such as solar power, and encourage electric utilities to eliminate or reduce standby charges.

Direct and indirect impacts of increased competition for water resources

The County fails to evaluate the impact of increased competition for water resources caused by development allowed in the 2040 General Plan on either the conversion of agricultural land or the loss of agricultural lands through the loss of topsoil.

The EIR states on page 4.2-3 that “...a reduction in available water resources for irrigation” is an example of indirect impacts on agricultural land due to loss of topsoil from increased wind and water erosion. But the County fails to analyze or propose mitigation measures to address this significant impact.

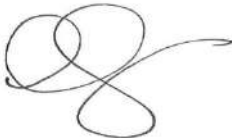

APAC is the expert charged with advising County decision-makers on agricultural issues in Ventura County. And the County should be seeking guidance from APAC about the actual issues that will impact farmland under the 2040 General Plan: lack of economic sustainability, the increasing regulatory demands on agriculture, increased competition for water resources, and increased compatibility conflicts from development.

CoLAB encourages APAC to provide guidance to the County on appropriate and effective mitigation measures to prevent the conversion of agricultural land to non-agricultural uses. These may include:

- 1) Strengthen the Right-to-Farm ordinance to prevent nuisance complaints from being used to justify the creation or expansion of setbacks or regulatory restrictions on normal farming practices;
- 2) Expand the Land Conservation Act Program to include Open Space zoned properties that are engaged in farming (including grazing); and
- 3) Protect agricultural land from urban-ag interface encroachment and compatibility conflicts by establishing setbacks on NON-AE-zoned land that will restrict the construction of bike paths, public trails, and sensitive receptors within 2000' of any land zoned A/E.

Thank you again for the opportunity to provide comments on this issue. We appreciate your consideration and leadership at this time.

Sincerely,

A handwritten signature in black ink, consisting of several loops and a long horizontal stroke extending to the right.

Susan Curtis, Manager
General Plan Update Section
Ventura County Planning Division
800 S. Victoria Ave
Ventura, CA 93009

VIA Email: GeneralPlanUpdate@ventura.org

Dear Ms. Curtis,

The Ventura County General Plan Update Draft Environmental Impact Report (DEIR) fails to adequately address the impacts associated with the policies proposed by the draft General Plan. Specifically, this letter comments on DEIR Section 4.2 – Agriculture and Forestry Resources.

Section 15168 (b)(2) of the California Resources Code identifies one of the advantages of a Program EIR as ensuring “consideration of cumulative impacts that might be slighted in a case-by-case analysis.” The DEIR further clarifies: “The impact analysis provided in this section addresses the physical changes to the existing environment that could occur as a result of 2040 General Plan implementation.”

The methodology of the analysis (Section 4.2.2) addresses only future development and land-use conflicts. Implementation of the General Plan is much more complex. This approach treats agricultural resources as just another land use designation while ignoring the viability of what CEQA determined to be a critical and valuable part of our environment.

There are numerous deficiencies but for brevity I will review the first two scoring factors in the California LESA model: water availability and project size. Both are critical to the viability of sustainable agricultural production but the impacts of the proposed General Plan policies and DEIR mitigations are not properly analyzed or evaluated. The proposed policies and mitigations could result in the conversion of Farmland to non-agricultural uses or create physical changes that are not analyzed or meaningfully mitigated under the DEIR.

Water Availability. The DEIR passingly references the importance of water to agricultural sustainability but fails to quantify existing conditions or anticipated changes in availability for agricultural uses. The Background Report and Section 4-10 identify groundwater basins in overdraft including the Oxnard Plain Basin that provides more than half of all agricultural irrigation water in the county. The proposed GSP for the Oxnard Basin will require significant reductions in agricultural groundwater extraction over the next 20 years - possibly up to 50%. The head of the Fox Canyon GMA is advocating for the full reductions immediately.

It is not possible to irrigate the same amount of land with half the water. The reductions in available water for irrigation and increased costs will necessarily lead to the fallowing of thousands of acres of agricultural land during the General Plan’s 20-year time horizon.

Unplanted areas will be subject to increased erosion from wind and water forces. The proposed General Plan policies will play a significant role in the conversion of current Farmland to non-agricultural uses.

The proposed mitigations of permanently restricting agricultural lands on a 2:1 basis is well established to be infeasible (see LAFCo analysis). Without water, the designated land could not be used for agricultural production. There is no analysis of any of the impacts from significant water supply reductions and the DEIR is inadequate.

Project Size. According to the DEIR, the county contains prime agricultural lands that "...are capable of supporting commercially viable agricultural operations on minimum 9-acre parcels. According to the most recent data from the USDA (2017), the majority of farms in the county are less than 50 acres and approximately half of the farms are less than 10 acres."

Despite this data, the General Plan sets a minimum lot size for Agriculture that is at least four times larger than half of the existing farms:

Policy LU-8.3: Minimal Parcel Size for the Agricultural Land Use Designation. The County shall ensure that the smallest minimum parcel size consistent with the Agricultural land use designation is 40 acres. The County may require larger minimum parcel sizes based on the zone classification.

For farms located in an Open Space land-use designation, the minimum lot size is 10 acres. These policies may make more than half of all farms nonconforming with the underlying General Plan. The probability that a nonconforming farm lot was created legally is extremely low. Over the extended life of the plan, the impacts on agricultural resources are potentially profound.

LU 4-4 and Sec. 8113-8 of the Non-Coastal Zoning Ordinance, for example, prohibit the allowed uses on a nonconforming lot unless it is a legal lot. No building permits may be issued on an illegal lot. To correct most illegal lots requires a Conditional Certificate of Compliance and the conditions are not required to be feasible. Generally, consistency with the General Plan requires that the lot conform to the established minimum lot size. By setting the minimum lot size larger than most of the existing farms, the General Plan will require that illegal lot owners purchase adjacent land. If that land is not available or too expensive, the county may shut down the existing agricultural use and/or deny any new permits.

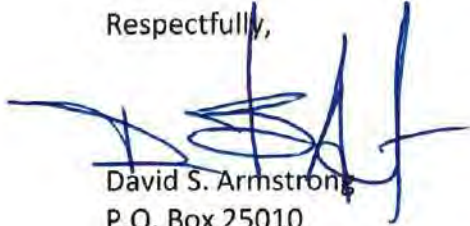

The General Plan sets minimum lot sizes larger than more than half of the County's farms and larger than what the County determined was necessary for commercial viability. There is no analysis of how many farms may be impacted by these policies or how they could result in the conversion to non-agricultural uses.

The conversion to non-agricultural uses under CEQA is not predicated on establishing an alternative land use designation. Any use or having no use that results in stopping the

production of agriculture constitutes a conversion. The DEIR fails evaluate all potential impacts and must be rewritten and subsequently recirculated for review.

Thank you in advance for your consideration.

Respectfully,

A handwritten signature in blue ink, appearing to read 'D. S. Armstrong', is written over a horizontal line. The signature is stylized and somewhat illegible.

RE: City of Oxnard Comments on Analysis of Environmental Impacts for Draft 2040 General Plan

The City of Oxnard (City) has received and reviewed the Draft Environmental Impact Report (DEIR) for the proposed County of Ventura (County) 2040 General Plan comprehensive update. The 2040 General Plan proposes to set forth the County's vision of its future and identify the goals, policies, and implementation programs that will guide future decisions concerning a variety of issues, including but not limited to land use, climate change, agriculture, transportation, hazards, public facilities, health and safety, environmental justice, and resource conservation out to the year 2040.

The City appreciates the opportunity to provide comments on the 2040 General Plan DEIR. The City is also appreciative of the ongoing working relationship and cooperation between the City and the County. The City looks forward to participating in the County's 2040 General Plan update process.

City of Oxnard DEIR Comments

City comments follow DEIR Sections as follows:

2.1 –Introduction

2.2.5- Structure and Content of the General Plan: Land Use Diagram

"Two changes are also proposed for lands within or adjacent to the incorporated cities in the county. As the County does not have land use authority over lands within the cities, these areas are noted as "City" on the 2040 General Plan Land Use Diagram and not given a land

use designation. The final land use designation change is the proposed removal of the Urban Reserve Overlay. This overlay is replaced by a policy that references the use of adopted spheres of influence to provide the same geographic boundary."

The City appreciates the County's efforts to clarify the relationship regarding land use authority between the County and surrounding cities by designating lands within the jurisdictional boundaries of surrounding cities as "City" in the Land Use Diagram. The new designation of "City" and the absence of a land use designation will clearly alert the general public that all lands with the designation are located within a city and that the general public should seek assistance from that appropriate city regarding all land use inquiries. Additionally, the City appreciates the County clearly stating that the County does not have land use authority over lands within the cities. The aforementioned statement will alleviate confusion to the general public about who is responsible for making land use decisions and will assist cooperation between surrounding cities and the County.

4.2 Agriculture

4.2.2 Environmental Impacts and Mitigation Measures

Mitigation Measures

Mitigation Measure AG-1: New Policy AG-X Avoid Development on Agricultural Land

The County shall include the following new policy in the 2040 General Plan.

Policy AG-X Avoid Development on Agricultural Land

"The County shall ensure that discretionary development located on land identified as Important Farmland on the State's Important Farmland Inventory shall be conditioned to avoid direct loss of Important Farmland as much as feasibly possible."

Mitigation Measure AG-2: New Implementation Program AG-X: Establish an Agricultural Conservation Easement

"The County shall include the following new implementation program in the 2040 General Plan.

Implementation Program AG-X: Establish an Agricultural Conservation Easement

Applicants for discretionary projects that would result in direct or indirect loss of Important Farmland in exceedance of the acreage loss thresholds listed in the table below shall ensure the permanent protection of offsite farmland of equal quality at a 2:1 ratio (acres preserved: acres converted) through the establishment of an offsite agricultural conservation easement."

The City, California State Coastal Conservancy (CSCC) and The Nature Conservancy (TNC) (Project Partners) are currently undertaking the Ormond Beach Restoration and Access Plan (OBRAP). The OBRAP area encompasses approximately 630 acres that are entirely within the

City of Oxnard, as is a significant portion of the broader Ormond Beach area. Property outside the OBRAP, in the Eastern Ormond Beach area between Edison Drive and Arnold Road, is within the County. The County also maintains a portion of Arnold Road. The Ventura County Watershed Protection District manages Tsumas Creek, the Ormond Lagoon Waterway, and the Hueneme Drain, including a flood control easement along the Ormond Lagoon Waterway. These waterways traverse lands owned by TNC and the City within the OBRAP area. The OBRAP area and the broader Ormond Beach area also straddle both the County non-coastal and Coastal Zones.

Ormond Beach is considered by wetland experts to be one of the most important wetland restoration opportunities in southern California. Unlike other coastal wetland restoration projects in southern California, there is room to restore the approximate extent of historic wetlands, provide surrounding upland habitat to complete the ecosystem and accommodate sea level rise. When combined with the adjacent Mugu wetlands, it will be one of the largest wetland systems in Southern California. Currently public access is limited. This plan will create restoration alternatives and enhance public enjoyment of Ormond Beach. The Project Partners recently held a public workshop in August of 2019 to present the draft OBRAP to the community and stakeholders. A number of County department representatives participated in the public workshop and provided valuable comments. The Partners greatly appreciate the ongoing participation and assistance of the County during the development of the OBRAP.

Expansion of the project area may occur in the future as a result of new land acquisitions. The OBRAP has identified a few potential land acquisitions opportunities, some of which are located within the County boundaries. Based on Mitigation Measures AG-1 and AG-2, it would potentially require the Project Partners to provide permanent protection of offsite farmland of equal quality at a 2:1 ratio (acres preserved: acres converted) through the establishment of an offsite agricultural conservation easement. The City believes that the policy should be amended to exempt restoration and similar plans from this requirement. The City believes that restoration plans like the OBRAP that are intended to provide regional open space and coastal access opportunities for the general public, protection and further enhancement of vital ecosystems and protection from sea level rise should not be considered “discretionary development” (i.e. hardscape development) and required to provide permanent protection of offsite farmland of equal quality at a 2:1 ratio (acres preserved: acres converted) through the establishment of an offsite agricultural conservation easement.

4.6 Energy

The Energy chapter within the DEIR fails to establish a specific reduction target but references reduction mandates commensurate with State standards. By inference, reduction targets are stated as being able to be met. The analysis does not quantify how the reduction targets will be

met with the added housing units to be constructed over the life of the 2040 General Plan, inclusive of the Housing Element. Additionally, Chapter B (Climate Change) of the DEIR identifies reduction targets (see page B-13). The City recommends that these targets be quantified in the Energy section to demonstrate how reductions will be met and that the GHG citation and evaluation criteria for inventory (ICLEI 2013) be referenced in this section.

4.8 Green Gas Emissions

ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES

Impact 4.8-2: Conflict with an Applicable Plan, Policy, or Regulation for the Purpose of Reducing the Emissions of GHGs

Impact 4.8-2 (page 4.8-50) states, “the County cannot meaningfully quantify the effect of all its 2040 General Plan policies and programs on future GHG emissions, and there, it cannot conclude, at this program level of analysis, that future GHG emissions in the county under the 2040 General Plan would be sufficiently reduced to meet the State’s 2030 or post-2030 targets.” The City recommends that policies and implementation measures be prioritized with measures to achieve greater reductions identified. Prioritization will also assist the County when budgeting and evaluating competing priorities. This could also be replicated in Appendix B.

4.11 Land Use Planning

Section 4.11.2 – Environmental Impacts and Mitigation Measures

2040 General Plan Policies and Implementation Programs

Agriculture Element

Policy PFS-5.2: Land Use Compatibility with Solid Waste Facilities

“The County shall review and condition discretionary development near landfills and other solid waste processing and disposal facilities (including facilities for composting, green waste, food waste) to avoid incompatible development and future nuisance complaints from encroachment by incompatible land uses.”

The City recommends that language be incorporated to Policy PFS-5.2 that would not permit the extension of discretionary permits for existing development near landfills and other solid waste processing and disposal facilities (including facilities for composting, green waste, food waste) adjacent to or near: wetlands; restoration plan areas; and areas that contain environmentally sensitive habitat, including federally and state endangered and listed species. This policy will ensure that such facilities site their operations in the appropriate zoning. The new policy language will assist in the preservation and enhancement of unique environmental settings that are becoming frequently rare in the County and will provide for additional restoration and conservation opportunities throughout the County.

4.12 Mineral

Section 4.12.2 – Environmental Impacts and Mitigation Measures

2040 General Plan Policies and Implementation Programs

Mitigation Measures

Mitigation Measure PR-1: Revised Policy COS-7.2: Oil Well Distance Criteria

The County shall include the following revised policy in the 2040 General Plan.

COS-7.2: Oil Well Distance Criteria

“The County shall require that new discretionary oil and gas wells to be located be sited a minimum of 1,500 feet from the well head to residential dwellings dwelling units and 2,500 from any school sensitive use structures which include dwellings, childcare facilities, hospitals, health clinics, and school property lines.”

The City recommends that revised policy COS-7.2 continue to require that new discretionary oil and gas wells be sited a minimum of 2,500 feet to sensitive use structures which include dwellings, childcare facilities, hospitals, health clinics, and school property lines instead of the proposed 1,500 feet. The DEIR cites the recommendations contained within the Los Angeles County LACDPH, Public Health and Safety Risks of Oil and Gas Facilities in Los Angeles County report (February 2018) and the City of Los Angeles Oil and Gas Report (July 2019) as justification for recommending the setback reduction of new discretionary oil and gas wells to sensitive use structures from 1,500 feet to 2,500 feet. However, the DEIR fails to identify how the conditions and infrastructure analyzed in the aforementioned reports relate to the conditions and infrastructure found within the County, and if the reduction in setback is adequate based on the conditions found in the County. The City recommends that the County commission a study that analyzes current oil and gas conditions in the County and how the reduction in setback will impact sensitive use structures.

4.14 Population and Housing

4.14.2 Environmental Impacts and Mitigation Measures

Methodology

Section 4.14.2 of the DEIR states the following: “Affordable housing units are defined as moderate-income in the Coastal Zone and lower-income for the remainder of the plan area. (Lower-income is the term used to collectively refer to low-, very-low, and extremely-low income households.)” Please clarify how allowance of only moderate-income housing units in the Coastal Zone complies with State Housing Law. The allowance would have major implications on how the City and surrounding cities in the County comply with State Housing Law.

4.17 Utilities

4.17.1 Background Report Setting Updates

Environmental Setting

Table 4.17-1 Wastewater Treatment Capacity, Ventura County

| Agency | Total Number of Connections | Rated Capacity (MGD ¹) | ADWF ² (MGD) | Treatment Level |
|---------------------------------------------------|----------------------------------------------|------------------------------------|-------------------------|-------------------------------|
| County Service Area No. 29 | 307 | N/A | 0.085 | Tertiary |
| County Service Area No. 30 | 274 | N/A | 0.2 | Tertiary |
| County Service Area No. 32 | N/A | N/A | N/A | N/A |
| County Service Area No. 34 | 1,364 | N/A | N/A | Tertiary |
| Camarillo Utility Enterprise | 57 | N/A | 0.0356 | Tertiary |
| Todd Road Jail | N/A | 0.08 | 0.044 | Secondary |
| Ventura County Waterworks District No. 1 | 10,000 (37,000 population) | 5 | 2 | Tertiary |
| Ventura County Waterworks District No. 16 | 544 (2,000 population) | 0.5 | N/A | Secondary |
| Camarillo Sanitary District | 70,000 (population, city and unincorporated) | 7.25 | 4 | Tertiary |

RE: Comments on Analysis of Environmental Impact Report for Draft 2040 General Plan
(State Clearinghouse #2019011026)

Dear Ms. Curtis:

This letter provides comments on behalf of ABA Energy Corporation (“ABA”) on the analysis of the environmental impacts provided in the Draft Environment Impact Report for the Draft 2040 General Plan (“DEIR”). In addition to my general comments, I have also included a more specific set of detailed comments referencing specific sections of the DEIR.

For the last ten years my company, ABA, has been actively exploring for and producing oil and gas in the Oxnard Oilfield in Ventura County utilizing traditional recovery methods. We have worked cooperatively with the Ventura County Planning, Building, and Fire Departments, the Ventura County Air Pollution Control District, as well as the state regulatory agencies to conduct our operations for the mutual benefit of the farming families who own the minerals under their farm property and others, including ABA who have a vested interest in the minerals. We have invested tens of millions of dollars in our effort and generated significant tax revenue in the process. It is our intention to continue to conduct these lawful operations and drill additional wells in accord with the existing stringent laws, regulations, and rules that are among the most rigorous in the world. As a mineral resource lessee and a production operator in the County, ABA will be directly and substantially affected by the adequacy of environmental review undertaken in support of the 2040 General Plan as well as implementation of the 2040 General Plan.

The DEIR is deficient in many aspects and we respectfully request that the DEIR be significantly revised and recirculated, as required by the California Environmental Quality Act (Pub. Resources Code, §§ 21000 et seq) (“CEQA”) and the State CEQA Guidelines (Cal. Code Regs., tit. 14, §§ 15000 et seq.) (“CEQA Guidelines”). Given the DEIR’s failure as an informational disclosure document and its failure to identify and impose all feasible mitigation measures, the DEIR, in its current form, cannot support approval of the County’s proposed update to its current general plan (“2040 General Plan”). The DEIR’s legal deficiencies must be cured and it must be recirculated prior to any approval of the 2040 General Plan.

An EIR must be prepared with a sufficient degree of analysis to provide decision-makers with the information needed to make an intelligent judgment concerning a project's environmental impacts. 14 Cal Code Regs §15151. *Napa Citizens for Honest Gov't v Napa County Bd. of Supervisors* (2001) 91 CA4th 342, 356. An EIR should, when looked at as a whole, provide a reasonable, good faith disclosure and

analysis of the project's environmental impacts. *Laurel Heights Improvement Ass'n v Regents of Univ. of Cal.* (1988) 47 C3d 376, 392.

GENERAL COMMENTS

Replacing Locally Produced Oil with Imported Oil Will Increase, Not Reduce, Greenhouse Gases.

The term “Greenwashing” applies to organizations that disseminate disinformation and misleading claims so as to present an environmentally responsible public image when in fact their policies and products have the opposite effect. As a part of California’s push for environmental justice, several companies that have engaged in Greenwashing have even been sued by the Attorney General.¹ The County of Ventura appears to be engaging in Greenwashing by proposing policies that it touts will achieve a decrease in greenhouse gases (“GHG”), by eliminating locally produced, highly regulated, oil and gas production, when in reality these policies will cause an increase in GHG and other pollutants. While the DEIR acknowledges at pages 4.12-21 through 4.12-23 and 4.12-32 that these policies, as proposed, will result in increases in the importation of oil (i.e. more oil trains and oil tankers), there has been no effort to quantify the corresponding increase in GHG and other pollutants that will be the direct result of such policies or their impact on the environment. The abject failure of the DEIR to address the environmentally harmful effects of policies designed to push impacts outside the County Line (as if they will then magically cease to exist) is Greenwashing by any definition.²

In my 37-year career as a petroleum engineer, I have had the opportunity to participate in the exploration and production of oil and gas both domestically in various states and all over the world and as a result, I am familiar with the regulations that have been imposed on oil and gas production by various foreign and state governments as well as other jurisdictions within the State of California. The existing laws, rules and regulations in Ventura County that apply to oil and gas production are among the strictest I have experienced in my career. For example, the Ventura County Air Pollution Control District enforces strict air quality standards and air credit programs that have resulted in dramatically reduced emissions as compared to the emissions from oil and gas production from other states and certainly other countries. In addition, and as noted below in the detailed comments, not all oil is created equal when it comes to Carbon Intensity. The California Air Resources Board (“CARB”) publishes Carbon Intensity values for the various crude oil sources under their Low Carbon Fuel Standard Regulation. The most recent published data is from 2018 which demonstrates that the Carbon Intensity from the oil produced in the Oxnard Oilfield (where all of ABA’s production is located), on an annual average, is less than half the Carbon Intensity of the crude oil used in California as a whole during 2018 (5.39 vs. 12.35 gCO₂e/MJ).³ A quick look at this Carbon Intensity data also reveals that the Carbon Intensity of oil from Alaska was 15.91 gCO₂e/MJ and the Carbon Intensity of the blended average of oil from Saudi Arabia was 8.82 gCO₂e/MJ.

Drop per drop, barrel per barrel, simply replacing locally produced Ventura County oil with imported oil will result in an increase in GHG, and that is true even before considering the huge environmental impacts associated with the GHG and other pollutants generated in the process of shipping that replacement oil across the world (not to mention the increased risks associated with oil spills). Simply put, the DEIR is

¹ <https://oag.ca.gov/environment/greenwashing>

² <https://foe.org/alaskan-arctic-california-crude/>; <https://www.forbes.com/sites/chuckdevore/2019/10/07/californias-next-offshore-oil-spill-will-be-caused-ironically-by-the-states-war-on-oil/#652f8fbb6535>

³ https://ww3.arb.ca.gov/fuels/lcfs/crude-oil/2018_crude_average_ci_value_final.pdf

deficient because it fails to quantify in any meaningful way, using readily available data, the increases in GHG and other pollutants that will be caused if the new policies inhibiting new oil and gas production presently contained in the 2040 General Plan are implemented. The failure of the County to “come clean” by providing a meaningful GHG analysis of its decision to favor imported oil over cleaner, highly regulated, locally produced oil, renders the DEIR inadequate as an informational disclosure document, as a matter of law.

The Proposed 1,500’/2,500’ Setback for New Discretionary Oil and Gas Wells is an Unmitigated Taking that is Not Supported by Substantial Evidence.

Policy COS-7.2 as proposed would require that new discretionary oil and gas wells be located a minimum of 1,500 feet from residential dwellings and 2,500 feet from any school. In support of these drastic setback requirements, the County failed to conduct any analytical studies demonstrating why the current setback (500’ and 800’) in combination with routine mitigation requirements (i.e. sound walls during drilling and workover operations) in combination with current air quality restrictions including vapor recovery for all facilities and zero emission tolerances are inadequate. The DEIR acknowledges that the VCAPCD conducts quarterly inspections of oil and gas facilities to enforce the zero emissions policy and it is unclear from any information why such current mitigations are inadequate. The DEIR fails to cite any air monitoring study, any noise study, any vibration detection study, or any odor study conducted in like or similar conditions to support its conclusion that a change in setbacks for oil and gas wells would in any way change a single environmental impact for sensitive receptors or otherwise.

Rather than rely upon actual data and analysis to support Policy COS-7.2, the DEIR relies heavily on a report by the Los Angeles County Department of Public Health issued in February of 2018 entitled: “Public Health and Safety Risks of Oil and Gas Facilities in Los Angeles County” (“LA County Report”). Such reliance is misplaced as the LA County Report fails to supply any actual data or analysis that is applicable to the circumstances at issue in the Ventura General Plan area. First, the basis of the study was to address public health and safety concerns related to oil and gas reserves that “lie beneath densely populated urban areas” which are the exact opposite of the areas currently available for new oil and gas wells in unincorporated Ventura County. Second, the LA County Report concluded, “the epidemiological studies are not able to conclude whether or not living near oil and gas activities is associated with long-term health impacts.” Third, neighborhood health investigations were conducted in support of the report, which demonstrated low risk levels for risks associated with hydrogen sulfide gas, operating pressures, and drilling frequency but six out of the 15 facilities they inspected had oil wells or tanks within 300 feet of residences or sensitive receptors which has no bearing on the current regulations for new wells in Ventura County.

No independent studies were conducted to determine actual setback criteria with and/or without mitigation measures. Rather, the study group looked at Seven (7) EIRs and Two (2) Health Impact Assessments plus one (1) study from Colorado, none of which related to oil and gas development in unincorporated Ventura County under existing setback requirements and emission controls that are applicable currently to new discretionary oil and gas wells in Ventura County. The LA County Report concluded that most of impacts could be mitigated, but it is unclear from this report upon what data and under what circumstances they based any of their findings. For example, even though they found little or no evidence of odors that were directly related to hydrogen sulfide (H₂S) that is associated with certain oil fields, they suggested imposing an additional 500-foot set back regardless of whether H₂S was known to be a problem in that oil field. Further, regarding their recommendation for setbacks to address noise issues, they failed to address the effect of routine mitigation measures that are employed during drilling operations. Simply put, the LA

County Report fails to provide substantial evidence to support the proposed increase in setback requirements for new discretionary oil and gas wells. The DEIR begrudgingly acknowledges that in July of 2019 the City of Los Angeles rejected the findings in the LA County Report and adopted a 600-foot setback for new oil and gas wells.

While the DEIR does reference a couple of other studies, the record is clear that none of the other studies cited in the DEIR, were conducted in Ventura County under conditions similar to or approximating the existing regulatory conditions to which a new discretionary oil and gas well would be subject. There is simply an absence of relevant data or a sufficient degree of analysis to provide decision-makers with the information needed to make an intelligent judgment concerning such a dramatic change in the setback requirements for new discretionary oil and gas wells.

It is worth noting that if Policy COS-7.2, (with mitigation measures or not) were adopted, a farmer who conducts farming operations utilizing diesel tractors and other heavy equipment, spraying pesticides, herbicides, and fertilizers, and otherwise engaging in dusty, noisy, routine farming immediately adjacent to sensitive receptors, would at the same time be completely precluded from developing the minerals on his property within 1,500 feet of those same sensitive receptors, even though such oil and gas development could be conducted in a manner that imposes little or no impacts on those same sensitive receptors. The application of an artificial setback requirement for which there is no actual scientific or other supporting data is illegal, is being applied in a punitive manner, and such loss of the rightful use of the farmer's property would be an unconstitutional taking, a fact that appears to be acknowledged in the DEIR.

Like Most Businesses, Trucking is the Only Feasible Method of Getting Our Product to Market.

Like most businesses in Ventura County that produce a product (i.e. farming, manufacturing, or other industries), the only feasible method for our company to get its product to market is to utilize trucking. Policy COS-7.7, as proposed, fails to address any other industry, but singles out oil production for some special mistreatment. Interestingly, this policy attacks only trucking to a refinery, but exempts from regulation the trucking of the finished petroleum product from that same refinery back into the community. There is no scientific or other basis that supports this disparate treatment such that the only logical conclusion is that it has been proposed as a punitive measure which is unconstitutional. As noted above, if the purpose of the Policy is to diminish Ventura County oil and gas production, the end result is an increase in GHG and other pollutants. Until the volume of oil production justifies the significant environmental impacts and costs associated with the construction and maintenance of new oil pipelines, trucking is the only feasible method of getting our product to market. Unless modified, Policy COS-7.7 will result in the inability to drill new discretionary oil and gas wells, which would cause economic harm to the mineral owners and other vested rightsholders, who intend to drill new discretionary oil and gas wells and it will result in an increase in GHG and other pollutants. The DEIR fails to include substantial evidence concerning the impacts to environment caused by the need to construct and maintain multiple new oil and water pipelines.

In Some Locations, Flaring of Natural Gas is the Only Feasible Option.

Policy COS-7.8 would require that natural gas produced from new discretionary wells be collected and used or removed for sale without flaring. ABA has expended much time and resources attempting to develop a sales market for the natural gas that is produced with its oil production. Unfortunately, despite our best hopes, none of the proposed compressed natural gas ("CNG") or liquid natural gas ("LNG") options we have investigated have come close to achieving a viable plan to take the natural gas we produce and

transport it in an environmentally and economically feasible manner for delivery to a stable, sustainable market. Although we are prohibited from sharing data concerning our efforts, we have also determined that delivering natural gas from our operation into a local utility line was not feasible regardless of the distance to the nearest utility pipeline. The remaining feasible option for most of our existing natural gas is to flare it in accord with the permits issued by the VCAPCD. To that end we have expended significant sums to obtain a BACT flare that has significantly diminished (>90%) the emissions from the flaring process and we participate in the air credit program administered by the VCAPCD (neither mitigation is considered in the DEIR). In other words, we have taken all feasible steps to mitigate the impacts of our production, which does not occur with most imported oil. Unless modified, Policy COS-7.8 would result in the inability to drill new discretionary oil and gas wells, which would cause economic harm to the mineral owners and other vested rightsholders, who intend to drill new discretionary oil and gas wells and it will result in an increase in GHG and other pollutants as well as constitute an unconstitutional taking of vested rights.

The DEIR Fails to Include an Economic Study or Address the Physical Changes to the Environment Caused by the Loss of Tax Revenue Resulting from Proposed Changes to Oil and Gas Policies.

The physical changes to the environment caused by the loss of tax revenue from diminished oil and gas production are significant and need to be addressed in the DEIR. While economic and social effects ordinarily need not be discussed in an EIR, physical changes to the environment caused by a project's economic or social effects are secondary impacts that must be included in an EIR's impact analysis if they are significant. (14 CCR §15064(e)). An EIR may trace the effects of economic or social changes resulting from a project to physical changes caused by the economic or social changes. (14 CCR §15131(a)). Under this rule, a social or economic effect resulting from a project may be found to cause a significant physical impact that must be analyzed in the EIR. See *Bakersfield Citizens for Local Control v City of Bakersfield* (2004) 124 CA4th 1184, 1215 (EIR improperly dismissed possibility that large shopping center could drive other retailers out of business as an economic effect when urban decay and other blight-like conditions could result); *El Dorado Union High Sch. Dist. v City of Placerville* (1983) 144 CA3d 123 (while increased student enrollment and potential for overcrowding by itself is likely insufficient to implicate CEQA, such effects are relevant when they will lead to construction of new facilities). See also *City of Hayward v Board of Trustees of Cal. State Univ.* (2015) 242 CA4th 833, 842 (EIR properly analyzed potential environmental impacts of constructing new fire station needed to serve project while also recognizing that cost of meeting increased need for fire protection services is economic impact).

The County of Ventura relies on tax revenue for its annual operating budget that includes significant tax revenue resulting from the drilling of new oil and gas wells. In fact, until there is a successful oil and gas well drilled, the mineral estate is not taxed and is not even included in the evaluation of property taxes. Operators of oil and gas properties, such as ABA, are required to provide data concerning new wells to the County Tax Assessor in order for each new well to be assessed for property tax purposes. The policies in the Draft 2040 General Plan attacking future oil and gas production will preclude mineral owners and their lessees from drilling new wells thus condemning the property (an unconstitutional taking) and cause the County to lose the property tax revenue that would have otherwise been generated had the minerals from such property been developed. Further, oil and gas development generates significant direct sales tax revenue and secondary revenue from employees, contractors and vendors all of which will be lost if the policies designed to inhibit future oil and gas development are adopted.

Even a cursory review of Section 5 of the Draft 2040 General Plan which addresses Public Facilities, Services, and Infrastructure reveals that any loss of funding for the essential facilities, services and

infrastructure the County provides would likely cause a physical change to the environment that would threaten the very existence of the citizens, homes, businesses, farms, open space and wildlife in Ventura County. Tight county budgets are already a reality with departmental belt tightening being the norm. For example, a loss of mineral tax revenue and associated sales tax revenue will further strain the budget of the Ventura County Fire Protection District (“VCFPD”) that provides fire protection in the unincorporated areas of the County along with various cities. A review of the Budget for the VCFPD for 2017-18 reveals that of the \$178,618,708 annual budget, property taxes (\$133,586,989) accounted for nearly 75% of the total budget. A cut in property taxes due to policies hindering oil and gas production will result in a drop in funding that will make the VCFPD less prepared to prevent and defend future wild fires to which the County of Ventura is already susceptible. Wild fires cause physical change to the environment which is significant and therefore an economic study must be conducted to determine the impacts caused by the loss of oil related tax revenue in this DEIR. Similarly, there are many other physical changes to the environment that are significant that could result from a lack of funding for the County services we rely on to protect the environment and if there is a deterioration of funding due to lack of oil related taxes, these direct and indirect effects must be included as a part of an economic study to provide decisionmakers with the information necessary to determine the significance of the impacts causing physical changes to the environment. The data to conduct such a study remains in the possession of the County which should be able, with little effort to determine, for example, how much of Ventura County’s budget is derived from property taxes on minerals? How much will Ventura County lose in tax revenue by implementing new policies that discourage or eliminate the drilling of new wells? How much sales tax revenue will be lost that is associated with drilling, maintaining oil and gas wells? How will this loss of revenue impact the Public Facilities, Services and Infrastructure described in the 2040 General Plan Section 5?

Ventura County’s Effort to Ban New Oil and Gas Wells Violates the Law

The DEIR relies upon legally infeasible policies proposed in the 2040 General Plan that have as their direct and indirect goal, the elimination of oil and gas exploration and production in Ventura County. These proposed Policy changes, as described herein, affecting new oil and gas wells are infeasible in that they will result in a ban on new drilling, which conduct by the County is preempted by state and federal law, is unconstitutional, violates equal protection under the law, is discriminatory as a matter of law, and constitutes a taking. ABA reserves all of its rights to pursue every available remedy resulting from the attempt by Ventura County to ban future oil and gas exploration and production in Ventura County.

DETAILED COMMENTS

ABA’s specific and detailed comments on the individual chapters and sections of DEIR are set forth below.

- 4.8-25** Without acknowledging the existing ad valorem taxes on oil that are paid to the County, the County is now proposing to evaluate the whether to establish another local tax on oil and gas operations. The DEIR states that increased taxes on oil and gas facilities may reduce GHG emissions which assertion is unsupported by substantial evidence. Further, as noted above, if an additional tax resulted in diminished oil and gas production, the result would be an increase in GHG and other pollutants as noted above. As other stationary sources contribute as much or more GHG, the County appears to be arbitrarily burdening a single industry sector by increasing taxes with no regard to the data presented in the DEIR

- 4.12-8** Policy COS 7.3. To the extent the County seeks to impose this Policy on new wells drilled subject to an existing and valid special use permit, such policy unlawfully impairs vested property rights and disregards well-settled controlling law concerning a mineral owner's right to recover resources from his or her sub-surface property and constitutes a taking under state and federal law. All analyses and assumptions flowing from the expected imposition of this policy are fatally flawed.
- 4.12-8** Policy COS 7.7. This policy is preempted by state and federal regulations. The DEIR disregards this. All analyses and assumptions flowing from the expected imposition of this policy are fatally flawed and not supported by substantial evidence. See the discussion under the General Comments.
- 4.12-12** As noted in the General Comments, as to Policy COS-7.3, there is no substantial evidence provided to justify an increase in the minimum setback requirements for new discretionary oil and gas wells or otherwise demonstrate why the existing setbacks are inadequate. Further, the imposition of such new setbacks will result in an unconstitutional taking. See the discussion in the General Comments regarding the inadequacy of the LA County Report.
- 4.12-13** Reliance on the CCST study is misplaced as it fails to address the existing standards, conditions, setbacks, and mitigation requirements that are in place in Ventura County and presently applicable to new discretionary oil and gas wells; a fact that the study acknowledges by stating that actual exposures and any related health impacts may be different and "have not been measured." In light of the stated deficiencies the CCST study is not sufficient evidence to support a change in the current setback requirements for new discretionary oil and gas wells.
- 4.12-13** Reliance on a University of Maryland study that purportedly (the study is no longer available on the U of M website) addressed fracking natural gas wells in the Marcellus Shale, completely fails to address the existing standards, conditions, setbacks, and mitigation requirements that are in place in Ventura County and applicable to new discretionary oil and gas wells. In light of the complete absence of relevance to existing conditions, the purported University of Maryland study is not sufficient evidence to support a change in the current setback requirements for new discretionary oil and gas wells.
- 4.12-14 through 4.12.18** See the General Comments regarding COS-7.2
- 4.12-18 through 4.12-20** Mitigation Measure PR-1 for Policy COS-7.2 is a tacit recognition that there is no substantive evidence to support the proposed 2,500-foot setback included in Policy COS-7.2. Mitigation Measure PR-1's continued reliance on the LA County Public Health Report referenced in the General Comments to support a 1,500-foot setback rather than the 600-foot setback adopted by the City of Los Angeles in July of 2019 demonstrates that this proposed policy is not driven by science, any true analysis, or the facts. As noted in the General Comments, LA County Public Health conducted no studies to measure actual conditions and certainly did not take into consideration the current conditions in Ventura County including the existing regulatory

and mitigation measures in place before they picked numbers out of a hat or otherwise guessed how far away you had to be to not smell H₂S. For oil fields in Ventura County that do not have H₂S, that is absolutely no evidence to support the final 500-foot setback reference in the LA County Public Health Report. That being said, there is no substantial evidence in the record to justify the setback language in Mitigation Measure PR-1 for Policy COS-7.2, however a 600-foot setback as adopted as adopted by the City of Los Angeles seems reasonable.

4.12-21 The DEIR's unsupported conclusions regarding horizontal drilling access are demonstrably false. The DEIR states that: "[w]hile the amended policy would put limitations on the placement of new discretionary oil and gas wells, it would not necessarily prohibit access to the oil and natural gas resources being sought. In resource locations near sensitive land uses, directional drilling (including horizontal drilling) techniques could be utilized. . . ." Ample evidence, readily available to the DEIR preparers, disproves the foregoing. Oilfields in Ventura County contain multiple oil sands vertically stacked in a compact manner. Accordingly, an additional offset of 1,500' would in most drilling cases either render the geological angle of attack moot, in that a well might ostensibly never be able to mechanically reach all of its targets, or, due to the foregoing, an operator might be required to drill multiple wells to achieve the same production, leading to a significant increase in impacts compared to a single well drilled to accomplish the same geologic goals. Directional drilling would not be possible to replace all of the reserves/resources due to terrain surrounding this area limiting surface locations as well the reservoir structural need to drill north-south directional paths from east or west locations.

4.12-21 through 4.12-23 The DEIR concedes that the majority of the COS policies to be adopted as part of the proposed GP 2040 are adopted for the express purpose of phasing out local oil and gas production within the County. The DEIR further concedes that the County will, as a direct result of this proposed phase-out, need to import foreign sources of oil and gas, and further acknowledges that the importation of such sources will have a more severe GHG production impact than reliance on local oil and gas resources. The DEIR then unlawfully punts on consideration of that more severe impact by stating that those impacts will occur "outside the GP 2040 plan area." This abdication of responsibility for GHG analysis is not only hypocritical given GP 2040's objective of combating climate change, but also unlawful. The more severe GHG impacts associated with the Importation of foreign oil and gas are known and must be considered now. To omit this evaluation is to deprive the public and decision makers of the ability to fully and fairly understand and consider the impacts of adopting GP 2040. See also the discussion of this in the General Comments.

4.12-26 The issues arising out of the requirement that produced water not be disposed of via trucking are the same as those discussed in the General Comments regarding trucking.

4.12-27 COS Policy 7.8. This policy is not only preempted, but is also inconsistent with VCAPD rule 54 as it notes that all new well gas would be piped through the same gathering system in existing fields. Outside of running a new pipeline to a different gas processing system, there would be no way to break out the gas from the general field production that goes through the

current gathering system through the gas plant, sales point, or flare. See the comments on the use of flares contained in the General Comments.

4.12-32 In balancing the competing environmental, economic, social and other issues relating to Mitigation Measures PR-2 and PR-3, the County should also consider the significant increases in GHG and other pollutants that will result if the County chooses imported oil with all of its associated risks and ramifications as compared to the cleaner, heavily regulated, locally produced oil that keeps workers employed and increased revenues in the County budget.

4.13-1 through The DEIR makes numerous, unsupported assumptions regarding the noise generated by oil and gas operations. Oil and gas operations generate noise equivalent to other industrial uses.

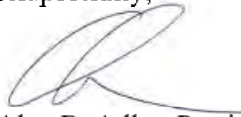

4.13-29 The DEIR does not, and cannot, provide evidence demonstrating that oil and gas production generates noise above and beyond the noise levels generated by industrial activities, let alone that it produces objectionable noise.

4.13-23 The discussion under Impact 4.13-4 lists oil supply facilities among major industrial noise sources. No substantial evidence exists in the DEIR or in the Background Report it references. Most oil supply facilities are located in areas far from sensitive receptors except to the extent that the County has permitted new development of sensitive receptors near oil supply facilities.

ABA hereby adopts and relies upon the comments to this DEIR contained in comment letters filed on behalf of all other oil and gas producers and oil industry associations that have provided comment letters as though such comments are fully set forth herein and as such they are incorporated herein by reference.

I look forward to working with County staff and the community to achieve a workable 2040 General Plan once this DEIR is rewritten to address the significant flaws referenced herein and the document is recirculated for further review and comment.

Respectfully,

Alan B. Adler, President

Simmons, Carrie

RE: Ventura County General Plan – Mineral Resources – Draft EIR Comments

Dear Mrs. Curtis:

These comments are offered on behalf of the California Construction and Industrial Materials Association (CALCIMA). CALCIMA is a statewide trade association representing construction and industrial material producers in California. Our members supply mineral resources such as construction aggregate inclusive of sand, gravel, crushed stone, slag, and recycled concrete that build our state's infrastructure, including public roads, rail, and water projects; help build our homes, schools and hospitals; assist in growing crops and feeding livestock; and play a key role in manufacturing wallboard, roofing shingles, paint, low energy light bulbs, and battery technology for electric cars and windmills. Our members develop mineral resources to provide the raw materials necessary to maintain society, and strategically site their operations throughout the state to minimize air quality impacts and greenhouse gas emissions associated with transportation by truck.

The Draft EIR for the Ventura County 2040 General Plan Update fails to give non-oil and gas mineral resources appropriate attention and analysis for impacts. As such the DEIR is deficient and should be corrected as we detail below. Once corrected, the DEIR should be recirculated for public review.

Incomplete Regulatory Setting

Neither the DEIR nor the Background report provide a complete and thorough description of the existing, current regulatory setting that oversees the management and production of mineral resources in the County and the State of California. This omission is particularly concerning because the existing General Plan discusses many of these regulatory schemes in great detail, along with the importance of mineral resources, generally, and the mineral resources located in the County, specifically. The EIR and the Background Report only disclose federal and state agencies that regulate pipelines and flaring, which is not applicable to all mineral resources that must be analyzed in an EIR under the CEQA guidelines. The EIR should be revised to include an overview and description of all potential regulations, regulatory bodies, and programs that regulate mineral resources in Ventura County.

Further, the deletion of policies from the previous general plan which are part of the current regulatory environment and whose removal may negatively impact mineral resources is not included in the current

regulatory background. Nor is their removal analyzed or quantified. Specifically, existing General Plan Policy 1.4.2 #6 "All General Plan amendments, zone changes, and discretionary developments shall be evaluated for their individual and cumulative impacts on access to and extraction of recognized mineral resources, in compliance with the California Environmental Quality Act," is not included in the revised general plan. Nor is any analysis of how that removal could affect mineral resources, or any explanation for why it's being removed. We remind you that mineral resources are part of the "environment" protected by CEQA.

"Less than Significant" Impact Determination Not Supported

The EIR fails to provide any discussion of non-oil and gas mineral resources in the "environmental setting" discussion in section 4.12 of the EIR. Without an understanding of the regulatory and environmental setting, there is simply no information or data in the EIR to support the County's outright dismissal of impacts to mineral resource production as "less than significant."

Further, the EIR fails to actually analyze for direct and indirect impacts to mineral resource zones that will occur as a result of the 2040 General Plan. The County admits that Land Use Designation changes in the 2040 General Plan will result in changes to land uses over known and important mineral reserves. But neither the EIR nor the Background Report provide any information regarding estimated and anticipated "buildout" in terms of acreage, actual location, number of dwelling units, and development density and intensity. These incompatible land uses will significantly impact future mineral resource production and must be evaluated and mitigated for in the EIR.

Finally, the determination of impacts on page 4.12-10 is not only completely unsupported, but it is contradicted in the EIR's language. The EIR admits that residential and industrial uses will be installed in the MRZ-2 zone (a major mineral resource zone), but then never provides any quantification of impacts or discusses the extent, location, or intensity of the development within the MRZ-2 zone. This impact is not "less than significant" as development over the MRZ-2 zone will significantly hamper access to these resources. The County's analysis is contrary to ISAG threshold of significance 1., which states that, "Any land use or project activity which is proposed to be located on or immediately adjacent to land zoned Mineral Resource Protection (MRP) overlay zone, or adjacent to a principal access road to an existing aggregate Conditional Use Permit (CUP), and which has the potential to hamper or preclude extraction of or access to the aggregate resources, shall be considered to have a significant adverse impact on the environment."

Direct and Indirect Impacts Not Analyzed Or Quantified

The EIR concedes that more than half of the project area to be impacted by the 2040 General Plan is zoned MRZ-3a/b. The County admits in the EIR that areas zoned MRZ 3a/b are those areas with known mineral deposits that lack sufficient detailed information to be labeled MRZ-2. But the EIR fails to conduct any impact determination or analysis of the project on these mineral resources and deposits.

The EIR never addresses indirect impacts to mineral resource development that will occur under the 2040 General Plan. As incompatible land uses (such as residential development) occur on or adjacent to mineral production and mineral reserves, compatibility conflicts will increase. Reasonably foreseeable indirect impacts include nuisance complaints, traffic conflicts, theft, vandalism and attempted trespass on mineral production sites. The EIR must analyze and evaluate these impacts on the ability to produce mineral resources in the County.

We appreciate the opportunity to provide comments.

Respectfully,

Adam Harper

Re: DEIR for Ventura County 2040 General Plan

Dear Ms. Curtis:

Thank you for the opportunity to comment on the Draft Environmental Impact Report (DEIR) for the County's General Plan update. The Coastal Conservancy has been involved in planning and funding habitat restoration, public access and other projects in Ventura County for several decades.

Our comments relate to Section 4.2 Agriculture and Forestry. The DEIR identifies potential impacts and mitigation measures for agricultural resources. Specifically, the DEIR identifies Impact 4.2-1: Loss of Prime Farmland, Farmland of Statewide Importance, Unique Farmland, and Farmland of Local Importance (4.2-9) and two mitigation measures which would be added to the General Plan. These policies call for avoidance of direct loss of farmland and call for mitigation of loss at a 2:1 ratio through the establishment of an offsite agricultural conservation easement.

The Coastal Conservancy is currently working with local partners at Ormond Beach and on the Satna Clara River to develop and implement habitat restoration and public access plans for those areas. Ormond Beach, an area with especially important coastal wetland habitat, has been identified as being very much at risk from sea level rise. As a consequence, the Coastal Conservancy, The Nature Conservancy, and the City of Oxnard have been looking to acquire neighboring agricultural properties to allow the dunes, wetlands, and uplands to migrate inland as sea level rises. These properties would transition from agriculture to these threatened coastal habitats which would ensure the survival of the Ormond Beach wetlands complex and would act to provide a buffer to neighboring communities in South Oxnard at risk from sea level rise.

1515 Clay Street, 10th Floor
Oakland, California 94612-1401
510-286-1015 Fax: 510-286-0470

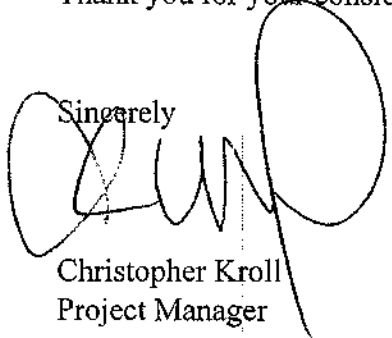

Similarly, the Coastal Conservancy has been funding the acquisition of thousands of acres of river-fronting land by The Nature Conservancy along the Santa Clara River since 2001 for ultimate habitat restoration and public access purposes to realize a Santa Clara River Parkway from the mouth of the river to the county line. The river is one of the last largely free flowing coastal rivers in southern California. But many areas have been encroached upon by development and adversely impacted by invasive non-native species such as *Arundo donax*. The Nature Conservancy has acquired some properties intended for habitat restoration and public access which currently support agriculture.

The proposed mitigation measures mentioned above may add significant additional costs and hurdles to implementing long-range planning for habitat restoration at Ormond Beach and along the Santa Clara River. These costs may be prohibitive to moving forward with implementing restoration plans for these areas.

We recommend that the County include exclusions to the above referenced mitigation measures for habitat restoration projects and related public access projects such as outlined above at Ormond Beach and the Santa Clara River.

Thank you for your consideration. Please contact me if I can provide additional information.

Sincerely

Christopher Kroll

RE: County of Ventura – Draft 2040 General Plan Update EIR

Dear Ms. Curtis,

Southern California Gas Company appreciates the opportunity to submit comments on the Draft 2040 General Plan EIR (“DEIR”) and believes the document will provide valuable direction for the County to pursue effective, long-term development goals, as well as enhance local sustainability objectives. In particular, we support proposed policies that encourage beneficial reuse of County-generated waste for energy generation. Such policies have great potential to help reduce County GHG emissions, especially from agriculture and human waste streams.

However, SoCalGas is concerned by one of the County’s proposed mitigation measures: MM GHG-1: New Implementation HAZ-X: Prohibit Natural Gas Infrastructure in New Residential Development:

Implementation Program HAZ-X: Prohibit Natural Gas Infrastructure in New Residential Development – To support the proposed reach codes under COS-S, the 2040 General Plan shall include a new program in the Hazards and Safety element that prohibits the installation of new natural gas infrastructure in new residential construction through amendments to the Ventura County Building Code. This program shall also be extended to include commercial building types such as offices, retail buildings, and hotels where the use of natural gas is not critical to business operations and contain appliances that can be feasibility substituted with electricity powered equivalents.” (pg. 4.8-45-46).

While we support the County’s attempt to reduce emissions associated with buildings, this mitigation measure is technology-restrictive, may actually increase emissions and will limit the County’s ability to explore other innovative approaches to achieve emissions reductions in the future without deleveraging residents and businesses to hedge themselves against climate risks such as wildfires and household rising energy costs.

This type of ban would contravene California state law and policy as it relates to the availability of natural gas as a resource for residents and to the provision of a reliable and resilient energy supply. In addition, such a ban raises concerns under federal law.

Further, the DEIR's analysis and treatment of MM GHG-1 is legally flawed under the California Environmental Quality Act ("CEQA"). First, the DEIR fails to consider, discuss or analyze the environmental effects of implementing MM GHG-1. Second, the County cannot rely on MM GHG-1 to mitigate GHG impacts caused by the 2040 General Plan because MM GHG-1 is "infeasible" under CEQA. Lastly, by finding that climate change impacts would remain significant and unavoidable even with implementation of MMs GHG-1 through GHG-3, the County has neglected to consider other GHG emission reduction strategies as potential mitigation in the DEIR.

1. The DEIR Fails to Analyze the Environmental Impacts Associated with MM GHG-1

CEQA Guidelines section 15126.4(a)(1)(D) provides that, if a mitigation measure would itself cause significant environmental impacts, those impacts must be discussed in the EIR.¹ Here, the DEIR discusses what MM GHG-1 would consist of (*i.e.*, implementation of programs to prohibit natural gas infrastructure in new residential development, otherwise known as "Reach Codes"), notes that MM GHG-1 would implement Policy COS-8.6, which "will encourage zero net carbon emissions building design, which was assumed for quantifying GHG reduction benefits of the program", and states that implementation of a Reach Code will be predicated on a "cost-effectiveness study" by the California Energy Commission ("CEC").² However, the DEIR fails to discuss the potential environmental effects from implementing a Reach Code that bans or restricts natural gas in residential and/or commercial buildings.

Substantial evidence indicates that adopting and implementing MM GHG-1 and Reach Codes could lead to the following significant environmental impacts under CEQA.

- ***Utilities and Service Systems*** – In the CEQA Guidelines Appendix G checklist,³ section "XIX. Utilities and Service Systems" asks whether proposed projects would "[r]equire or result in the relocation or construction of new or expanded water, wastewater treatment or storage drainage, *electric power*, ... facilities, the construction or relocation of which *could* cause significant environmental effects."

¹ 14 Cal Code Regs. § 15126.4(a)(1)(D); *see also Sacramento Old City Assn. v. City Council* (1991) 229 Cal.App.3d 1011, 1027; *Stevens v. Montecito Water Dist.* (2004) 116 Cal.App.4th 396, 400 (mitigation measures employed to prevent downstream flooding associated with reservoir project may themselves have a significant environmental impact, but was not analyzed); *Gray v. Cty. of Madera* (2008) 167 Cal.App.4th 1099, 1118 (EIR did not address potentially significant impacts associated with water quality mitigation measures).

² DEIR at 4.8-47.

³ *See* Governor's Office of Planning and Research, Final Adopted Text of Revisions for CEQA Guidelines, http://resources.ca.gov/ceqa/docs/2018_CEQA_FINAL_TEXT_122818.pdf.

Adoption and implementation of a Reach Code would require new buildings to either be all-electric or, if mixed-fuel, likely subject to higher levels of energy efficiency than all-electric buildings. It is reasonably foreseeable that some developers will choose to develop buildings with all-electric energy, which will increase the demand for electricity; however, there is no analysis in the DEIR as to whether (i) the local grid has the generating resources and capacity to meet such increased demand for electricity, or (ii) whether the local public utility or load-serving entity has sufficient distribution or transmission assets to provide increased service in a safe and reliable manner.⁴ The DEIR fails to quantify increased electricity demand, how many additional generation, distribution or transmission assets may be needed to facilitate this increased demand, or how the construction or relocation of such assets could impact the environment.⁵

The need to substantially overbuild local power systems when natural gas is not used as a base load means that a much greater amount of land, habitat and related physical resources will be impacted by solar and wind generation facilities. In a scenario where natural gas is banned across the state, new solar arrays and wind farms will need to be fabricated, transported to, and installed throughout California at more than five times the historical rate of deployment every year for the next 25 years.⁶ This deployment will significantly impact the physical environment across California. The fabrication, transportation and construction of the required generation facilities will also generate GHG emissions that would have cumulative climate change impacts.

In addition, as more electric energy is utilized new transmission capacity must be fabricated, transported to and installed throughout the state to connect with thousands of miles of new nationwide transmission lines. Additional transmission facilities will have significant impacts to the physical environment and result in aesthetic and potentially cultural impacts. The fabrication, transportation, and construction of new transmission equipment and capacity will also generate GHG emissions.

Because renewable generation is intermittent, California will also be required to increase power storage capacity to unprecedented levels if natural gas is banned. Additionally, California would need to dramatically increase hydropower capacity by increasing the size of state reservoirs by as much as 100 times above current levels. Battery storage on this scale would have significant hazardous materials, human health,

⁴ See, e.g., Pub. Res. Code § 451 (“Every public utility shall furnish and maintain such adequate, efficient, just, and reasonable service, instrumentalities, equipment, and facilities, including telephone facilities, as defined in Section 54.1 of the Civil Code, as are necessary to promote the safety, health, comfort, and convenience of its patrons, employees, and the public.”).

⁵ Cf. *California Clean Energy Comm. v. City of Woodland* (2014) 225 Cal.App.4th 173, 208 (EIR for shopping center lacked required energy analysis despite stating, among other things, that existing facilities were sufficient to serve the project: “In addition, a substation, multiple utility lines (60 kV, 115 kV, and 230 kV), and gas transmission lines exist in the area to serve the buildout of the proposed project.”).

⁶ Clean Air Task Force, Comments On SB 100 Joint Agency Report - Charting a Path to a 100% Clean Energy Future, September 19, 2019, <https://efiling.energy.ca.gov/GetDocument.aspx?tn=229800&DocumentContentId=61244> (CATF 2019).

fire, fire suppression, and policing services, GHG emissions, and physical impacts. The construction of new hydropower storage would similarly have significant air quality, aquatic plant, animal and habitat, land, GHG emissions, water and hydrology, public safety, and other impacts.

CEQA caselaw holds that EIRs must consider the effects of changes to the environment that can result from an expansion of facilities, services, or utilities to serve the project.⁷ Here, DEIR Chapter 4.17 does not cross-reference MM GHG-1 and fails to discuss how implementation of MM GHG-1 may lead to expanded facilities, services or utilities that would be necessary in the future when a Reach Code is adopted.

- **Greenhouse Gas (GHG) Impacts** – Implementation of a Reach Code under MM GHG-1 is predicated on the assumption that 100% electrified buildings are more energy-efficient and have a smaller carbon footprint than buildings with gas-powered appliances. Yet, multiple, independent studies demonstrate that such an assumption is not accurate.
 - In May 2019, the U.S. Department of Commerce, National Institute of Standards and Technology (“NIST”) published a study of the energy use, environmental impacts, and economic performance of residential buildings using either electricity or natural gas for space and domestic water heating. The analysis was based on a single-family home meeting all applicable building code requirements in Maryland. The NIST research concluded that a natural gas-heated home is more economical, results in “lower environmental impacts across numerous impact categories,” including lower GHG emissions, has a faster heating response time and generates a greater level of indoor comfort than an all-electric residence. In particular, GHG emissions were found to be higher because of the greater amount of fuels required to produce electricity for home use compared with the use of natural gas equipment in a residence.⁸
 - Although California has a larger proportion of renewable utility-scale energy than Maryland, consistent with the NIST study the CEC has also shown that, on average, natural gas generates substantially lower GHG emissions than electrical building use in California. As shown below, in 2018 the CEC estimated that electricity use in buildings produces a greater level of GHG emissions than natural gas about 60 percent of the year in California.⁹ Natural gas results in lower GHG emissions during a significant majority of all morning and evening hours in all months, the periods of highest residential energy demand. The significantly lower GHG emissions from natural gas use in California buildings

⁹ CEC, Building Decarbonization, 2018 Update – Integrated Energy Policy Report, Presentation by M. Brook at June 14 2018 IEPR Workshop at 16, <https://efiling.energy.ca.gov/GetDocument.aspx?tn=223817>.

reflects the fact that, except during daytime hours from about March to June, intermittent solar and wind is insufficient to meet in-state building energy demand. When intermittent renewable energy is not available, electrical generation is less efficient and produces a greater level of GHG emissions than natural gas use in California buildings.

- Other researchers have also questioned whether requiring all electric buildings might, however unintentionally, result in higher GHG emissions. Household energy demand tends to peak in the morning and evening hours, when residents are preparing to leave for or returning from work, school or other activities and when intermittent renewable power, particularly solar, is unavailable. At these times, electric supplies must be produced from other sources, including natural gas-fired power plants. Converting fuels, such as natural gas, to electricity to meet home demands is less efficient than directly using natural gas. As a result, a Stanford University researcher has estimated that when renewable power is unavailable, such as during the evening hours, residential electricity consumption produces *three times* more GHG emissions than natural gas.¹⁰
- The County cannot assume that, over time, GHG emissions from electrical generation will be reduced during peak morning and evening periods when natural gas is currently a lower emission energy source in the state. Recent studies indicate that even if additional intermittent wind and solar generation capacity is deployed, gas-fired electrical facilities will almost certainly remain essential to stabilize the state's power grid. The gas-fired generators serving the state, however, may be forced to increasingly operate as short-term inefficient

¹⁰ See Anthony R. Kavscek, *Is a natural gas ban an 'antidote to climate change'?*, San Jose Mercury News (Nov. 12, 2019), https://mercurynews-ca.newsmemory.com/?publink=754c8d2e3_13411ac. Professor Kavscek is a member of the Energy Resources Engineering faculty at Stanford University.

“peaker plants” which are known to emit more GHG emissions.¹¹ Thus, it is far from clear that an all-electric building mandate will reduce GHG emissions.

The DEIR must disclose and acknowledge potential GHG impacts that could occur from shifting building energy use from natural gas to electric power given reasonably foreseeable conditions in which electrical energy consumption would produce more GHG emissions than natural gas building use.

- **Energy Impacts** – Under the CEQA Appendix G Checklist, a project may involve a significant environmental impact if it would result in “wasteful” or “inefficient” energy consumption. MM GHG-1 seeks to prohibit the installation of new natural gas infrastructure in new residential construction. But nowhere does the DEIR discuss how that may result in either (i) a failure to use already captured natural gas, or (ii) the expenditure of additional energy to transport or divert natural gas elsewhere. Studies have shown that low carbon natural gas may continue to be a viable resource in assisting the state with reaching its climate goals, and should continue to be utilized in typically hard to electrify thermal applications in residential, commercial and industrial uses.¹² Specifically, Renewable Natural Gas (“RNG”), or biomethane, can be produced from biomass wastes (e.g. forest, agriculture, waste water and food and green waste) and then processed to inject into existing pipelines. Because its production removes more potent greenhouse gas from the air (methane) compared to what is produced when used (carbon dioxide), RNG production can be carbon negative from a lifecycle perspective. The County cannot determine whether full electrification policies will have unintended consequences of “wasteful” or “inefficient” energy use, without first analyzing these impacts in the DEIR.
- **Public Health and Safety** – In an era of increasingly dry and warm climates, and increased population in the wildfire urban interface along with build out of electrical infrastructure that could be an ignition source to serve population growth, California wildfires are occurring at increased frequencies and severities. Each of the three California investor-owned utilities adhere to wildfire mitigation plans (“WMP”) submitted to and approved by the California Public Utilities Commission (“CPUC”) — which establish internal mechanisms and protocols for de-energization events, also known as Public Service Power Shutoffs (“PSPS”). PG&E’s most recent PSPS event (occurring on October 6, 2019) impacted over 728,980 customers in 35 counties across the Sacramento Valley, Sierra Foothills, North Bay, South Bay, East Bay, Central Coast,

¹¹ See, e.g., Mark Thurber, *Gas-fired generation in a high-renewables world*, Stanford University School of Earth, Energy & Environmental Sciences and Precourt Institute for Energy Natural Gas Initiative, NGI Research Brief (June 2018), https://ngi.stanford.edu/sites/g/files/sbiybj14406/f/NGI_Brief_2018-06_R3_Thurber.pdf.

¹² Energy + Environmental Economics, *Decarbonizing Pipeline Gas to Help Meet California’s 2050 Greenhouse Gas Reduction Goal* (Jan. 2005), https://www.ethree.com/wp-content/uploads/2017/02/E3_Decarbonizing_Pipeline_01-27-2015.pdf.

and parts of Southern California.¹³ Southern California Edison (“SCE”)— the investor-owned utility whose service territory includes the County — is likewise obligated to implement PSPS protocols in certain circumstances giving risk to wildfires and has done so on numerous occasions in 2019 and 2020. For example, on November 15-17, 2019, SCE instituted a PSPS event that was initially estimated to impact 31,975 customers on 48 circuits across four counties (including the County), although had a much smaller impact than originally considered.

It is evident that increasing the amount of power needed from the electrical grid, such as by reducing the use of natural gas and increasing the use of electricity, will only exacerbate these problems. Until that time, however, PSPS events will be the “new norm,” both in Northern and Southern California. In addition to the large-scale economic losses that customers suffer as a result of a PSPS event, public safety issues can also arise due to several factors. These include loss of power at critical medical facilities, added strain on first responder services (such as local police departments and EMTs), loss of school days, and disruption of critical city infrastructure during emergency responses (such as traffic lights). Although MM GHG-1 will contribute to an overloaded grid and exacerbate the economic and safety implications from future, likely PSPS events; the DEIR mentions none of these issues.

The County should consider how increased deployment of other technologies, such as microgrids and energy storage projects, can help achieve decarbonization and resiliency goals. A 2018 CEC report found that microgrid projects offer a number of “value propositions,” including renewable energy integration, grid resiliency, and carbon reductions.¹⁴ The CEC report concluded that microgrid projects align with the state’s Renewables Portfolio Standard and GHG reduction mandates.¹⁵ The County should analyze the effectiveness of these mitigation options instead of a ban on natural gas.

- ***Impacts on Biological Resources, Water Quality and Noise Stemming From Additional Renewable Generating Resources*** – As stated above, the County has not demonstrated how adopting and implementing MM GHG-1 will impact existing electricity demand. In other words, no evidence exists to support the notion that existing or future electricity load could meet energy demands if natural gas infrastructure is banned for all future residential construction. Rather, it is reasonably foreseeable that new renewable energy resources will be needed, in addition to those required under the California Renewables Portfolio Standard (“RPS”), to meet new building electrification policies. The CEC’s 2019 *California Energy Efficiency Action Plan Staff Report* acknowledges that statewide

¹³ PG&E, “Public Safety Power Shutoff (PSPS) Report to the CPUC Oct. 9-12, 2019 De-Energization Event” (Oct. 25, 2019), at https://www.pge.com/pge_global/common/pdfs/safety/emergency-preparedness/natural-disaster/wildfires/PSPS-Report-Letter-10.09.19.pdf.

¹⁴ Asmus, Peter, Adam Forni, and Laura Vogel. Navigant Consulting, Inc. 2017. *Microgrid Analysis and Case Study Report*. California Energy Commission. Publication Number: CEC-500-2018-022, <https://ww2.energy.ca.gov/2018publications/CEC-500-2018-022/CEC-500-2018-022.pdf>

¹⁵ *Id.* at ii.

building electrification efforts “will seek to increase the share of renewable generation on the electricity grid...”¹⁶

The DEIR does not analyze how development of foreseeable additional renewable generating resources will impact the environment. Because it is likely that the County can determine with particularity the amount of MW or MWh that will be needed to fully implement MM GHG-1 in years to come, an accompanying analysis of generating resources and their potential environmental impacts must be provided. These renewable resource facilities are known to have their own environmental impacts associated with construction and operation, including but not limited to, impacts on federal and California sensitive species, water quality and quantity, nearby noise receptors, and project-related air quality impacts.

Because such commercial-scale facilities might be located outside the County does not insulate the County from its obligation to consider the indirect environmental impacts from MM GHG-1. Indeed, “the purpose of CEQA would be undermined if the appropriate governmental agencies went forward without an awareness of the effects a project will have on areas outside of the boundaries of the project area.”¹⁷ It is well-settled that “the project area does not define the relevant environment for purposes of CEQA when a project's environmental effects will be felt outside the project area.”¹⁸

- **Environmental Justice** – “Environmental justice” is defined as “the fair treatment of people of all races, cultures, and incomes with respect to the development, adoption, implementation, and enforcement of environmental laws, regulations, and policies.” Gov. Code § 65040.12(e). An Attorney General report defines “fairness” in this context to mean that “the benefits of a healthy environment should be available to everyone, and the burdens of pollution should not be focused on sensitive populations or on communities that already are experiencing its adverse effects.” “In addition, though CEQA’s main purpose is to evaluate whether a project may have a significant effect on the physical environment, “human beings are an integral part of the environment.”

The CEQA Guidelines state that “[e]conomic or social effects of a project may be used to determine the significance of physical changes caused by the project. For example, if the construction of a new freeway or rail line divides an existing community, the construction would be the physical change, but the social effect on the community would be the basis for determining that the effect would be significant.” Here, MM GHG-1 would require the construction of new electric infrastructure, including within the County, to supply the electricity necessary to support a natural gas ban. This

¹⁶ California Energy Commission, 2019 Energy Efficiency Action Plan Draft Staff Report, <https://efiling.energy.ca.gov/getdocument.aspx?tn=229496>.

¹⁷ *Napa Citizens for Honest Government v. Napa County Bd. of Supervisors* (2001) 91 Cal.App.4th 342, 369.

¹⁸ *County Sanitation Dist. No. 2 of Los Angeles County v. County of Kern* (2005) 127 Cal.App.4th 1544, 1582–1583.

physical change to the environment will lead to cost increases for ratepayers, an economic impact which must be considered under CEQA.

Before the County can adopt MM GHG-1, the DEIR must consider the impact it will have on customer affordability and ratepayers. About 90 percent of residential energy consumers in Southern California use natural gas for space and water heating, and ratepayers prefer a choice in how they heat their homes and cook their food. Further, according to a 2018 study produced by Navigant Consulting on behalf of the California Building Industry Association, switching to all-electric appliances could cost single-family homeowners in Southern California “over \$7,200 and increase energy costs by up to \$388 per year.” Low-income customers would be the most burdened by the costs of building electrification.

Thus, as a result of adopting MM GHG-1, the County will have effectively established an unnecessary energy policy that will disproportionately impact its disadvantaged communities. Under CEQA, the County cannot gloss over this potential impact.

Given the substantial evidence that adopting and implementing MM GHG-1 will result in potential significant environmental impacts, the County is required to undertake proper CEQA review of such impacts, including both the direct and indirect environmental impacts stemming therefrom.

2. MM GHG-1 is Not “Feasible” under CEQA

Pursuant to CEQA Guidelines section 15126.4(a)(1), an EIR must “describe feasible measures which could minimize significant adverse impacts, including where relevant, inefficient and unnecessary consumption of energy.” “Feasible” means “capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social, and technological factors.”¹⁹ Courts do not defer to an agency’s determination that mitigation measures will work when their efficacy is not apparent and there is no evidence in the record showing they will be effective.²⁰ Here, there is no evidence that MM GHG-1 is feasible as a means to mitigate GHG-related impacts associated with the 2040 General Plan. In fact, evidence demonstrates that natural gas bans are environmentally, economically and technologically infeasible.

Intermittent Renewable Generation Inhibits Feasibility of a Natural Gas Ban

Since 2015, several studies have evaluated the results of multiple assessments of national and California decarbonization strategies and options.²¹ Other studies have considered the power

²¹ See, e.g., P. Loftus et al., A critical review of global decarbonization scenarios: what do they tell us about feasibility?, WIREs Climate Change, January/February 2015, <https://www.researchgate.net/publication/267875650> A critical review of global decarbonization scenarios w

system and costs associated with relying solely on intermittent renewable power for decarbonization, in contrast with approaches that also utilize fossil fuels with CCS or renewable natural gas (“RNG”).²² These studies consistently conclude that renewable generation without a reliable baseload power source cannot achieve deep carbonization, will require installing massive amounts of additional generation and distribution facilities, and will be unaffordable.

- Relying on variable renewable sources such as wind, hydroelectric and solar to decarbonize will require the fabrication, installation and operation of approximately 3 to 10 times the level of solar and wind facilities that would be required if a reliable lower-carbon energy source was also utilized.²³ This overbuilding is required as intermittent power cannot achieve its nominal nameplate capacity—100 megawatts of solar or wind power will produce approximately 20-40 percent of capacity per year compared with approximately 90 percent capacity rates for natural gas. Thus, a much larger power system must be built to produce enough energy.
- As the percentage of intermittent renewable power serving a community increases, the amount of energy that is “curtailed” or wasted because it is not produced when needed can approach 40 percent of total generation.²⁴ Due to the timing mismatch between demand and the availability of solar and wind power, wind and solar would be unable to meet about 30 percent of California’s annual energy demand.²⁵ As a result, massive electrical power storage must be constructed, installed and operated

²⁵ CATF 2019.

to capture a community's surplus intermittent power generation. In California alone, storing surplus generation would require batteries with an instantaneous capacity "larger than the generating capacity of the entire US electric grid." Even assuming battery storage costs fall dramatically to \$80 per megawatt, California communities would be required to pay about \$2.9 trillion to secure the necessary power storage.²⁶

- To increase the reliability of intermittent renewable energy, significant new large-scale transmission will be required to "knit together diverse wind, sun and hydro resources" including as much as "a twenty-fold increase in US transmission capacity and interties for very high renewable energy scenarios, according to the National Renewable Energy Laboratory."²⁷
- Due to the need for overbuilding, energy storage increases, and new transmission capacity, decarbonization using intermittent renewables without reliable low-carbon power sources would be unattainably expensive. The cost of electricity generation in California has been estimated to rise from about \$58 per megawatt hour with 60 percent renewable generation to \$389 using 80 percent renewable power, and an astonishing \$1,402 per megawatt hour at 100 percent renewable levels even assuming that the cost of wind, solar and storage falls substantially.²⁸ Other studies have estimated that California communities would pay more than \$1,600 per megawatt hour using 100 percent renewable power.²⁹

A Natural Gas Ban is Economically Infeasible for Customers

According to 2019 survey data published by the U.S. Energy Information Agency, the average household in California currently consumes about 7 megawatt hours of energy at a cost of approximately \$1,000 (\$0.14 per kilowatt hour). Published estimates indicate that California electrical generation costs could rise by 8 to 24 times current levels with 60 percent renewable power, higher utilization of renewables than at present. California households would also use more electrical power over time for transportation and other needs under a 100 percent renewable power scenario. Assuming that the average household electrical demand increases to 10 megawatt hours per year,³⁰ and that prices do not significantly increase until renewable use reaches 80 to 100 percent of total generation, the average California household electric bill

²⁶ CATF 2019.

³⁰ EIA, *How much electricity does an American home use?* (Oct. 2, 2019), <https://www.eia.gov/tools/faqs/faq.php?id=97&t=3> (explaining that in 2018, the average annual electricity consumption for a U.S. residential utility customer was 10,972 kWh).

would increase to about \$8,000 per year at 80 percent renewable use, and to about \$24,000 per year with 100 percent renewable use.

Annual cost increases of this magnitude could be expected to stimulate significant population relocation to lower cost communities. Physical relocation, including the use of larger, high emission vehicles, could have significant impacts on air quality, population and housing. High household energy costs would also have significant health and safety impacts, including higher mortality and illness rates for vulnerable populations due to the inability to heat or cool homes. Direct relocation GHG emissions, and additional emissions that could occur from the movement of large amounts of households to lower cost communities with higher average household emission rates could also generate significant cumulative climate change impacts.

Higher electrical power costs could also result in the relocation, or failure to open and operate businesses in the state and the relocation of these activities to lower cost, higher-emission communities. As discussed in a January 2020 report by the California Legislative Analyst's Office, California communities already have disproportionately higher energy costs than most of the U.S. compared with marginal generation expenses. Consequently, higher costs associated with 100 percent renewable energy could generate significant GHG impacts.

3. The DEIR Finds that GHG Impact 4.8-1 Will Remain Significant and Unavoidable, but Does So Without Considering Other Feasible and Effective GHG Mitigation

Under CEQA, a lead agency may not adopt a project unless it has eliminated or substantially lessened all significant effects on the environment, or determined that remaining significant effects are acceptable due to overriding considerations.³¹ Here, the County concluded that, with the implementation of all identified GHG mitigation measures, Impact 4.8-1 would remain significant and unavoidable.³² However, the County cannot adopt this finding without implementation all feasible mitigation measures.³³ While it is true that "an EIR need not analyze 'every imaginable alternative or mitigation measure' ..., " it "must respond to specific suggestions for mitigating a significant environmental impact unless the suggested mitigation is facially infeasible."³⁴

SoCalGas urges the County to consider other GHG emission-reduction strategies that are scalable and easier to implement, more resilient and more affordable. Specifically, the use of renewable gases such as hydrogen and renewable natural gas (RNG), are low carbon to negative fuels that can dramatically reduce county greenhouse gas emissions and provide optionality and flexibility for the energy system.

³¹ Pub. Res. Code. § 15092(b).

³² DEIR at 4.8-49.

³³ Guidelines §§ 15043(a), 15092(b).

³⁴ *Los Angeles Unified Sch. Dist. v. City of Los Angeles* (1997) 58 Cal. App. 4th 1019, 1029; citing *San Francisco Ecology Center v. City and County of San Francisco* (1975) 48 Cal.App.3d 584, 596 (EIR did not respond to School District's suggestion that air conditioning and filtering might prove feasible means of reducing air quality impacts under proposed plan).

As stated in our prior comment letter for the General Plan Update (attached), RNG, or biomethane, can be produced from a variety of waste resources (e.g. agricultural waste, forest biomass, waste water, and landfills) and then processed to meet pipeline specifications. Further, green hydrogen can be produced from excess solar and wind power generated when demand is low. The hydrogen can then be stored for later use in hydrogen fueling stations, be used for electric generation in fuel cells, and/or blended into the gas pipeline system to decarbonize gas supply which benefits all sectors. This technology, called Power-to-Gas, has been demonstrated in numerous pilot projects, including UC Irvine.³⁵

Carbon Intensity Values of Current Certified Pathways (2020)

36

Renewable Gases Can Achieve Numerous Co-Benefits

Because most production of renewable natural gas removes methane from the air and converts it to carbon dioxide when used, RNG production can be significantly carbon negative from a

³⁵ UCI Samueli School of Engineering. UCI and SoCalGas Partner to Design "Advanced Energy Community." December 2017. Available at: <https://engineering.uci.edu/news/2017/12/uci-and-socalgas-partner-design-advanced-energy-community>

³⁶ California Air Resources Board. LCFS Certified Pathway Carbon Intensities. February 2020. Available at: <https://ww2.arb.ca.gov/resources/documents/lcfs-pathway-certified-carbon-intensities>

lifecycle perspective. Renewable gases can also achieve numerous co-benefits by helping the energy system be more flexible and work across sectors. For example, conversion of dead trees or other forest waste to renewable gases can dramatically reduce wildfire risks. The Power to Gas concept that can convert excess renewable electricity to hydrogen and store it for months instead of hours as in the case with batteries enables extension of the renewable energy for long durations to meet demand. Finally, renewable gases can reduce greenhouse gases in hard to decarbonize sectors such as agriculture and industry which form the economic engine of California. As the County is aware, SoCalGas is working towards the goal of replacing 5% of our natural gas supply with RNG by 2022, and 20% by 2030.

The CPUC is evaluating the levels of hydrogen that can be blended into the natural gas system. Just last month, Lawrence Livermore National Labs issued a study of how California can get to carbon neutrality by leveraging the gas pipelines and their rights-of-way to convey hydrogen and carbon dioxide.³⁷ In fact, the most cost-effective carbon negative solution is to convert biomass waste to hydrogen and sequester the carbon via pipelines using the rights-of-ways of the natural gas system. In addition, studies show that replacing roughly 16% of SoCalGas throughput with RNG achieves the same emissions reductions as electrifying the entire building sector by 2030.³⁸

Inclusion of RNG as a mitigation strategy also aligns with policies already included in the Draft General Plan. In particular, policies PFS-5.4, PFS-5.5, PFS-5.6, and COS-8.1 all support reuse of waste resources for energy generation as well as replacement of fossil fuels with renewable energy resources, including bioenergy. Accordingly, the use of renewable gases as a mitigation measure seems a natural complement to these policies, whereas a ban on gas infrastructure seems counterproductive. Therefore, we encourage the County to replace Mitigation Measure GHG-1: Prohibit Natural Gas in New Residential Construction, with an alternative mitigation measure that is performance-based, technology neutral and allows for flexibility in use of renewable fuels to help achieve emissions reductions.

We appreciate the opportunity to submit comments on the DEIR and look forward to working with the County as a valuable energy partner to achieve their environmental goals. If you have any questions, please do not hesitate to reach out via telephone or email.

Sincerely,

Deanna Haines

Ventura, CA 93009

**RE: Comment on Draft Environmental Impact Report for the County of Ventura
Draft 2040 General Plan**

Dear Ms. Curtis,

The Port of Hueneme appreciates the opportunity to comment on the *Draft EIR* for the County's *2040 General Plan*. The inclusion and thoroughness exhibited throughout this document is appreciated. The Port applauds the detailed work of County staff, and the deliberate inclusion of economic vitality spurring sustainable development within our County.

We respectfully submit the following comment:

1. Pg. 4.13-29 Impact 4.13-7 Expose Noise-Sensitive Land Uses to Railroad Noise and Vibration that Exceeds Applicable Standards

We ask the County to revise this section to clarify that the costs associated with measuring noise levels surrounding railways for the 2040 General Plan Policies – HAZ-9.2 and HAZ-9.6 will not be placed on the owner or operator of the railroad.

We suggest the following text to clarify:

“However, 2040 General Plan Policies-HAZ-9.2 and HAZ-9.6 would ensure indoor noise levels in habitable rooms do not exceed 45 dBA CNEL and outdoor noise levels do not exceed 60 dBA L10 and would require an acoustical analysis to determine noise levels and provide appropriate reduction measures. *Costs associated with measuring these noise levels will not be the burden of the railroad owner, nor operator.* As required by 2040 General Plan Policy HAZ-9.1, the County would

prohibit discretionary development which would be impacted by noise that cannot be reduced to meet the standards prescribed in Policy HAZ-9.2.”

Sincerely,

A handwritten signature in black ink, appearing to read 'Kristin Decas', enclosed in a thin black rectangular border.

Susan Curtis,

Dear Ventura County Board of Supervisors and Planning Department,

Climate issues are something I feel worried about. Ventura County is warming faster than any county in the nation. Our ocean is acidifying faster. Drought and floods have hit us worse, and we can expect more extreme weather.

My family and community are counting on you to assure analysis of the full scope of environmental impacts and mitigations in the Draft EIR.

First, it is necessary that all greenhouse gas emissions be counted based on the most current science.

There are many ways to mitigate climate impacts, like a sunset plan for oil and gas production, decarbonization of transportation and buildings, zero waste, incentives for regenerative agriculture and water management, and reducing emissions from tailpipes.

I want an EIR that covers major climate impacts via a systematic plan.

Thank you—

To: Curtis, Susan <Susan.Curtis@ventura.org>
Subject: Ventura County General Plan

Dear Ms. Curtis,

I am writing to express my concern over the flaws in the process, data, and conclusions of the Ventura County General Plan, Draft EIR, and supplemental documents.

My great-great grandfather, Mark McLoughlin (1843-1914), was a true Ventura County pioneer, purchasing his first 318 acres of undeveloped land in Ventura County in 1875. He was a hard-working visionary, revered by his community. With his son—my great grandfather, James Patrick McLoughlin—he raised livestock and farmed the land, providing jobs and feeding the growing towns of Oxnard and Ventura.

Our land, in a vitally important location on Olivas Park Drive across from the Ventura Marina, has been in the family, and part of the economic fabric of the community, for 100 years. And we want it to be part of the future of this community, with a flourishing economy, a thriving job market, and unsurpassed quality of life for its residents.

But the General Plan and DEIR do not describe a viable path for us as landowners going forward.

I will begin with some specific issues regarding language in the Coastal Area Plan, 4-82-83 and

4-94-95. Part of our land is located in the Central Coastal Zone, adjacent to the Ventura Marina, on Olivas Park Drive at Harbor Blvd. The only conclusion the Plan draws about our land is the statement that, “unlike the Preble area, services are not readily available to the Olivas lands.” This is false. Our property has access to all utilities, water, main roads, and the freeway. Indeed, easements on our property serve surrounding areas with utilities.

The Plan also claims that our property is “not included in the City’s sanitation district because of problems with water pressure.” This language is irrelevant and incorrect. There is no evidence that there are water pressure issues, and the sanitation district’s pipelines actually traverse our property.

While we do not know the original source of these misstatements, such misrepresentations—now repeated in the Plan—threaten to diminish the value of our land in relation to the Preble property. And, of course, they undermine the goal and the value of the Plan itself.

The General Plan also speaks of the widening of Olivas Park Drive, our southern boundary. This would have a direct impact on our property. But the Plan does not address how this would happen or how it would affect our land.

Damaging misstatements about our property also appear in the DEIR. Contrary to the portrayal in the DEIR, our property has significant infrastructure in place, as well as prime accessibility to the highway and the harbor. In fact, with easy access to the marina and beach community, and with the railroad as part of our eastern boundary, our land is uniquely suited to be an important part of future economic development in the area. We are entitled to have all these matters corrected.

I would also like to raise some additional concerns:

1. The General Plan and DEIR continue to ignore the 28% increase in the homeless population in our community.
2. According to the General Plan, if we were to build an acre of low income / worker housing we would need to buy two replacement acres of same Ag land to be placed into perpetual agricultural preservation. This is unrealistic and infeasible, and certainly not in line with the State government’s housing policies.
3. The EIR does not adequately address the enormous “indirect impacts” that will occur as a result of implementing the General Plan, calling them “less than significant.”
4. The General Plan contains policies that will increase the costs of normal farming operations, making it difficult for farming to remain profitable.
5. The Plan does not adequately evaluate the impacts of increased competition for water in our community.

The EIR is a flawed document, full of errors, that does not disclose all impacts, direct and indirect, caused by the General Plan. It was obviously rushed—completed in six weeks. It is inaccurate and incomplete, and fails to provide members of the community with the information that they are legally entitled to. This EIR should be corrected and reconsidered, and a reasonable time period should be allowed for meaningful and thoughtful community input.

Sincerely,

Patrick de Nicola

Sanger Hedrick, Chair

Agricultural Policy Advisory Committee (APAC) County of Ventura
[800 S. Victoria Blvd.](#)
[Ventura, CA 93003](#)

Re: 2040 General Plan Environmental Impact Report (EIR)

Dear Mr. Hedrick and Honorable Members of APAC:

Thank you for the opportunity to provide comments following today's presentation by Ventura County Planning staff on the 2040 General Plan EIR.

There are several issues with the 2040 General Plan EIR that CoLAB believes will negatively impact the viability of local agriculture.

Proposed mitigation measure AG-2: The County proposes that any project that either directly or indirectly results in the loss of farmland must obtain and place into perpetual agricultural preservation twice the total of the farmland loss. This mitigation measure is infeasible. Contrary to statements made by County Planning staff today at the APAC meeting, the California Environmental Quality Act (CEQA) requires that all mitigation proposed in an EIR be feasible. CEQA Section 21061.1 defines feasible as "capable of being accomplished in a successful manner within a reasonable period of time,

" (*emphasis added*). All mitigation measures proposed in an EIR must be shown to reduce impacts

and an infeasible mitigation measure, by definition, cannot and will not reduce impacts.

The EIR does not provide evidence of any of the following:

1. 1) Whether there is sufficient land available for purchase/conservation easement for each farmland category;
2. 2) The cost per acre to purchase each category of farmland;
3. 3) The anticipated cost of establishing a conservation easement for each category of farmland;

4. 4) The anticipated cost associated with managing each category of farmland under a conservation easement;
5. 5) The anticipated cost associated with monitoring these mitigation parcels scattered throughout the County and who will bear that cost;
6. 6) Any information that could constitute a “plan” for management of farmland in conservation easements;

February 19, 2020

[Ventura County Coalition of Labor, Agriculture and Business / 1672 Donlon Street, Ventura, CA 93003 / 805-633-2260 / info@colabvc.org](#)

Page 2 of 4

7. 7) An analysis of direct and indirect impacts caused by this mitigation measure (including impacts associated with LU compatibility conflicts and increased urban-ag-interface);
8. 8) Whether the smallest possible mitigation acreage required will achieve the minimum to ensure viability of agriculture on the parcel; and
9. 9) Whether the proposed mitigation is in conflict with other ordinances and regulations, such as the County’s Zoning Ordinance and the County’s minimum lot sizes.

The County is already aware that this proposed mitigation measure is infeasible. On March 24, 2016, at a Local Agency Formation Commission (LAFCo) hearing, Supervisor Linda Parks attempted to establish an “Agricultural Mitigation Measure” through the LAFCo project approval process. The mitigation measure would have required the 1-to-1 purchase of local farmland (half of what is proposed in the 2040 General Plan EIR) to replace farmland that would be impacted by any proposed development. Ventura County Counsel, Michael Walker, informed both LAFCo and Supervisor Parks that the proposed mitigation measure did not meet the standard for economic feasibility, and, for that and other reasons, LAFCo could not adopt Supervisor Park’s proposed mitigation measure. He referenced a 2015 legal decision, *City of Irvine v. County of Orange*, in which the Court stated, “the sheer astronomical expense of land supports the finding of the EIR that the purchase of an agricultural conservation easement is a non-starter.”

In addition to being infeasible, CoLAB does not believe that this mitigation measure will reduce impacts on agricultural land, as it does not address the actual issues that will impact farmland under the 2040 General Plan: lack of economic sustainability, the increasing regulatory demands on agriculture, increased competition for water resources, and increased compatibility conflicts from development.

Indirect Impacts

The EIR dismisses “indirect impacts” that will occur as a result of implementing the 2040 General Plan as “less than significant.”

Page 4.2-13 of the EIR states “AG-2.3 maintains the Right-to-Farm Ordinance to protect agricultural land uses from conflicts with non-agricultural uses, as well as to help land purchasers and residents understand the potential for nuisance, (e.g., dust, noise, odors) that may occur as the natural result of

living in or near agricultural areas...These sections of the code protect farmers engaged in agricultural activity from public nuisance claims...This protects the farming community, including Important Farmlands and farms less than 10 acres, from developments that would inhibit their ability to continue agricultural production.”

Page 4.2-17 of the EIR states: “Residential growth in areas nearby agricultural lands has the potential to result in land use conflicts. Residential land uses are generally more sensitive and prone to conflict with adjacent agricultural land uses than commercial or industrial land uses. The placement of sensitive land uses, such as residences and schools, nearby classified farmland can negatively impact both uses due to conflict including odor nuisances and noise from agriculture machinery. The countywide Right-to-Farm Ordinance protects existing agricultural and farming operations from conflicts attributed to residential development...**Therefore, the potential for conflicts would be minimal. This impact would be less than significant**” (*emphasis added*).

This is simply not true. Historic and recent County actions have shown that the County has and will continue to create new restrictions and ordinances that have a significant impact on existing agricultural

[Ventura County Coalition of Labor, Agriculture and Business / 1672 Donlon Street, Ventura, CA 93003 / 805-633-2260 / info@colabvc.org](#)

Page **3** of **4**

and farming operations because of conflicts attributed to residential development. The recent interim urgency ordinance restricting hemp cultivation is one such example.

Contrary to statements made today by Ventura County Planning staff, an EIR, whether it is labeled as “programmatic” or “project”, must analyze all reasonably foreseeable consequences of the action that is proposed. For the 2040 General Plan EIR, the action proposed is the implementation of all policies and programs within. Therefore, if the implementation of a policy in the 2040 General Plan will result in an impact, that impact must be analyzed. For example, the 2040 General Plan contains land use designation changes that will increase allowable housing density near agricultural land. It is reasonably foreseeable that more houses will create more compatibility conflicts with normal farming operations. The impact of these compatibility conflicts must be addressed in the EIR.

In 2014, the California Court of Appeal stated in a ruling that “[T]he fact that this EIR is labeled a ‘project’ rather than a ‘program’ EIR matters little....Designating an EIR as a program EIR ... does not by itself decrease the level of analysis otherwise required in the EIR. All EIRs must cover the same general content. The level of specificity of an EIR is determined by the nature of the project and the “rule of reason,” rather than any semantic label accorded to the EIR.”

It is CoLAB’s opinion that indirect impacts from increasing urban-ag interface are SIGNIFICANT and cannot be dismissed in the EIR.

Direct and indirect impacts of increased costs

The 2040 General Plan has policies that will increase the costs of normal farming operations. CoLAB believes that the most effective way to minimize conversion of agricultural land to non-agricultural uses is to take active measures to allow farming to remain profitable. And even the County admits that reducing the cost of farming reduces conversion of agricultural land in their discussion of the Williamson Act in Chapter 4.2 of the EIR.

But the County fails to analyze direct and indirect impacts of 2040 General Plan policies that will increase the cost of normal farming operations, such as:

- Policy AG-5.2: Electric- or Renewable-Powered Agricultural Equipment. The County shall encourage and support the transition to electric- or renewable-powered or lower emission agricultural equipment in place of fossil fuel-powered equipment when feasible.
- Policy AG-5.3: Electric- or Renewable-Powered Irrigation Pumps. The County shall encourage farmers to convert fossil fuel-powered irrigation pumps to systems powered by electric or renewable energy sources, such as solar power, and encourage electric utilities to eliminate or reduce standby charges.

Direct and indirect impacts of increased competition for water resources

The County fails to evaluate the impact of increased competition for water resources caused by development allowed in the 2040 General Plan on either the conversion of agricultural land or the loss of agricultural lands through the loss of topsoil.

The EIR states on page 4.2-3 that "...a reduction in available water resources for irrigation" is an example of indirect impacts on agricultural land due to loss of topsoil from increased wind and water erosion.

But the County fails to analyze or propose mitigation measures to address this significant impact.

[Ventura County Coalition of Labor, Agriculture and Business / 1672 Donlon Street, Ventura, CA 93003 / 805-633-2260 / \[info@colabvc.org\]\(mailto:info@colabvc.org\)](http://www.colabvc.org)

Page 4 of 4

APAC is the expert charged with advising County decision-makers on agricultural issues in Ventura County. And the County should be seeking guidance from APAC about the actual issues that will impact farmland under the 2040 General Plan: lack of economic sustainability, the increasing regulatory demands on agriculture, increased competition for water resources, and increased compatibility conflicts from development.

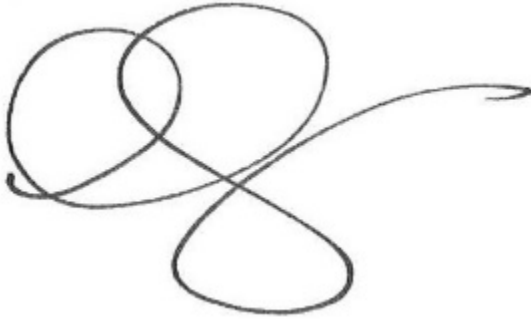

CoLAB encourages APAC to provide guidance to the County on appropriate and effective mitigation measures to prevent the conversion of agricultural land to non-agricultural uses. These may include:

1. 1) Strengthen the Right-to-Farm ordinance to prevent nuisance complaints from being used to justify the creation or expansion of setbacks or regulatory restrictions on normal farming practices;
2. 2) Expand the Land Conservation Act Program to include Open Space zoned properties that are engaged in farming (including grazing); and
3. 3) Protect agricultural land from urban-ag interface encroachment and compatibility conflicts by establishing setbacks on NON-AE-zoned land that will restrict the construction of bike paths, public trails, and sensitive receptors within 2000' of any land zoned A/E.

Thank you again for the opportunity to provide comments on this issue. We appreciate your consideration and leadership at this time.

Sincerely,

Louise Lampara Executive Director

Re: Comments on Ventura County General Plan DEIR

Dear Ms. Curtis:

I represent and serve on the McLoughlin Family Committee, a group of family members that own approximately 300 acres of agricultural property off of Olivas Park Road in the County of Ventura, in proximity to the City of Ventura.

The McLoughlin family has farmed this land for generations. It remains our desire to continue this legacy. However, in the face of never-ending changes to the regulatory environment, we again find ourselves attempting to ascertain how new policies and programs as proposed in the draft 2040 General Plan will impact and challenge our ability to serve as stewards of this heritage.

It had been our hope that the DEIR would provide some clarity and insight into how the new policies and programs within the revised General Plan would impact our farming operation. However, that is not the case. Simply said, we believe the General Plan Update and subsequent Environmental Impact Report fail to adequately analyze or study impacts on the farming industry.

With that said, we would like to specifically present the following:

- The Background report Table 6-26: Transportation Department Planned Capital Projects lists sections of roadways the County plans for expanded capacity or widening, along with the scope of those enhancements. It also covers in length the plan to add bike paths and bike lanes in accordance with existing County wayfarer plans. However, the DEIR never analyzes the loss of farmland resulting from these changes in infrastructure – it’s not even mentioned as a possibility in the DEIR.

Olivas Park Road between Victoria and Harbor is listed as one of the areas planned for road widening, a stretch of roadway that borders the entire eastern portion of our farmland and property. While the impact on our farming operation and financial losses due to property loss are clearly quantifiable, the report fails to list or quantify these impacts.

- In Section 3-8, The DEIR states that because there will be no “substantive” change to the agricultural, open space, or rural designations, the General Plan Update (GPU) will be consistent with SOAR. However, no further details beyond this conclusory statement is provided. There is no way for the reader to come to his or her own conclusion on whether the GPU will result in inconsistencies with SOAR that might lead to physical environmental impacts. There is no description of the changes to the Agriculture, Open Space, and Rural policies to determine whether they are in fact non-substantive.

Given the length and breath of the Draft General Plan update and CEQA analysis, we made an attempt to focus our initial review and subsequent comments to issues specific to agriculture and farming. However, it’s clear that the 2040 General Plan will impact the Ventura County local economy across sectors – all of which influence the ability to live and work in this region. The DEIR’s lack of analysis of those economic impacts, calls into question the legitimacy of both the draft General Plan update, and the CEQA analysis. As such, we respectfully request that the DEIR be recirculated in the hopes that further study will resolve these shortcomings.

I appreciate your consideration.

Dear Ms. Curtis,

I am writing to express my concern over the flaws in the process, data, and conclusions of the Ventura County General Plan, Draft EIR, and supplemental documents.

My great-great grandfather, Mark McLoughlin (1843-1914), was a true Ventura County pioneer, purchasing his first 318 acres of undeveloped land in Ventura County in 1875. He was a hard-working visionary, revered by his community. With his son—my great grandfather, James Patrick McLoughlin—he raised livestock and farmed the land, providing jobs and feeding the growing towns of Oxnard and Ventura.

Our land, in a vitally important location on Olivas Park Drive across from the Ventura Marina, has been in the family, and part of the economic fabric of the community, for 100 years. And we want it to be part of the future of this community, with a flourishing economy, a thriving job market, and unsurpassed quality of life for its residents.

But the General Plan and DEIR do not describe a viable path for us as landowners going forward.

I will begin with some specific issues regarding language in the Coastal Area Plan, 4-82-83 and 4-94-95. Part of our land is located in the Central Coastal Zone, adjacent to the Ventura Marina, on Olivas Park Drive at Harbor Blvd. The only conclusion the Plan draws about our land is the statement that, “unlike the Preble area, services are not readily available to the Olivas lands.” This is false. Our property has access to all utilities, water, main roads, and the freeway. Indeed, easements on our property serve surrounding areas with utilities.

The Plan also claims that our property is “not included in the City’s sanitation district because of problems with water pressure.” This language is irrelevant and incorrect. There is no evidence that there are water pressure issues, and the sanitation district’s pipelines actually traverse our property.

While we do not know the original source of these misstatements, such misrepresentations—now repeated in the Plan—threaten to diminish the value of our land in relation to the Preble property. And, of course, they undermine the goal and the value of the Plan itself.

The General Plan also speaks of the widening of Olivas Park Drive, our southern boundary. This would have a direct impact on our property. But the Plan does not address how this would happen or how it would affect our land.

Damaging misstatements about our property also appear in the DEIR. Contrary to the portrayal in the DEIR, our property has significant infrastructure in place, as well as prime accessibility to the highway and the harbor. In fact, with easy access to the marina and beach community, and

with the railroad as part of our eastern boundary, our land is uniquely suited to be an important part of future economic development in the area. We are entitled to have all these matters corrected.

I would also like to raise some additional concerns:

1. The General Plan and DEIR continue to ignore the 28% increase in the homeless population in our community.
2. According to the General Plan, if we were to build an acre of low income / worker housing we would need to buy two replacement acres of same Ag land to be placed into perpetual agricultural preservation. This is unrealistic and infeasible, and certainly not in line with the State government's housing policies.
3. The EIR does not adequately address the enormous "indirect impacts" that will occur as a result of implementing the General Plan, calling them "less than significant."
4. The General Plan contains policies that will increase the costs of normal farming operations, making it difficult for farming to remain profitable.
5. The Plan does not adequately evaluate the impacts of increased competition for water in our community.

The EIR is a flawed document, full of errors, that does not disclose all impacts, direct and indirect, caused by the General Plan. It was obviously rushed—completed in six weeks. It is inaccurate and incomplete, and fails to provide members of the community with the information that they are legally entitled to. This EIR should be corrected and reconsidered, and a reasonable time period should be allowed for meaningful and thoughtful community input.

Sincerely,

Patrick de Nicola

Good afternoon,

Please accept the attached letter below as part of the public comment on the 2020 General Plan Draft Economic Impact Report. The letter expresses the views of coalition partners named in the letter and I can share their contact information with you if needed for verification.

If possible, I would appreciate a response as confirmation of receipt of this comment for the public record.

Thank you,

Re: General Plan Update Draft Environmental Impact Report Comments

Dear Ms. Curtis,

We represent workers in Ventura County through the Tri-Counties Building & Construction Trade Unions, LiUNA Local 585, International Brotherhood of Electrical Workers (IBEW 952), and Southwest Carpenters.

Our organization advocates for local government policies that support the rights of workers, their families and communities. We advocate for policies that support a strong economy that provides robust opportunities for a skilled, well-trained workforce. We are committed to fight against policies that restrict the ability to work in the high-paying jobs that afford our members lifetime career opportunities.

The Draft Environmental Impact Review (DEIR) does not sufficiently evaluate the impacts that the General Plan policies will have on jobs and the economy. It falls short of addressing the housing crisis facing Ventura County. It does not do enough to address the need for increasing housing supply in the county.

The General Plan Update disproportionately targets the local oil and gas industry that have worked in Ventura County for decades. The DEIR underrepresents the number of workers who would be impacted by the oil and gas policies outlined in the General Plan.

We represent a diverse group of workers who depend on high-paying jobs with upward mobility and benefits for our families. The suggestion that our members should re-train from a specialized skill they have dedicated their career to is objectionable. The DEIR must address the salary differences and opportunities between the suggested green jobs of a carbon neutral economy and those currently held by the skilled workforce.

Our primary goal is to ensure our members' jobs and families are protected. Upon review of the General Plan Update it is clear that jobs will be impacted and in some cases eliminated and that is not reflected in this iteration of the DEIR.

We respectfully ask that the county revises and recirculates the DEIR and takes the time to thoughtfully analyze the impacts these policies will have on working families. The General Plan is a critical factor in the county's economic success. It should encourage economic growth and opportunity for working people.

Sincerely,

Martin Rodriguez

Subject: Comments Regarding the Draft Environmental Impact Report (EIR) for the County of Ventura Draft 2040 General Plan

Mrs. Curtis,

Thank you for providing the opportunity to provide comments regarding the Draft EIR for the County of Ventura Draft 2040 General Plan. The City of Moorpark requests that you consider the following:

Comment 1

The City of Moorpark had previously provided comments on July 3, 2015 and August 16, 2019 regarding a desire to have certain regional roadway improvements acknowledged as priorities in the Circulation Element and, by extension, the EIR. These items do not appear to be included, either directly or indirectly, in the current draft. Our City Council has identified traffic improvements as a strategic priority. We are therefore resubmitting our request that the following projects are identified within the goals and policies of the Circulation Element and EIR:

- Improvements to Grimes Canyon Road, including the realignment of Hitch Boulevard at Los Angeles Avenue; and
- Construction of the Broadway Road connection to the State Route 23 bypass, as outlined in the 2009 Ventura County Congestion Management Plan.

Additionally, the Draft Circulation Element (page 4-3) establishes a Level of Service (LOS) standard of "E" for State Route (SR) 118, immediately west of the City of Moorpark. This condition should be addressed and improved in the General Plan and can be mitigated with the construction of an additional lane of travel in each direction. The draft EIR and General Plan Circulation Element should consider mitigation the LOS E condition and circulation on this corridor of SR118.

Comment 2

Page 4.13-1 states the following (emphasis added):

ENVIRONMENTAL SETTING

In addition to the information provided in Section 11.6, “Noise and Vibration,” of the Background Report (Appendix B), the following information is relevant to understanding and evaluating the potential noise and vibration impacts of the 2040 General Plan.

The existing traffic noise evaluation included in the Background Report (Appendix B) analyzed a number of roadway segments that are located outside of the County’s jurisdiction. In addition, the traffic noise assessment included in the Background Report (pages 11-88 to 11-97) was based on traffic data from 2014 and 2015. Since the preparation of the Background Report, more recent traffic data are available. **For the purposes of the analysis, the traffic noise modeling was updated to only evaluate roadway and highway segments within the unincorporated portions of the county that are regularly counted by the County’s Public Works Agency and to include updated traffic counts conducted in 2017 and 2018.** Table 4.13-1 provides the modeled existing noise levels at 50 feet from the roadway, as well as distances to the 60, 65, and 70 A-weighted decibel (dBA) community noise equivalent level (CNEL) contour for all modeled roadways. Detailed noise modeling inputs are provided in Appendix E.

Pursuant to the requirements of the California Environmental Quality Act, the EIR must evaluate traffic noise modeling for all roadway and highway segments that are within the scope of the DEIR and Draft General Plan. The scope of analysis in the EIR should not be limited to roadways that may or may not be “counted” by the County Public Works Agency.

Comment 3

Table 4.13-1 Existing Noise Contour Distances and Table 4.13-6 Projected 2040 Noise Levels and Contours: Please update this section to include a map or exhibit that more clearly indicates the limits of each “corridor and segment”. In many cases, the scope of each corridor and segment are not clearly identified. Additional comments may be provided when the limits of the corridors are fully understood.

Comment 4

Table 4.13-1 Existing Noise Contour Distances and Table 4.13-6 Projected 2040 Noise Levels and Contours: Corridor and Segment 105 references “Walnut Avenue north of Los Angeles Avenue (SR 118)”. “Walnut Street” is not within the City of Moorpark; please clarify whether this is intended to reference Walnut Avenue or Walnut Canyon Road. As mentioned in Comment 3, a map or exhibit would also assist in identifying what this corridor includes.

Comment 5

Page 4.13-8 states the following:

Generate new or additional transit uses or heavy vehicle (e.g., semi-truck or bus) trips **on uneven roadways** located within proximity to sensitive uses that has the

potential to either individually or when combined with other recently approved, pending, and probable future projects, exceed the threshold criteria of the transit use thresholds shown in Table 4.13-3 below.

This section should be updated to identify the thresholds used to determine an uneven roadway or include a map or exhibit that identifies where these conditions exist.

Comment 6

Page 4.13-9 identifies Policy HAZ-9.2 for Noise Compatibility Standards and provides the following mitigation:

4. New noise generators, proposed to be located near any noise sensitive use, shall incorporate noise control measures so that ongoing outdoor noise levels received by the noise sensitive receptor, measured at the exterior wall of the building, do not exceed any of the following standards:

- a. Leq1H of 55dB(A) or ambient noise level plus 3dB(A), whichever is greater, during any hour from 6:00 a.m. to 7:00 p.m.;
- b. Leq1H of 50dB(A) or ambient noise level plus 3dB(A), whichever is greater, during any hour from 7:00 p.m. to 10:00 p.m.; and
- c. Leq1H of 45dB(A) or ambient noise level plus 3dB(A), whichever is greater, during any hour from 10:00 p.m. to 6:00 a.m.

This mitigation measure may not be sufficient to address noise impacts presented by increased operations of *existing* noise generators. This language should be updated to clarify that the mitigation measure will apply to all new noise generators and also existing noise generators that may be modified to expand or intensify the noise generated.

Comment 7

Page 4.13-10 includes Policy HAZ-9.3:

Policy HAZ-9.3: Development Along Travel Routes. The County shall evaluate discretionary development for noise generated by project-related traffic along the travel route to the nearest intersection which allows for movement of traffic in multiple directions. In all cases, the evaluation of project-related roadway noise shall be evaluated **along the travel route(s) within 1,600 feet of the project site.**

The use of a 1,600 foot boundary in order to determine whether or not a proposed development will impact roadway noise is not clearly explained and can appear arbitrary. The term “travel routes” is also not clearly defined and open to interpretation (i.e. private driveways, access easements, public rights-of-way). The noise impacts associated with major new development do not cease when trucks travel 1,600 feet beyond the project site. Accordingly, this policy should be developed further to evaluate and mitigate the noise impacts along the likely travel routes serving the project.

Comment 8

Page 4.13-14 includes the following:

15. Select truck routes for material delivery and spoils disposal so that noise from heavy-duty trucks will have a minimal impact on noise sensitive receptors. **Proposed truck haul routes are to be submitted to the County Transportation Division for approval.**

a. Conduct truck loading, unloading, and hauling operations so noise and vibration are kept to a minimum.

b. Route construction equipment and vehicles carrying soil, concrete or other materials over streets and routes that will cause the least disturbance to residents in the vicinity of construction sites and haul roads.

c. Do not operate haul trucks on streets within 250 feet of school buildings during school hours or hospitals and nursing homes at any time, without a variance.

d. Submit haul routes and staging areas to the County Transportation Division for approval, at least 30 days before the required usage date.

If the above listed construction equipment noise control measures are not sufficient to reduce noise levels, the project would be required to install construction noise curtains, blankets, and barriers or receptor noise control barriers detailed in the *Construction Noise Threshold Criteria and Control Plan* to ensure noise levels are reduced below applicable County noise standards. The 2040 General Plan policies and measures listed in the *Construction Noise Threshold Criteria and Control Plan* would require individual development projects to include numerous noise-reducing techniques and minimize noise at receiving land uses. The effectiveness of these measures would be ensured through Policies HAZ-9.4 and HAZ-9.2, which require the implementation of mitigation developed through project-level acoustical analyses. Because noise levels generated from construction under the 2040 General Plan would be temporary and reduction measures would be implemented to ensure construction noise would not exceed applicable standards at nearby receptors, this impact would be less than significant.

Please update this item to identify the specific criteria upon which the County Transportation Division would be evaluating proposed truck haul routes, including items a. through d. As written, it appears as though the routes are submitted for summary approval, with no evaluation or discretion. It is also requested that language is included to require the County Transportation Division to notify the appropriate City counterparts within any jurisdictions that may be impacted by the proposed truck routes and provide an opportunity to receive feedback received prior to approving a truck haul route.

We sincerely appreciate your consideration of these items and look forward to continued collaboration on issues that cross jurisdictional boundaries. Please feel free to contact me at (805) 517-6251 or Dspondello@moorparkca.gov if you would like to discuss further.

Regards,

Hi Susan,

Please see the attached response memo from Groundwater Resources for the Ventura County 2040 General Plan Update Environmental Impact Report. Groundwater Resources also reviewed and updated relevant information in Chapter 10 (Water Resources) of the Background Report (Appendix B) from the DEIR. A word document of Chapter 10 with markup and comments is also attached.

Let us know if you have questions or comments.

Thanks,

James Maxwell, PG, CEG

To: Maxwell, James <James.Maxwell@ventura.org>
Subject: VC2040 | Notice of Availability of a Draft EIR for Public Review

CAUTION: If this email looks suspicious, DO NOT click. Forward to Spam.Manager@ventura.org

Notice of Availability of a Draft EIR For Public Review

Notice is hereby given that a Draft Environmental Impact Report (EIR) has been prepared by the County of Ventura, State of California, and is available for public review pursuant to the California Environmental Quality Act (CEQA) Guidelines for the Ventura County 2040 General Plan (State Clearinghouse No. #2019011026).

PROJECT LOCATION: All unincorporated areas within Ventura County

PROJECT DESCRIPTION: The proposed project is a comprehensive update of the County of Ventura General Plan, also known as the 2040 General Plan. The 2040 General Plan will set forth the County's vision of its future and identify the goals, policies, and implementation programs that will guide future decisions concerning a variety of issues, including but not limited to land use, climate change, agriculture, transportation, hazards, public facilities, health and safety, environmental justice, and resource conservation out to the year 2040. The County, as the lead agency, has prepared an EIR in accordance with CEQA. The purpose of the notice of availability is to call attention to this EIR and to request that interested persons review and provide comments on significant environmental issues, mitigation measures, and range of reasonable alternatives addressed in the EIR. The 2040 General Plan is anticipated to be adopted in 2020. With implementation of the 2040 General Plan, development may occur on or near site(s) identified in one of the regulatory databases compiled pursuant to Government Code Section 65962.5.

SIGNIFICANT ENVIRONMENTAL EFFECTS: The Draft EIR has identified significant and unavoidable environmental impacts in the following resource areas.

- Agriculture and Forestry Resources
- Air Quality
- Biological Resources
- Cultural, Tribal Cultural, and Paleontological Resources
- Greenhouse Gas Emissions
- Hazards, Hazardous Materials, and Wildfire
- Mineral and Petroleum Resources

- Noise and Vibration
- Public Services and Recreation
- Transportation and Traffic
- Utilities

WHERE THE DRAFT EIR IS AVAILABLE: The Draft EIR and supporting documents are available for public review at the following locations:

- 2040 General Plan Update webpage at <https://vc2040.org/>;
- The Planning Division website at <http://vcrma.org/divisions/planning> (select “CEQA Environmental Review”); and
- County of Ventura, Resource Management Agency, Planning Division Public Counter, 3^d Floor, Hall of Administration, 800 S. Victoria Avenue, Ventura, CA, 93009, between the hours of 7:30 a.m. and 4:30 p.m., Monday through Friday.

Digital versions of the Draft EIR and supporting documents are available at the following libraries:

- Albert H. Soliz Library (2820 Jordan Street, Oxnard, CA 93036);
- Avenue Library (606 North Ventura Ave., Ventura, CA 93001);
- E.P. Foster Library (651 East Main St., Ventura, CA 93001);
- Fillmore Library (502 2nd St., Fillmore, CA 93015);
- Hill Road Library (1070 S. Hill Rd., Ventura, CA 93003);
- Meiners Oaks Library (114 North Padre Juan, Ojai, CA 93023);
- Oak Park Library (899 North Kanan Rd., Oak Park, CA 91377);
- Oak View Library (555 Mahoney Ave., Oak View, CA 93022);
- Ojai Library (111 East Ojai Ave., Ojai, CA 93023);
- Piru Library (3811 Center St., Piru, CA 93040);
- Ray D. Pruetter Library (510 Park Ave., Port Hueneme, CA 93041); and
- Saticoy Library (1292 Los Angeles Ave., Ventura CA 93004).

PUBLIC REVIEW AND COMMENT PERIOD: The 45-day public review and comment period during which the County will receive comments on the Draft EIR begins Monday, January 13, 2020 and ends at 5:00 p.m. on Thursday, February 27, 2020.

WATERSHED PROTECTION

MEMORANDUM

DATE: February 27, 2020

TO: Susan Curtis, Manager, General Plan Update Section

FROM: James Maxwell, Groundwater Specialist 

SUBJECT: Ventura County Public Works Agency, Water Resources Division (VCWRD) Response, Draft Environmental Impact Report (DEIR), Ventura County 2040 General Plan

VCWRD reviewed the DEIR and supporting documents (Appendix B, Ventura County 2040 General Plan Update Background Report, Revised Public Review Draft January 2020) submitted by the County of Ventura. VCWRD does not have any comments regarding the DEIR. Relevant updates and comments have been made to Chapter 10 (Water Resources) of the Background Report.

Ventura County
2040
GENERAL PLAN

Chapter 10

Water Resources

10 WATER RESOURCES

INTRODUCTION

This chapter assesses various water resources and water resource issues in Ventura County and provides guidance in the following sections:

- Resources Assessment Major Findings (Section 10.1)
- Land Regulatory Framework for Water Management (Section 10.2)
- Land Regulatory Framework (Section 10.3)
- Existing Conditions by Watershed (Section 10.4)
- Trends and Future Conditions (Section 10.5)
- Key Terms (Section 10.6)
- References (Section 10.7)

The origin of this chapter differs from the State Board of Agriculture Report because of the nature of its subject matter because the overall regulatory framework for water resources is largely understood through such resources as managed by the framework. This basic discussion in this chapter because water resources are somewhat of geographic existing conditions discussions are organized according to the County Watershed System aspect of the resource addressed at the sub-regional level of each watershed.

SECTION 10.1 RESOURCES ASSESSMENT MAJOR FINDINGS

Since a decade ago, water supply is a new and ongoing concern in Ventura County due to climate change and drought conditions, associated declines in surface flows and reservoir levels, increased use of seawater, groundwater contamination of groundwater, extensive pollution in the Ventura County, pollution of new groundwater wells, and reduced diversions of imported water. More than 8,500,000 gallons and 156 square miles of 0.2 acres of land in Ventura County experienced direct impact from the drought conditions beginning in 2012.

The water supply challenges are great and could potentially impact domestic residents, commercial/industrial, municipal businesses, agricultural, and the environmental resources of Ventura County without goal-oriented planning and implementation concerted action.

- o ~~Climate change poses major challenges for water supply. Climate change is a significant environmental issue that poses a threat to the availability of water. Climate change may compromise the efficiency of water supply methods and demand resources. Climate change will increase demand for water. Climate change will increase the need for water for irrigation. Climate change will increase the need for water for municipal use. Climate change will increase the need for water for industrial use. Climate change will increase the need for water for agricultural use. Climate change will increase the need for water for domestic use.~~

Background Report

County of Ventura

~~Declines in surface water flow and reservoir levels in Western Ventura County~~
~~Report~~

o **Declines in surface water flow and reservoir levels in Western Ventura County.**

Western Ventura County's water resources have declined significantly since 2012. The decline is due to a combination of factors, including reduced precipitation, increased water demand, and the impact of climate change. The decline in water flow is particularly concerning for the agricultural and residential sectors. The decline in reservoir levels is also a cause for concern, as it reduces the county's ability to store water for use during dry periods. The decline in water flow and reservoir levels is a result of a combination of factors, including reduced precipitation, increased water demand, and the impact of climate change. The decline in water flow is particularly concerning for the agricultural and residential sectors. The decline in reservoir levels is also a cause for concern, as it reduces the county's ability to store water for use during dry periods.

Formatted: Strikethrough

Formatted: Strikethrough

o **Drought has significantly affected local water supplies.** More than 8,500 residents and 156 square miles of agricultural land in Ventura County experienced a water shortage from the beginning of 2012.

There are inadequate water supplies to meet future demands in some areas of the county. Developing new water projects and securing funding for water infrastructure are critical to ensuring that the county has sufficient water supplies to meet future demands. Some of the new water projects being considered include the development of water storage facilities, the construction of new water treatment plants, and the implementation of water conservation programs. The county is also exploring the possibility of desalination as a source of water. The county is also exploring the possibility of desalination as a source of water.

o **Overdrafted groundwater basins in the county are experiencing overdraft conditions.**

Groundwater is the most important source of water in the County, and is being used at a rate that is unsustainable. The County Department of Water Resources (DWR) has identified the following groundwater basins in Ventura County as being overdrafted:

- Cuyama Valley Basin (DWR RB 0913)
- Oxnard Subbasin (DWR RB 09042)
- Pasadena Valley Basin (DWR RB 0906)

The Cuyama Valley Basin is a critical source of water for the County, and is being used at a rate that is unsustainable. The County Department of Water Resources (DWR) has identified the following groundwater basins in Ventura County as being overdrafted:

Formatted: Indent: Left: 2.54", No bullets or numbering

Water Resources

2040 General Plan These basins serve both urban populations and agriculture. In A 2014 project ground water rules by the Fox Canyon Groundwater Management Agency passed Emergency Ordinance E with and reduced extensions in many of the ground water basins in the Ventura County with December 2014 the Ventura County Board of Supervisors approved and adopted Ordinance 4468 with the new water

10

¹ A study of the Ventura County Groundwater Management Agency basins is being conducted to determine the condition of present water management practices would result in and versus over time environmental and economic impacts such as persistence of ground water yield of wells in areas ground water recharge in the region of water quality and sustainability of water systems and des.

well-identified boundary in the unincorporated County of the major groundwater basins. These policies will be removed in the Groundwater Sustainability Agencies (GSAs) are formed and have completed Groundwater Sustainability Plans (GSPs) per the Sustainable Groundwater Management Act (SGMA). Implementation of SGMA in the Sustainable Groundwater Management Act will require an assessment of the condition of groundwater basins, conditions and management of groundwater and implementation of groundwater recharge projects to achieve long-term sustainability.

- **Variability in deliveries of imported water.** A proximal 7.5% decrease of Ventura County residents receive imported water from C.M.W. Delta-Munich Water District. Imported water volume is the amount of imported water depending on seasonal conditions, regulatory restrictions on SWP export conditions, water cost, and regional demands. The DWR California Department of Water Resources prepares annual public evaluation of imported water from the State Water Project. The most recent public 2017-2018 State Water Project Delivery Cycle Report states that extreme seasonal imported water system-wide winter water availability years and groundwater recharge water availability during the drought years decreased and increased average annual delivery of water since the 2015 Report.
- **Water resources dedicated to environmental purposes may change.** State and federal agency guidelines require that the amount of exported SWP water must remain available for end-user species and habitat management of water resources. Water availability requirements and diversions will be updated by the management of flow to put an reservoir of water equipment to provide increased instream flows could further diversify water availability and diversions.
- **There are insufficient adequate water supplies to meet future County demands in some areas of the county.** Dewatering new water projects and equipment is a significant challenge for managing and securing future environment water projects and construction. Some of the new water projects are being considered in the advanced management of water for use as a public water supply and the development of local groundwater and ocean desalination. Funding in the delivery of SWP State Water Project equipment are being considered. In addition, water conservation measures are being implemented in the county and state agencies are doing so to increase efficiency. These efforts will need to continue and be sustained.

▪ **Shift toward Integrated Regional Watershed Management (IRWM).** In the past, the development of the water systems were managed independently from each other. Groundwater was managed as a separate resource from surface water and separated from each other. There has been a shift in water resources management and regulation toward watershed-based approaches. This shift in water resources management and regulation toward watershed-based approaches are significant in many facets of water resources management and groundwater management. Management of ecosystem health and ecosystem health is enhanced collaboration across geographic jurisdictions and diverse stakeholders groups.

* **Water supplies dedicated to environmental purposes may change.** State and federal equipment that the amount of water available for end-user species and habitat management of water resources and equipment to provide increased instream flows could

Background Report

County of Ventura

~~for the use of water in agricultural and domestic~~

- **There is great diversity in the size, source, and organization of water suppliers in Ventura County.** Many areas are served by private wellhead surface water diversions. Other areas are served by municipal water companies, private water districts, and various water agencies. There are more than 162 water suppliers in the county.

- Land development Water supply and demand for land developments significantly affects demand and supply.** The type of land use and development projects creates demand and demand for water. The type and volume of water needed for development will require a different water treatment and distribution system. Water used by sewer systems is collected and can be treated and used as a secondary recycled water. A groundwater system may be able to provide an recycled water and a portion of water in groundwater systems.
- Impacts from Urban land development can impact water quality resources.** Land development can impact water quality; however, the implementation of best management practices and conservation practices can be employed to avoid and lessen potential urban impacts. Land development commonly increases impervious surfaces, which increases the amount of runoff volume and stormwater pollutants. As stormwater runoff over impervious surfaces has no porous way and infiltrates into non-accumulated sediment, nutrients and sediment. Stormwater is typically conveyed through ditches, channels, pipes, ditches, and to the ocean, which may impact development and impact flood plains, increases the risk of flooding, and decreases the ability to manage stormwater. Development in flood plains may impact groundwater recharge basins through runoff and may reduce groundwater recharge. Land development uses other point sources of pollution including discharges from sewerage treatment plants, individual septic tanks, community wastewater treatment systems, and industrial sites.
- Impacts from Agriculture land development can impact water quality resources.** Soil disturbance and subsequent erosion of fields changes the runoff and infiltration characteristics of the ground surface, which affects percolation to the surface and recharge of groundwater. This also increases erosion and resulting sediment deposition on the surface water bodies. Changes in infiltration affect the amount of groundwater surface water.
- Poor water quality limitations to beneficial uses of water.** Decreased water quality limits the ability of water bodies to support beneficial uses such as agricultural production, fisheries, and wildlife. Poor water quality also limits the use of the water for as a water supply and may increase the treatment costs.
- Development impacts to affect natural hydrologic processes.** Some development can alter topography and surface geology. Removal of natural vegetation and mammal structures such as dunes and dunes structures disrupts hydrologic processes such as sediment transport, deposition, groundwater recharge. These changes alter watershed watersheds and ecosystems and the ecosystem characteristics needed by fish and wildlife.

Commented [MJ2]: This paragraph is a summary of the individual types of development below.

SECTION 10.2 LEGAL AND REGULATORY FRAMEWORK FOR WATER MANAGEMENT

The framework for water management framework of the Ventura County is complex and reflects the network of laws, rules, and regulations governing California water. Many laws and many decisions influence water planning. (Table 10-1) Table 10-1 provides a legal and regulatory overview. A detailed list of laws, rules, and regulations which influence water planning is summarized on the following pages.

Formatted: Font: Bold

**TABLE 10-1
FRAMEWORK FOR WATER MANAGEMENT**

| Statute, Code, or Authority | Relationship to Water Management |
|-----------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| State of California Constitution, Article X, Section 2 | Requires that all entities in the State use water in a beneficial manner and prohibits unreasonable use and water waste. |
| State of California Riparian Water Rights | Allows owners of land on a stream to divert and use a portion of the flow. |
| State of California Appropriative Water Rights | The right to divert, store, and use water on any land, provided the use is reasonable and does not harm earlier appropriators. Appropriative rights are managed by the State Water Resources Control Board. |
| State of California Water Commission Act | Established a system of State-issued permits and licenses to appropriate water. |
| Federal Endangered Species Act | Designed to protect endangered and threatened species and promote species recovery. Requires that federal agencies consult with the US Fish and Wildlife Service and the National Marine Fisheries Service to ensure that federal actions do not jeopardize endangered or threatened species or their habitat. |
| National Environmental Policy Act | Requires federal agencies to conduct an environmental review for federal actions that may affect the environment; encourages implementation of mitigation measures to avoid impacts. |
| State of California Endangered Species Act | Designed to protect endangered and threatened species and promote species recovery. Requires that state and local agencies consult with the California Fish and Wildlife Service to ensure that their actions do not jeopardize endangered or threatened species or their habitat. |
| California Environmental Quality Act (CEQA) | Requires state and local governments to evaluate environmental effects and find ways to mitigate effects where feasible, prior to approving projects. |
| State of California Porter-Cologne Water Quality Control Act | This is a water quality control law and regulatory program to protect water quality and beneficial use of the State’s water. This act allows regulation of discharges to water. |
| Federal Clean Water Act | Requires permits for the discharge of pollutants to waters of the United States from any point source. See additional detail below. |
| Federal and State Safe Drinking Water Act | Under this law, federal and state agencies set and enforce standards for drinking water quality. |
| State of California Regional and Local Water Agency Formation enabling acts | Guides the formation of districts for controlling, conserving, managing, and distributing water. |
| State of California Urban Water Management Planning (UWMP) Act | Requires urban water suppliers to conduct regular comparisons of supplies and demands. (See additional detail below.) Within the UWMP, water suppliers must include, to the extent practicable, information on the water quality of existing sources and the manner in which water |

**TABLE 10-1
FRAMEWORK FOR WATER MANAGEMENT**

| Statute, Code, or Authority | Relationship to Water Management |
|-------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| | quality affects supply reliability. Based on the UWMP, water suppliers explore enhancing basic supplies from traditional sources such as the State Water Project (SWP) as well as other options. These include groundwater extraction, water exchanges and transfers, water conservation, recycling, brackish water desalination and water banking/conjunctive use. Each option will involve evaluations of how it would: (1) fit into the overall supply/demand framework; (2) impact the environment; and (3) affect customers. The objective of these more detailed evaluations would be to find the optimum mix of conservation and supply programs that ensure customers' needs are met. |
| State of California Agricultural Water Management Act | Senate Bill X7-7, the Water Conservation Act of 2009 (SB X7-7), requires agricultural water suppliers who provide water to more than 25,000 irrigated acres (excluding acreage irrigated by recycled water) to adopt and submit Agricultural Water Management Plans (AWMP) to DWR and to implement Efficient Water Management Practices, including the measurement and volumetric pricing of water deliveries. Within Ventura County, Casitas Municipal Water District, Camrosa Water District, and Ventura County Waterworks District No. 1 prepared AWMPs in 2015. |
| State of California Water Conservation in Landscaping Act | Requires specific water efficiencies for landscapes in new or redevelopment projects. |
| State of California Energy Commission Title 20 | Sets standards for toilets, urinals, faucets, and showerheads. The appliance standards dictate what can be sold in California and impact new construction and replacement fixtures in existing homes. |
| State of California CAL Green Building Code | Requires residential and non-residential water efficiency and conservation measures for new structures that will reduce the overall potable water use by 20 percent. Water savings can be achieved by installing plumbing fixtures and fittings that meet the 20 percent reduced flow rate specified in the CAL Green Code, or by other measures that meet the reduction standard. |
| State of California Sustainable Groundwater Management Act | Requires entities using water from groundwater basins designated as high or medium priority by the Department of Water Resources to assess the condition of groundwater basins and to develop a framework for long-term sustainability through demand management and groundwater recharge activities. (See additional discussion on the Sustainable Groundwater Management Act further in this Section below.) |
| <u>State of California Class II Underground Injection Control Program</u> | <u>Regulation of wells used to inject fluids associated with oil and natural gas production. The purpose of the regulation is to ensure fluids associated with oil and gas production are not introduced into drinking water sources. (See additional details below.)</u> |

**TABLE 10-1
FRAMEWORK FOR WATER MANAGEMENT**

| Statute, Code, or Authority | Relationship to Water Management |
|-------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| State of California Permitting of Water Systems | Regulates the formation of new public water systems by the State Water Resources Control Board. (See additional detail below.) |
| County of Ventura General Plan Goals, Policies and Programs | Complies with Section 65300 of the California Government Code which requires that, "Each planning agency shall prepare and the legislative body of each county and city shall adopt a comprehensive, long-term general plan for the physical development of the county or city, and of any land outside its boundaries which in the planning agency's judgment bears relation to its planning." |
| County of Ventura Subdivision Ordinance | Regulates and control subdivisions of land and in conjunction implements the County's General Plan. (See additional detail below.) |
| County of Ventura Coastal Zone Ordinance | Regulates all proposed development in the Coastal Zone of Ventura County. (See additional detail below.) |
| County of Ventura Non-Coastal Zone Ordinance | Regulates all proposed development in the Non-Coastal Zone of Ventura County. (See additional detail below.) |
| Ventura County Groundwater Conservation Ordinance | Regulates construction, maintenance, operation, use, repair, modification, and destruction of groundwater wells. (See additional detail below.) |
| County of Ventura Landscape Design Criteria | Requires approval of a landscape plan for new and modified developments. Limits the plant types and plant pallets so as to conserve water; and requires minimum irrigation efficiency. |
| State of California Propositions 50, 84, and 1 | Grant funding to encourage regional integrated planning of water resources. (See additional detail below.) |
| State of California Non-potable Water Reuse Systems-Chapter 15 of the California Plumbing Code (CPC) (as of 2017) | Allows for use of non-potable water (i.e., graywater), which includes wastewater from bathtubs, showers, bathroom washbasins, clothes washing machines and laundry tubs. Requires a plumbing permit from the County of Ventura Resource Management Agency, Building and Safety Division. |

Urban Water Management Plan Act (State)

State requires that every city or county with a population of 100,000 or more must develop and update every five years or when there are significant changes in its population. The Urban Water Management Plan (UWMP) is a planning document that guides the management of water supply, distribution, and use. The plan is intended to be updated by the local government. For example, the Legislature made the Plan a local government responsibility.

Commented [MJ3]: Renamed to California Geology Energy Management Division (GEM)

Background Report

County of Ventura

evaluation of certain UC wells December 2016.² Staff from the Water Board reviewed 657 UC wells determined by D-O-GGR C-DEM to be in violation of non-exempt rules. This evaluation included C-DEM UC wells in Ventura County UC wells were screened for proximity to water supply wells for any determination of risk of impact to drinking water and other beneficial uses.

Based on this screening, D-O-GGR C-DEM ordered the immediate shut of 23 UC wells one of which were in Ventura County. A shut well one which is capable of injection or production; but is not operating. A double Water Board issued 71 Information Orders to require additional information from operators of 256 UC wells no longer in Ventura County received an Order for UC wells which has been abandoned.

In addition to above UC regulations Public Resources Code Section 3106 requires D-O-GGR C-DEM while in the process to supervise the drilling, operation, maintenance, and abandonment of wells and the operation, maintenance, and removal or abandonment of tanks and facilities attendant to oil and gas production and designated pipelines, so as to prevent, as far as possible, damage to life, health, property, and natural resources; damage to underground oil and gas deposits from infiltrating water and other causes; loss of oil, gas, or reservoir energy, and damage to underground and surface waters suitable for irrigation or domestic purposes by the infiltration of, or the addition of, detrimental substances.

The Department of the California Code of Regulations Title 14 Division 2 Chapter 4 Development and Conservation of Oil and Gas Resources includes several provisions with the goal of injection projects (injection wells). D-O-GGR C-DEM is the responsible agency for approving all underground injection and disposal projects before any surface injection or disposal can begin. This includes EPA Class II wells and injection wells that are exempt from the requirements of the National Underground Injection Control Act (42 U.S.C. 17240-17242, 17482, 17483) and standards for the shallow injection wells (including abandoned wells) (Section 1723). This includes C-DEM D-O-GGR rule requirements as necessary to prevent damage to the health and natural resources (Section 1954).

Clean Water Act (Federal)

The Clean Water Act ~~is amended~~, requires permit for discharge of pollutants of the United States. The Clean Water Act and the Pollution Control Act are responsible for the SW RC-B-E-S-W-R-Resources Control and the Regional Water Quality Control Boards in the Ventura County Regional Board site Los Angeles Regional Water Quality Control Board. The Los Angeles Regional Water Quality Control Board is a Regional Board site Los Angeles Board. The Los Angeles Regional Water Quality Control Board 2014. The Board is reviewed and updated every three years and ~~but~~ can be amended at any time. The Los Angeles Regional Water Quality Control Board manages water quality based on "beneficial use" of water.

² The Staff evaluated "non-exempt" rules. The following federal statute must be met for a permit to be considered exempt cannot be achieved in any way so the rule to be a rule of drinking water injection must not impact or create a beneficial use of injection fields must maintain the proposed exempt area.

³ USEPA Region 9 and Southern Regions approved the D-O-GGR rule for exempt equipment of water in Ventura County.

1. **Municipal and Domestic Supply (MUN).**

Uses of water for community and individual users through public utility systems such as drinking water supply.

2. **Agricultural Supply (AGR).** Uses of water

for farming and ranching such as irrigation, stock watering and profit vegetation for range grazing.

3. **Industrial Process Supply (PROC).** Uses

of water for industrial processes such as pulp and paper mills.

4. **Industrial Service Supply (IND).** Uses of

water for industrial processes such as power generation, cooling, and other industrial processes such as food processing, chemical manufacturing, and other industrial processes.

5. **Ground Water Recharge (GWR).** Uses of

water for the recharge of groundwater resources for future extraction and use for municipal, industrial, and agricultural purposes.

6. **Freshwater Replenishment (FRSH).** Uses

of water for the replenishment of surface water resources such as rivers and streams.

7. **Navigation (NAV).** Uses of water for

shipping and navigation by private and commercial vessels.

8. **Hydropower Generation (POW).** Uses of

water for hydroelectric power generation.

9. **Water Contact Recreation (REC-1).** Uses

of water for recreational activities involving body contact with water where the degree of water exposure is not intended to be significant such as swimming, wading, fishing, and scuba diving.

such as water skiing and use of natural springs.

10. **Non-contact Water Recreation (REC-2).**

Uses of water for recreational activities involving proximity to water but not necessarily involving body contact with water where the degree of water exposure is not intended to be significant such as beachcombing, angling, fishing, and other recreational activities such as boating, water skiing, and other recreational activities.

11. **Marine Habitat (MAR).** Uses of water

to maintain ecosystemic diversity through protection and enhancement of marine habitats such as coral reefs, fish and wildlife, and marine mammals.

12. **Wildlife Habitat (WILD).** Uses of water

to protect ecosystemic diversity through protection and enhancement of freshwater, wetland, and riparian habitats, and other wildlife and riparian habitats.

13. **Commercial and Sport Fishing (COMM).**

Uses of water for commercial and recreational fishing and other commercial and recreational fishing activities.

14. **Aquaculture (AQUA).** Uses of water for

aquaculture and other aquaculture activities such as fish farming, shellfish farming, and other aquaculture activities.

15. **Warm Freshwater Habitat (WARM).**

Uses of water to maintain warm water ecosystemic diversity through protection and enhancement of aquatic

“Site Design Principles and Techniques; Source Control Measures; Retention Management Practices; BMPs; Best Management Practices; Treatment Control Measures; and new development and redevelopment projects.

Water from water treatment plants is regulated through water discharge permits (referred to as Water Discharge Requirements (WDRs)). Through permit process the RWQCB regulates the permittees; and specific content in discharges of C from coastal surface waters; and groundwater.

In 2011 the L.A. County RWQCB adopted a Conditional Water Discharge Requirement for Discharges from Landfills and Leachate from Landfills. The Conditional Water Discharge Requirement is a permit requirement for the owners of landfills and solid waste management facilities and their subsidiaries and agents. The permittees are required to implement BMPs to reduce the quantity of leachate and stormwater runoff for the purpose of minimizing discharges, which may include sediment, and other pollutants from each surface water. The Conditional Water Discharge Requirement is a discharge response of the Conditional Water Discharge Requirement of the Conditional Water Discharge Requirement (CWD) (which serves as a discharge response permit) and owners and growers who are part of the Conditional Water Discharge Requirement program on behalf of V.C.A.L.G. members.

By the San Water Resources Control Board (SWRCB) and RWQCB signed a permit agreement to operate and maintain these permits and the type of treatment and effluent requirements and ongoing water quality monitoring and regulation and manner of recycled water. The San Water Resources Control Board's 2009 Recycled Water Program amended in 2013 requires groundwater recharge recycled water facilities discharges in various ways, which change can be managed by State Nutrient Management Plans. The purpose of a State Nutrient Management Plan is to optimize recycled water use while ensuring protection of groundwater quality and beneficial uses and human health. State Nutrient Management Plans are submitted to the RWQCB, which can require the permittees to submit and the RWQCB requires recycled water and wastewater discharges to operate in a manner consistent with the permit management plan.

The Clean Water Act's national design mechanism called the Total Maximum Daily Load (TMDL) program. TMDL is specific to a pollutant (chemical or physical) and aspect of water body. A TMDL is a limit of "pollution budget" and is a calculation of the maximum amount of a pollutant that can occur in a water body and meet water quality standards so as to protect beneficial uses. The TMDL should be necessary to ensure one or more pollutants. TMDLs can force the implementation of BMPs to reduce pollution and the discharge of pollutants in water bodies. The following TMDLs are in place:

- Ventura River Watershed
 - Agriculture Control and Nutrients
 - Trash
- San Joaquin River Watershed
 - Bacteria
 - Chloride
- Colorado River Watershed

Background Report

County of Ventura

- Metal
- Salt
- Trash
- Toxic
- Toxic Hazardous Pesticides
- Nitrogen

Under section 30.31 of the Clean Water Act, states and tribes are to develop a water quality plan that is based on the best available science and technology. The 30.31(a) LSA is used to develop TMDLs and are used to identify the mechanisms to improve water quality. Several water quality criteria are outlined in section 30.31(a) LSA for CWA SW RC B (2016).

Permitting of Public Water Systems

The SWRCB (Sanitary Water Resources Control Board) Division of Drinking Water and DWS (Division of Drinking Water and Distribution) oversees the permitting of public water systems. On September 29, 2016, Governor Brown approved Senate Bill 1263 to prevent the formation of small public water systems. This bill requires a person submitting an application for a proposed new public water system to first submit a preliminary engineering report to the SWRCB. The bill also requires the applicant to conduct a feasibility study and a preliminary engineering report. The bill also requires the applicant to provide an adequate and reliable supply of domestic water service to the proposed new public water system. The SWRCB determines the feasibility of the service to the proposed public water system to be served by one or more existing public water systems and the feasibility of providing the proposed new public water system with a reliable source of drinking water. The bill also requires the applicant to provide a detailed description of the proposed public water system.

County of Ventura Role in Water Management

The County of Ventura has a role in water management. Through the General Public Works and Programs Subdivision and Zoning Ordinances and Building Code of the County of Ventura, conditions development ensure adequate water supply of water supply and protection of ground water and surface water quality. Through the Land and Scenic Design Code of Ventura County, requirements for water distribution projects use of existing water facilities and water efficiency in home equipment. Per the authority of the Flood Management Ordinance of the County of Ventura, prohibited uses and activities which may be dangerous to health and property due to modification or obstruction of flood water control of water course.

The County of Ventura also oversees projects managed by water resources, which include but are not limited to groundwater recharge, stormwater management, and wells and flood control. The County of Ventura is responsible for the operation and maintenance of several water resources. For example, the County of Ventura maintains a network of flood control and groundwater recharge and inspect groundwater wells and groundwater recharge.

County of Ventura General Plan Goals, Policies and Programs

The General Plan 2005 Goals and Programs (GP) include the following water resources and programs:

- ERD eN of A eaP dr;
- N chV em nA venue A eaP dr;
- O kP akA eaP dr;
- O gV dly A eaP dr;
- P n A eaP dr;
- S aroy A eaP dr;
- Thous nd O ks A eaP dr and
- L ke Sherwood H d den V dly A eaP dr.

County of Ventura Ordinances

Subdivision Ordinance

The County of Ventura Subdivision Ordinance and its amendments implement the "intent" of the Ordinance which is to provide for the adequate provision of water to all subdivisions in the County of Ventura.

Provisions to ensure adequate provision of water:

- Section 8.20.3 and Section 8.20.6A require a description of the method and plan for providing permanent on-site water supply to be provided by a public water system. In areas where ground waters have been determined to be inadequate, a permanent on-site water supply for each lot for a period of at least 60 years. A firm approved development not being served by a public water supply shall not be permitted until a binding agreement has been entered into between the owner of the lot and the water provider to the firm supply agreed upon by the owner and the water provider.

⁴ A water supply system as defined in § 8.20.3 of the Ventura County Subdivision Ordinance which requires the proposed water system of a subdivision to be a public water supply system is defined in § 15 of the Ventura County Water Management Act which still remains in effect.

Background Report

County of Ventura

The water supply system consists of the quaternary aquifers of the 22 of the Central Code of Regulations and the new development within the water supply area. The water system will comply with the 22 and the fact of the water supply system will be able to serve the proposed subdivision to exceed the equipment of the County of Ventura Improvement Standards and Specifications.

- Section 8 2047: Requirements never proposed subdivision and within boundaries of a public agency will not provide water service to the public water agency shall be chosen as the water provider for the proposed subdivision.
- Section 8 2058: Requirements for water supply and sewerage provisions (Public Commission hearing on subdivision when a site map and final map required)
- Section 8 2072: Provisions of a final map or a preliminary map as may be specified in the subdivision or the subdivision improvement agreement complete specific improvement and permanent water supply.

Provisions to protect surface and groundwater quality:

- Section 8 2032: Requirements for existing and proposed water wells defined on the map.
- Section 8 2033: Requirements for hydrology and hydraulic study by subdivision within the map and the following conditions before and after proposed development of the subdivision: drainage easement, water supply and storm water drainage and collection systems.
- Section 8 2033: Requirements for the proposed method and proposed sewerage disposal for each proposed lot.
- Section 8 2045: Design of a subdivision shall conform to the County of Ventura Flood Plain Management Ordinance and shall provide for the proper design of the improvement based on the information acquired from the development of the watershed in accordance with the General Plan for the technical drainage and sewerage design and construction in a manner to minimize potential damage to any concerns or increases of surface water resulting from the development of the subdivision must be conveyed by means of adequate facilities and shall not divert or seep into the area.
- Section 8 2072: Provisions of a final map or a preliminary map as may be specified in the subdivision or the subdivision improvement agreement complete specific improvement and permanent improvement for drainage and erosion control for the proposed subdivision regardless of technical drainage improvement necessary to prevent damage to other property, sewerage and permanent water supply systems shall be installed in each proposed subdivision and connections to be made from each subdivision to the bonded water well within the proposed subdivision shall be destroyed or be subject to a certificate of Exemption in compliance with the County of Ventura Code.
- Section 8 2095A: A condition of approval for any subdivision within the map for which the subdivision is not complete within 30 days of the date of any public hearing or sewerage

for a public utility sewerage the subdivision may be required to pay fees or...
consideration hereof for the purpose of defraying the direct and indirect cost of...

conservation in any manner that may be necessary to protect riparian resources from such flood damage and to prevent the loss of riparian resources and the destruction of riparian habitat.

- prevent the loss of riparian resources and the destruction of riparian habitat from such flood damage and the destruction of riparian habitat.

- obtain and maintain riparian flood and debris basins for the benefit of riparian resources.

- provide for the protection of riparian resources and the destruction of riparian habitat.

Under the Authority of the Watershed Protection District, the power is hereby granted to the District to

to acquire, purchase, lease, and otherwise obtain and enforce such corresponding regulations and conditions.

With the power hereby granted and conferred as a condition of development of land, the District

is authorized to acquire, purchase, lease, and otherwise obtain and enforce such corresponding

regulations and conditions for the protection of riparian resources and the destruction of riparian habitat.

County of Ventura Flood Plain Management Ordinance

This ordinance exists and is hereby adopted to protect riparian resources and the destruction of riparian habitat.

and to prevent the loss of riparian resources and the destruction of riparian habitat.

and to prevent the loss of riparian resources and the destruction of riparian habitat.

and to prevent the loss of riparian resources and the destruction of riparian habitat.

and to prevent the loss of riparian resources and the destruction of riparian habitat.

County of Ventura Building Code

Subject to the provisions of the Permitting and Inspection Code, the District is authorized to

to acquire, purchase, lease, and otherwise obtain and enforce such corresponding regulations and conditions.

and to prevent the loss of riparian resources and the destruction of riparian habitat.

and to prevent the loss of riparian resources and the destruction of riparian habitat.

and to prevent the loss of riparian resources and the destruction of riparian habitat.

and to prevent the loss of riparian resources and the destruction of riparian habitat.

and to prevent the loss of riparian resources and the destruction of riparian habitat.

County of Ventura Groundwater Conservation Ordinance

The purpose of this ordinance is to protect riparian resources and the destruction of riparian habitat.

and to prevent the loss of riparian resources and the destruction of riparian habitat.

and to prevent the loss of riparian resources and the destruction of riparian habitat.

and to prevent the loss of riparian resources and the destruction of riparian habitat.

and to prevent the loss of riparian resources and the destruction of riparian habitat.

and to prevent the loss of riparian resources and the destruction of riparian habitat.

and to prevent the loss of riparian resources and the destruction of riparian habitat.

SECTION 10.3 INTEGRATED REGIONAL WATER MANAGEMENT

At the passage of Proposition 50 in 2002, the Integrated Regional Water Management (IRWM) became a new approach to forming water resources while passage of Proposition 50 in 2002. The approach... water resources management... and recreation enhanced... The Watershed Council of Ventura County (W-CVC) was formed as the IRWM... and seek innovative solutions among...

The 2014 W-CVC IRWM Plan Godac outlined as follows:

- Reduce dependence on imported water and protect and augment water supplies
Protect and improve water quality
Protect property and the environment from adverse flooding impacts
Protect and restore habitat ecosystems in watersheds
Provide water and recreation to access and management and educational opportunities
Prepare for and adapt to climate change

Commented [MJ6]: We can save this since it was added in the RW M Plan and 2019 update.

Grants funded under Proposition 50 (2002), Proposition 8 (2006) and Proposition 1 (2014) have developed decisions for project implementation. The Working Group developed the concept for creating farm-to-consumer farm in the flood plain... To date, almost 500 acres of flood plain within the Santa Clara River Watershed have been acquired through the National Flood Protection Program.

SECTION 10.4 EXISTING CONDITIONS

Ventura County covers approximately 18,733 square miles, of which 8,600 square miles, over half, are forested. The Los Padres National Forest, the county's largest agency-managed forest, covers 4,350,000 acres. The county's average annual precipitation is 45 inches, with an average summer precipitation of 18 inches and an average winter precipitation of 27 inches. The county's average annual precipitation is 45 inches, with an average summer precipitation of 18 inches and an average winter precipitation of 27 inches. The county's average annual precipitation is 45 inches, with an average summer precipitation of 18 inches and an average winter precipitation of 27 inches.

www.cdpr.ca.gov

The Regional Council of Governments (RCOG) for the Ventura River Watershed is the Ventura River Watershed Council (VRWC). The VRWC is a non-profit organization that provides technical assistance to local governments in the watershed. The VRWC was established in 1990 and has since then provided a wide range of services to its members. The VRWC's primary focus is on water quality and quantity issues, but it also provides assistance in other areas such as land use planning and public participation. The VRWC's website is www.vrwc.org.

Ventura River Watershed

The Ventura River Watershed is located in the northwestern portion of Ventura County and drains approximately 228,000 acres (452,000 acres). The watershed extends 33 miles from the steep Transverse Ranges of the Santa Monica Mountains to the Pacific Ocean. The Ventura River Watershed is a major water source for the county and provides water for agriculture, industry, and municipal use. The Ventura River Watershed is a major water source for the county and provides water for agriculture, industry, and municipal use.

Periodically, the Ventura River Watershed experiences seasonal and annual variations in water availability. The watershed experiences a wide range of weather conditions, including drought, heavy rain, and snow. The watershed's water resources are managed by the Ventura River Watershed Council (VRWC) and the County of Ventura. The VRWC provides technical assistance to local governments in the watershed and manages the watershed's water resources.

The County of Ventura has designated the Ventura River Watershed as a municipal watershed. The County of Ventura has designated the Ventura River Watershed as a municipal watershed. The County of Ventura has designated the Ventura River Watershed as a municipal watershed.

- Federal National Forest 47.7%
- Undeveloped land 29%
- Agriculture 18.5%
- Urban uses 4.4% in the County of Ventura

Surface Water

The major surface water resource is the Matilija Reservoir, Lake Casitas, and Ventura River.

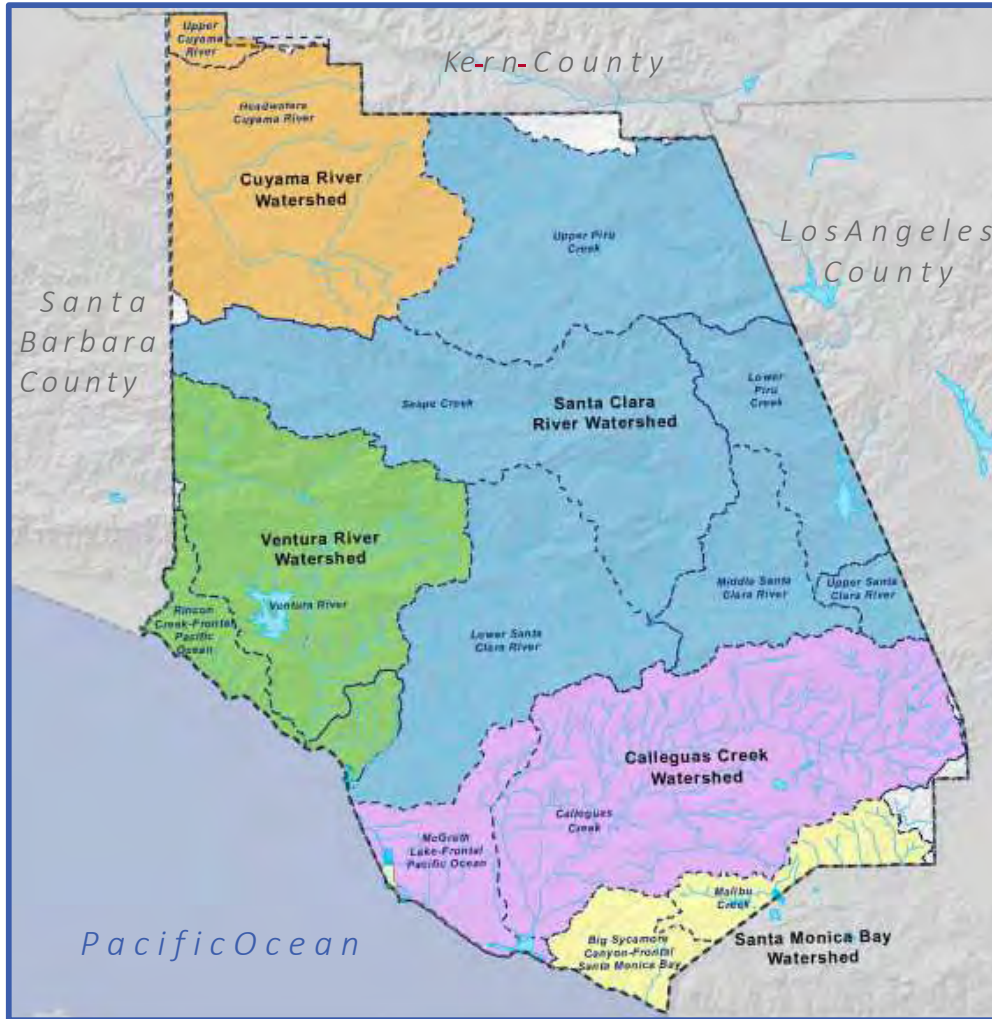

Matilija Reservoir Matilija Reservoir is the largest reservoir in the western United States. It was built in the 1940s for the purpose of providing water to the western United States. The reservoir provides water for 701,800 acres of agricultural land. The reservoir's storage capacity has been significantly reduced by sedimentation and snowmelt. It is estimated that only about 65,000 acre-feet of water are available for storage. The reservoir provides water for 701,800 acres of agricultural land. The reservoir's storage capacity has been significantly reduced by sedimentation and snowmelt. It is estimated that only about 65,000 acre-feet of water are available for storage. The reservoir provides water for 701,800 acres of agricultural land. The reservoir's storage capacity has been significantly reduced by sedimentation and snowmelt. It is estimated that only about 65,000 acre-feet of water are available for storage.

The fact is...

Lake Casitas Lake Casitas is a reservoir in the Ventura River watershed. It has a capacity of 250,000 acre-feet. The reservoir provides water for 701,800 acres of agricultural land. The reservoir's storage capacity has been significantly reduced by sedimentation and snowmelt. It is estimated that only about 65,000 acre-feet of water are available for storage. The reservoir provides water for 701,800 acres of agricultural land. The reservoir's storage capacity has been significantly reduced by sedimentation and snowmelt. It is estimated that only about 65,000 acre-feet of water are available for storage.

Ventura River The Ventura River is the largest river in the watershed. It flows from the mountains to the ocean. The river is a major source of water for the region.

- The segment above Roberts Division is the river's steep and narrow.
The segment below Roberts Division and above San Antonio Creek is the river's meandering and highly variable. The river's flow is highly variable and is affected by the flow of the San Antonio Creek. The river's flow is highly variable and is affected by the flow of the San Antonio Creek.

Background Report

County of Ventura

- San Antonio Creek only once at Foster Park in the irregular narrow San Antonio Creek entrenchment segment west of the point of the river can receive water from "down" groundwater where groundwater forced to the surface as a result of geologic conditions and down to an aquifer in the upper Ventura River basin. This is a typical flow year and except in the dry periods Ventura River Watershed Council (2015).
- Foster Park Ventura River Estuary is a shallowly flooded estuary from the Ojai Valley Sanitary District water treatment plant. The effluent is significant to river flow and local aquifer and several minor ditches. Many Canyon Creek and Saddle Mountain District do not include segment Ventura River Watershed Council (2015). The point of the river City of Ventura can divert surface water to surface channels and shallow wells. The well located at Foster Park is part of the Ojai Valley Sanitary District of discharge between 2010 and 2014 and produced by the City of Ventura from the Ventura River averaged 51 A.F.Y.
- The Ventura River Estuary is a shallow body of water where the Ventura River mixes with the daily seasonal and bay-pulse water from the estuary from the ocean when storms are able to send the flow of the river directly to the Pacific Ocean Ventura River Watershed Council (2015).

Groundwater

There are four major groundwater basins in the Ventura River Watershed: ~~the~~ Upper Ojai DWR Basin 4-001 Ojai Valley DWR Basin 4-002 Upper Ventura River DWR Basin 4-003 and Lower Ventura River DWR Basin 4-004 (see **Figure 10-2**). These are unconfined groundwater basins and fluctuate seasonally on seasonal conditions.

Formatted: Font: Bold

In 2014 DWR Mined Criteria groundwater basins are "high medium low" or "very low" and this is based on the following:

- Overlapping population
- Projected growth of overlapping population
- Population density
- Total number of wells
- Land use and agriculture
- Reliance on groundwater as the primary source of water
- Impact on the groundwater and the overall balance in the watershed
- Other information determined to be relevant by Department of Water Resources

~~Highly accessible~~ Ojai Valley ~~groundwater~~ and Upper Ventura River ~~groundwater~~ basins were deemed ~~high~~ medium ~~high~~ ~~respected~~ basins. ~~Dependency on groundwater in these basins is a primary factor for the groundwater in these basins as a primary factor in the~~

The Ojai Valley ~~Groundwater~~ Basin is currently managed by the Ojai Basin Groundwater Management Agency (OB-GMA) and the agency will be ~~GSA groundwater sustainability~~ under SGMA. The OB-GMA has submitted an Application to the GSP which demonstrates the OB-GMA is already being successfully managed as part of the GSP.

California Department of Water Resources and the County of Ventura are in the process of forming a new groundwater sustainability agency for the Upper Ventura River Groundwater Basin.

Important Recharge Areas

The Ventura River watershed groundwater basins are typically recharged by precipitation. Recharge occurs while permeable unconsolidated deposits of gravel and sand are in stream channels and lakes.

In order to increase groundwater storage and recharge in the Ogilby Groundwater Basin, the Santa Ana North Speaking Grounds Recharge Project was completed by the Ventura County Watershed Protection District in 2014 and the proposed 2017 project will increase recharge on the basin by an average of 126 A-FY.

Other Water Supplies

The Ventura River watershed is currently not a non-potable water source. The City of Ventura and the County of Ventura are currently providing 100% of the water supply for the City of Ventura. However, there are no means of imported water in the watershed. However, the City of Ventura is evaluating options for delivery of those watersheds as of the end of 2017.

Water Quality

As described in Section 10.2 of the Los Angeles River-Qualicum Basin, the Ventura River watershed is shown in Table 10-2 from the Basin Plan for Coastal Watersheds of Los Angeles and Ventura Counties and provides detailed information for specific Ventura River reaches. The Los Angeles River-Qualicum Basin has developed programs and the TMDLs to protect these beneficial uses. The following TMDLs are in place for portions of the Ventura River watershed:

- The European Community in the Ventura River in the Escondido and San Luis TMDLs effective June 28, 2013
- Ventura River Escondido TMDL effective March 2008

In addition to existing TMDLs, other TMDLs may be developed as severe Ventura River watershed areas are identified in California (303(d)) listed impaired watersheds in the future. Ventura River and its associated fishbars and pumping and dissolved soils, and many other factors on the Ventura River watershed from impairment due to bacteria. The Ventura River watershed is impaired with DDT and PCBs.

E, P, and I: shall be protected as required

* Asterisked MUN designations are designated under SB 88-63 and RB 89-03. Some destinations may be considered for exemption at a later date.

a: Waterbodies are listed multiple times if they cross hydrologic area or subarea boundaries. Beneficial use designations apply to all tributaries to the indicated waterbody, if not listed separately.

b: Waterbodies designated as WET may have wetlands habitat associated with only a portion of the waterbody. Any regulatory action would require a detailed analysis of the area.

c: Coastal waterbodies which are also listed in inland Surface Waters Tables (2-1) or in Wetlands Table (2-4).

e: One or more rare species utilizes all ocean, bays, estuaries, and coastal wetlands for foraging and/or nesting.

f: Aquatic organisms utilize all bays, estuaries, lagoons, and coastal wetlands, to a certain extent, for spawning and early development. This may include migration into areas which are heavily influenced by freshwater inputs.

g: Condor refuge.

Background Report

County of Ventura

Available Water Supplies

The sources of water in the Ventura River watershed include surface water from the Central Valley and groundwater. A valid surface water rights (from the Central Valley) are provided have been quantified by the California Municipal Water District 2014 as 98,364,200 cfs. The City of Ventura draws approximately 20% of its water supplied an average of 151 AFY from 2010 to 2014 from the Ventura River. Limited riparian owners may divert much as 11,000 AFY from the Ventura River to local economic development in the Ventura River surface water project to provide SW-RCB-eW-RM-S-d-ae).

Estimate groundwater supply is quite difficult. To understand the yield of a groundwater basin, change from precipitation minus evaporation from the ground surface and infiltration minus discharge and outflow and from adjacent groundwater basins must be assessed. This is not an accepted definition for yield of the groundwater basin in the Ventura River Watershed. However, the DWR Report of Water Resources has made rough estimates of groundwater yield by evaluating groundwater discharge by evaluating past groundwater extractions. The Ventura County Watershed Protection District has provided estimates of groundwater supply in various basins. Groundwater supply is a function of surface groundwater recharge and discharge and may not be representative of the groundwater yield. Table 10-3 provides an estimate of supply by groundwater basin in the Ventura River Watershed. The difference in the groundwater supply estimates documented in the groundwater supply.

Source: Ventura River Watershed Council 2015 Table 3.4.1.3.1

Private well and water services serve the irrigated and domestic water users in the watershed. Twenty different agencies are registered with the State Water Resources Control Board as having jurisdiction over surface water in the Ventura River watershed (SWRCB 2014 and Ventura River Watershed Council 2015). There are 442 active wells in the Ventura River watershed (Ventura River Watershed Council 2015). In addition, these private users extract approximately 2,000 AFH of water (Ventura River Watershed Council 2015).

Commented [MJ9]: A line .

Estimates of Water Demand

In 2014 the Ventura County Water Assessment Program Data and Evaluation of Countywide Water Demand. This effort used data from water agencies and groundwater pumping (where available). However, the geographic areas of Ventura County are served by water agencies but the private well surface water diversions and groundwater pumping are not included. Future agricultural groundwater extraction is reported but not metered in many areas and but the demand data was used to develop the Integrated Water Modeling (IWM) Demand Calculator developed by the Department of Water Resources. This proprietary model estimates water demands for crop and residential and commercial uses. The IWM calculator estimates urban water requirements and returns based on population and per capita water usage. The results for the County of Ventura 2013 Water Supply and Demand estimates and demands for each of the major watershed in the Ventura River Watershed Results are provided in **Table 10-7**.

Formatted: Font: Bold

| Watershed/Sub-watershed | Total Agricultural Demand (AF) | Total Municipal Demand (AF) | Total Demand (AF) |
|--------------------------------------|--------------------------------|-----------------------------|-------------------|
| Rincon | 5,727 | 1,848 | 7,575 |
| Ventura River | 11,745 | 13,351 | 25,096 |
| Subtotal (rounded to nearest 100 AF) | 17,500 | 15,200 | 32,700 |

Source: Hydrometrics 2015, Table 6.

Note: Table 10-7 shows the distribution of demand as agricultural demand is estimated to be slightly more than municipal demand.

Formatted: Font: Bold

Demand Management

Table 10-8 summarizes the various water conservation and demand management measures undertaken in the Ventura River Watershed. Table 10-8 summarizes demand management measures undertaken under normal conditions as well as less extensive efforts during drought and severe conservation conditions during drought. Most agencies continue to provide public information on how to conserve water however these efforts increase expenditure during droughts. During normal conditions water providers may provide public information on how to conserve water but during drought conditions they may provide more information on how to conserve water. The demand management measures undertaken during drought depend on the severity and length of drought. In the beginning of drought conditions may be limited to 3 days a week and during drought conditions may be limited to one day a week or even public display.

Water for Environmental Purposes

As water agencies plan for the future, the development of water supply systems that protect environmental resources and demonstrate the ability to meet the needs of the future is essential. Endangered Species Act on water resources.

The Roberts Division site is located in the Ventura River watershed. The California Department of Water Resources (DWR) is the lead agency for the development of the Ventura River watershed. The DWR is currently conducting a study to determine the water requirements for the Ventura River watershed. The study is currently in progress and is expected to be completed in 2018.

In 2008 the City of Ventura began conducting studies of Ventura River flow conditions in order to assess the potential for water supply. The study was conducted by the City of Ventura and the Ventura River Watershed Council. The study found that the Ventura River watershed is currently over-allocated and that there is a need to develop a water supply plan that takes into account the needs of the future. The study also found that there is a need to develop a water supply plan that takes into account the needs of the future.

Quality

The Ventura River watershed is a highly sensitive area. The watershed is currently over-allocated and there is a need to develop a water supply plan that takes into account the needs of the future. The study also found that there is a need to develop a water supply plan that takes into account the needs of the future.

Cuyama Watershed

The Cuyama Watershed is a highly sensitive area. The watershed is currently over-allocated and there is a need to develop a water supply plan that takes into account the needs of the future. The study also found that there is a need to develop a water supply plan that takes into account the needs of the future.

Oxnard Plain

The Oxnard Plain is an important area for water resources. The Oxnard Plain is a sub-division of the San Joaquin Hills and is a part of the Oxnard Plain. The Oxnard Plain is a sub-division of the San Joaquin Hills and is a part of the Oxnard Plain.

The Oxnard Plain is a sub-division of the San Joaquin Hills and is a part of the Oxnard Plain. The Oxnard Plain is a sub-division of the San Joaquin Hills and is a part of the Oxnard Plain. The Oxnard Plain is a sub-division of the San Joaquin Hills and is a part of the Oxnard Plain.

Santa Clara River Watershed

The Santa Clara River is a sub-division of the San Joaquin Hills and is a part of the Oxnard Plain. The Santa Clara River is a sub-division of the San Joaquin Hills and is a part of the Oxnard Plain. The Santa Clara River is a sub-division of the San Joaquin Hills and is a part of the Oxnard Plain.

Background Report

County of Ventura

The climate of the Santa Clara River watershed is characterized by drought periods and wet winters. In the coastal oceanic climate, moderate temperatures result in an average 74 inches of rain annually. The average annual precipitation in the Western Regional Climate Center Station 0492852 Ventura is 74 inches. Precipitation can exceed 110 inches in the summer and drop below freezing in the winter. The Western Regional Climate Center Station 047957 Santa Ana Peak receives precipitation in the form of winter storms and dry conditions. Approximately 75 percent of the annual precipitation occurs from December through March. The mean seasonal precipitation varies from about 40 inches in the mountains to about 18 inches in the Piru and the County of Ventura. The Western Regional Climate Center Station 046940 Piru (ESE) and Station 043050 (W-NW) and under 15 inches in the coastal Western Regional Climate Center Station 0492852 Ventura.

The climate of the Santa Ana and Ventura and Ventura watersheds is characterized by moderate temperatures and precipitation. The County of Ventura is a part of the Piru Basin and the Santa Ana and El Rio and the Ventura County watersheds are as follows:

- Agriculture 42%
- Open Space 27%
- Urban Uses 26%
- Other (includes open space reserve) 5%

Surface Water

The major surface water resource in the watershed is the Lake Piru Reservoir on the Santa Clara River.

Lake Piru Reservoir The construction of Santa Fe Dam on the Piru Creek in 1955 created the Lake Piru Reservoir. The purpose of the dam and the reservoir is to provide approximately 8,000 AFUW (C.D. 2016). The reservoir receives water runoff from the watershed and can receive imported SWP water from the Pyramid Lake. Water from Lake Piru is released into Piru Creek and flows to the Santa Clara River where it is joined by runoff from Sespe and Santa Ana Creeks. The releases are used for agricultural and municipal purposes and water made available for irrigation. The agricultural UW C.D. 2016 Lake Piru is operated by United Water Conservation District (UW C.D.) General UW C.D. schedules all conservation releases from Lake Piru. The releases are scheduled to exchange between Piru and the Santa Ana and the Santa Ana and the Santa Ana. The timing of the flows is directed by the Freeman Diversion for exchange in the Oxnard Forb and the Oxnard Forb.

D-Howe The dam and the dam on the Lake Piru will prevent the UW C.D. from performing conservation releases in some years. The dam is owned and operated by the Federal Energy Regulatory Commission (FERC). The FERC license to operate Santa Fe Dam has many requirements for the dam to be operated in a way that is consistent with the requirements of the dam. The FERC license requirements include the dam to be operated in a way that is consistent with the requirements of the dam. The dam is dependent on the dam.

Santa Clara River Due to the dam and the dam on the Santa Clara River can be described as a perennial stream, which is a perennial stream and is not intermittent. The releases are controlled by the dam and the dam. The dam is owned and operated by the Federal Energy Regulatory Commission (FERC). The dam is operated by the dam. The dam is dependent on the dam.

E: Existing beneficial use

P: Potential beneficial use

I: Intermittent beneficial use

E,P, and I: shall be protected as required

* Asterisked MUN designations are designated under SB 88-63 and RB 89-03. Some destinations may be considered for exemption at a later date.

a: Waterbodies are listed multiple times if they cross hydrologic area or subarea boundaries. Beneficial use designations apply to all tributaries to the indicated waterbody, if not listed separately.

b: Waterbodies designated as WET may have wetlands habitat associated with only a portion of the waterbody. Any regulatory action would require a detailed analysis of the area.

g: Condor refuge.

j: Out of service.

Water Resources

2040 General Plan

Available Supplies

Water resources include surface water, groundwater, and recycled water. A list of supplies is provided in Table 10-11.

Formatted: Font: Bold

Surface Water

UCD collects and treats surface water from the San Joaquin River and the Delta. The purpose of this water is to provide a reliable source of water for agricultural and municipal use. The average flow is approximately 28,369 acre-feet per year. The water is treated and then distributed to users. The water is also used for irrigation and industrial purposes.

The Delta and other sources provide water for agricultural and industrial use. The water is treated and then distributed to users. The water is also used for irrigation and industrial purposes.

Imported Water

Since 1991, UCD has received approximately 4.47 billion gallons of water per year. The water is imported from the State Water Project and the Central Valley Project. The water is treated and then distributed to users. The water is also used for irrigation and industrial purposes.

The imported water is used for agricultural and industrial purposes. The water is treated and then distributed to users. The water is also used for irrigation and industrial purposes.

The City of Oxnard receives imported water from the San Joaquin River and the Delta. The water is treated and then distributed to users. The water is also used for irrigation and industrial purposes.

Recycled Water

Ventura County Water District No. 6 (VCWWD) is also constructing a...
 upgrade for existing Piru Water Treatment Plant...
 LARQCBA Water Treatment Plant...
 meet the code of Regulations 22 equipment for new recycled

Water use is approximately 500 AF per year. A FY will be added for use as a new water source in the City of Oxnard (640 acres) of nearby agricultural property. This supply is added year 2020. The metered and effluent discharge is on a per acre basis.

The City of Oxnard completed recycled water in 2009 and discharges approximately 2000 AF per year. A FY of recycled water plants and school districts and for ground water per acre basis. H. ydromats 2015 (City of 2016)

The City of Santa Paula and its recycled water for ground water recharge. To avoid overcounting Santa Paula recycled water is not counted as ground water supply.

The City of Oxnard has been pursuing recycled water program for over 10 years. The City has constructed an Advanced Water Purification Facility (AWPF) as well as extensive transmission pipelines for recycled water system as of 2015. The AWPF has the capacity to produce 7000 AF per day. In 2015, the City is able to supply recycled water to a number of agricultural courses and residential common areas. The City has entered into an agreement with agricultural users in the Oxnard Plain to provide recycled water. The price to serve the Oxnard Plain is based on the current rate. Oxnard adjusts pricing between 7000 up to 14000 AF of recycled water to benefit users. ~~sign 2020 in the next 10 years~~

The City of Ventura has access to recycled water supply through the Ventura Water Reclamation Facility. The City of Ventura is the largest user of recycled water in the County. The City of Ventura is currently providing approximately 700 AF per day of recycled water for landscape irrigation by several residential City recycled water plants. In the next ten years, the City of Ventura anticipates increasing the amount of recycled water used in agricultural and residential applications. The City of Ventura is currently reviewing the use of recycled water. The City of Ventura is currently reviewing the use of recycled water. The City of Ventura is currently reviewing the use of recycled water. ~~at a price~~

| TABLE 10-11 CURRENT (2016) ESTIMATE OF SUPPLY SANTA CLARA RIVER WATERSHED | |
|---------------------------------------------------------------------------------|--------------------|
| Supply Source | Annual Volume (AF) |
| Surface Water, Santa Clara River ¹ | 0 |
| Imported Water, City of Oxnard from Calleguas ¹ | 12,000 |
| Recycled Water | 10,200 to 19,700 |
| Groundwater (see Table 10-10) | 136,400 to 171,000 |
| Low Estimate (rounded to nearest 100 AF) | 158,400 |
| High Estimate (rounded to nearest 100 AF) | 202,700 |

1. UWCD directly delivers approximately 12,000 AFY to agricultural users in the Calleguas Creek Watershed. This water is diverted in the Santa Clara Watershed but is a supply in the Calleguas Creek Watershed.

Water Suppliers

There are six major water suppliers serving more than 1000 persons in the Ventura County portion of the Santa Clara River Watershed as well as 74 smaller water systems and irrigation companies. Persons or businesses in the Watershed are also served by private wells and surface water diversions. The major water supplies are documented in Table 10-12 and are shown in Figure 10-4.

Section 10.4: Existing Conditions
10-46

Estimate of Demand

The data described in this section is based on the V C W P Demand on the Watershed Program Data and the results of the Countywide Demand Assessment conducted in the County of Ventura in 2013. The Watershed Demand Study 2015 Results of the Study for the Santa Clara Watershed are provided in Table 10.

Formatted: Font: Bold

| TABLE 10-13 ESTIMATED SANTA CLARA RIVER WATERSHED DEMAND | | | |
|-------------------------------------------------------------|--------------------------------|-----------------------------|-------------------|
| Watershed/Sub-watershed | Total Agricultural Demand (AF) | Total Municipal Demand (AF) | Total Demand (AF) |
| Hall Canyon/Arundel | 815 | 9,924 | 10,739 |
| Ormond Beach | 2,797 | 22,913 | 25,710 |
| Santa Clara River | 114,919 | 31,284 | 146,203 |
| Subtotal (Rounded to nearest 100 AF) | 118,500 | 64,100 | 182,600 |

Source: Hydrometrics 2015. Table 6.

Note: Table 10 shows the distribution of demands. Agricultural demand is the most significant, followed by municipal demand.

Demand Management

Table 10 summarizes the various water conservation efforts undertaken in the Santa Clara River Watershed. Table 10 summarizes demand management measures undertaken under normal conditions and less-extractive demand efforts during drought periods.

Formatted: Font: Bold

Comparison of Supply and Demand

Water availability is estimated to be 158,400 AF for 2027. The Santa Clara Watershed is estimated to have a peak demand of approximately 182,600 AF. The difference between supply and demand is approximately 24,200 AF. The difference between supply and demand is approximately 24,200 AF. The difference between supply and demand is approximately 24,200 AF.

Water-Related Challenges

Below are the water-related challenges for the Santa Clara River Watershed as of 2016:

**TABLE 10-14
DEMAND MANAGEMENT MEASURES IN SANTA CLARA RIVER WATERSHED**

| Agency | Conservation Measures in Effect at All Times | | | | | | | Conservation Measures that May Be Implemented in Drought | | | | |
|------------------------------------|----------------------------------------------|--------------------------|----------|----------------------|-----------------------------------------------|-----------------------------------------------|-------------------------|----------------------------------------------------------|--------------------------------------------|---------------------------------|-------|-------------------------------------|

Water Resources

2040 General Plan

10

Coastal Groundwater Overdraft

Groundwater overdraft in the Oxnard Plain dropped below sea level as the 1940s. Overdraft conditions now persist in the southern and eastern portions of the Plain and the annual overdraft is estimated to be 200,000 to 250,000 A FY U W C D 2017 by The estimated overdrafts for seawater intrusion and push the area of overdraft subsidence.

~~Oxnard~~
~~est~~

Sea Water Intrusion

The low water level in the Oxnard Plain for seawater intrusion in the center of the freshwater aquifers. The USGS and U W C D have documented the inland movement of seawater adjacent to the Hueneme and Mugu submarine canyons.

Water for Environmental Purposes

U W C D diverts San Cár River water to the Freeman Division to recharge groundwater basins and for direct delivery to agricultural uses. U W C D provides bypass flows to the Freeman Division for the upstream and downstream main of the Southern California State Canal July 2008 the National Marine Fisheries Service NMFS issued a Biological Opinion B O J that concluded that operations at the Freeman Division would jeopardize the continued existence of the Southern California R in the San Cár River U W C D is developing a mitigation plan and in consultation with NMFS. The result bypass flows are unknown but estimated to be the current bypass flow regime has decreased diversions and hence water supply by up to 22500 A FY through significant from year to year personnel communication. Robert Richardson United Water Conservation District

Quality

The Los Angeles RW QCB has identified the San Cár River downstream of Point Creek having water quality impairment and bacteria. The Los Angeles RW QCB has identified runoff from residential and commercial activities as the source of the bacterial load. The bacteria is found in sediments and is a potential source of groundwater contamination. The bacteria is a food web source and is a potential source of human water contamination. The bacteria is a potential source of contamination of the San Cár River by pathogens and is a potential source of contamination of the San Cár River by pathogens and is a potential source of contamination of the San Cár River by pathogens. Some waterborne pathogens are associated with enteric fever and bacterial meningitis. A bacterial load is a potential source of contamination of the San Cár River by pathogens and is a potential source of contamination of the San Cár River by pathogens. The bacteria is a potential source of contamination of the San Cár River by pathogens and is a potential source of contamination of the San Cár River by pathogens.

Calleguas Creek Watershed

The Calleguas Creek watershed is located in the southeastern portion of Ventura County and drains an area of approximately 343 square miles (21,920 acres). The San Susana and Ok Ridge Mountains form the northern boundary and the southern boundary is defined by the Santa Ines and Santa Maria Mountains. The watershed is bounded by the Santa Ines and Santa Maria Mountains. The watershed is bounded by the Santa Ines and Santa Maria Mountains. The watershed is bounded by the Santa Ines and Santa Maria Mountains.

Long-term monitoring by the Ventura County Water Agency shows that Calleguas Creek watershed cycles through wet and dry periods and does not have a common "normal" season.

Background Report

County of Ventura

Possible form of rainfall about 85 percent of the rainfall occurs from November to March during the peak of the monsoon. The 2004 National Oceanic and Atmospheric Administration (NOAA) - summer high average of 64°F and winter average of 53°F during the peak of the monsoon. The 2004 high temperatures can exceed 104°F in the summer and drop below freezing in the winter (Western Regional Climate Center Station 048904 Thousand Oaks 1 SW).

The watershed includes the cities of Oxnard (including the Port of Hueneme) and Moorpark in Ventura County, Thousand Oaks, and unincorporated areas of Ventura County according to the Watershed of Ventura County - 2014 and uses include watershed as follows:

~~CVC-related section~~

- Undeveloped land 50%
- Agriculture 25%
- Urban uses 25%

Surface Water

The major surface water features include the Lake Bard Arroyo, Simi Arroyo, Las Posas Creek, Conejo Creek, and Honda Barranca/Beardsley Wash/Revolon Slough system.

Lake Bard is an artificial reservoir constructed to store water from the Moorpark Water District of Southern California. This water is used to meet emergency demands of Lake Bard and is operated by the Los Angeles Municipal Water District (2016).

Arroyo Simi/Arroyo Las Posas/Calleguas Creek. This series of creeks drain from and urban runoff from the Simi Valley east to Las Posas Valley through the eastern portion of the Oxnard Plain and urban runoff from the Arroyo Simi. This discharge from the Simi Valley is collected by the City of Simi Valley and effluent from the Simi Valley Wastewater Treatment Plant. Under certain conditions the Ventura County Wastewater District #1 Moorpark Wastewater Treatment Plant and the Calleguas Wastewater Treatment Plant may discharge effluent to the Conejo Creek during the peak of the monsoon (2004).

~~and a well~~

Conejo Creek System. The Arroyo Santa Rosa, Arroyo Conejo, and Conejo Creek make up the drainage system. The Santa Rosa Valley portion of the Conejo Creek is in the City of Thousand Oaks and is collected by the system. This system carries runoff from the Honda Barranca/Beardsley Wash/Revolon Slough and the Santa Rosa Wastewater Treatment Plant.

The Honda Barranca/Beardsley Wash/Revolon Slough. The western portion of the Las Posas Valley portion of the Conejo Creek is drained by the Honda Barranca/Beardsley Wash/Revolon Slough. The major flow of water comes from agricultural runoff during the peak of the monsoon (2004).

Groundwater

There are multiple groundwater basins within the Conejo Creek Watershed. These include the Las Posas Valley Basin, Moorpark Basin, and the Las Posas Valley Basin.

E: Existing beneficial use
P: Potential beneficial use
I: Intermittent beneficial use
E,P, and I: shall be protected as required
* Asterisked MUN designations are designated under SB 88-63 and RB 89-03. Some destinations may be considered for exemption at a later date.

a: Waterbodies are listed multiple times if they cross hydrologic area or subarea boundaries. Beneficial use designations apply to all tributaries to the indicated waterbody, if not listed separately.
b: Waterbodies designated as WET may have wetlands habitat associated with only a portion of the waterbody. Any regulatory action would require a detailed analysis of the area.
c: Coastal waterbodies which are also listed in inland Surface Waters Tables (2-1) or in Wetlands Table (2-4).
d: Limited public access precludes full utilization.
e: One or more rare species utilizes all ocean, bays, estuaries, and coastal wetlands for foraging and/or nesting.
f: Aquatic organisms utilize all bays, estuaries, lagoons, and coastal wetlands, to a certain extent, for spawning and early development. This may include migration into areas which are heavily influenced by freshwater inputs.
o: Marine habitats of the Channel Islands and Mugu Lagoon serve as pinniped haul-out areas for one or more species (i.e. sea lions).
p: Habitat of the Clapper Rail.

Source: Table 2-1. Basin Plan for Coastal Watersheds of Los Angeles and Ventura Counties (electronic copy accessed December 27, 2016).

Groundwater

The estimated groundwater supply for the Calleguas Creek Watershed Area is based on the SGM Assessment which is based on the 1016 per centile of the groundwater based on available difference in the groundwater supply. The estimated groundwater supply and consensus on groundwater supply is approximately 300 AFY of groundwater in the City of Thousand Oaks region developed from the Conejo Groundwater Basin.

Surface Water

The Conejo Creek system owned and operated by Caltrans and does not provide surface water to the watershed from the creek system. The average flow is 7920 AFY. The SGM Assessment estimated that surface water uses may divert up to as much as 300 AFY from the watershed (WRCB EWRMS Database).

2. Supplies from Calleguas are anticipated imported water supplies less 12,000 AF expected to go to Oxnard in the Santa Clara Watershed (CMWD 2016, Oxnard 2016). Supplies from UWCD are on average 9,417 AF to the Calleguas Creek Area from the Santa Clara Watershed (FCGMA 2016).
3. Camrosa 2016; Camarillo 2016, VCWWD8 2016, and VCWWD1 2016.

Suppliers

The area is served by 52 small water systems and 52 large water suppliers. The watershed is also served by private well and surface water diversions. The major water suppliers are documented in Table 10-18 and the unincorporated County. These are mapped in Figure 10-5.

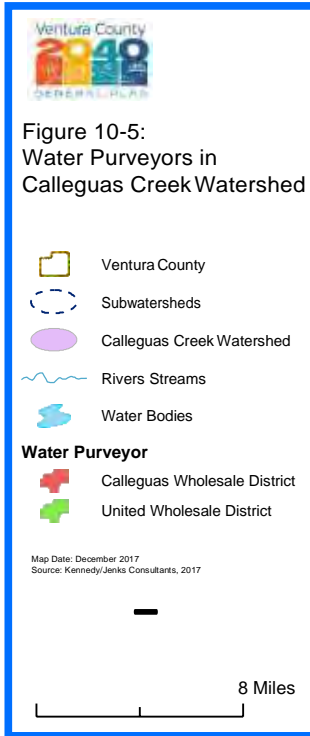

Figure 10-5:
Water Purveyors in
Calleguas Creek Watershed

Background Report

County of Ventura

Estimate of Demand

As described previously in 2014, the V C W P D C County of Ventura Water Planning Department undertook an estimate of Countywide water demand documented in the County of Ventura 2013 Water Supply and Demand Study 2015. Results of the study for the Calleguas Creek Watershed are provided in [Table 10-19](#).

Formatted: Font: Bold

| Watershed/Sub-watershed | Total Agricultural Demand (AF) | Total Municipal Demand (AF) | Total Demand (AF) |
|--------------------------------------|--------------------------------|-----------------------------|-------------------|
| Calleguas Creek | 112,701 | 89,335 | 202,036 |
| Malibu Creek | 1,083 | 19,291 | 20,374 |
| South Coast | 86 | 2,035 | 2,121 |
| Subtotal (rounded to nearest 100 AF) | 113,900 | 110,700 | 224,600 |

Source: Hydrometrics 2015. Table 6.

Comparison of Supply and Demand

Estimated supply for the Calleguas Creek Watershed ranges from 196,000 to 227,000 AF in any given year. This supply of course varies given drought and operational conditions. Estimated demand is approximately 224,600 AF. The downward estimate of supply is considered a conservative estimate. The upward estimate is considered a conservative estimate.

Water-Related Challenges

Below are the water-related challenges for the Calleguas Creek Watershed as of 2016.

Long-Term Groundwater Overdraft and Increased Salinity

The Pleasant Valley Basin is experiencing overdraft of the U C D 2017 D and groundwater levels and over-pumping in the southern portion of the basin has led to upwelling of brines from high chloride zones U C D 2017 b in the northern Pleasant Valley Basin seabed recharge which is water that has caused increased salinity in the Arroyo L as P oas.

Localize Pumping Depressions

While the West L as P oas Basin groundwater levels have dropped by 325 feet between 1950 and the early 1990s L P U G 2012. The increasing concern regarding groundwater supply and increased production and even more dry wells (L P U G 2012) D-hal-dial-pressed groundwater may indicate areas of poor quality groundwater from surrounding areas.

Heavy Dependence on Imported Water by Urban Users

Imported water makes up 20 percent of Ventura County's water supply. Approximately 75 percent of the County's population receives water imported by Calleguas. Drought conditions and environmental demands on the SW P system could increase reliance on this water supply. Calleguas

Municipal Water and the Pleasant Valley Basin water supply system are in need of more steps to ensure the system's long-term sustainability. Construction of additional water storage reservoirs and the construction of additional surface water intake ponds and water basins as well as

existing water needed during and during special emergency and during multiple
in conditions which otherwise.

SECTION 10.5 TRENDS AND FUTURE CONDITIONS

As documented above, the following are the Venti C or n y a and i
is necessary to develop different plans for Venti C or n y Trends going forward include:

- Increased use of backflow prevention Venti C or n y has abundant sources of ground water

and all its found coral reefs and seagrass communities in its waters and dune system waters.

- Increased efficiency of water use and reduced effort are being developed and implemented to provide incentives for water users and utilities to conserve water and reduce dependence on groundwater.
- Changes in the operation of surface waters to protect endangered species waters are being implemented and managed in a way that will be less water intensive and urban uses because more flow will need to be defined in ways to protect them.

SECTION 10.6 KEY TERMS

The following terms used in this report are defined as follows:

303(d) List. References section 303(d) of the Clean Water Act where by a state and lies are developed of water bodies that are not designated and not meeting water quality standards. The 303(d) List is used to develop Total Maximum Daily Loads and other water quality mechanisms to improve water quality.

Acre-feet (AF). The amount of water necessary to cover an acre (43,560 square feet) to a depth of one foot. 43,560 cubic feet is equivalent to 32.828 gallons.

Adjudication. The legal process of determining the rights of water users in proceedings and is overseen by a court appointed water master.

Aquifer. A subsurface geological formation that is permeable to conduct groundwater and capable of yielding substantial quantities of water available for use.

Beneficial Uses. The various purposes for which water or aquatic ecosystems may be used. Examples include municipal domestic water supply, agriculture, preservation and protection of areas of special significance, recreation, fish and wildlife, commercial and sporting, estuarine habitat, shoreline protection, groundwater recharge, and other public health and safety. The preservation of rare and endangered species, critical habitat, and other values.

Best Management Practice (BMP). Any practice, technology, process, or other method or measure designed to prevent or reduce pollution.

Conjunctive Use. The use of surface water and groundwater in a way that will not deplete either source from the basin in the long term.

Critical Overdraft. A defined state of groundwater management that is subject to be overdrawn when continuation of present water management practices would probably result in significant adverse environmental or economic impacts.

Coastal Zone. The portion of the land and waters of Ventura County as shown on the "Coastal Zone" maps adopted by the California Coastal Commission.

Groundwater Basin. A n aquifer system of aquifers that is reasonably well defined boundaries and more or less defined areas of recharge and discharge. Refers to subsurface deposits and geology formations that are capable of yielding substantial quantities of water to wells. The Sustainable Groundwater Management Act defines "basin" as ground water basin, defined and defined in Department of Water Resources Bulletin 118 or as modified pursuant to Section 107.22 of the Act.

Integrated Regional Water Management. A comprehensive and collaborative approach for managing water to concurrently achieve social, environmental, and economic objectives. This integrated approach includes the review of investments by considering the spreading multiple benefits and working across jurisdictional boundaries to appropriate geographic areas. Examples of multiple benefits include improved water quality, habitat management, and enhanced ecosystems, and more resilient watersheds. Department of Water Resources 2014 California Water Plan Update (2013).

Mutual Water Company. A private corporation organized for the purposes of delivering water to stockholders and members.

Permanent domestic water supply. A supply of water to be provided by a system or systems approved by a public agency of the State of California. The Environmental Health Division of the Ventura County Resource Management Agency and the Ventura County Public Works Agency in aquifers that are not subject to seasonal and continuous withdrawal equipment of the consumer and maximum demand conditions.

Retail Water Supplier. A water agency provides water to individual customers and end users such as homes and businesses.

Safe Yield. Commonly defined as the maximum quantity of water that can be continuously withdrawn from a reservoir or ground water without causing adverse effects.

State Water Project. The SWP is the state's largest water project in the country was authorized by the California State Legislature in 1959 while construction of most facilities completed by 1973. Today the SWP includes 28 dams and reservoirs, 26 pumping and generating plants and approximately 660 miles of aqueducts. The primary water source for the SWP is the Feather River tributary of the Sacramento River. Storage is provided from Oroville Dam on the Feather River. Downstream, water is pumped to the Sacramento and San Joaquin River Delta. In some SWP supply systems, water is pumped from the northern Delta to the North Bay Aqueduct. The vast majority of SWP supply is pumped from the southern Delta to the 444-mile California Aqueduct. The California Aqueduct conveys water along the west side of the San Joaquin Valley. Edmonson Pumping Plant where water is pumped over the Tehachan Mountains to Southern California.

Stormwater Pollution Control Plan. A plan defining pollution sources from a construction site and describing proposed design and implementation of Best Management Practices to effectively prevent stormwater discharges and reduce pollution from stormwater discharges to the storm drain system to the maximum extent practicable during construction activities.

Stormwater Pollution Prevention Plan. A plan required by a State General Permit for Stormwater Discharges defining pollution sources and describing design and implementation of Best Management Practices to effectively prevent stormwater discharges and reduce pollution from stormwater discharges during activities covered by the General Permit.

Background Report

County of Ventura

Stormwater Quality Master Plan A plan that defines the goals and describes the design, implementation and implementation of Best Management Practices to effectively prevent stormwater discharges and reduce pollution stormwater discharges to the maximum extent practicable for protection of the stormwater discharge to the storm drain system.

Total Maximum Daily Load. A regulatory pollution load based on a calculation of the maximum amount of pollution that can occur in a water body and the water quality standards so as to protect beneficial uses. The TMDL should be necessary to reduce one or more pollutants. TMDLs can force the implementation of B M P strategies for improvement and the reduction of pollution.

Watershed. A geographic region which has a watershed is a natural drainage area or order water body. A watershed is also referred to as a catchment area.

Wholesale Water Supplier A water agency provides water to other agencies in the region. It provides water to the end users for residential use.

APPENDIX 10.A: SGMA/CALIFORNIA GOVERNMENT CODE

65350.5. REVIEW AND CONSIDERATION OF GROUNDWATER REQUIREMENTS

Before the adoption of any submittal of a groundwater general plan, the planning agency shall view and consider the following:

- a) A final plan for a groundwater sustainability or groundwater management plan pursuant to P a 27. 4 (commencing with Section 107 20) or P a 27. 5 (commencing with Section 107 50) of Division 6 of the Water Code or groundwater management or related general plan.
- b) A final plan of water.
- c) A non-errand plan by the State Water Resources Control Board pursuant to Chapter 1 (commencing with Section 107 35) of P a 27. 4 of Division 6 of the Water Code.

65352. REFERRAL OF PROPOSED GENERAL PLAN UPDATES TO OTHER AGENCIES

Before a local body takes any action or proposes a general plan, the planning agency shall refer the proposed action to the following entities:

- 1) A local agency or other entity that is covered by the proposed action and may be significantly affected by the proposed action determined by the planning agency.
- 2) A local agency or other entity that is covered by the proposed action.
- 3) The local agency or other commission.
- 4) A local agency whose operations may be significantly affected by the proposed action determined by the planning agency.
- 5) A federal agency whose operations or interests may be significantly affected by the proposed action determined by the planning agency.
- 6) A) The branches of the United States Armed Forces have provided the Office of Planning and Research with a Confidential Address pursuant to subdivision (j) of Section 6594 of the proposed action with 1000 feet of any other points which specify a use or other use in the vicinity defined in Section 21098 of the Public Resources Code and the United States Department of Defense provides electronic maps of the vicinity in which the proposed action is located and in an electronic format acceptable to the Office of Planning and Research.
 B) Within 30 days of determination by the Office of Planning and Research of the information provided by the Department of Defense is submitted in an acceptable and format to the office shall disclose its and contents of the action of the information on the Internet disclose its and contents shall comply with paragraph A) within 30 days of receiving notice from the office.
- 7) A) A public water system as defined in Section 11627 5 of the Health and Safety Code within 1000 feet or service connection to a water consumer which is covered by the proposed public water system shall have at least 45 days to comment on the proposed plan, in accordance with subdivision (j) and (k) provide the planning agency with the information set forth in Section 65352.

Background Report

County of Ventura

8) Any groundwater sustainability plan adopted by a groundwater sustainability agency shall be subject to the same management provisions of a groundwater sustainability plan as the plan for the proposed general plan.

9) The State Water Resources Control Board shall adopt a minimum groundwater protection standard commencing with Section 10735 of Part 4 of Division 6 of the Water Code that is consistent with the plan for the proposed general plan.

10) The Bay Area Aquifer Management District for proposed action within the boundaries of the district.

11) A California National Merit award shall be considered by the National Merit High School Commission and shall be considered while the project is under review.

12) The Central Valley Flood Protection Board for proposed action within the boundaries of the Sacramento-San Joaquin Delta Settlement Section 8501 of the Water Code.

b) A notice of proposed general plan amendment or general plan update shall be published 45 days from the date the agency makes its comments unless otherwise specified by the agency.

c) (1) This section does not affect the validity of the general plan.

(2) To the extent the equipment of this section conflicts with the equipment of Chapter 4 commencing with Section 65919, the equipment of Chapter 4 shall prevail.

65352.5. REQUIREMENT TO PROVIDE WATER-RELATED DOCUMENTS TO GENERAL PLAN AGENCY

a) The Legislature finds and declares that there be close coordination and consultation between California water planning agencies and California local agencies to ensure that water planning and management projects occur so as to accommodate project water resource needs and demands on water planning and resource management.

b) It is the intent of the Legislature to provide a standardized process for determining the adequacy of existing and planned future water projects to meet existing and planned future demands on these water projects and the impact of such decisions on the management of California water projects resources.

c) Upon receiving a request under Section 65352, notification of a project proposed action and a project shall be provided to the water system as defined in Section 11627.5 of the Health and Safety Code within 90 calendar days of the date the project is received by the agency with the following information as appropriate and relevant:

(1) The current status of water management plan adopted pursuant to Part 4 commencing with Section 10610 of Division 6 of the Water Code.

(2) The current status of any improvement program or other project pursuant to Section 31147.3 of the Water Code.

- 3) A description of the source resources of the watershed project and the water supply by water for consumption account and a concern regarding normal and dry non-flood years.
- 4) A description of the quantity of surface water that was provided by the watershed in the previous five years.
- 5) A description of the quantity of groundwater that was provided by the watershed in the previous five years.
- 6) A description of proposed additional sources of water for the watershed including the estimated dates by which these additional sources should be added and the quantity of additional water that is being proposed.
- 7) A description of the number of customers currently served by the watershed and by the following categories and by the amount of water served to each category:
 - A) Agricultural uses.
 - B) Commercial uses.
 - C) Industrial uses.
 - D) Residential uses.
- 8) Quantity of the expected future demand estimated by each customer category within paragraph 7 associated with future implementation of watershed water management measures estimated in the watershed plan water management.
- 9) A narrative description of the advanced planning and adequacy of existing planned future watershed projects to meet existing and planned future demands on the watershed.

d) Upon receiving a suit and Section 65352 notice of action or a court proposed action of a court suit and general agency of groundwater sustainability defined in Section 107.21 of the Water Code or an emergency suit and a court order under Section 107.35 shall provide the planning agency with the following information as appropriate and relevant:

- 1) The current version of the groundwater sustainability plan or the approved plan pursuant to Part 4.4 commencing with Section 107.20) of Division 6 of the Water Code.
- 2) The groundwater sustainability manager's groundwater sustainability account for the jurisdictional area or agreement among affected water rights holders of the State Water Resources Control Board has approved and submitted pursuant to Chapter 11 commencing with Section 107.35) of Part 4.4 of Division 6 of the Water Code of the groundwater sustainability plan shall provide the planning agency with maps of recharge basins and perched ponds, existing and the relevant information on the court jurisdictional area. See the Groundwater Management Act and related provisions (Chapter 6A of the Effective January 12, 2016 [revised 2016]).
- 3) A report on the anticipated effect of proposed action of a court suit and general agency on the implementation of groundwater sustainability pursuant to Part 4.4 commencing with Section 107.20) of Division 6 of the Water Code.

Ventura County Board of Supervisors
Attn: RMA Planning Division
General Plan Update
800 Victoria Avenue L#1740
Ventura, California 93009-1740

Dear Board of Supervisors and Staff:

We are writing this letter to urge the Board of Supervisors to reconsider moving forward with the Draft General Plan EIR. The draft EIR has been accelerated to the point that too many issues and impacts have not been properly addressed or studied. These impacts and the corresponding mitigation measures will have severe impacts to land owners and especially those, like us in the agricultural industry and other productive economic segments.

Our family has been involved in the agricultural industry for more than 100 years in Ventura County. We have owned numerous land holdings that remain in the family to this date. We have farmed throughout Ventura County and hope to continue to do so in the future.

The Draft EIR is deficient on many levels. CEQA requires that all mitigation measures must be technically and economically feasible. Numerous proposed mitigation measures are neither. We have in the past attempted to identify land and any owners that would be open to sell their development rights for land that was converting from agricultural to commercial use. Not only did we not find anyone that would do so, no one would even quote a price. The only positive response from numerous land owners were that you can buy my property for full market value and then you can do what you want. There is not a project that can be built by adding double land cost to the equation. This was very recently experienced based on proposed policies at LAFCo. These policies were eventually not enacted due to the inability to purchase development rights in an economical feasible manner. This was when LAFCo was contemplating an acre for acre ag preserve. The new policy that is proposed in the 2040 General Plan is requiring 2 acres for every 1 acre of land converted from ag to any other use. This will eliminate the ability to add any new required ag buildings or even farm worker housing. The Draft EIR must study these impacts, since they are not feasible.

The Draft EIR also deals with water in a manner that is not properly studied. There is no analysis on increased water costs and diminishing availability of water. Without reasonable water costs and supply, there is no agricultural industry.

The General Plan indicates that agriculture is a high priority in the County. However, new policies and requirements in the General Plan add additional mitigation measures that will make ag virtually impossible. These include new setbacks, limiting types of fumigants pesticides and fertilizers. The General Plan also requires the conversion of all farm equipment to be all electric. Again, not feasible. The costs to purchase new pumps, farm equipment and other existing fuel using equipment will increase operational costs to a point that the County crops will not be competitive in the open market. These new mitigation measures are not sufficiently studied and again are not economically feasible.

The Draft EIR is extremely difficult to read and understand. The background reports are lacking in depth of what has been studied other than numerous general statements and very poor mapping. Detailed studies must be added to sufficiently identify impacts and the related mitigation measures for both direct and indirect impacts on the agricultural industry. It is our understanding that reports and studies need to be timely prepared. However numerous studies are older than 5 years. Not timely.

After numerous devastating wildfires over the last few years, which significantly impacted ag, the General Plan continues to lay out limiting mitigation measures for fire prevention. The Wildlife corridor eliminates any ag operation or fire prevention in the proposed corridor areas. This is also a major concern not studied in the Draft EIR.

The Draft EIR for the 2040 General plan does not provide adequate analysis for the expansion of permanent bike paths and pedestrian walking trails throughout the County. These impacts are very severe due to constant conflicts from trail users and ag operations. Spraying, dust, odors from ag operations, along with impacts created by the trail users. These are usually theft, vandalism, litter and pet waste. The proposed mitigation measures require additional setbacks from these trails which renders additional land unusable for ag operations.

In addition to the above comments on the agricultural aspects and related land use concerns of the DEIR, the undersigned is also a mineral owner directly interested in the impacts on oil and gas production of the DEIR and related General Plan 2040 proposed provisions. In these documents there is a total failure to address the economic impacts of the various policies proposed in violation of the requirements for this process, including but not limited to the loss of royalty income to a large group of County residents. I join in the detailed comments on the various deficiencies and concerns identified in the DEIR as described in the concurrent submissions on behalf of Aera Energy and other operators delivered this week to the County.

Please look at the long-term consequences of these General Plan policies and mitigation measures. We formally request additional studies and a revised Draft EIR that will properly look at these and many more issues. The DEIR must be corrected with details of the revisions. Then it can be recirculated.

Sincerely,

Michael Diacos

After numerous devastating wildfires over the last few years, which significantly impacted ag, the General Plan continues to lay out limiting mitigation measures for fire prevention. The Wildlife corridor eliminates any ag operation or fire prevention in the proposed corridor areas. This is also a major concern not studied in the Draft EIR.

The Draft EIR for the 2040 General plan does not provide adequate analysis for the expansion of permanent bike paths and pedestrian walking trails throughout the County. These impacts are very severe due to constant conflicts from trail users and ag operations. Spraying, dust, odors from ag operations, along with impacts created by the trail users. These are usually theft, vandalism, litter and pet waste. The proposed mitigation measures require additional setbacks from these trails which renders additional land unusable for ag operations.

In addition to the above comments on the agricultural aspects and related land use concerns of the DEIR, the undersigned is also a mineral owner directly interested in the impacts on oil and gas production of the DEIR and related General Plan 2040 proposed provisions. In these documents there is a total failure to address the economic impacts of the various policies proposed in violation of the requirements for this process, including but not limited to the loss of royalty income to a large group of County residents. I join in the detailed comments on the various deficiencies and concerns identified in the DEIR as described in the concurrent submissions on behalf of Aera Energy and other operators delivered this week to the County.

Please look at the long-term consequences of these General Plan policies and mitigation measures. We formally request additional studies and a revised Draft EIR that will properly look at these and many more issues. The DEIR must be corrected with details of the revisions. Then it can be recirculated.

Sincerely,

Timothy Shaw McGrath

Re: 2040 General Plan Environmental Impact Report (EIR)

Dear Mr. Hedrick and Honorable Members of APAC:

Thank you for the opportunity to provide comments following today's presentation by Ventura County Planning staff on the 2040 General Plan EIR.

There are several issues with the 2040 General Plan EIR that CoLAB believes will negatively impact the viability of local agriculture.

Proposed mitigation measure AG-2: The County proposes that any project that either directly or indirectly results in the loss of farmland must obtain and place into perpetual agricultural preservation twice the total of the farmland loss. This mitigation measure is infeasible. Contrary to statements made by County Planning staff today at the APAC meeting, the California Environmental Quality Act (CEQA) requires that all mitigation proposed in an EIR be feasible. CEQA Section 21061.1 defines feasible as “capable of being accomplished in a successful manner within a reasonable period of time, ” (*emphasis added*). All mitigation measures proposed in an EIR must be shown to reduce impacts

and an infeasible mitigation measure, by definition, cannot and will not reduce impacts.

The EIR does not provide evidence of any of the following:

1. 1) Whether there is sufficient land available for purchase/conservation easement for each farmland category;
2. 2) The cost per acre to purchase each category of farmland;
3. 3) The anticipated cost of establishing a conservation easement for each category of farmland;
4. 4) The anticipated cost associated with managing each category of farmland under a conservation easement;
5. 5) The anticipated cost associated with monitoring these mitigation parcels scattered throughout the County and who will bear that cost;
6. 6) Any information that could constitute a “plan” for management of farmland in conservation easements;

February 19, 2020

Ventura County Coalition of Labor, Agriculture and Business / 1672 Donlon Street, Ventura, CA 93003 / 805-633-2260 / info@colabvc.org

Page 2 of 4

7. 7) An analysis of direct and indirect impacts caused by this mitigation measure (including impacts associated with LU compatibility conflicts and increased urban-ag-interface);
8. 8) Whether the smallest possible mitigation acreage required will achieve the minimum to ensure viability of agriculture on the parcel; and
9. 9) Whether the proposed mitigation is in conflict with other ordinances and regulations, such as the County’s Zoning Ordinance and the County’s minimum lot sizes.

The County is already aware that this proposed mitigation measure is infeasible. On March 24, 2016, at a Local Agency Formation Commission (LAFCo) hearing, Supervisor Linda Parks attempted to establish an “Agricultural Mitigation Measure” through the LAFCo project approval process. The mitigation measure would have required the 1-to-1 purchase of local farmland (half of what is proposed in the 2040 General Plan EIR) to replace farmland that would be

impacted by any proposed development. Ventura County Counsel, Michael Walker, informed both LAFCo and Supervisor Parks that the proposed mitigation measure did not meet the standard for economic feasibility, and, for that and other reasons, LAFCo could not adopt Supervisor Park's proposed mitigation measure. He referenced a 2015 legal decision, *City of Irvine v. County of Orange*, in which the Court stated, "the sheer astronomical expense of land supports the finding of the EIR that the purchase of an agricultural conservation easement is a non-starter."

In addition to being infeasible, CoLAB does not believe that this mitigation measure will reduce impacts on agricultural land, as it does not address the actual issues that will impact farmland under the 2040 General Plan: lack of economic sustainability, the increasing regulatory demands on agriculture, increased competition for water resources, and increased compatibility conflicts from development.

Indirect Impacts

The EIR dismisses "indirect impacts" that will occur as a result of implementing the 2040 General Plan as "less than significant."

Page 4.2-13 of the EIR states "AG-2.3 maintains the Right-to-Farm Ordinance to protect agricultural land uses from conflicts with non-agricultural uses, as well as to help land purchasers and residents understand the potential for nuisance, (e.g., dust, noise, odors) that may occur as the natural result of living in or near agricultural areas...These sections of the code protect farmers engaged in agricultural activity from public nuisance claims...This protects the farming community, including Important Farmlands and farms less than 10 acres, from developments that would inhibit their ability to continue agricultural production."

Page 4.2-17 of the EIR states: "Residential growth in areas nearby agricultural lands has the potential to result in land use conflicts. Residential land uses are generally more sensitive and prone to conflict with adjacent agricultural land uses than commercial or industrial land uses. The placement of sensitive land uses, such as residences and schools, nearby classified farmland can negatively impact both uses due to conflict including odor nuisances and noise from agriculture machinery. The countywide Right-to-Farm Ordinance protects existing agricultural and farming operations from conflicts attributed to residential development...**Therefore, the potential for conflicts would be minimal. This impact would be less than significant**" (*emphasis added*).

This is simply not true. Historic and recent County actions have shown that the County has and will continue to create new restrictions and ordinances that have a significant impact on existing agricultural

[Ventura County Coalition of Labor, Agriculture and Business / 1672 Donlon Street, Ventura, CA 93003 / 805-633-2260 / \[info@colabvc.org\]\(mailto:info@colabvc.org\)](http://www.colabvc.org)

Page 3 of 4

and farming operations because of conflicts attributed to residential development. The recent interim

urgency ordinance restricting hemp cultivation is one such example.

Contrary to statements made today by Ventura County Planning staff, an EIR, whether it is labeled as "programmatic" or "project", must analyze all reasonably foreseeable consequences of the action that is proposed. For the 2040 General Plan EIR, the action proposed is the implementation of all policies and programs within. Therefore, if the implementation of a policy in the 2040 General Plan will result in an impact, that impact must be analyzed. For example, the 2040 General Plan contains land use designation changes that will increase allowable housing density near agricultural land. It is reasonably foreseeable that more houses will create more compatibility conflicts with normal farming operations. The impact of these compatibility conflicts must be addressed in the EIR.

In 2014, the California Court of Appeal stated in a ruling that "[T]he fact that this EIR is labeled a 'project' rather than a 'program' EIR matters little....Designating an EIR as a program EIR ... does not by itself decrease the level of analysis

otherwise required in the EIR. All EIRs must cover the same general content. The level of specificity of an EIR is determined by the nature of the project and the “rule of reason,” rather than any semantic label accorded to the EIR.”

It is CoLAB’s opinion that indirect impacts from increasing urban-ag interface are SIGNIFICANT and cannot be dismissed in the EIR.

Direct and indirect impacts of increased costs

The 2040 General Plan has policies that will increase the costs of normal farming operations. CoLAB believes that the most effective way to minimize conversion of agricultural land to non-agricultural uses is to take active measures to allow farming to remain profitable. And even the County admits that reducing the cost of farming reduces conversion of agricultural land in their discussion of the Williamson Act in Chapter 4.2 of the EIR.

But the County fails to analyze direct and indirect impacts of 2040 General Plan policies that will increase the cost of normal farming operations, such as:

- Policy AG-5.2: Electric- or Renewable-Powered Agricultural Equipment. The County shall encourage and support the transition to electric- or renewable-powered or lower emission agricultural equipment in place of fossil fuel-powered equipment when feasible.
- Policy AG-5.3: Electric- or Renewable-Powered Irrigation Pumps. The County shall encourage farmers to convert fossil fuel-powered irrigation pumps to systems powered by electric or renewable energy sources, such as solar power, and encourage electric utilities to eliminate or reduce standby charges.

Direct and indirect impacts of increased competition for water resources

The County fails to evaluate the impact of increased competition for water resources caused by development allowed in the 2040 General Plan on either the conversion of agricultural land or the loss of agricultural lands through the loss of topsoil.

The EIR states on page 4.2-3 that “...a reduction in available water resources for irrigation” is an example of indirect impacts on agricultural land due to loss of topsoil from increased wind and water erosion. But the County fails to analyze or propose mitigation measures to address this significant impact.

Ventura County Coalition of Labor, Agriculture and Business / 1672 Donlon Street, Ventura, CA 93003 / 805-633-2260 / info@colabvc.org

Page 4 of 4

APAC is the expert charged with advising County decision-makers on agricultural issues in Ventura County. And the County should be seeking guidance from APAC about the actual issues that will impact farmland under the 2040 General Plan: lack of economic sustainability, the increasing regulatory demands on agriculture, increased competition for water resources, and increased compatibility conflicts from development.

CoLAB encourages APAC to provide guidance to the County on appropriate and effective mitigation measures to prevent the conversion of agricultural land to non-agricultural uses. These may include:

1. 1) Strengthen the Right-to-Farm ordinance to prevent nuisance complaints from being used to justify the creation or expansion of setbacks or regulatory restrictions on normal farming practices;
2. 2) Expand the Land Conservation Act Program to include Open Space zoned properties that are engaged in farming (including grazing); and

3. 3) Protect agricultural land from urban-ag interface encroachment and compatibility conflicts by establishing setbacks on NON-AE-zoned land that will restrict the construction of bike paths, public trails, and sensitive receptors within 2000' of any land zoned A/E.

Thank you again for the opportunity to provide comments on this issue. We appreciate your consideration and leadership at this time.

Sincerely,

Louise Lampara Executive Director

Ventura County Board of Supervisors
Attn: RMA Planning Division
General Plan Update
800 Victoria Avenue L#1740
Ventura, California 93009-1740

Dear Board of Supervisors and Staff:

We are writing this letter to urge the Board of Supervisors to reconsider moving forward with the Draft General Plan EIR. The draft EIR has been accelerated to the point that too many issues and impacts have not been properly addressed or studied. These impacts and the corresponding mitigation measures will have severe impacts to land owners and especially those, like us in the agricultural industry and other productive economic segments.

Our family has been involved in the agricultural industry for more than 100 years in Ventura County. We have owned numerous land holdings that remain in the family to this date. We have farmed throughout Ventura County and hope to continue to do so in the future.

The Draft EIR is deficient on many levels. CEQA requires that all mitigation measures must be technically and economically feasible. Numerous proposed mitigation measures are neither. We have in the past attempted to identify land and any owners that would be open to sell their development rights for land that was converting from agricultural to commercial use. Not only did we not find anyone that would do so, no one would even quote a price. The only positive response from numerous land owners were that you can buy my property for full market value and then you can do what you want. There is not a project that can be built by adding double land cost to the equation. This was very recently experienced based on proposed policies at LAFCo. These policies were eventually not enacted due to the inability to purchase development rights in an economical feasible manner. This was when LAFCo was contemplating an acre for acre ag preserve. The new policy that is proposed in the 2040 General Plan is requiring 2 acres for every 1 acre of land converted from ag to any other use. This will eliminate the ability to add any new required ag buildings or even farm worker housing. The Draft EIR must study these impacts, since they are not feasible.

The Draft EIR also deals with water in a manner that is not properly studied. There is no analysis on increased water costs and diminishing availability of water. Without reasonable water costs and supply, there is no agricultural industry.

The General Plan indicates that agriculture is a high priority in the County. However, new policies and requirements in the General Plan add additional mitigation measures that will make ag virtually impossible. These include new setbacks, limiting types of fumigants pesticides and fertilizers. The General Plan also requires the conversion of all farm equipment to be all electric. Again, not feasible. The costs to purchase new pumps, farm equipment and other existing fuel using equipment will increase operational costs to a point that the County crops will not be competitive in the open market. These new mitigation measures are not sufficiently studied and again are not economically feasible.

The Draft EIR is extremely difficult to read and understand. The background reports are lacking in depth of what has been studied other than numerous general statements and very poor mapping. Detailed studies must be added to sufficiently identify impacts and the related mitigation measures for both direct and indirect impacts on the agricultural industry. It is our understanding that reports and studies need to be timely prepared. However numerous studies are older than 5 years. Not timely.

After numerous devastating wildfires over the last few years, which significantly impacted ag, the General Plan continues to lay out limiting mitigation measures for fire prevention. The Wildlife corridor eliminates any ag operation or fire prevention in the proposed corridor areas. This is also a major concern not studied in the Draft EIR.

The Draft EIR for the 2040 General plan does not provide adequate analysis for the expansion of permanent bike paths and pedestrian walking trails throughout the County. These impacts are very severe due to constant conflicts from trail users and ag operations. Spraying, dust, odors from ag operations, along with impacts created by the trail users. These are usually theft, vandalism, litter and pet waste. The proposed mitigation measures require additional setbacks from these trails which renders additional land unusable for ag operations.

In addition to the above comments on the agricultural aspects and related land use concerns of the DEIR, the undersigned is also a mineral owner directly interested in the impacts on oil and gas production of the DEIR and related General Plan 2040 proposed provisions. In these documents there is a total failure to address the economic impacts of the various policies proposed in violation of the requirements for this process, including but not limited to the loss of royalty income to a large group of County residents. Subject: NBVC Comments on DEIR Ventura County 2040 General Plan

Dear Clay,

Thank you for the opportunity to review and comment on the Public Draft Environmental Impact Report (PDEIR) for the Ventura County 2040 General Plan. Please see attached letter and enclosure from Naval Base Ventura County (NBVC) submitted on 7/30/2019 to the County of Ventura.

The Ventura County 2040 General Plan PDEIR presents an important opportunity to evaluate Naval Base Ventura County (NBVC) military influence areas and incorporating the Joint Land Use (JLUS) Study Recommendations (Sep 2015) and Recommendations from the NBVC-Point Mugu Air Installations Compatible Use Zone (AICUZ) Study (Dec. 2016). Thank you for incorporating the military-compatibility areas (MCAs) and military operational airspace and restricted use airspace areas for policies and land use evaluations for the short- and long-range planning goals of Ventura County. While Naval Base Ventura County does not wish to enter any new comments into the record, we kindly request the County to carefully consider CMAs and reinforce the comments previously submitted by NBVC in July 2019. We also encourage strategic references to the JLUS (Sep. 2015) and 2016 NBVC-Point Mugu AICUZ Study throughout the General Plan Update, which provides more current data on adverse effects from aircraft noise than the ALUCUP, which is currently referenced in the Plan.

Again, thank you for the opportunity to review and comment on the Public Draft EIR for Ventura County 2040 General Plan.

Mr. Steve Bennett
Chair, Board of Supervisors
County of Ventura
800 S. Victoria Ave.
Ventura, CA 93009

Dear Chairman Bennett,

Subj: NAVAL BASE VENTURA COUNTY COMMENTS ON THE COUNTY OF
VENTURA 2040 GENERAL PLAN PRELIMINARY PUBLIC REVIEW DRAFT

The County of Ventura 2040 General Plan presents an important opportunity to implement the strategies of the Naval Base Ventura County (NBVC) Joint Land Use Study (JLUS) and recommendations of the Air Installations Compatible Use Zone (AICUZ) Study, to incorporate key military-community compatibility components, such as noise contours, accident potential zones, military training routes, and special use airspace.

Since the 1940s, the U.S. Navy has had an important presence in Ventura County. Today, Naval Base Ventura County has an annual economic impact within Ventura County of more than \$2 billion and supports more than 20,000 direct, indirect, and induced jobs. Ventura County residents hold over 18,000 of those jobs.

We are pleased to see that the General Plan Preliminary Public Review Draft incorporates many JLUS and AICUZ strategies, particularly in Chapter 2-Land Use, Chapter 4-Circulation, Transportation, and Mobility, and Chapter 7-Hazards and Safety. For example, Goal LU-21 seeks to ensure that County plans and policies are consistent with state laws concerning military compatibility and the recommendations contained in the Naval Base Ventura County Joint Land Use Study as they relate to land use and communications. Corresponding policies include participation in a JLUS Coordination Committee, using the JLUS to guide land use and resource management decisions and plan updates, establishing Military Compatibility Areas, enhancing communications, and coordinating with NBVC on infrastructure expansions, stormwater infrastructure improvements, and capital improvements.

In particular, Policy LU-21.1 states that the County shall participate in the NBVC JLUS Coordination Committee responsible for coordination among JLUS partners and implementation of JLUS recommendations to enhance long-term coordination on military compatibility issues. Given the County's leadership and facilitation roles across jurisdictions and stakeholders, we suggest that the County consider taking a leadership role to convene and facilitate the Coordination Committee.

Naval Base Ventura County appreciates the many goals, policies, and programs related to military-community compatibility included throughout the General Plan Preliminary Public

Subj: NAVAL BASE VENTURA COUNTY COMMENTS ON THE COUNTY OF
VENTURA 2040 GENERAL PLAN PRELIMINARY PUBLIC REVIEW DRAFT

Review Draft. As the County finalizes the Draft General Plan for environmental review and adoption, please consider the comments and suggested edits provided in Enclosure 1.

Thank you for your efforts to incorporate and foster military-community compatibility within the Draft General Plan, and thank you for the continued strong partnership between the County of Ventura and Naval Base Ventura County.

For additional information and coordination, please contact Ms. Amanda Fagan, Community Planning Liaison Officer at COMM: (805) 989-9752 or by email: amanda.fagan@navy.mil.

Sincerely,

J.E. CHISM
Captain, U.S. Navy
Commanding Officer

Encl (1): Comments Regarding Selected Military Compatibility Policies and References to Naval Base Ventura County, Ventura County 2040 General Plan Preliminary Public Review Draft – May 2019

**County of Ventura 2040 General Plan
Preliminary Public Review Draft - May 2019**

**Selected Military Compatibility Policies and References to Naval Base Ventura County
Assembled by Amanda Fagan, NBVC CPLO**

Page 1-4

Guiding Principles:

Economic Vitality

Foster economic and job growth that is responsive to the evolving needs and opportunities of the County's economy and preserves land use compatibility with Naval Base Ventura County and the Port of Hueneme, while enhancing our quality of life and promoting environmental sustainability.

Commented [FALCNSM1]: Concur

Page 1-11

Inter-governmental Coordination (IGC)

The County must coordinate with numerous local, regional, state, and federal agencies to implement the General Plan. These agencies provide services, facilities, or funding and administer regulations that directly or indirectly affect many issues addressed in the General Plan. The following is a partial list of public agencies that may play a role in implementing the General Plan:

- Local agencies such as cities, special districts, and school districts;
- Regional agencies such as Ventura Local Agency Formation Commission, Ventura County Air Pollution Control District, Ventura Council of Governments, and Ventura County Transportation Commission;
- State agencies such as Caltrans, General Services, California State University, California Environmental Protection Agency, California Coastal Commission, and Native American Heritage Commission; and
- Federal agencies such as U.S. Coast Guard, Naval Base Ventura County (NBVC), U.S. Fish and Wildlife Service, U.S. Army Corps of Engineers, and Federal Emergency Management Agency.

Commented [FALCNSM2]: Concur

Page 2-56

2.8 Military Compatibility

Ventura County is home to several significant military installations and operations areas. These facilities are not only critical to the nation's defense, but also provide significant economic benefits and land use challenges. Naval Base Ventura County (NBVC) consists of three operating facilities – Point Mugu, Port Hueneme, and San Nicolas Island – that encompass a diverse set of specialties, including three warfare centers (Naval Air Warfare Center – Weapons Division, Naval Surface Water Center – Port Hueneme Division, and Naval Facilities Engineering and Expeditionary Warfare Center). NBVC is also home to deployable units, including the Pacific Seabees and the West Coast E-2-G Hawkeyes. Adjacent to Naval Base Ventura County, Point Mugu is the 204-acre Channel Islands Air National Guard Base Station is located adjacent to Naval Base Ventura County Point Mugu. Additionally, the Instrument Route-200 (IR-200) missile corridor military training route passes through Ventura County connecting the Point Mugu Sea Range and the Naval Air Weapons Station (NAWS) China Lake. Compatibility between military installations, adjacent land uses, and local communities is essential to protect military missions, the health of local economies and industries, and the quality of life for county residents. In order to achieve compatibility, the military and local

Commented [FALCNSM3]: Concur, with minor edits suggested

Commented [FALCNSM4]: The Hawkeye community is currently in the process of converting its fleet of E-2C to the E-2D. The document will be more timeless without a model designator (C or D).

improvement projects on Victoria Avenue. (MPSP, IGC) (Source: New Policy, NBVC JLUS Strategy LU-5B)

Page 2-61

Program H: Develop Memorandum of Understanding, JLUS Coordination Committee Guidance Document

The County should collaborate through the Naval Base Ventura County (NBVC) and Joint Land Use Study (JLUS) Coordination Committee to facilitate the development of a formal Memorandum of Understanding (MOU) guidance document that delineates the roles and responsibilities for each partner agency in the JLUS Study Area, including the County, NBVC, and incorporated cities. This document should ~~Each agency representative should acknowledge this document, which should~~ contain information such as:

- Point of contact and contact information for each agency,
- Role in addressing compatibility issues with the base,
- Responsibility in addressing compatibility issues,
- Community and military response times, and
- Triggers for coordination and communication, e.g., infrastructure planning, water resources planning, economic development.

[Source: New Program, NBVC JLUS Strategy COM-1B]

Commented [FALCNSM13]: An MOU may not be the right vehicle to meet the intent of this Program and associated Policy. There will likely be changes necessary to the document, such as POCs changing or newly devised triggers for coordination. As such, a more flexible instrument may work better, such as a "guidance" document developed by the Coordination Committee and acknowledged by each agency representative.

Page 2-63

Program I: Develop a JLUS Resource Management Reference Guide

The County shall cooperate with Naval Base Ventura County (NBVC) Joint Land Use Study (JLUS) partners in the development of a reference guide providing information about the various agencies in the JLUS Study Area with their respective responsibilities. It shall be tailored to existing JLUS issues and contain:

- Map(s) identifying the important resources in the area, and
- County and JLUS partner contact information for the agency representative that will help in cases of community-military compatibility.

[Source: New Program, NBVC JLUS Strategy COM-1D]

Commented [FALCNSM14]: Concur

Page 2-63

Program J: Update Plans and Amend Regulations with AICUZ Recommended Land Uses

The County should amend the Zoning Ordinance and/or Initial Study Assessment Guidelines, if necessary to incorporate the Air Installations Compatible Use Zones (AICUZ) recommended land use limitations and standards in the safety and noise zones. (MPSP)

[Source: New Policy, NBVC JLUS Strategy LU-8A]

Commented [FALCNSM15]: Concur

Program K: Amend Zoning Ordinance

The County should amend the Zoning Ordinances, if necessary, to comply with the Federal Aviation Administration (FAA) vertical obstruction guidelines, more specifically with the Navy's Airfield Imaginary Surfaces of the airfields located in the area. These surfaces are more restrictive and provide for greater safety of the public, pilots, and aircraft. The Navy's Airfield Imaginary Surfaces include slopes and heights that are allowable from various distances from the airfield.

[Source: New Program, NBVC JLUS Strategy LU-3B, LSA-5A, LG-1D, and VO-2A]

Commented [FALCNSM16]: Concur

Program L: Military Compatibility Areas (MCA)

The County shall update the Non-Coastal Zoning Ordinance and the Coastal Zoning Ordinance, if necessary, to delineate and establish the Military Compatibility Areas and Subzones illustrated

Commented [FALCNSM17]: Concur, with suggested edits

Page 4-23

Goal CTM-5: To ensure that air transportation systems provide safe, efficient, and reliable movements of people and goods. [Source: New Goal]

Commented [FALCNSM24]: Concur

Page 4-23

CTM-5.3 Private Airstrips and Agricultural Landing Fields

The County shall require private airstrips and agricultural landing fields to be sited to minimize conflicts with the flight paths of existing airports and other areas that would present significant hazards or nuisances.

Commented [FALCNSM25]: Concur. While military compatibility is not directly cited in this policy, it has benefit to military compatibility and NBVC.

Page 4-23

CTM-5.5 Airport Land Use Compatibility

Discretionary development that would endanger the efficient, safe operation of an airport or would result in significant land use incompatibility impact with an airport shall be prohibited. (RDR, SO)

[Source: Existing GPP Policy 4.2.2.10, modified]

Commented [FALCNSM26]: Concur. While military compatibility is not directly cited in this policy, it has benefit to military compatibility and NBVC.

Page 5-3

PFS-1.5 Infrastructure Expansion Coordination with Naval Base Ventura County

The County shall coordinate with Naval Base Ventura County (NBVC) when planning for infrastructure expansions, improvements, and maintenance that may impact any NBVC facility or operation. (IGC)

[Source: New Policy, NBVC JLUS Strategy IE-1A, IE-2A]

Commented [FALCNSM27]: Concur

Page 6-2 – 6-6

Section 6.1 Biological Resources

Section 6.2 Coastal Resources

Page 7-12

HAZ-2.4 Low Impact Development Upstream of Military Installations

The County shall encourage discretionary development upstream of military installations to incorporate low impact designs that reduce the risk of flooding downstream.

(RDR) [Source: New Policy, NBVC JLUS Strategy BIO-1A, modified]

Commented [FALCNSM28]: The goals and policies included in Sections 6.1 Biological Resources and 6.2 Coastal Resources do not directly address military compatibility. However, these goals and policies have a benefit to military compatibility by protecting special status species and habitat outside of Naval Base Ventura County, which reduces pressure on land, habitat, and species within the Naval Base and reduces impacts to military mission.

Page 7-18

Section 7.6 Transportation Related Hazards

Hazards associated with movement of goods and people or conveyance of hazardous materials have been grouped together and are addressed below. These include incidents related to aviation, vehicles, and railroad operations.

Although airplane crashes can occur anywhere, crashes that affect life and property on the ground occur most frequently in airport approach and departure zones. Residences, schools, and other buildings occupied by people that are located in such zones are subject to an ever-present risk from airplane accidents. Hazard zones have been identified for the four airports within the county: 1) Ventura County Airport at Oxnard; 2) Ventura County Airport at Camarillo; 3) Santa Paula Airport; and 4) Naval Base Ventura County, Point Mugu.

Commented [FALCNSM29]: Concur

Page 7-19

HAZ-6: To minimize the loss of life, injury, damage to structures, and economic and social dislocations resulting from hazards created by proximity to airports, railroads and truck routes.

Commented [FALCNSM30]: Concur

HAZ-8.3 Military Compatibility and Renewable Energy Development

The County shall require that new larger-scale commercial renewable energy development is consistent with Joint Land Use Study (JLUS) policies and regulations and that Naval Base Ventura County (NBVC) and the Department of Defense (DOD) Siting Clearinghouse are included in the development review process. (MPSP)

[Source: New Policy, NBVC JLUS Strategy ED-1A, ED-1C, modified]

Commented [FALCNSM39]: Concur

HAZ-8.4 Frequency Spectrum Encroachment Review

For discretionary development within 10 miles of Naval Base Ventura County (NBVC), Point Mugu that includes transmission facilities operating near military spectrum, the County shall submit project applications to NBVC for review and comment to determine appropriate coordination and review. (SO, IGC)

[Source: New Policy, NBVC JLUS Strategy FRQ-2C, FRQ-2B, modified]

Commented [FALCNSM40]: Concur

HAZ-8.5 Light and Glare Control

The County shall coordinate and consult with Naval Base Ventura County (NBVC) when reviewing applications for commercial alternative energy facilities (e.g., wind, solar, tidal) to ensure the systems do not impact flight or test operations. (RDR)

[Source: New Policy]

Commented [FALCNSM41]: Concur

Page 7-23

Section 7.9 Noise

HAZ-9: To protect the health, safety, and general welfare of county residents by striving to eliminate or avoid the adverse noise impacts on existing and future noise sensitive uses. [Source: Existing GPP Goal 2.16.1.1]

Commented [FALCNSM42]: Concur

HAZ-9.2 Noise Compatibility Standards

The County shall review discretionary development for noise compatibility with surrounding uses. The County shall determine noise based on the following standards:

Commented [FALCNSM43]: Concur, with minor edit suggested (delete extra comma in 3a)

1. New noise sensitive uses proposed to be located near highways, truck routes, heavy industrial activities and other relatively continuous noise sources shall incorporate noise control measures so that indoor noise levels in habitable rooms do not exceed Community Noise Equivalent Level (CNEL) 45 and outdoor noise levels do not exceed CNEL 60 or Leq1H of 65 dB(A) during any hour.
2. New noise sensitive uses proposed to be located near railroads shall incorporate noise control measures so that indoor noise levels in habitable rooms do not exceed Community Noise Equivalent Level (CNEL) 45 and outdoor noise levels do not exceed L10 of 60 dB(A)
3. New noise sensitive uses proposed to be located near airports:
 - a. Shall be prohibited if they are in a Community Noise Equivalent Level (CNEL) 65 or greater; noise contour; or
 - b. Shall be permitted in the Community Noise Equivalent Level (CNEL) 60 to CNEL 65 noise contour area only if means will be taken to ensure interior noise levels of CNEL 45 or less.

Page 7-24

HAZ-9.6 Airport Noise Compatibility

The County shall use the aircraft noise analysis prepared for local airports or the noise contours

Commented [FALCNSM44]: Concur, with minor edit suggested

Enclosure (1)

keep the base in the Navy's long-term plans, recognizing, however, that defense priorities can change. NBVC projects significant growth in coming years as an emerging hub for unmanned systems. Overall, NBVC generates about \$2 billion in total economic benefit to Ventura County each year.

EV-3: To facilitate the retention, expansion, and attraction of key industries and business clusters in the county.

[Source: New Goal]

Page 10-6

EV-3.1 Existing Business Retention

The County shall proactively focus on retention of existing businesses in key industry clusters. In the unincorporated areas, this would include prioritizing Naval Base Ventura County and agricultural activities. (MPSP, JP)

[Source: EVSP Policy C.2]

Commented [FALCNSM50]: Concur

Page 10-6

EV-3.4 Expansion of Naval Base Ventura County and Port of Hueneme Support Businesses

The County shall encourage expansion and attraction of businesses that can further support existing activities at Naval Base Ventura County and the Port of Hueneme including the strengthening of existing business relationships and establishing spin-off businesses that can transfer technologies used for military applications into other markets. (IGC, JP)

[Source: EVSP Policies A.7 and A.8, modified]

Commented [FALCNSM51]: Concur

Page 10-10

Program C: Business Retention and Expansion

The County shall coordinate with the Economic Development Collaborative - Ventura County to focus on retention and expansion of existing businesses in key industry clusters, including Naval Base Ventura County and Port of Hueneme support businesses.

Re: Comments on VC 2040, GPU DEIR

2-27-2020

- Program H: County Tree Planting Program. The County shall plant at least one thousand trees annually on County property.

Comment: Priority should be given to planting appropriate native tree species, for their habitat value. County Administration and Court site at Victoria provides opportunity to create public awareness and education through the planting of native trees (and other native plants) with explanatory signage.

- Policy-- Countywide Tree Planting: The County shall establish and support a countywide target for the County, cities in Ventura County, agencies, organizations and citizens to plant two million trees throughout the county by 2040.

Comment: County should encourage the planting of appropriate native trees.

- Air Quality Impacts:

Comment: Need for best management practices for dust control and/or mitigation along the dirt shoulders of some agricultural fields; particularly when such dust contains remnants of chemicals from fertilizers, herbicides, pesticides.

- Water Quality impacts:

Comment: Need for best management practices and/or mitigation to control rain and or run-off, to prevent dirt from agricultural fields and/or shoulders of roadways, from washing into culverts/barrancas/streams/rivers/coastal waters/ocean, particularly when such dust contains remnants of chemicals from fertilizers, herbicides, pesticides.

**VENTURA COUNTY
AIR POLLUTION CONTROL DISTRICT**
Memorandum

TO: Susan Curtis, County Planning

DATE: February 27, 2020

FROM: 
Dr. Laki Tisopulos, APCO

SUBJECT: Public Comment for Draft Environmental Impact Report (DEIR) for the County of Ventura General Plan Update 2040 (GPU)

Thank you for the opportunity to provide comments on the GPU's DEIR. The GPU is proposed to set forth the County's vision of its future and express the goals, policies, and implementation programs that will guide future decisions concerning a variety of issues, including land use, health and safety, and resource conservation out to the year 2040. The project is not expected to identify any increase in overall development relative to the existing General Plan. However, the project will address topics and issues pursuant to state requirements adopted since the existing General Plan was approved in 2005. The Project Location includes all unincorporated areas within Ventura County. The Lead Agency for the project is the County of Ventura.

District staff provides the following comments and suggestions to further clarify and improve the document relative to the air quality and greenhouse gas emissions reduction benefits:

Section 4.3- Air Quality

Item 1- Page 4.3-16. The significance after mitigation discussion states that "implementation of Mitigation Measures AQ-1a, AQ-2a, and AQ-2b would reduce impacts to air quality to the extent feasible because construction-related emissions of criteria air pollutants and precursors would be minimized through the use of the highest rate diesel engines available for heavy duty". This mitigation reduction is also quantified and included as part of mitigation construction emissions in Table 4.3-3 and the CalEEMod report found in Appendix C- AQ Modeling displays Tier 4 equipment as the mitigation selected. However, the mitigation measures listed do not explicitly require cleaner diesel EPA off-road construction equipment (Tier 3 and Tier 4). We recommend including specific language such as "minimum use of Tier 3 or Tier 4 off-road construction diesel equipment. The use of cleaner diesel engines will dramatically reduce NOx and Diesel Particulate Matter, a toxic air contaminant, emissions during construction and may reduce short-term health impacts to sensitive receptors, particularly for prolonged extended construction periods of individual development projects.

Item 2- Page 4.3-19. The heading of Impact 4.3-4 should read "...would not result in..." or "...that does not exceed..." since the CO discussion concluded a less than significant localized

impact in relation to CO emissions. Furthermore, the District's Air Quality Assessment Guidelines have not been updated to reflect more recent information regarding CO attainment status and monitoring in Ventura County. For informational purposes, the following language reflects what is currently being recommended for determining local air quality impacts in relation to CO:

"Some localized areas, such as traffic-congested intersections, can have elevated levels of CO concentrations (CO hotspots). CO hotspots are defined as locations where ambient CO concentrations exceed the State Ambient Air Quality Standards (20 ppm for 1-hr standard, 9 ppm for 8-hr standard). The Federal Ambient Air Quality Standard for CO is 35 ppm for 1-hr standard and 9 ppm for the 8-hr standard. In Ventura County, ambient air monitoring for CO stopped in 2004, with the approval of the U.S. Environmental Protection Agency- Region 9, because CO background concentrations in El Rio, Simi Valley, and Ojai were much lower than the State Ambient Air Quality Standard (highest recorded CO background concentration in Ventura County was in Simi Valley at 6.2 ppm for 1-hr, 1.6 ppm for 8-hr (AQAG, Table 6-2). Therefore, no CO hotspots are expected to occur in the Growth and Non-Growth Areas where and additional CO modeling analysis is not warranted. In addition, with over 80% of the CO in urban areas emitted by motor vehicles, and with stricter, cleaner emission standards to the mobile fleet since 2003, CO ambient concentrations should remain at or lower than the most recent CO monitoring data available for Ventura County."

Item 3- Page 4.3-21. Policy LU-17.2 referenced on the last paragraph could not be found in DEIR Section 4.11 "Land Use and Planning" list of Land Use Proposed Policies.

Item 4- Page 4.3-23. When reviewing discretionary projects from other jurisdictions, it has been the practice of the District to recommend certain mitigation measures if local toxic exposure is considered significant (HRA cancer risk exceeds OEHHA thresholds). Please consider incorporating the following measures that may help reduce toxic exposure from heavily travelled transportation corridors into Policy HAZ-10.X or as a separate item under Mitigation Measure AQ-3:

- install location of air intakes furthest away from toxic source (such as a heavily traveled transportation corridor)
- limit window opening height or permanently seal windows so that they don't open on side of sensitive-receptor buildings (hospitals, retirement homes, schools, libraries, residential)
- install a vegetative barrier, considering height and cover thickness, to create a natural buffer between sensitive receptors and toxic source (freeway or heavily traveled transportation corridor)

Section 4.8- Greenhouse Gas Emissions

Item 5- Page 4.8-1. In addition to the CARB GHG Regulations for Crude Oil and Natural Gas, please include the CARB GHG Methane Municipal Waste Landfill Regulation with background information. Much like the CARB GHG Crude Oil and Natural Gas Regulation, the District

came into a Memorandum of Understanding with CARB in 2015 to be able to implement and enforce the regulation for landfills inside the District's jurisdiction.

Item 6- Page 4.8-5. The chemical abbreviation used for carbon dioxide should be CO₂, not CO (carbon monoxide). This is found throughout the text in the first paragraph.

We look forward to working with the County of Ventura to make sure the 2040 General Plan Update is consistent with recently adopted air quality regulations and the state's plans to reduce greenhouse gas emissions.

If you have any questions regarding the contents of this memo, you may contact Mr. Ali Ghasemi, Planning, Rules, and Incentives Manager at aghasemi@vcapcd.org or Mrs. Nicole Collazo, Air Quality Specialist, at nicole@vcapcd.org.

Hi Susan,

Please see the attached response memo from Groundwater Resources for the Ventura County 2040 General Plan Update Environmental Impact Report. Groundwater Resources also reviewed and updated relevant information in Chapter 10 (Water Resources) of the Background Report (Appendix B) from the DEIR. A word document of Chapter 10 with markup and comments is also attached.

Let us know if you have questions or comments.

Thanks,

James Maxwell, PG, CEG

To: Maxwell, James <James.Maxwell@ventura.org>
Subject: VC2040 | Notice of Availability of a Draft EIR for Public Review

CAUTION: If this email looks suspicious, DO NOT click. Forward to Spam.Manager@ventura.org

Notice of Availability of a Draft EIR For Public Review

Notice is hereby given that a Draft Environmental Impact Report (EIR) has been prepared by the County of Ventura, State of California, and is available for public review pursuant to the California Environmental Quality Act (CEQA) Guidelines for the Ventura County 2040 General Plan (State Clearinghouse No. #2019011026).

PROJECT LOCATION: All unincorporated areas within Ventura County

PROJECT DESCRIPTION: The proposed project is a comprehensive update of the County of Ventura General Plan, also known as the 2040 General Plan. The 2040 General Plan will set forth the County's vision of its future and identify the goals, policies, and implementation programs that will guide future decisions concerning a variety of issues, including but not limited to land use, climate change, agriculture, transportation, hazards, public facilities, health and safety, environmental justice, and resource conservation out to the year 2040. The County, as the lead agency, has prepared an EIR in accordance with CEQA. The purpose of the notice of availability is to call attention to this EIR and to request that interested persons review and provide comments on significant environmental issues, mitigation measures, and range of reasonable alternatives addressed in the EIR. The 2040 General Plan is anticipated to be adopted in 2020. With implementation of the 2040 General Plan, development may occur on or near site(s) identified in one of the regulatory databases compiled pursuant to Government Code Section 65962.5.

SIGNIFICANT ENVIRONMENTAL EFFECTS: The Draft EIR has identified significant and unavoidable environmental impacts in the following resource areas.

- Agriculture and Forestry Resources
- Air Quality
- Biological Resources
- Cultural, Tribal Cultural, and Paleontological Resources
- Greenhouse Gas Emissions
- Hazards, Hazardous Materials, and Wildfire
- Mineral and Petroleum Resources

- Noise and Vibration
- Public Services and Recreation
- Transportation and Traffic
- Utilities

WHERE THE DRAFT EIR IS AVAILABLE: The Draft EIR and supporting documents are available for public review at the following locations:

- 2040 General Plan Update webpage at <https://vc2040.org/>;
- The Planning Division website at <http://vcrma.org/divisions/planning> (select “CEQA Environmental Review”); and
- County of Ventura, Resource Management Agency, Planning Division Public Counter, 3^d Floor, Hall of Administration, 800 S. Victoria Avenue, Ventura, CA, 93009, between the hours of 7:30 a.m. and 4:30 p.m., Monday through Friday.

Digital versions of the Draft EIR and supporting documents are available at the following libraries:

- Albert H. Soliz Library (2820 Jordan Street, Oxnard, CA 93036);
- Avenue Library (606 North Ventura Ave., Ventura, CA 93001);
- E.P. Foster Library (651 East Main St., Ventura, CA 93001);
- Fillmore Library (502 2nd St., Fillmore, CA 93015);
- Hill Road Library (1070 S. Hill Rd., Ventura, CA 93003);
- Meiners Oaks Library (114 North Padre Juan, Ojai, CA 93023);
- Oak Park Library (899 North Kanan Rd., Oak Park, CA 91377);
- Oak View Library (555 Mahoney Ave., Oak View, CA 93022);
- Ojai Library (111 East Ojai Ave., Ojai, CA 93023);
- Piru Library (3811 Center St., Piru, CA 93040);
- Ray D. Pruetter Library (510 Park Ave., Port Hueneme, CA 93041); and
- Saticoy Library (1292 Los Angeles Ave., Ventura CA 93004).

PUBLIC REVIEW AND COMMENT PERIOD: The 45-day public review and comment period during which the County will receive comments on the Draft EIR begins Monday, January 13, 2020 and ends at 5:00 p.m. on Thursday, February 27, 2020.

WATERSHED PROTECTION

MEMORANDUM

DATE: February 27, 2020

TO: Susan Curtis, Manager, General Plan Update Section

FROM: James Maxwell, Groundwater Specialist 

SUBJECT: Ventura County Public Works Agency, Water Resources Division (VCWRD) Response, Draft Environmental Impact Report (DEIR), Ventura County 2040 General Plan

VCWRD reviewed the DEIR and supporting documents (Appendix B, Ventura County 2040 General Plan Update Background Report, Revised Public Review Draft January 2020) submitted by the County of Ventura. VCWRD does not have any comments regarding the DEIR. Relevant updates and comments have been made to Chapter 10 (Water Resources) of the Background Report.

Ventura County
2040
GENERAL PLAN

Chapter 10

Water Resources

10 WATER RESOURCES

INTRODUCTION

This chapter summarizes the various water resources and water resource issues in Ventura County. It is organized into the following sections:

- ~~Resources Assessment~~Major Findings (Section 10.1)
- Legal and Regulatory Framework for Water Management (Section 10.2)
- Integrated Regional Water Management (10.3)
- Existing Conditions (by watershed) (Section 10.4)
- Trends and Future Conditions (Section 10.5)
- Key Terms (Section 10.6)
- References (Section 10.7)

The organization of this chapter differs from others in the Background Report because of the nature of its subject matter. First, because the overall legal and regulatory framework affecting water resources is key to understanding how such resources are managed, the framework is the first substantive discussion in this chapter. Second, because water resources are so integrally tied to geography, the existing conditions discussions are organized according to the County's watersheds, with each aspect of the resource addressed as it relates uniquely to each watershed.

SECTION 10.1 ~~RESOURCES ASSESSMENT~~MAJOR FINDINGS

~~Sustainable Adequate water supply is an current and ongoing concern in Ventura County due to climate change and drought conditions, associated the related declines in surface river flows and reservoir levels, historic overdraft of several local groundwater basins, curtailment of groundwater extractions supplies in southern Ventura County, prohibition of new groundwater wells prohibitions, and reduced deliveries of imported water. More than 850,000 residents and 156 square miles (95,802 acres) of irrigated farmland in Ventura County experienced direct impacts from the drought conditions that began in 2012.~~

- ~~The water supply challenges are great and could potentially impact domestic residents, commercial/industrial, municipal businesses, agricultural, and the environmental resources of Ventura County without goal-oriented planning and implementation concerted action.~~

- ~~Climate change poses major challenges for water supply. Climate change is causing warmer temperatures, altered patterns of precipitation, runoff, and rising sea levels. Climate change may compromise the ability to effectively manage water supplies, floods and other natural resources. It is anticipated that climate change will increase demand for water as temperatures rise, increase the need for water for firefighting purposes, change the timing and pattern of snowmelt and runoff, and sea level rise will threaten aging coastal water infrastructure. Planning for and adapting to these changes, particularly impacts to long term water supply reliability, will be a significant challenge. Additional~~

Formatted: Strikethrough

Background Report
County of Ventura

~~details on climate change are found in Chapter 12 of the General Plan Background Report.~~

- ~~**Declines in surface water flow and reservoir levels in Western Ventura County.**~~
Water supplies ~~The water~~ for more than 70,000 people in western Ventura County are strained by ~~is at risk due to the~~ drought conditions that began in 2012. Imported water delivered by Calleguas Municipal Water District (CMWD) is not available ~~cannot currently be delivered~~ to western Ventura County and groundwater resources are ~~is very~~ limited. Water agencies that obtain ~~typically get~~ all or part of their supply ~~water~~ from wells ~~have had to start supplementing~~ purchasing water from Lake Casitas ~~water, as their wells have run dry.~~ During the drought conditions, purchases of Lake Casitas water increased ~~by 1,000%.~~ The lake is a diminished ~~important, but dwindling,~~ resource threatened by both water quality and ~~water supply issues~~ concerns. As of February 2020, Lake Casitas is over 40% capacity; however, ~~for the first time since 1968, reservoir volume~~ levels in ~~Lake Casitas are~~ expected to drop below 35% ~~due to decreased inflow volume.~~ Historic ~~low water volume~~ levels in 1968 resulted in significant thermal stratification and anoxic ~~(without dissolved oxygen) conditions.~~ ~~The~~ ~~low oxygen levels~~ created an environment where manganese and hydrogen sulfide, normally trapped in sediments, became soluble, causing unfavorable color and taste to the reservoir ~~lake water to have a brown color and bitter metallic taste.~~ ~~There were also~~ These conditions encourage growth of large blue-green algae blooms. ~~Normally~~ creek inflows typically provide supply and facilitate lake water mixing (which helps maintain good water quality). ~~Inflows have significantly decreased since 2012, causing the lake to stratify and stagnate.~~ Casitas Municipal Water District (Casitas) added ~~has had to add~~ aeration facilities ~~to combat the water quality effects from the drought.~~
- ~~**Drought has significantly affected local water supplies.**~~ More than 850,000 residents and 156 square miles (95,802 acres) of irrigated farmland in Ventura County experienced direct impacts from the drought that began in 2012.
- ~~**There are inadequate water supplies to meet future demands in some areas of the county.**~~ Developing new water supplies is costly and requires a significant amount of time for planning, identifying and securing funding, environmental review, permitting, and construction. Some of the new supplies being considered include advanced treatment of wastewater for use as potable water, stormwater capture and reuse, treatment of brackish groundwater, and ocean desalination. Facilities to import and deliver locally-held, State Water Project entitlements are being considered. In addition, significant water conservation efforts have begun, mainly in municipal and industrial uses. Agricultural practices are also increasing in efficiency. ~~These efforts will need to continue and be sustained.~~
- ~~**Overdrafted groundwater basins in the county are experiencing overdraft conditions.**~~
Groundwater is ~~the largest single source of water in the County, pumped by individual well owners and water purveyors, estimated to provide 67 percent of the local water supply.~~ The California Department of Water Resources (DWR) has identified the following groundwater basins ~~in Ventura County~~ as being in critical overdraft:
 - ~~Cuyama Valley Basin (DWR Basin No. 3-013)~~
 - ~~Oxnard Subbasin (DWR Basin No. 4-004.02)~~
 - ~~Pleasant Valley Basin (DWR Basin No. 4-006).~~

~~The Cuyama Valley Basin as a whole is considered to be in overdraft, however, the United States Geological Survey (USGS) estimates the portion in Ventura County not to be in overdraft, Oxnard Plain, and Pleasant Valley.~~

Water Resources

2040 General These basins serve both urban populations and agriculture. In April 2014, to protect groundwater supplies, the Fox Canyon Groundwater Management Agency, passed Emergency Ordinance E which mandated reduced extractions in many of the groundwater basins in southern Ventura County. In December 2014 the Ventura County Board of Supervisors approved and adopted Ordinance 4468 which prohibits new water

10

¹ As defined in the Sustainable Groundwater Management Act, a basin is subject to critical overdraft when continuation of present water management practices would probably result in significant adverse overdraft-related environmental, social, or economic impacts such as persistent lowering of groundwater levels, drying of wells, reductions in groundwater storage, sea water intrusion, degradation of water quality, land subsidence, and reduction of water in streams and lakes.

wells within a defined boundary in the unincorporated County in the majority of groundwater basins. These prohibitions will not be removed until Groundwater Sustainability Agencies (GSAs) are formed and have completed Groundwater Sustainability Plans (GSPs) per the Sustainable Groundwater Management Act (SGMA). Implementation of SGMA the Sustainable Groundwater Management Act will require an assessment of the condition of groundwater basin conditions and managing groundwater demand, and undertaking implementation of groundwater recharge projects to achieve long-term sustainability.

- **Variability in deliveries of imported water.** Approximately 75% three quarters of Ventura County residents receive imported water supply from CMWD Alleguas Municipal Water District. Imported water volume The amount of imported water varies depending on seasonal climate conditions, regulatory restrictions on SWP exports, conditions water costs and regional demands. The DWR California Department of Water Resources prepares a biennial report to evaluate the reliability of imported water from the State Water Project. The most recent update, the 2017 State Water Project Delivery Capability Report, anticipates greater extremes in the imported water system with lower than historic water availability in dry years and greater than historic water availability in wet years, with the long-term average deliveries decreasing reported an increased average annual delivery of water since the 2015 Report.
- **Water resources dedicated to environmental purposes may change.** State and federal agency regulations restrict requirements dictate the amount of exported SWP water that must remain be available for endangered species and this affects management of water resources. Water availability for municipal, agricultural and other uses will be potentially reduced by stricter management of inflow to upstream reservoirs to Potential requirements to provide increased instream flows could further reduce water available for municipal, agricultural, and other uses.
- **There are insufficient adequate water supplies to meet future County demands in some areas of the county.** Developing new water supplies is costly and requires a significant amount of time for planning, identifying and securing funding, environmental review, permitting, and construction. Some of the new supplies Alternative water sources being considered include advanced treatment of wastewater for use as potable water, stormwater capture and reuse, treatment of brackish groundwater, and ocean desalination. Facilities to import and deliver locally held SWP State Water Project entitlements are being considered. In addition, significant w Water conservation measures are efforts have begun, mainly in municipal and industrial uses. Agricultural practices are also increasing in efficiency. These efforts will need to continue and be sustained.
- **Shift toward Integrated Regional Watershed Management (IRWM).** In the past, various different elements of the water systems were managed independently separately from other elements, i.e., Groundwater was managed as a separate resource from stormwater and separate from recycled water. There has been a shift in water resources management and regulation toward watershed-based approaches. This A shift in water resources management and regulation toward a watershed-based approach integrates on a regional level the many facets of water resources management, including water supply, water quality, flood management, ecosystem health, and recreation through enhanced collaboration across geographic and political boundaries and diverse stakeholder groups.
- * **Water supplies dedicated to environmental purposes may change.** State and federal requirements dictate the amount of water that must be available for endangered species and this affects management of water resources. Potential requirements to provide increased instream flows could

Background Report

County of Ventura

~~further reduce water available for municipal, agricultural, and other uses.~~

- ~~There is great diversity in the size, source, and organization of w~~**Variety of water ater suppliers in Ventura County.** Many properties are served by private wells and surface water diversions. Other properties are served by mutual water companies, irrigation companies, special districts, cities, private utilities, and wholesale water agencies. There are more than 162 water suppliers in the county.

- ~~Land development Water supply and demand for land developments significantly affects demand and supply. The type of use and usage and development greatly drives the demand and dictates the type and volume of water needed. High-density residential development will require drinking-quality water water treated to drinking water standards. Water sent to users with Water collected by sewer systems is collected and can be treated and used as a secondary recycled water supply. Agricultural users users may be able to apply utilize raw or recycled water and application of water in agricultural fields that assists with may recharge to groundwater.~~
- ~~Impacts from Urban land development can impact water quality resources. Land development can impact water quality; however, but there are implementation of best management practices and conservation other practices can be employed methods to to avoid and lessen potential residuals such impacts. Land development commonly creates an increases in impervious surfaces, which increases the amount of runoff volume and stormwater pollutants in stormwater. As s Stormwater runoff is over impervious surfaces such as rooftops, roadways, and parking lots, the runoff accumulates sediment, pollution pollution and sediment, nutrients, bacteria, and other impacts pollutants. Pollutants in s Stormwater is are typically conveyed transported directly to drainage local channels, tributaries, rivers, and the ocean, prior to or without any treatment. Land development potentially impacts floodplains, increases the risk of flooding, and decreases the ability to manage storm waters naturally. Developments in floodplains may impact the ability to recharge groundwater recharge basins through infiltration and may reduce remove percolation surface area potential sites with recharge capabilities. In addition to altering stormwater runoff, it and development introduces other point sources of pollution including discharges from sewage-treatment plants, individual septic tanks, community wastewater treatment systems, and industrial facilities.~~
- ~~Impacts from Agriculture land development can impact water quality resources. Soil disturbance Tillage and subsequent irrigation of land changes the runoff and infiltration characteristics of the ground surface land, potentially affecting percolation to the subsurface and recharge to groundwater. This also and increases erosion and resulting sediment deposition into surface-water bodies, while altering evapotranspiration. This in turn affects the interaction of groundwater and surface water.~~
- ~~Poor water Water quality limitations to s beneficial uses of water. Decreased Poor water quality can limit the availability of suitability of a water body resource for beneficial uses such as agriculture, recreation, fisheries, and riverine habitat. Poor water quality also can limits the use of the water for as a water supply or drastically increase the treatment cost.~~
- ~~Development impacts to can affect natural hydrologic processes. D Some development can potentially significantly alter land topography and surface geography. Removal of natural vegetation and manmade structures such as levees, dams, and diversion structures disrupt natural hydrologic processes (i.e. sediment transport and deposition, groundwater recharge). These changes alter water velocity, river substrate, water shading, soil moisture, and other ecosystem characteristics needed by fish and wildlife.~~

Commented [MJ2]: This paragraph is extraneous if we are describing individual types of development below.

SECTION 10.2 LEGAL AND REGULATORY FRAMEWORK FOR WATER MANAGEMENT

The ~~framework for~~ water management ~~framework of~~ Ventura County ~~is complex and~~ reflects the ~~network of~~ laws, policies, and regulations governing California water. Many laws and many institutions influence water planning (Table 10-1); ~~Table 10 provides a broad regulatory overview.~~ Additional details ~~on several of these laws,~~ and a discussion of regulations with land use linkages, are further summarized on the following pages.

Formatted: Font: Bold

**TABLE 10-1
FRAMEWORK FOR WATER MANAGEMENT**

| Statute, Code, or Authority | Relationship to Water Management |
|-----------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| State of California Constitution, Article X, Section 2 | Requires that all entities in the State use water in a beneficial manner and prohibits unreasonable use and water waste. |
| State of California Riparian Water Rights | Allows owners of land on a stream to divert and use a portion of the flow. |
| State of California Appropriative Water Rights | The right to divert, store, and use water on any land, provided the use is reasonable and does not harm earlier appropriators. Appropriative rights are managed by the State Water Resources Control Board. |
| State of California Water Commission Act | Established a system of State-issued permits and licenses to appropriate water. |
| Federal Endangered Species Act | Designed to protect endangered and threatened species and promote species recovery. Requires that federal agencies consult with the US Fish and Wildlife Service and the National Marine Fisheries Service to ensure that federal actions do not jeopardize endangered or threatened species or their habitat. |
| National Environmental Policy Act | Requires federal agencies to conduct an environmental review for federal actions that may affect the environment; encourages implementation of mitigation measures to avoid impacts. |
| State of California Endangered Species Act | Designed to protect endangered and threatened species and promote species recovery. Requires that state and local agencies consult with the California Fish and Wildlife Service to ensure that their actions do not jeopardize endangered or threatened species or their habitat. |
| California Environmental Quality Act (CEQA) | Requires state and local governments to evaluate environmental effects and find ways to mitigate effects where feasible, prior to approving projects. |
| State of California Porter-Cologne Water Quality Control Act | This is a water quality control law and regulatory program to protect water quality and beneficial use of the State’s water. This act allows regulation of discharges to water. |
| Federal Clean Water Act | Requires permits for the discharge of pollutants to waters of the United States from any point source. See additional detail below. |
| Federal and State Safe Drinking Water Act | Under this law, federal and state agencies set and enforce standards for drinking water quality. |
| State of California Regional and Local Water Agency Formation enabling acts | Guides the formation of districts for controlling, conserving, managing, and distributing water. |
| State of California Urban Water Management Planning (UWMP) Act | Requires urban water suppliers to conduct regular comparisons of supplies and demands. (See additional detail below.) Within the UWMP, water suppliers must include, to the extent practicable, information on the water quality of existing sources and the manner in which water |

**TABLE 10-1
FRAMEWORK FOR WATER MANAGEMENT**

| Statute, Code, or Authority | Relationship to Water Management |
|-------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| | quality affects supply reliability. Based on the UWMP, water suppliers explore enhancing basic supplies from traditional sources such as the State Water Project (SWP) as well as other options. These include groundwater extraction, water exchanges and transfers, water conservation, recycling, brackish water desalination and water banking/conjunctive use. Each option will involve evaluations of how it would: (1) fit into the overall supply/demand framework; (2) impact the environment; and (3) affect customers. The objective of these more detailed evaluations would be to find the optimum mix of conservation and supply programs that ensure customers' needs are met. |
| State of California Agricultural Water Management Act | Senate Bill X7-7, the Water Conservation Act of 2009 (SB X7-7), requires agricultural water suppliers who provide water to more than 25,000 irrigated acres (excluding acreage irrigated by recycled water) to adopt and submit Agricultural Water Management Plans (AWMP) to DWR and to implement Efficient Water Management Practices, including the measurement and volumetric pricing of water deliveries. Within Ventura County, Casitas Municipal Water District, Camrosa Water District, and Ventura County Waterworks District No. 1 prepared AWMPs in 2015. |
| State of California Water Conservation in Landscaping Act | Requires specific water efficiencies for landscapes in new or redevelopment projects. |
| State of California Energy Commission Title 20 | Sets standards for toilets, urinals, faucets, and showerheads. The appliance standards dictate what can be sold in California and impact new construction and replacement fixtures in existing homes. |
| State of California CAL Green Building Code | Requires residential and non-residential water efficiency and conservation measures for new structures that will reduce the overall potable water use by 20 percent. Water savings can be achieved by installing plumbing fixtures and fittings that meet the 20 percent reduced flow rate specified in the CAL Green Code, or by other measures that meet the reduction standard. |
| State of California Sustainable Groundwater Management Act | Requires entities using water from groundwater basins designated as high or medium priority by the Department of Water Resources to assess the condition of groundwater basins and to develop a framework for long-term sustainability through demand management and groundwater recharge activities. (See additional discussion on the Sustainable Groundwater Management Act further in this Section below.) |
| <u>State of California Class II Underground Injection Control Program</u> | <u>Regulation of wells used to inject fluids associated with oil and natural gas production. The purpose of the regulation is to ensure fluids associated with oil and gas production are not introduced into drinking water sources. (See additional details below.)</u> |

**TABLE 10-1
FRAMEWORK FOR WATER MANAGEMENT**

| Statute, Code, or Authority | Relationship to Water Management |
|-------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| State of California Permitting of Water Systems | Regulates the formation of new public water systems by the State Water Resources Control Board. (See additional detail below.) |
| County of Ventura General Plan Goals, Policies and Programs | Complies with Section 65300 of the California Government Code which requires that, "Each planning agency shall prepare and the legislative body of each county and city shall adopt a comprehensive, long-term general plan for the physical development of the county or city, and of any land outside its boundaries which in the planning agency's judgment bears relation to its planning." |
| County of Ventura Subdivision Ordinance | Regulates and control subdivisions of land and in conjunction implements the County's General Plan. (See additional detail below.) |
| County of Ventura Coastal Zone Ordinance | Regulates all proposed development in the Coastal Zone of Ventura County. (See additional detail below.) |
| County of Ventura Non-Coastal Zone Ordinance | Regulates all proposed development in the Non-Coastal Zone of Ventura County. (See additional detail below.) |
| Ventura County Groundwater Conservation Ordinance | Regulates construction, maintenance, operation, use, repair, modification, and destruction of groundwater wells. (See additional detail below.) |
| County of Ventura Landscape Design Criteria | Requires approval of a landscape plan for new and modified developments. Limits the plant types and plant pallets so as to conserve water, and requires minimum irrigation efficiency. |
| State of California Propositions 50, 84, and 1 | Grant funding to encourage regional integrated planning of water resources. (See additional detail below.) |
| State of California Non-potable Water Reuse Systems-Chapter 15 of the California Plumbing Code (CPC) (as of 2017) | Allows for use of non-potable water (i.e., graywater), which includes wastewater from bathtubs, showers, bathroom washbasins, clothes washing machines and laundry tubs. Requires a plumbing permit from the County of Ventura Resource Management Agency, Building and Safety Division. |

Urban Water Management Plan Act (State)

State law requires that urban water suppliers with more than 3,000 customers, or who deliver more than 3,000 acre-feet per year (AFY), adopt water management and conservation plans that evaluate water supplies and water demands for a 20-year period. Urban Water Management Plans (UWMP) are to be updated every five years or when there are significant changes in available supplies or demands. An UWMP is a planning tool that generally guides the actions of water management agencies. It provides managers and the public with a broad perspective on a number of water supply issues. It is not a substitute for project-specific planning documents, nor was it or intended to be when mandated by the State Legislature. For example, the Legislature mandated that the Plan include a Section that "describes the opportunities for exchanges or water transfers on a short-term or long-term basis." (California Urban

Background Report

County of Ventura

Water Management Planning Act, Article 2, Section 10630(d)). The identification and inclusion of such opportunities, ~~and the inclusion of those opportunities~~ in a general water service reliability analysis, neither commits a water management agency to pursue a particular water exchange/transfer opportunity, nor precludes a water management agency from exploring exchange/transfer opportunities not identified in the Plan. When specific projects are chosen to be implemented, detailed project plans are developed, environmental analysis, if required, is prepared, and financial and operational plans are detailed.

“A plan is intended to function as a planning tool to guide broad-perspective decision making by the management of water suppliers.” (Sonoma County Water Coalition v. Sonoma County Water Agency (2010) 189 Cal. App. 4th 33, 39). It should not be viewed as an exact blueprint for supply and demand management. Water management in California is not a matter of certainty and planning projections may change in response to a number of factors. “[L]ong-term water planning involves expectations and not certainties. Our Supreme Court has recognized the uncertainties inherent in long-term land use and water planning and observed that the generalized information required . . . in the early stages of the planning process are replaced by firm assurances of water supplies at later stages.” (Id., at 41). From this perspective, it is appropriate to look at the UWMP as a general planning framework, not a specific action plan. It is an effort to generally answer a series of planning questions including:

- What are the potential sources of supply and what is the reasonable probable yield from them?
- What is the probable demand, given a reasonable set of assumptions about growth and implementation of good water management practices?
- How well do supply and demand figures match up, assuming that the various probable supplies will be pursued by the implementing agency?

Using these “framework” questions and resulting answers, the implementing agency will pursue feasible and cost-effective options and opportunities to meet demands.

Based on the UWMP, water suppliers explore enhancing ~~basic~~ supplies from traditional sources such as ~~the State Water Project (SWP) water as well as other options~~. These include groundwater extraction, water exchanges and transfers, water conservation, recycling, brackish water desalination and water banking/conjunctive use. ~~Specific planning efforts will be undertaken in regard to each option, involving detailed evaluations of how each~~ Options are evaluated regarding feasibility would fit into the overall supply/demand framework ~~including, how each option would impact the~~ environmental impacts and how each option would affect customers. The objective of these ~~more detailed~~ evaluations ~~is~~ would be to find the optimum mix of conservation and supply programs that ~~balance water demand, ensure that the needs of customers are met~~.

The Urban Water Management Plan Act requires ~~60-days notice to any applicable city of county coordination with local land use entities. A where the water agency supplies water that the plan is being updated, at least 60 days prior to the public hearing on the plan any applicable city or county where the water agency supplies water must be notified that the plan is being updated~~. The water supplier must ~~also~~ provide notice when the Draft UWMP is available for review and comment. Upon completion of the UWMP a copy of the plan must be provided to the applicable land use jurisdictions.

Sustainable Groundwater Management Act (State)

In September 2014, the California legislature enacted comprehensive legislation to manage California groundwater. Known as the Sustainable Groundwater Management Act (SGMA) ~~of 2014~~, the legislation provides a framework for sustainable management of groundwater supplies by local authorities, ~~but~~ with

the potential for state intervention, if necessary. ~~The first step in the process laid out by~~ The legislation requires the formation of local groundwater sustainability agencies (GSAs). ~~These GSAs are established to~~ must be formed to address the basing groundwater basins determined by the state prioritization ~~to be state of high or medium priority,~~ (unless adjudicated). In Ventura County, ~~one seven~~ basins ~~is~~ are designated as medium priority, Ojai Valley, Upper Ventura River, Cuyama Valley, Arroyo Santa Rosa Valley, Mound, Santa Paula (which is adjudicated), Fillmore and ~~eight four~~ are designated as high priority, Oxnard Plain, Pleasant Valley, Las Posas, and

~~Paula~~ Three basins are listed as “critical overdraft:” Oxnard Plain, Pleasant Valley, and Cuyama Valley. The Santa Paula Basin is adjudicated, and is currently only subject to annual reporting requirements to DWR under SGMA.

GSAs are empowered to utilize a number of new management tools to achieve the sustainability goal. ~~For example,~~ GSAs may require registration of groundwater wells, mandate annual extraction reports ~~from individual wells,~~ impose limits on extractions (allocations), and assess fees to support creation and adoption of a groundwater sustainability plan (GSP). GSAs also may request a revision of a groundwater basin boundary.

GSPs for critically ~~overdrafted~~ basins must be completed and adopted by January 31, 2020. GSPs for high- and medium-priority basins not in overdraft must be completed and adopted by the GSA by January 31, 2022. All high- and medium-priority groundwater basins must achieve sustainability within 20 years of GSP adoption.

The ~~legislation aims~~ aim of the legislation is to ~~achieve~~ have groundwater basins management within the sustainable yield of each basin. The legislation defines “sustainable groundwater management” as the management and use of groundwater in a manner that can be maintained during the planning and implementation horizon without causing undesirable results. ~~This is,~~ which are defined as ~~any of the following effects~~ the: chronic lowering of groundwater levels, significant and unreasonable reductions in groundwater storage, significant and unreasonable seawater intrusion, significant and unreasonable degradation of water quality, significant and unreasonable land subsidence, and surface water depletions that have significant and unreasonable adverse impacts on beneficial uses.

~~The~~ SGMA amends planning and zoning laws to require increased coordination among land use planning agencies and the GSAs, regarding groundwater plans and ~~any~~ updates or modifications of General Plans.

Existing local government land use and groundwater authorities are not modified in the Act. Specific changes to California Government Code resulting from SGMA are detailed in Appendix 10.A at the end of this chapter.

Class II Underground Injection Control Program (State)

As discussed in Chapter 8, Section 8.1 (Energy Resources) there are currently 57 oil companies operating in Ventura County, under the authority of 135 conditional use permits granted by the County ~~to~~ authorize oil and gas activities. This, ~~includes~~ the underground injection of water. According to the California Department of Conservation, Division of Oil, Gas and Geothermal Resources’ (DOGGR), there are 614 active Underground Injection Control (water injection) wells in Ventura County. The State of California was delegated primary responsibility for implementing the Class II Oil and Gas Underground Injection Control [UIC] program of the federal Safe Drinking Water Act [SDWA] in 1983.

To determine whether certain UIC wells were posing a threat to water supply wells, the State Water Resources Control Board (SWRCB) and its regional water quality control boards (RWQCBs) ~~Water Boards~~ completed an

Formatted: Indent: Left: 0", Right: 1.14", Space Before: 4.6 pt

Formatted: Indent: Left: 0"

Commented [MJ3]: Renamed to California Geologic Energy Management Division (CalGEM)

Background Report

County of Ventura

evaluation of certain UIC wells in December 2016.² Staff from the Water Boards reviewed 6,157 UIC wells determined by ~~DOGGR~~-CalGEM to be injecting into non-exempt aquifers.³ This evaluation included Class II UICs located in Ventura County. UIC wells were screened for proximity to water supply wells or any other indication of risk of impact to drinking water and other beneficial uses.

Based on this screening criteria, ~~DOGGR~~-CalGEM ordered the immediate shut-in of 23 UIC wells, none of which were in Ventura County. (A shut-in well is one which is capable of injection or production but is not in operation). Additionally, the Water Boards issued 71 Information Orders (IOs), requesting additional information from operators of 256 UIC wells. One operator in Ventura County received an IO for a UIC well, which has been abandoned.

In addition to the above UIC regulations, Public Resources Code Section 3106 et. seq. grants ~~DOGGR~~-CalGEM with the authority to supervise the drilling, operation, maintenance, and abandonment of wells and the operation, maintenance, and removal or abandonment of tanks and facilities attendant to oil and gas production and designated pipelines, so as to prevent, as far as possible, damage to life, health, property, and natural resources; damage to underground oil and gas deposits from infiltrating water and other causes; loss of oil, gas, or reservoir energy, and damage to underground and surface waters suitable for irrigation or domestic purposes by the infiltration of, or the addition of, detrimental substances.

~~Furthermore, the~~ California Code of Regulations, Title 14, Division 2, Chapter 4, Development, Regulation, and Conservation of Oil and Gas Resources includes several provisions which regulate injection projects (water injection wells). ~~DOGGR~~-CalGEM is the responsible agency for approving all underground injection and disposal projects before any subsurface injection or disposal project can begin. This includes all EPA Class II wells and air- and gas-injection wells. There are requirements for filing, notification, operating, and testing for underground injection projects (Sections 1724.10 1748.2, 1748.3), and standards for freshwater protection when plugging and abandoning wells (Section 1723.2). This includes CalGEM~~DOGGR~~'s authority to require testing as necessary to prevent damage to life, health, property, and natural resources (Section 1954).

Clean Water Act (Federal)

The Clean Water Act, ~~as amended,~~ requires permits for the discharge of pollutants to waters of the United States. Implementation of the Clean Water Act and the Porter-Cologne Water Act is the responsibility of the ~~SWRCB~~ State Water Resources Control Board and the ~~Regional Water Quality Control Boards~~. In the Ventura area the applicable Regional Board is the Los Angeles Regional Water Quality Control Board (L~~Aos Angeles~~-RWQCB). The L~~Aos Angeles~~-RWQCB lays out the water quality objectives, regulations, and programs to implement the regulations in the Los Angeles Basin Plan (Los Angeles RWQCB 2014). The Basin Plan is reviewed and updated every three years ~~and, but~~ can be amended at any time. The L~~Aos Angeles~~-RWQCB manages water quality based on "beneficial uses". In Ventura County, there are twenty-four identified beneficial uses:

²The State evaluated "non-exempt" aquifers. The following federal and state criteria must be met for an aquifer to be considered exempt: (a) cannot be a current drinking water source; (b) unlikely to be a future source of drinking water; (c) injection must not impact current/potential future beneficial use; and (d) injection fluids must remain in the proposed exempted area.

³U.S. EPA, Region IX (Pacific Southwest Region) has approved six ~~DOGGR~~ aquifer exemption requests, none of which are in Ventura County.

1. **Municipal and Domestic Supply (MUN).** Uses of water for community, military, or individual water supply systems including, but not limited to, drinking water supply.
2. **Agricultural Supply (AGR).** Uses of water for farming, horticulture, or ranching including, but not limited to, irrigation, stock watering, or support of vegetation for range grazing.
3. **Industrial Process Supply (PROC).** Uses of water for industrial activities that depend primarily on water quality.
4. **Industrial Service Supply (IND).** Uses of water for industrial activities that do not depend primarily on water quality including, but not limited to, mining, cooling water supply, hydraulic conveyance, gravel washing, fire protection, or oil well re-pressurization.
5. **Ground Water Recharge (GWR).** Uses of water for natural or artificial recharge of ground water for purposes of future extraction, maintenance of water quality, or halting of saltwater intrusion into freshwater aquifers.
6. **Freshwater Replenishment (FRSH).** Uses of water for natural or artificial maintenance of surface water quantity or quality (e.g., salinity).
7. **Navigation (NAV).** Uses of water for shipping, travel, or other transportation by private, military, or commercial vessels.
8. **Hydropower Generation (POW).** Uses of water for hydropower generation.
9. **Water Contact Recreation (REC-1).** Uses of water for recreational activities involving body contact with water, where ingestion of water is reasonably possible. These uses include, but are not limited to, swimming, wading, water-skiing, skin and scuba diving, surfing, white water activities, fishing, or use of natural hot springs.
10. **Non-contact Water Recreation (REC-2).** Uses of water for recreational activities involving proximity to water, but not normally involving body contact with water, where ingestion of water is reasonably possible. These uses include, but are not limited to, picnicking, sunbathing, hiking, beachcombing, camping, boating, tidepool and marine life study, hunting, sightseeing, or aesthetic enjoyment in conjunction with the above activities.
11. **Marine Habitat (MAR).** Uses of water that support marine ecosystems including, but not limited to, preservation or enhancement of marine habitats, vegetation such as kelp, fish, shellfish, or wildlife (e.g., marine mammals, shorebirds).
12. **Wildlife Habitat (WILD).** Uses of water that support terrestrial ecosystems including, but not limited to, preservation and enhancement of terrestrial habitats, vegetation, wildlife (e.g., mammals, birds, reptiles, amphibians, invertebrates), or wildlife water and food sources.
13. **Commercial and Sport Fishing (COMM).** Uses of water for commercial or recreational collection of fish, shellfish, or other organisms including, but not limited to, uses involving organisms intended for human consumption or bait purposes.
14. **Aquaculture (AQUA).** Uses of water for aquaculture or mariculture operations including, but not limited to, propagation, cultivation, maintenance, or harvesting of aquatic plants and animals for human consumption or bait purposes.
15. **Warm Freshwater Habitat (WARM).** Uses of water that support warm water ecosystems including, but not limited to, preservation or enhancement of aquatic

habitats, vegetation, fish, or wildlife, including invertebrates.

16. **Cold Freshwater Habitat (COLD).** Uses of water that support cold water ecosystems including, but not limited to, preservation or enhancement of aquatic habitats, vegetation, fish, or wildlife, including invertebrates.
 17. **Inland Saline Water Habitat (SAL).** Uses of water that support inland saline water ecosystems including, but not limited to, preservation or enhancement of aquatic saline habitats, vegetation, fish, or wildlife, including invertebrates.
 18. **Estuarine Habitat (EST).** Uses of water that support estuarine ecosystems including, but not limited to, preservation or enhancement of estuarine habitats, vegetation, fish, shellfish, or wildlife (e.g., estuarine mammals, waterfowl, shorebirds).
 19. **Wetland Habitat (WET).** Uses of water that support wetland ecosystems, including, but not limited to, preservation or enhancement of wetland habitats, vegetation, fish, shellfish, or wildlife, and other unique wetland functions which enhance water quality, such as providing flood and erosion control, stream bank stabilization, and filtration and purification of naturally.
 20. **Preservation of Biological Habitats (BIOL).** Uses of water that support
- designated areas or habitats, such as Areas of Special Biological Significance (ASBS), established refuges, parks, sanctuaries, ecological reserves, or other areas where the preservation or enhancement of natural resources requires special protection.
 21. **Rare, Threatened, or Endangered Species (RARE).** Uses of water that support habitats necessary, at least in part, for the survival and successful maintenance of plant or animal species established under state or federal law as rare, threatened, or endangered.
 22. **Migration of Aquatic Organisms (MIGR).** Uses of water that support habitats necessary for migration, acclimatization between fresh and salt water, or other temporary activities by aquatic organisms, such as anadromous fish.
 23. **Spawning, Reproduction, and/or Early Development (SPWN).** Uses of water that support high quality aquatic habitats suitable for reproduction and early development of fish.
 24. **Shellfish Harvesting (SHELL).** Uses of water that support habitats suitable for the collection of filter-feeding shellfish (e.g., clams, oysters, and mussels) for human consumption, commercial, or sports purposes.

To protect these beneficial uses, the ~~Los Angeles~~ RWQCB has many regulatory programs to reduce pollutants that originate in stormwater, wastewater, agricultural runoff, and recycled water.

~~Los Angeles~~ RWQCB regulates discharges from many classes of municipal stormwater systems through a permit program. The Ventura County Watershed Protection District, County of Ventura, and the cities of Camarillo, Fillmore, Moorpark, Ojai, Oxnard, Port Hueneme, Ventura, Santa Paula, Simi Valley, and Thousand Oaks are named as co-permittees under a countywide municipal National Pollutant Discharge Elimination System (NPDES) permit for stormwater discharges issued by the ~~RWQCB Regional Water Quality Control Board~~. The co-permittees are required to administer, implement, and enforce a Stormwater Quality Management Program. The goal is to minimize runoff pollution typically caused by land development and to protect the beneficial uses of receiving waters by limiting ~~effective~~ impervious area to no more than five percent of the project area and retaining stormwater on site. The co-permittees require

“Site Design Principles and Techniques,” “Source Control Measures,” “Retention Best Management Practices [BMPs],” “Biofiltration BMPs,” and “Treatment Control Measures” be incorporated into new development and redevelopment projects.

Wastewater from wastewater treatment or industrial activities is typically regulated through waste discharge permits, (also referred to as Waste Discharge Requirements (WDRs)). Through this permit process the RWQCB regulates the place, volume, and specific constituents in discharges to California’s coastal waters, surface waters, and groundwater.

In 2016, the ~~Los Angeles~~ RWQCB readopted a Conditional Waiver of Waste Discharge Requirements for Discharges from Irrigated Lands within the Los Angeles Region. Typically referred to as the “Conditional Waiver” program, it requires the owners of irrigated farmland to prepare and submit water quality management plans, conduct monitoring in agricultural drains and other sites influenced by agricultural runoff, and implement BMPs that address the quantity and quality of irrigation return flows and stormwater runoff. The purpose is to limit ~~these~~ discharges, ~~that~~ which carry nutrients, pesticides, sediment, salts, and other pollutants ~~from cultivated fields~~, from reaching surface waters. The Conditional Waiver allows growers to comply as individuals or ~~by working~~ collectively as a “discharger group.” In response to the Conditional Waiver, the Farm Bureau of Ventura County formed the Ventura County Agricultural Irrigated Lands Group (VCAILG), which serves as a unified discharger group for those agricultural landowners and growers who agree to join. The Farm Bureau of Ventura County administers the program on behalf of VCAILG members.

Both the ~~State Water Resources Control Board (SWRCB)~~ and RWQCBs regulate recycled water. Permits are required to operate recycled water facilities and these permits mandate the type of treatment and resultant water quality, mandate ongoing water quality monitoring, and regulate the place and manner of recycled water use. The State Water Resources Control Board’s 2009 Recycled Water Policy, amended in 2013, requires groundwater basins receiving recycled water (e.g., effluent discharge in waterways, injection, recharge, or irrigation) to be managed by Salt and Nutrient Management Plans. The purpose of a Salt Nutrient Management Plan is to optimize recycled water use while ensuring the protection of groundwater supply and beneficial uses, agricultural beneficial uses, and human health. Salt and Nutrient Management Plans are submitted to the RWQCB, which incorporate the plans into the applicable Basin Plan. ~~and~~ The RWQCB requires recycled water facilities and wastewater dischargers to operate in a manner consistent with applicable salt nutrient management plan.

The Clean Water Act also includes a regulatory mechanism called the Total Maximum Daily Load (TMDL) program. A TMDL is specific to a given impairment (chloride, nutrients) and a specific waterbody. A TMDL is a kind of “pollution budget” and includes a calculation of the maximum amount of a pollutant that can occur in a waterbody and still meet water quality standards so as to protect beneficial uses. The TMDL also allocates the necessary reductions to one or more pollutant sources. TMDLs can force the implementation of BMPs, infrastructure improvements, and other actions to limit pollution. Within Ventura County the following TMDLs are in place:

- Ventura River Watershed
 - Algae, Eutrophic Conditions, and Nutrients
 - Trash
- Santa Clara River Watershed
 - Bacteria
 - Chloride
- Calleguas Creek Watershed

- Metals
- Salts
- Trash
- Toxicity
- Toxins/Historic Pesticides
- Nitrogen/Nutrients

Under section 303(d) of the Clean Water Act, states, territories, and tribes are to develop lists of waterbodies that are polluted or otherwise degraded and not meeting water quality standards. The 303(d) List is used to develop TMDLs and/or are used to identify other mechanisms to improve water quality. Several waterbodies in Ventura County are on the current 303(d) List for California (SWRCB 2016).

Permitting of Public Water Systems

The ~~State Water Resources Control Board (SWRCB)~~, Division of Drinking Water (DDW) oversees the permitting of Public Water Systems. On September 29, 2016, Governor Jerry Brown approved Senate Bill 1263 to prevent the formation of small unsustainable water systems. This bill requires a person submitting a permit application for a proposed new public water system to first submit a preliminary technical report to the SWRCB. The bill directs the applicant to undertake additional discussion and negotiation with existing public water systems with the technical, managerial, and financial capacity to provide an adequate and reliable supply of domestic water to the service area of the proposed new public water system. If the SWRCB determines that it is feasible for the service area of the proposed public water system to be served by one or more currently permitted public water systems and if it is reasonably foreseeable that the proposed new public water system will be unable to provide affordable, safe drinking water in the reasonably foreseeable future, the permit will be denied.

County of Ventura Role in Water Management

~~The County of Ventura has a large role to play in water management.~~ Through the General Plan Goals, Policies and Programs, Subdivision and Zoning Ordinances and Building Code, the County of Ventura conditions development to ensure adequate water supply, availability of wastewater disposal, and protection of groundwater and surface water quality. Through its Landscape Design Criteria, Ventura County requires water budget and project use calculations, use of reclaimed water ~~if feasible~~, and water-efficient model home requirements. Per the authority of the Floodplain Management Ordinance, the County restricts and prohibits land uses or land alteration which may be dangerous to health, safety, and property due to modification or obstruction of flood waters or alteration of a water course.

~~In addition to the regulatory setting, the County of Ventura actively undertakes projects to manage~~ water resources; ~~which include but are not limited to, through~~ well permitting, groundwater recharge, stormwater treatment and infiltration, ~~and~~ ~~as well as~~ levees and flood control channels. Ventura County ~~also~~ is responsible for the operation and maintenance of several water and ~~sanitation~~ ~~water~~ utilities ~~within the county~~. ~~VCWPD~~ ~~various county departments also~~ collect and maintain data on countywide water resources. ~~For example, the~~ VCWPD maintains a network of rainfall and streamflow gauges, inventories and inspects groundwater wells, collects water quality data, and groundwater level information.

County of Ventura General Plan Goals, Policies and Programs

The General Plan (2005) Goals Policies and Programs (GPP) include ~~ds~~ goals, policies, and programs related to water resources in Chapter 1, Resources, Section 1.3. In addition to policies in the GPP, the following Area Plans ~~also contain applicable water resource goals and policies related to water resources:~~

- El Rio/Del Norte Area Plan;
- North Ventura Avenue Area Plan;
- Oak Park Area Plan;
- Ojai Valley Area Plan;
- Piru Area Plan;
- Saticoy Area Plan;
- Thousand Oaks Area Plan; and
- Lake Sherwood/Hidden Valley Area Plan.

County of Ventura Ordinances

Subdivision Ordinance

The ~~intent of the~~ County of Ventura Subdivision Ordinance ~~is to regulate and control~~ subdivisions of land and ~~in conjunction,~~ implements the County's General Plan. The ~~Subdivision~~ Ordinance applies to "all divisions, reversions to acreage, lot line adjustments, and mergers respecting real property located wholly or partially within the unincorporated areas of Ventura County" and "governs the filing, processing, approval, conditional approval, or disapproval of tentative, final and parcel maps, map waivers, and any modifications thereto." The ~~Subdivision~~ Ordinance ~~includes the following provisions meant to ensure~~ adequate provision of water, ~~to protect~~ water supply, and ~~to protect~~ surface and groundwater quality.

Provisions to ensure adequate provision of water:

- Section 8203-3, Section 8206-3.8, and Section 8206-3.9. At the tentative tract stage, requires a description of the method and plan for providing a permanent domestic water supply. If the water supply is to be provided by a public water system the tentative tract map must be accompanied by a "water availability letter."⁴ In areas where groundwater supplies have been determined to be questionable or inadequate, a report must also be submitted demonstrating the availability of a permanent domestic water supply to each lot for a period of at least 60 years. At the final map phase, developments not being served water by individual wells, must provide a "water supply certificate" documenting that a binding agreement has been entered into between the owner of the land and water supplier. Also at the final map stage a registered civil engineer must determine (a)

⁴ A water availability letter pursuant to the §8203-3 (l) of the Ventura County Subdivision Ordinance, which requires that the proposed water system of a subdivision provide a letter stating that they will supply permanent domestic water supply to each lot, is not synonymous with the requirement for a water purveyor to supply a "water availability letter" as defined in §1.3.6 of the Ventura County Waterworks Manual, which shall demonstrate that the water purveyor has the necessary water capacity for their entire service area.

Background Report

County of Ventura

that the water suppliers' system complies with the quality and quantity standards of Title 22 of the California Code of Regulations and that the new development will not impact the water supplier in a way such that the water system will not comply with Title 22 and (b) the facilities of the water supplier's system, including the portion to serve the proposed subdivision, meet or exceed the requirements of the County of Ventura Improvement Standards and Specifications.

- Section 8204-7. Requires that whenever a proposed subdivision is located within the boundaries of a public water agency willing and able to provide water service to the lots, the public water agency shall be chosen as the water purveyor for the proposed subdivision.
- Section 8205-5.1. Requires notification to water, sewage and other service providers prior to Planning Commission hearing on a subdivision (when a tentative map and final map are required).
- Section 8207-2. Prior to recordation of a final map or parcel map, or at such earlier time as may be specified in this Article, the subdivider shall complete or shall enter into an improvement agreement to complete specific improvements including permanent domestic water supply.

Provisions to protect surface and groundwater quality:

- Section 8203-2. Requires water courses and existing or abandoned water wells be identified on tentative maps.
- Section 8203-3. Requires a hydrologic and hydraulic study be submitted with the tentative map indicating the following conditions before and after proposed development of the subdivision: drainage areas, major watercourses, quantity and pattern of storm water, and diversion and collection systems.
- Section 8203-3. Requires a description of the proposed method and plan for sewage disposal for each proposed lot.
- Section 8204-5. Design of a subdivision shall conform to the County of Ventura Flood Plain Management Ordinance and shall provide for the proper drainage of all lots and improvements based on the runoff that can be anticipated from ultimate development of the watershed in accordance with the General Plan. All public facilities including water and sewer, must be located and constructed in a manner to minimize potential flood damage. Any concentrations or increases of surface water resulting from the development of the subdivision must be conveyed by means of adequate facilities to a suitable natural watercourse in the area.
- Section 8207-2. Prior to recordation of a final map or parcel map, or at such earlier time as may be specified in this Article, the subdivider shall complete or shall enter into an improvement agreement to complete specific improvements including: (a) all improvements for drainage and erosion control required for the proposed subdivision, regardless of location, including improvements necessary to prevent sedimentation or damage to off-site property, (b) sewage and permanent domestic water supply systems shall be installed in each proposed subdivision and connections thereto made from each lot within the subdivision, (c) all abandoned water wells within the proposed subdivision shall either be destroyed or be retained subject to a Certificate of Exemption in compliance County of Ventura Code.
- Section 8209-5. As a condition of approval of any subdivision, the tentative map for which is filed no sooner than 30 days after the adoption of any applicable drainage or sanitary sewer plan

for a particular drainage or sanitary sewer area, the subdivider may be required to pay fees or consideration in lieu thereof for the purpose of defraying the actual or estimated costs of constructing planned drainage facilities for the removal of surface and storm waters from local or neighborhood drainage areas and of constructing planned sanitary sewer facilities.

Commented [MJ4]: We don't need to list these, they are already summarized.

Coastal Zone and Non-Coastal Zone Ordinances

The County of Ventura Coastal Zoning Ordinance (CZO) regulates all proposed development in the Coastal Zone of Ventura County; areas outside of this zone are regulated by the Non-Coastal Zoning Ordinance (NCZO). Many of the provisions of the Coastal Zone and Non-Coastal Ordinance are similar to those in the Subdivision Map Act. In relation to water quality, though provisions differ given the proposed land use, generally these ordinances require:

- Obtaining a permit or zoning clearance prior to: (a) constructing or expanding a septic system; (b) constructing, destroying or rehabilitating expanding a water wells, and (c) constructing private water storage and distribution system facilities.
- A-100- to 300-foot setbacks from water channels and prohibition of obstructions to drainage courses.
- Development to be undertaken in accordance with conditions and requirements established by the Ventura Countywide Stormwater Quality Management Program, National Pollutant Discharge Elimination System (NPDES) Permit No. CAS063339 and the Ventura Stormwater Quality Management Ordinance No. 4142 and as these permits and regulations may be amended.
 - Construction activity including clearing, grading or excavation that requires a grading permit shall be undertaken in accordance with any conditions and requirements established by the NPDES Permit or other permits which are reasonably related to the reduction or elimination of Pollutants in Stormwater from the construction site.
 - Preparation of a Stormwater Pollution Control Plan or Stormwater Pollution Prevention Plan for construction activities.
 - Generally new development or redevelopment projects affecting 5,000 square feet or greater must incorporate post-construction stormwater quality design principals for new development or projects affecting 5,000-square feet or greater, details are provided in the Ventura County Technical Guidance Manual for Stormwater Quality Control Measures.
- A unique provision in the NCZO is the definition of the Arroyo Santa Rosa/Tierra Rejada Groundwater Quality Impact Area. In this area, the ratio of developed floor area relative to the parcel size for a second dwelling unit is regulated of developed floor area relative to parcel size to limit the amount of septic discharge to groundwater in the Arroyo Santa Rosa/Tierra Rejada Area.

County of Ventura

retaining and ~~recharging, causing to percolate into the soil;~~

Background Report

County of Ventura

~~conserving in any manner all or any of such waters and protecting from such flood or storm waters the watercourses, watersheds, public right-of-ways, highways, life and and County property, in the District;~~

- ~~preventing waste of water or diminution of the water supply in, or exportation of water from groundwater basins within the County, the District;~~
- ~~obtain, retain and reclaim drainage, storm, flood and other waters for beneficial use; and~~
- ~~provide for the protecting on from erosion of beaches and shorelines and to providing for the restoration of such beaches and shorelines.~~

~~Under the Act, The Watershed Protection District has the power to undertake projects consistent with its goals purpose and to adopt and enforce corresponding regulations consistent with its purpose. The District has the power to prescribe, revise, and collect fees as a condition of development of land. A permit from the Watershed Protection District must be obtained for most activities in, on, over, under, or across the bed, banks, and overbank areas of local streams and channels.~~

County of Ventura Flood Plain Management Ordinance

This ordinance restricts and prohibits land uses or ~~land alteration which may be dangerous to health, safety, and property due from~~ modification or obstruction of flood waters or alteration of a water course. ~~It~~ Further, this ordinance requires that ~~land uses~~ vulnerable to floods be protected against flood damage at the time of initial construction. The Watershed Protection District implements the Flood Plain Management Ordinance through its encroachment and watercourse permit programs.

County of Ventura Building Code

~~Submittal of grading plans during the Permitted grading projects permitting process~~ requires an applicant to evaluate ~~site soils and geology and site drainage conditions patterns prior to grading. Project Site~~ design must include measures to detain or retain ~~surface runoff, stormflows so that runoff is not appreciably different post development and.~~ Design must include measures to prevent erosion of slopes, ~~such as vegetation, soil stabilizers, and rip rap.~~ The County of Ventura requires (Building Code Section J112) that best management practices be used to prevent erosion and stormwater flows from discharging offsite.

County of Ventura Groundwater Conservation Ordinance

The purpose of Ordinance No. 4468, division 4, Chapter 8, Article 1 is to protect groundwater quality, supply and quantity by regulating the construction, maintenance, operation, use, repair, modification, and destruction of wells and engineering test holes in Ventura County. Such work requires obtaining a permit and approval from ~~Ventura County Watershed Protection District the respective agency authorized to regulate new well construction.~~ Permits shall require compliance with all applicable standards set forth in the Ordinance, and in accordance with DWR California Well Standards Bulletins Nos. 74-81 and 74-90, and County of Ventura Water Well Standards Bulletin No. 74-9.

Formatted: Normal, No bullets or numbering

SECTION 10.3 INTEGRATED REGIONAL WATER MANAGEMENT

After the passage of Proposition 50 in 2002, Integrated Regional Water Management (IRWM) became a new paradigm for managing water resources with the passage of Proposition 50 in 2002. This approach integrates the many facets of water resources management on a regional level, including water supply, water quality, flood management, ecosystem health, and recreation through enhanced collaboration with various stakeholder groups across geographic and political boundaries and diverse stakeholder groups. The Watersheds Coalition of Ventura County (WCVC) was formed as the IRWM group to develop and implement a plan to identify water management challenges, resolve conflicts over the best use of resources, bridge gaps in data, find common ground, and seek innovative solutions among stakeholders. A primary goal is implementation of projects and programs that efficiently address water management priorities.

The 2014 WCVC Integrated Regional Water Management Plan Goals are outlined as follows:

- Reduce dependence on imported water and protect, conserve and augment water supplies
- Protect and improve water quality
- Protect people, property and the environment from adverse flooding impacts
- Protect and restore habitat and ecosystems in watersheds
- Provide water-related recreational, public access, stewardship, engagement and educational opportunities
- Prepare for and adapt to climate change

Grant funds made available through Proposition 50 (2002), Proposition 84 (2006), and Proposition 1 (2014), have leveraged local funds for project implementation. These funds helped communities, including disadvantaged communities, throughout Ventura County to enhance the availability of clean water supplies for the benefit of people and the environment, to protect communities from flood damage, and to provide access to water-related recreation opportunities. WCVC participants benefit from the cost-sharing, collaboration, and effective problem-solving opportunities made possible by working together. The WCVC completed a 2019 amendment to the 2014 IRWM Plan, which was deemed compliant by the DWR with Proposition 1 IRWM Plan standards.

One example of an ongoing project partially funded through the IRWM Program with Proposition 84 grant funds is the Natural Floodplain Protection Program (NFPP), which is focused on preserving a critical section of the remaining floodplain in the Santa Clara River Watershed. A Floodplain Working Group was formed to develop the project and is comprised of the County's Watershed Protection District, the Ventura County Farm Bureau, The Nature Conservancy, and the Ventura County Resource Conservation District.

The Working Group developed the concept of incentivizing farmers to continue to farm in the floodplain, thus leaving their land undeveloped. This is done by offering to purchase flood (inundation) easements over private land within the floodplain. These easements cover working farmland, a use that is encouraged to continue under the easement. The farmers are financially compensated for keeping their property in the floodplain and giving up rights they may have to develop the land. The value of easements is established through negotiations with individual land owners and verified by an appraisal.

To date, almost 500 acres of flood plain within the Santa Clara River Watershed have been acquired through the Natural Floodplain Protection Program.

Commented [MJ6]: We can leave this here, since that was a section in the IRWM Plan and 2019 update.

SECTION 10.4 EXISTING CONDITIONS

Ventura County covers approximately 1,873 square miles, a large proportion of which (860 square miles, over half a million acres) lies within the Los Padres National Forest. The coastal areas have a generally mild climate, with an average high temperature of 73 degrees Fahrenheit (°F) in July and an average January low temperature of 45 °F (Western Regional Climate Center web site at www.wrcc.dri.edu for Station 049285 Ventura, January 1900 to August 2013). Average rainfall in the coastal areas is 14.67 inches per year (Western Regional Climate Center web site at www.wrcc.dri.edu for Station 049285 Ventura, January 1900 to August 2013). Interior valleys without coastal influence have hotter summers (average high temperature of 93.20 °F in July) and cooler winters (average low temperature of 44.35 °F) but also modest average rainfall of 14.37 inches per year (California Irrigation Management Information System data provided from Station No. 219, Los Angeles region, September 2011 to November 2015 and Station No. 204, Los Angeles Region, January 2007 to August 2011).

The Region contains ~~three~~ four major watersheds (and part of the Cuyama River Watershed), smaller coastal watersheds, and 24 DWR-designated basins (see **Figure 10-1** and **Figure 10-2**). This background report has organized information according to the major watersheds: Ventura River, Cuyama, Santa Clara River, and Calleguas Creek. A small portion of the Malibu Creek Watershed falls in Ventura County. For the purposes of this document, this area is included with information on the Calleguas Creek Watershed. The Oxnard Plain, while not a watershed is an important water feature in the county and is given its own discussion in the text.

Ventura River Watershed

The Ventura River Watershed is located in the northwestern portion of Ventura County and drains an approximately 228-square mile (145,920 acres) area. The watershed extends 33.5 miles from the steep Transverse Ranges of the Matilija Wilderness to the Pacific Ocean. The Matilija, North Fork Matilija, San Antonio, and Cañada Larga are the major tributaries. The watershed is unique in that developed land makes up only 13 percent of the watershed area (Ventura River Watershed Council 2015). Approximately half of the Ventura River Watershed is Forest Service land. This means the upper portion of the Ventura River Watershed is minimally developed and has large areas with good water quality and excellent aquatic habitat. A 30-mile portion of the upper fork of Matilija Creek and its tributaries are designated as Wild and Scenic Rivers. Most of the southern half of the watershed lies within unincorporated Ventura County.

Precipitation in the Ventura River Watershed varies greatly between seasons and across years. There are notable cycles of drought and flood. Most of the precipitation is in the form of rain, but a small portion of the upper watershed experiences snow. Most precipitation occurs during just a few storms between November and March; summer and fall months are typically dry. Many parts of the Ventura River and its tributaries are dry during the summer and fall months (Ventura River Watershed Council 2015).

The cities of Ojai and Ventura are located in the Ventura River Watershed as are the unincorporated communities of Meiners Oaks, Mira Monte, Oak View, and Casitas Springs. Land uses in the watershed are as follows:

- Federal land/National Forest 47.7%
- Undeveloped land 29.8%
- Agriculture 18.5%
- Urban uses 4% (3.1% in cities, 0.9% in unincorporated County)

Commented [MJ7]: Should update with recent general averages. Since drought conditions have been in effect since 2012.

Formatted: Font: Bold

Formatted: Font: Bold

Surface Water

The major surface water features in the watershed are the Matilija Reservoir, Lake Casitas, and Ventura River.

Matilija Reservoir. Matilija Creek originates in the steep mountains in the northwest corner of the watershed and is considered the headwaters of the Ventura River. Matilija Dam captures the creek to create the Matilija Reservoir, which is owned by the Ventura County Watershed Protection District. Matilija Dam was built in the late 1940s for the purpose of providing irrigation water to the western Ojai Valley. Matilija Reservoir originally provided for 7,018 acre-feet (AF) of water storage. However, the storage capacity of the reservoir has been significantly reduced by sedimentation and is now estimated to be only about 6500 AF (Tetra Tech 2009). The majority of the sediment was deposited during a few big storm years (USACE 2004). Matilija Reservoir no longer provides any water supply benefit. ~~In fact, the dam is now considered an environmental liability. The dam prevents the natural flow of sand and sediment from the mountains to the beaches and it also blocks the endangered steelhead trout from upstream habitat. Since 1999, the Ventura County Watershed Protection District, in partnership with the US Bureau of Reclamation and the US Army Corps of Engineers, have evaluated means to remove the dam. The US Congress approved removal of the dam in 2007. However, dam removal efforts have been stalled by the complicated process of removing the sediment in the reservoir, while protecting fish and wildlife and by significant cost. Efforts to remove the dam are ongoing. In March 2016 the Dam Oversight Group completed an evaluation of three different dam removal concepts, including features to handle the estimated eight million cubic yards of sediment and mitigations for water supply, water quality, and fisheries.~~ ~~The next step is to develop a funding plan.~~

Lake Casitas. Lake Casitas, also called Casitas Reservoir, is the largest reservoir in the Ventura River Watershed, with a capacity of 254,000 AF. The approximate safe yield is 20,000 AFY. When full, the reservoir covers a surface area of 4.3 square miles and has 32 miles of shoreline. Source water for Lake Casitas is direct rainfall on the lake surface, local watershed runoff from Coyote and Santa Ana Creeks, and diversions of the Ventura River made through the Robles Diversion Facility. The lake is operated by the Casitas Municipal Water District (Casitas). The primary purpose of Lake Casitas is to supplement local groundwater. Local groundwater comes from mostly unconfined aquifers whose available supply varies greatly based on rainfall and streamflow conditions. In dry periods, local wells can go dry and water demands are then met using water from Lake Casitas. Casitas ~~Municipal Water District~~ is the primary and/or backup water supply for nine retail water purveyors and for some individual agricultural customers with groundwater wells (Casitas Municipal Water District 2016). Casitas Municipal Water District estimates that there are 70,288 persons within its service area and 8.4 square miles (~5,400 acres) of irrigated crops (Casitas Municipal Water District 2016).

Ventura River. The Ventura River gives its name to the watershed. The condition of the river varies widely over its journey from the mountains to the ocean. The river is typically categorized in five segments:

- The segment above Robles Diversion. Here the river is in steep and narrow terrain.
- The segment below Robles Diversion and above San Antonio Creek. This segment is less mountainous and has a gentle gradient. The Robles Diversion diverts from the west bank of the River. Below the diversion the river widens and becomes a braided channel. Until the confluence with San Antonio Creek, the river is commonly dry – about 80 percent of the time there is no significant flow in the section (Cardno-Entrix 2012).

Background Report

County of Ventura

- San Antonio Creek Confluence to Foster Park. Here the river again narrows. San Antonio Creek enters in this segment. In wet periods this portion of the river can also receive water from “daylighting” groundwater, where groundwater is forced to the surface as a result of geologic constriction near the downstream margin of the upper Ventura River basin. This reach typically flows year-round except in multiyear dry periods (Ventura River Watershed Council 2015).
- Foster Park to Ventura River Estuary. In this reach, the river receives treated effluent from the Ojai Valley Sanitation District wastewater treatment plant. The effluent is a significant input to river flow. Cañada Larga Creek, and several minor drainages (Manuel Canyon Creek, Cañada de San Joaquin, and Dent Drain) also enter in this segment (Ventura River Watershed Council 2015). In this portion of the river, the City of Ventura can divert surface water via subsurface collectors and shallow wells. The wells are located at Foster Park, upstream of the Ojai Valley Sanitation District point of discharge. Between 2010 and 2014, annual production by the City of Ventura from the Ventura River averaged 3,051 AFY.
- The Ventura River Estuary. The estuary is a shallow body of water where the Ventura River mixes with salt water. During the dry season a sandbar typically separates the estuary from the ocean; when storms breach the sandbar, the flow of the river directly enters the Pacific Ocean (Ventura River Watershed Council 2015).

Groundwater

There are four major groundwater basins in the Ventura River Watershed: ~~the~~ Upper Ojai (DWR Basin 4-00-1), Ojai Valley (DWR Basin 4-002), Upper Ventura River (DWR Basin 4-003.01), and Lower Ventura River (DWR Basin 4-003.02) (see **Figure 10-2**). These are unconfined groundwater basins and fluctuate greatly depending on ~~seasonal conditions~~ **precipitation**.

In 2014, DWR ranked California’s groundwater basins as “high-,” “medium-,” “low-,” or “very low-” priority. This ranking was based on the following:

- Overlying population
- Projected growth of overlying population
- Public supply wells
- Total number of wells
- Irrigated acreage overlying the basin
- Reliance on groundwater as the primary source of water
- Impacts on the groundwater; including overdraft, subsidence, saline intrusion, and other water quality degradation
- Other information determined to be relevant by Department of Water Resources

~~In this ranking process the~~ Ojai Valley ~~groundwater basin~~ and Upper Ventura River ~~groundwater~~ basins were deemed ~~high- and medium-~~ **priority, respectively** ~~basins. Dependency on groundwater in these basins is a primary ranking factor. The great dependency on groundwater in this area was a primary factor in the ranking.~~

The Ojai Valley ~~Groundwater~~ Basin is currently managed by the Ojai Basin Groundwater Management Agency (O~~Bjai Basin~~ GMA) and this agency will be the ~~GSA groundwater sustainability agency~~ under SGMA. The O~~Bjai Basin~~ GMA has submitted an Alternative to the GSP which demonstrates that the Ojai Basin is already being sustainably managed, in-lieu of preparing a GSP.

Casitas Municipal Water District, Meiners Oaks Water District, Ventura River Water District, the City of Ventura and the County of Ventura ~~are have started the process of forming the new groundwater sustainability agency~~ Upper Ventura River Groundwater Sustainability Agency for the Upper Ventura River ~~Groundwater~~ Basin.

Important Recharge Areas

In the Ventura River Watershed, groundwater basins are typically surrounded by steep, impermeable bedrock mountainous areas of impermeable bedrock. Recharge ~~primarily~~ occurs within the permeable unconsolidated deposits of gravels and sands ~~underlying within~~ stream channels ~~and tributaries~~.

In order to increase groundwater storage and recharge in the Ojai Valley ~~Groundwater~~ Basin, the San Antonio Spreading Grounds Rehabilitation Project was completed by the Ventura County Watershed Protection District in 2014 and final approval given in 2017 to divert creek flow. ~~It is anticipated the project will increase recharge to the basin by an average of 126 AFY.~~

Other Water Supplies

The Ventura River Watershed relies entirely on local water. No imported water is used ~~in the watershed or is readily accessible~~. Both Casitas ~~Municipal Water District~~ and the City of Ventura hold entitlements to State Water Project water (5,000 ~~and 10,000 AFY acre feet per year~~ [AFY] respectively). ~~however~~ ~~There are currently~~ no means ~~of~~ delivery of imported water to the watershed. ~~However,~~ ~~the~~ City of Ventura is ~~currently~~ evaluating options for delivery of those entitlements. ~~a report is due at the end of 2017.~~

Water Quality

~~As described in Section 10.2, the Los Angeles RWQCB has identified beneficial uses for the Ventura River Watershed.~~ **Table 10-2** is taken from the *Basin Plan for Coastal Watersheds of Los Angeles and Ventura Counties* and provides detail on beneficial uses for specific Ventura River reaches. The ~~Los Angeles LA~~ RWQCB has developed permit programs and the TMDLs to protect these beneficial uses. The following TMDLs are in place for portions of the Ventura River Watershed:

- Algae, Eutrophic Conditions, and Nutrients in the Ventura River including the Estuary and its Tributaries – TMDL effective June 28, 2013
- Ventura River Estuary Trash – TMDL effective March 6, 2008

In addition to the existing TMDLs, other TMDLs may be developed as several Ventura River Watershed areas are included in California’s 303(d) List (list of impaired waters). Identified impairments in the Ventura River and its tributaries include fish barriers and pumping/water diversion, total dissolved solids, aluminum, and mercury. Rincon Beach and the Ventura Harbor are listed for impairments due to bacteria. The Ventura Marina jetties are listed as impaired with DDT and PCBs.

* Asterisked MUN designations are designated under SB 88-63 and RB 89-03. Some destinations may be considered for exemption at a later date.

a: Waterbodies are listed multiple times if they cross hydrologic area or subarea boundaries. Beneficial use designations apply to all tributaries to the indicated waterbody, if not listed separately.

b: Waterbodies designated as WET may have wetlands habitat associated with only a portion of the waterbody. Any regulatory action would require a detailed analysis of the area.

c: Coastal waterbodies which are also listed in inland Surface Waters Tables (2-1) or in Wetlands Table (2-4).

e: One or more rare species utilizes all ocean, bays, estuaries, and coastal wetlands for foraging and/or nesting.

f: Aquatic organisms utilize all bays, estuaries, lagoons, and coastal wetlands, to a certain extent, for spawning and early development. This may include migration into areas which are heavily influenced by freshwater inputs.

g: Condor refuge.

Source: Table 2-1. Basin Plan for Coastal Watersheds of Los Angeles and Ventura Counties (electronic copy accessed December 27, 2016).

Available Water Supplies

The sources of water supply in the Ventura River watershed include surface water from Lake Casitas, Ventura River, and groundwater. Available surface water supplies (from Lake Casitas) are reported have been quantified by Casitas Municipal Water District (2020) as 99,836 AF. The City of Ventura draws approximately 20% of its water resources produced an average of 3,051 AFY from 2010 to 2014 from the Ventura River. It is estimated that private landowners may divert as much as 1,100 AFY from the Ventura River, but records are not available to confirm the long-term Ventura River surface water supply available to private users (SWRCB eWRIMS database).

Estimating groundwater supply is quite a bit more difficult. To understand long-term yield of a groundwater basin, recharge from precipitation must be estimated, recharge from irrigation and other return flows must be calculated, and underflow and outflows to and from adjacent groundwater basins must be assessed. There is not an accepted long-term yield for any of the groundwater basins in the Ventura River Watershed. However, the DWR has made rough estimates of groundwater “budgets” by evaluating available groundwater studies and past groundwater extractions. The VCWPD has also prepared estimates of groundwater use in various different basins. Groundwater use is only a rough estimate of supply. Groundwater extractions may include water recharged in the distant past and may not be representative of the long-term yield. Table 10-3 provides an estimate of supply by groundwater basin in the Ventura River Watershed. The difference in the high and low supply estimates document the lack of data on groundwater supply.

Formatted: Font: Bold

Commented [MJ8]: Present the data we have.

| Basin | DWR Estimate of Groundwater Budget (AFY) | Past Groundwater Extractions (AFY) | Notes |

| <i>High Estimate (rounded to nearest 100 AF)</i> | <i>44,400</i> |

Water Suppliers

There are five major water suppliers (entities serving more than 1,000 persons) in the Ventura River Watershed as well as 11 mutual water companies. ~~Persons or businesses in the Water is Ventura River Watershed are~~ also supplied by private wells and surface water diversions.

~~M~~The major urban suppliers, documented in **Table 10-5** provide water to the cities of Ojai and Ventura, and ~~also~~ to the unincorporated County. These are also mapped in **Figure 10-3**.

Formatted: Font: Bold

Formatted: Font: Bold

The 11 mutual water companies provide water to their stockholders and members. These mutual water companies ~~can~~ serve as few as 10 people and up to 800 persons. ~~M~~The mutual water companies, documented in **Table 10-6** provide water almost exclusively to residents and businesses in the unincorporated County (see ~~also~~ **Figure 10-3**).

Source: Ventura River Watershed Council 2015 Table 3.4.1.3.1

Private wells and water diversions serve the remaining agricultural and domestic water users ~~in the watershed~~. Twenty-one different entities are registered with the ~~SWRCB State Water Resources Control Boards~~ as having rights to withdraw surface water from the Ventura River Watershed (SWRCB 2014 cited in Ventura River Watershed Council 2015). There are ~~442 active wells~~ in the Ventura River watershed (Ventura River Watershed Council 2015). It is estimated that these private users extract as much as 2,100 AF (Hydrometrics 2015).

Commented [MJ9]: At the time.

Estimates of Water Demand

In 2014, the Ventura County Watershed Protection District undertook an estimate of countywide water demand. This effort used data from water agencies and groundwater reporting (where available). However large geographic areas of Ventura County are ~~served by~~ not served by a water agency, but rather private wells or surface water diversions. Also, not all groundwater production is reported. Further, the agricultural groundwater ~~extractions~~ production that ~~are~~ is reported ~~are~~ is not metered in many areas ~~and~~ but rather estimated from electrical use or crop type. ~~To fill in data gaps a~~ demand calculator was used ~~to fill in data gaps~~. In this case the Integrated Water Flow Model (IWFM) Demand Calculator developed by the ~~DWR~~ California Department of Water Resources was used. This is a non-proprietary model that computes water demands for cropped areas using ~~specified~~ climatic and irrigation information. The IWFM calculator also estimates urban water requirements and return flows based on population and per-capita water usage. The resulting report, *County of Ventura 2013 Water Supply and Demand*, estimates current demands for each of the major watersheds, including the Ventura River Watershed. Results of the study are provided in **Table 10-7**.

Formatted: Font: Bold

| Watershed/Sub-watershed | Total Agricultural Demand (AF) | Total Municipal Demand (AF) | Total Demand (AF) |
|---------------------------------------------|---------------------------------------|------------------------------------|--------------------------|
| Rincon | 5,727 | 1,848 | 7,575 |
| Ventura River | 11,745 | 13,351 | 25,096 |
| <i>Subtotal (rounded to nearest 100 AF)</i> | <i>17,500</i> | <i>15,200</i> | 32,700 |

Source: Hydrometrics 2015. Table 6.

Notable in Table 10-7 is the distribution of demands. Agricultural demand is estimated to be slightly higher than municipal demand.

Formatted: Font: Bold

Demand Management

Table 10-8 summarizes the various water conservation actions ~~undertaken~~ in the Ventura River Watershed. **Table 10-8** summarizes demand management measures ~~undertaken~~ under normal conditions as well as ~~those extra ordinary~~ efforts taken during drought periods. Conservation actions intensify during drought. ~~Most a~~ Agencies ~~continuously~~ provide public information on how to conserve water, however these efforts ~~increase~~ expand exponentially during dry periods. ~~During normal conditions a water provider may just provide public information on their website or billing inserts; during drought, the water provider is likely to take out radio advertisements, place roadway signs, and run conservation contests to bring attention to the drought. Many agencies offer water use surveys to customers upon customer request; during drought the water agencies contact high water users and offer water efficiency incentives.~~ The demand management measures undertaken during drought depend on the severity and length of drought. ~~In the beginning of a drought outdoor irrigation may be limited to 3 days a week, as drought continues outdoor watering may be restricted to one day a week or even prohibited all together.~~

Comparison of Supply and Demand

~~While it is difficult to quantify, it~~ is estimated that there is between ~~157,436~~~~37,700 AF to 44,400 AF~~ of annual water supply in the Ventura River Watershed. This supply will vary given drought and operational conditions. Estimated demand is approximately ~~14,508~~~~32,700 AF and is only about 13-percent greater than demand.~~

~~There are concerns about long-term supplies. SGMA could result in a need to reduce groundwater pumping.~~ Some water agencies in the Ventura River Watershed are evaluating projects to increase supply. ~~Several mutual water agencies that receive water from Casitas Municipal Water District have sent letters to Casitas Municipal Water District urging them to pursue options to bring imported water into the watershed.~~ The City of Ventura is pursuing additional use of recycled water, including indirect and direct potable reuse and is studying ocean desalination (City of Ventura 2016b).

Water-Related Challenges

Below are the water related challenges for the Ventura River Watershed as of ~~early 2020~~~~late 2016~~:

Drought and Supply Variability

The 70,000 people in western Ventura County have been impacted by ~~the~~ drought ~~conditions~~ that began in 2012. Due to lack of distribution infrastructure and required agreements, imported water cannot be delivered to western Ventura County and groundwater ~~supply~~ is very limited. Recharge to groundwater is primarily from Ventura River flow and smaller amounts from direct precipitation, percolation from lesser creeks and channels, and mountain ~~front~~ recharge. The groundwater in the area is relatively shallow and responds quickly to rainfall ~~or lack thereof~~. Wells operated by Meiners Oaks Water District have gone dry due to low water levels in the Ventura River and ~~they~~ are now entirely dependent on purchases of Lake Casitas water. Ventura River Water District ~~has only one of its four wells still in operation; operates six wells and~~ customer needs are ~~being~~ served through purchases of Lake Casitas water supplies. ~~Since 2011, purchases of Lake Casitas water have increased by 1,000 percent. The lake is an important, but dwindling, resource with both water quality and water supply concerns.~~

~~As of early 2020,~~ ~~the water level~~~~water volume~~ in Lake Casitas ~~is slightly above~~~~has dropped below~~ 40 percent of its “full” volume ~~since the onset of the drought in 2012~~. Low water levels in 1968 resulted in significant thermal stratification and anoxic (without dissolved oxygen) conditions, rendering the lake generally unsuitable for aquatic life. The low oxygen levels also created an environment where ~~manganese and hydrogen sulfide, normally trapped in sediments, became soluble, causing the lake~~ water to have ~~color and odor issues~~~~a brown color and bitter metallic taste~~. There were also large blue-green algae blooms (Casitas Municipal Water District 2013). Casitas Municipal Water District ~~has had~~ ~~to~~ installed a second lake aeration system to avoid anoxic conditions.

Mandatory drought reductions are in place for customers in the Ventura Watershed. Depending on the water supplier, customers need to reduce water use by up to 30 percent.

Revised Public Review Draft
January 2018

Section 10.4: Existing Conditions

Water for Environmental Purposes

As water agencies plan to rehabilitate infrastructure or develop more supply there ~~are potential~~ can be conflicts with protecting environmental resources ~~and demonstrates the influence laws and regulations, such as the Endangered Species Act, have on water resources.~~

The Robles Diversion is the facility that diverts Ventura River water to Lake Casitas. A “Biological Opinion,” (BO) written by the National Marine Fisheries Service includes requirements to provide flow for the migration and passage of the steelhead up and down the main stem of the Ventura River and past the diversion during the steelhead migration season (January 1 to June 30). Implementation of the flow release requirements of the BO started in 2005. The Robles Fish Passage Facility became operational in 2006. There is concern by Casitas Municipal Water District that future changes to the BO could require costly infrastructure and impact diversions to, and the water supply within, Lake Casitas.

In 2008, the City of Ventura began conducting studies of Ventura River flow conditions in order to operate its Foster Park facilities in a more sustainable manner. The City is working towards developing a pumping regime that will balance production demands with environmental concerns. Presently, the City has voluntarily adopted a production schedule that limits its pumping based on annual rainfall conditions. ~~Ventura Water intends to work with experts to ascertain a pumping regime that will balance production with environmental concerns and is presently studying the relationship between groundwater production and surface flows.~~

Quality

~~W~~In the Ventura River Watershed water quality is generally not an impairment for domestic water supply ~~to using water for domestic water supply. However, o~~Other beneficial uses such as fisheries-habitat, wildlife habitat, and recreation are negatively affected by water quality in the Ventura River. W~~The majority of~~ water quality problems involve eutrophication (excessive nutrients, nitrogen, and the resulting algae blooms) and affect the portion of the river from Foster Park to the Estuary. M~~The major~~ nitrogen contributors to the Ventura River are~~were~~ identified by the Los Angeles ARWQCB as: wet-weather runoff from urban areas, wet-weather runoff from horse/livestock land uses, wet-weather runoff from open space, and discharges from the Ojai Valley Sanitary District Wastewater Treatment Plant. The Algae TMDL was adopted by the LARWQCB ~~Los Angeles Regional Water Board in December 2012. The TMDL~~ sets limits on the amount of nutrients that can be discharged from various sources, and requires upgrades to the sewage treatment plant, and and requires widespread implementation of BMPs to limit fertilizer and animal waste and other sources of nitrogen ~~from the river.~~

Cuyama Watershed

~~Only~~Limited data is available on the portion of the Cuyama Watershed within Ventura County. The Cuyama Watershed originates in a remote mountainous area of Ventura County within the Los Padres National Forest, but also falls within Kern, Santa Barbara, and San Luis Obispo counties. DWR~~The California Department of Water Resources~~ has categorized the Cuyama Groundwater Basin as being in “critical overdraft” and a GSA~~groundwater sustainability agency~~ is being formed. Based on information from the United States Geological Survey (USGS), the critical overdraft conditions of the Cuyama Groundwater Basin reflect extractions and uses outside of Ventura County. The portion inside Ventura County is referred to as the Ventucopa Uplands (USGS 2014). The area is lightly populated, but is used for irrigated agriculture. The USGS estimates the groundwater supply in the Ventucopa Uplands to be approximately 22,000 AFY with domestic demands of only 8 AFY and agricultural demands of approximately 10,000 AFY. ~~Nevertheless, as a whole, the basin is in a condition of overdraft.~~

Oxnard Plain

The Oxnard Plain is an important geographic area for water resources (see **Figure 10-2**) and ~~The Oxnard Plain~~ supplies large amounts of groundwater for municipal users ~~including the county's largest city, Oxnard~~. It's estimated that the Oxnard Plain also supplies the water for more than half of the county's

Formatted: Font: Bold

\$2.2 billion agricultural industry (Ventura County Agricultural Commissioner 2016). The Oxnard ~~Plain Groundwater Basin is a~~ Subbasin ~~of the Santa Clara River Valley Groundwater Basin~~ (DWR Groundwater Basin Number 4-004.02). ~~The Oxnard Plain Groundwater Basin is~~ an alluvial basin containing a collection of interconnected aquifers separated by layers of clay strata. The ~~Oxnard Plain Groundwater Basin can be generally~~ subbasin is categorized into three parts: the Oxnard Forebay, the Upper Aquifer System (UAS) and the Lower Aquifer System (LAS).

Formatted: Right: 0.32", Space Before: 11.9 pt

The Oxnard Forebay is the unconfined portion of the ~~subbasin Oxnard Plain Basin~~ generally located along the Santa Clara ~~ita~~ River northeast of where the Pacific Coast Highway joins U.S. Highway 101 in the City of Oxnard. ~~The Oxnard Forebay is the primary means by which the Oxnard Plain Groundwater Basin is recharged.~~ The ~~subbasin Forebay Basin~~ is recharged by infiltration from ~~the riverbed of the~~ Santa Clara River and spreading basins ~~constructed for that purpose~~. ~~From the Oxnard Forebay, located in the upper most portion of the Oxnard Plain Basin,~~ groundwater moves into the Upper and Lower Aquifer Systems because the clay layers which separate the aquifers are not continuous ~~at this location~~.

The ~~Upper Aquifer System (UAS)~~ comprises of the upper 500 feet of the confined portions of the Oxnard ~~Subbasin Plain Basin and~~ which includes a semi-perched zone and the Oxnard and Mugu aquifers. The UAS is hydraulically connected to the Pacific Ocean through the Oxnard and Mugu aquifers and is the route by which seawater ~~intrusion~~ enters the ~~subbasin Oxnard Plain Basin~~. The ~~Lower Aquifer System (LAS)~~ ~~includes the deeper confined aquifers~~ includes the Hueneme, Fox Canyon, and Grimes Canyon aquifers. The LAS is separated by an approximately 80-foot thick layer of silty clay which is continuous except near the ~~Oxnard~~ Forebay.

Because of its importance as a water source, there is ~~great~~ concern about the health of the Oxnard ~~Subbasin Plain basin~~. ~~The FCGMA~~ In fact, the Fox Canyon Groundwater Management Agency (Fox Canyon GMA) was formed in 1982 to control groundwater overdraft and ~~to minimize the threat of~~ seawater intrusion ~~in the Oxnard Plain~~. ~~A major goal of the F~~ Fox Canyon GMA is to regulate ~~s~~ groundwater from the Oxnard ~~Subbasin~~ and ~~operate the basin~~ at a safe yield. ~~However, today~~ DWR has characterized the basin as being in "critical overdraft". Evidence suggests that groundwater ~~underlying~~ in the Oxnard Plain dropped below sea level as early as the 1940s. The annual overdraft is estimated to be 20,000 to 25,000 AFY (UWCD 2017b). This continued overdraft allows seawater intrusion and puts the area at risk of land subsidence.

Santa Clara River Watershed

The Santa Clara River headwater is at Pacifico Mountain in the San Gabriel Mountains and ~~it flows in a~~ ~~generally western direction~~ for approximately 84 miles through Tie Canyon, Aliso Canyon, Soledad Canyon, the Santa Clarita Valley, the Santa Clara River Valley, and the Oxnard Plain before discharging to the Pacific Ocean near the Ventura Harbor. The Santa Clara River and tributary ~~iesy system~~ ~~haves~~ a watershed area of about 1,634 square miles (~1,000,000 acres). ~~Approximately 40 percent of the~~ watershed is in Los Angeles County, with the remaining 60 percent in Ventura County. The Santa Clara River is unique in that it is the largest river system in Southern California ~~remaining~~ in a relatively natural state.

The climate of the Santa Clara River watershed is characterized by long, dry periods and a relatively short wet winters. Near the coast, cool moist ocean winds produce moderate temperature; summer highs average 74°F, winter lows average 44 °F, and frost is rare (Western Regional Climate Center Station 0492852 Ventura). Inland temperatures can exceed 110 °F in the summer and drop below freezing in the winter (Western Regional Climate Center Station 047957 Santa Paula). Precipitation is generally in the form of winter storms, thunderstorms, and tropical cyclones. Approximately 75 percent of the annual precipitation occurs from December through March. The mean seasonal precipitation varies from about 40 inches in the mountainous areas of the watershed, to about 18 inches in the Piru and Fillmore areas (Western Regional Climate Center Stations 046940 Piru ESE and Station 043050 Fillmore WNW) and under 15 inches at the coast (Western Regional Climate Center Station 049285 Ventura).

The cities of Fillmore, Santa Paula, Oxnard, and Ventura are located in the watershed as are the communities of Piru, Bardsdale, Saticoy, and El Rio. Land uses in the Ventura County area of the watershed are as follows:

- Agriculture 42%
- Open Space 27%
- Urban Uses 26%
- Other (urban reserve, open space reserve, harbor) 5%

Surface Water

The major surface water features in the watershed are the Lake Piru Reservoir and the Santa Clara River.

Lake Piru Reservoir. The construction of Santa Felicia Dam on Piru Creek in 1955 created the Lake Piru Reservoir for the purpose of recharging groundwater. The reservoir can store approximately 82,000 AF (UWCD 2016). The reservoir receives winter runoff from local drainages and can receive imported SWP water from Pyramid Lake. Water from Lake Piru is released into Piru Creek and flows to the Santa Clara River where it is joined by runoff from Sespe and Santa Paula Creeks. The releases are used to replenish underground aquifers, and water is made available to municipalities, industry, and agriculture (UWCD 2016). Lake Piru is operated by United Water Conservation District (UWCD). Generally, UWCD schedules a fall conservation release from Lake Piru to recharge both the Piru and Fillmore Subbasins. The remaining portion of the flows are diverted at the Freeman Diversion for recharge in the Oxnard Forebay area and distribution to agricultural users.

However, drought and low inflow into Lake Piru will prevent UWCD from performing conservation releases in some years. Operation of the Santa Felicia Dam is regulated by the Federal Energy Regulatory Commission (FERC). The FERC license to operate Santa Felicia Dam has many requirements for structural safety, public safety, water quality, recreational opportunities and protection of biological resources. Specific FERC license requirements include releasing water to allow migration of steelhead in Piru Creek and portions of the Santa Clara River (dependent on river conditions), as based on the applicable to the National Marine Fisheries Service biological opinion.

Santa Clara River. Due to climatic and geologic factors, streamflow in the Santa Clara River can be described as interrupted perennial: with alternating perennial reaches and intermittent (summer dry) reaches influenced by surface and water-groundwater interactions (SFEI 2011). Flow is supplemented by releases from Lake Piru Reservoir and tributary inflows from tributaries. About 10 miles from the River mouth, UWCD can divert water at the Freeman Diversion for recharge of the Oxnard Subgroundwater basin. Several mutual water companies operate small diversions located on Piru Creek, Sespe Creek,

Background Report

County of Ventura

and the Santa Clara River for agricultural irrigation; ~~the amount of water diverted at these locations are unknown~~ (Ventura County Watershed Protection District 2015b). In the past, several wastewater treatment plants discharged to the Santa Clara River. With the exception of the City of Ventura, most wastewater treatment facilities have been upgraded and now percolate treated effluent to groundwater rather than releasing water to the Santa Clara River (Ventura County Watershed Protection District 2015b). ~~The wastewater treatment facilities are permitted to discharge effluent via WDR from the LARWQCB.~~ The City of Ventura currently discharges to the Santa Clara River Estuary but is actively studying ways to increase recycled water use in a manner protective of the Santa Clara River Estuary (City of Ventura 2016b).

Groundwater

The Santa Clara River Valley Basin is the primary basin underlying the Ventura County portion of the Santa Clara River Watershed. This basin is subdivided into sub-basins: Piru (DWR Basin No. 4-004.06), Fillmore (DWR Basin No. 4-004.05), Santa Paula (DWR Basin No. 4-004.04), Mound (DWR Basin No. 4-004.03), and Oxnard (DWR Basin No. 4-004.02). All groundwater basins/subbasins in the Ventura County portion of the Santa Clara River, with the exception of the Santa Paula SubbBasin (which is adjudicated) are subject to SGMA. ~~As described earlier, in 2014, the California Department of Water Resources ranked California's groundwater basins as "high," "medium," "low," or "very low" priority. In this ranking process, the Oxnard and Piru groundwater subbasins were deemed "high"-priority and the Fillmore, Santa Paula, and Mound subbasins deemed "medium"-priority basins. The heavy great dependency on groundwater in these areas is was a primary factor in the ranking. The Oxnard basin was also listed as being in "critical overdraft."~~

~~Stakeholders have met to discuss forming the necessary groundwater sustainability agency for the Piru, Fillmore, and Mound basins. As of the preparation of this background report, no formal notification of groundwater sustainability agency formation has been filed with the Department of Water Resources for those basins.~~

The ~~Fox Canyon~~ GMA ~~is selected to be the GSA groundwater sustainability agency~~ under SGMA for the basins within its ~~Fox Canyon GMA~~ boundaries ~~which includes~~ the Oxnard Subbasin.

Imported Supplies

In 1964, the Ventura County Flood Control District (~~currently the Ventura County Watershed Protection District VCWPD~~) contracted with the ~~DWR State of California Department of Water Resources~~ for a SWP allocation of 20,000 ~~-AF~~. ~~Currently~~, the City of Ventura has an allocation of 10,000 ~~-AF~~, Casitas Municipal Water District has an allocation of 5,000 ~~-AF~~, and UWCD has an allocation of 5,000 ~~-AF~~. Port Hueneme Water Agency uses 1,850 ~~-AF~~ of UWCD's entitlement ~~and but~~ receives the water through Calleguas Municipal Water District. ~~The SWP contract expires in 2035 but negotiations are underway to extend the contract.~~ Up to 3,150 ~~-AF~~ of SWP water is permitted to be released from Pyramid Lake and sent to Lake Piru.

From 1991 to 2013 the total SWP delivery has been 34,212 AF and SWP has not been purchased or delivered in every year (Ventura County Watershed Protection District 2015b). The amount of SWP water allocated in each year depends on availability; and delivery is only allowed from November 1

Water Resources

2040 General Plan

10

through the end of February (Ventura County Watershed Protection District 2015b). In addition, UWCD has periodically entered into annual agreements with Casitas Municipal Water District and the City of

Ventura to purchase a portion of their unused SWP allocation. According to UWCD “The purchase of SWP water will be considered by United annually on an as-need basis” (UWCD 2016).

In addition to the SWP supplies delivered to Lake Piru Reservoir, the City of Oxnard purchases imported water from Calleguas Municipal Water District. During the period from 1991-2013 direct deliveries of SWP water to the Oxnard area were 316,000 AF – nearly 10 times the amount of water delivered to Lake Piru. These supplies are ~~in turn~~ provided to the Channel Islands Beach Community Services District, the City of Port Hueneme, and Naval Base Ventura County, via the Port Hueneme Water Agency.

~~At this time~~ the City of Ventura does not have the ~~infrastructure facilities~~ needed to deliver SWP water into its distribution system. ~~However,~~ Ventura is ~~currently~~ working with Calleguas Municipal Water District and others on a potential ~~plans~~ ~~reject~~ to bring SWP allocation to the City’s system.

Other Supplies

Several water agencies in the Santa Clara River Watershed produce and deliver recycled water, including ~~the following:~~

- ~~• The City of Fillmore,~~
- ~~• City of Oxnard, and~~
- ~~▪ City of Ventura~~

Water Quality

The ~~e Los Angeles LA~~ RWQCB has identified beneficial uses for the Santa Clara River Watershed as detailed in ~~Table 10-9~~. Permit programs and TMDLs have been developed to protect these beneficial uses. The following TMDLs are in place for portions of the Santa Clara Watershed:

- ~~▪ Bacteria in the Santa Clara River Estuary and Reaches 3 (area between Fillmore and Saticoy), 5 (Los Angeles County and eastern 4,500 feet of Santa Clara River within Ventura County), 6 (Los Angeles County), and 7 (Los Angeles County) – TMDL effective March 21, 2012~~
- ~~▪ Chloride in the Santa Clara River Reach 3 (area between Fillmore and Saticoy) – TMDL effective June 18, 2003~~
- ~~▪ Chloride in the Upper Santa Clara River (only a small portion lies within the county) – TMDL effective April 28, 2015~~

In addition to the existing TMDLs, other TMDLs may be developed as several Santa Clara Watershed areas are included in California’s 303(d) List. Identified impairments in the Santa Clara River and its tributaries include chloride, pH, boron, sulfates, total dissolved solids, toxicity, as well as multiple chemicals generally referred to as “Chem A”. The McGrath Beach area is ~~considered to be~~ impaired by coliform bacteria and toxic sediments.

E: Existing beneficial use
 P: Potential beneficial use
 I: Intermittent beneficial use
 E, P, and I: shall be protected as required
 * Asterisked MUN designations are designated under SB 88-63 and RB 89-03. Some destinations may be considered for exemption at a later date.

a: Waterbodies are listed multiple times if they cross hydrologic area or subarea boundaries. Beneficial use designations apply to all tributaries to the indicated waterbody, if not listed separately.
 b: Waterbodies designated as WET may have wetlands habitat associated with only a portion of the waterbody. Any regulatory action would require a detailed analysis of the area.
 g: Condor refuge.
 j: Out of service.

Source: Table 2-1. Basin Plan for Coastal Watersheds of Los Angeles and Ventura Counties (electronic copy accessed December 27, 2016).

Available Supplies

The sources of water supply in the Santa Clara River Watershed include surface water, imported water, groundwater, and recycled water. A total estimate of supply in the Santa Clara Watershed is provided in Table 10-11.

Formatted: Font: Bold

Surface Water

UWCD collects and releases surface water at Santa Felicia Dam/Lake Piru. The purpose of this water and subsequent releases from the dam are to replenish the Piru, Fillmore, and Santa Paula Subbasins, and to provide flows to benefit facilities receiving water from the Freeman Diversion. Releases since 1999 averaged 28,369 AFY with an annual minimum of zero and a maximum of 47,400 AF, dependent on rainfall that year seasonal conditions and environmental bypass flow requirements (UWCD 2014). UWCD estimates that approximately ten percent of the water released from Santa Felicia Dam is delivered to agricultural users in the Calleguas Creek Watershed via the Pumping Trough Pipeline (PTP) and Pleasant Valley Pipeline. UWCD also has a right to divert Santa Clara River flows at the Freeman Diversion. In recent years UCWD has diverted between 2,500 AF (in 2015) and 94,000 AF (in 2011) at this location (UWCD 2017b). Water diverted in this location is used for both artificial recharge – the primary source of recharge to the Oxnard coastal plain – and direct delivery to agricultural users. To avoid over counting supplies, surface water used for recharge is not counted as a supply in this report.

It is estimated that private landowners may divert as much as 880 AFY from the Santa Clara River, but records are not available to confirm the long-term Santa Clara River surface water supply available to private users (SWRCB eWRIMS database).

Imported Water

Since 1991, UWCD has received from 0 up to 4,047 AF of imported SWP water in any given year with an average of 1,487 AFY.

DWR prepares a biennial report to assist SWP users and local planners in assessing the near- and long-term availability of supplies from the SWP. DWR issued its most recent update, the 2017 DWR State Water Project Delivery Capability Report (DCR), in March July 2018. In the 2017 update, DWR provides SWP supply estimates for SWP contractors to use in their planning efforts. The 2015 DCR includes DWR’s estimates of SWP water supply availability under both current and future conditions. The DCR estimates that UWCD on average, will receive between 45 and 70 percent of its allocation, depending on implementation of California Water Fix (SWP Delivery Capability Report, Existing Conditions January 2018, Table D.31 and Alternative 4 H3 Scenario Table F.31).

10-43

The imported water acquired by UWCD is intermingled with surface water at Lake Piru and released for groundwater recharge. It is not possible to track UWCD’s imported water separate from surface water, any discussion on Direct surface water deliveries and groundwater recharge by UWCD may include a small component of SWP water.

Besides UCWD, the City of Oxnard receives imported water within the Santa Clara River Watershed. The City of Oxnard receives imported water from Calleguas Municipal Water District (Calleguas), who is a member agency of the Metropolitan Water District of Southern California (MWD), a wholesale supplier of State Water Project water. In 2018 the City of Oxnard purchased 45% 42,187 of total supply AF from Calleguas and, in the

Background Report

County of Ventura

~~future (2020-2040) the City anticipates receiving 11,826 AF (47% of imported water from Calleguas in 2020 (Oxnard 2016).~~

Groundwater

~~Estimating groundwater supply is a difficult and time-consuming process and must take into account not only basin configuration, underflow, and weather, but other management practices such as volume of applied water and recharge operations. There is not an accepted long-term yield for groundwater in the Santa Clara Watershed. As part of the SGMA process stakeholders will evaluate long-term sustainable yield. Table 10-10 presents a high-level estimate of available supply groundwater based on available data. The difference in the high and low supply estimate documents the lack of data or consensus on groundwater supply.~~

Recycled Water

Ventura County Waterworks District No. 16 (VCWWD 16) plans to construct a tertiary treatment upgrade for the existing Piru Wastewater Treatment Plant to mitigate high chloride and comply with LARWQCB WDRs. After tertiary treatment, effluent from the Piru Wastewater Treatment Plant will meet California Code of Regulations, Title 22 requirements for unrestricted recycled

~~Water.~~ ~~And~~ approximately 500 AFY will be available for use as a new, lower cost irrigation supply for up to 1 square mile (640 acres) of nearby agricultural property. This supply is anticipated ~~in before~~ ~~year~~ 2020. In the meantime, treated effluent is discharged to percolation basins.

The City of Fillmore completed a recycled water plant in 2009 and distributes approximately 2,000 AFY of reclaimed water to parks and school fields and ~~for~~ groundwater percolation ~~basins~~ (Hydrometrics 2015, Fillmore 2016).

The City of Santa Paula utilizes its recycled water for groundwater recharge. To avoid over counting, Santa Paula's recycled water supply is categorized as a groundwater supply.

The City of Oxnard has been pursuing a recycled water program for more than 10 years. The City has constructed an Advanced Water Purification Facility (AWPF) as well as extensive transmission pipelines for the recycled water system. As of 2015 the AWPF has the capacity to produce 7,000 AFY ~~and; but in 2015~~ delivered only 605 AF ~~in 2015~~. The City is actively pursuing users for its recycled water including landscape irrigation of parks, schools, golf courses and residential common areas. The City has entered into an agreement with agricultural users in the Oxnard Plain to provide recycled water ~~when available~~. ~~The pipeline to serve the Oxnard Plain is planned for completion in the future.~~ Oxnard anticipates putting between 7,000 up to 14,000 AFY of recycled water to beneficial use ~~starting in 2020 in the next 10 years~~.

The City of Ventura has access to recycled water supply through the Ventura Water Reclamation Facility. ~~The Currently, the Ventura Water~~ Reclamation Facility discharges most of its tertiary treated effluent to the Santa Clara River Estuary with approximately 700 AFY diverted as recycled water for landscape irrigation by several users along the City's recycled water pipeline alignment. In the next ten years the City of Ventura intends to increase the amount of recycled water delivered to irrigation customers and is examining direct potable use of recycled water. The City of Ventura service area includes ~~areas portions~~ in both the Ventura and Santa Clara watersheds, but the recycled water supply is being accounted for in the Santa Clara watershed.

| TABLE 10-11 CURRENT (2016) ESTIMATE OF SUPPLY SANTA CLARA RIVER WATERSHED | |
|---------------------------------------------------------------------------------|--------------------|
| Supply Source | Annual Volume (AF) |
| Surface Water, Santa Clara River ¹ | 0 |
| Imported Water, City of Oxnard from Calleguas ¹ | 12,000 |
| Recycled Water | 10,200 to 19,700 |
| Groundwater (see Table 10-10) | 136,400 to 171,000 |
| Low Estimate (rounded to nearest 100 AF) | 158,400 |
| High Estimate (rounded to nearest 100 AF) | 202,700 |

1. UWCD directly delivers approximately 12,000 AFY to agricultural users in the Calleguas Creek Watershed. This water is diverted in the Santa Clara Watershed but is a supply in the Calleguas Creek Watershed.

Water Suppliers

There are six major water suppliers (entities serving more than 1000 persons) in the Ventura County portion of the Santa Clara River Watershed as well as 74 smaller water systems and irrigation companies. Persons or businesses in the Watershed are also supplied by private wells and surface water diversions. The major urban suppliers, documented in **Table 10-12** provide water to the cities but also to the unincorporated County. These are also mapped in **Figure 10-4**.

Section 10.4: Existing Conditions
10-46

Estimate of Demand

~~As described previously, in 2014, the VCWP Ventura County Watershed Protection District~~ undertook an estimate of Countywide water demand, documented in the County of Ventura 2013 Water Supply and Demand (January 2015). Results of the study for the Santa Clara Watershed are provided ~~Table 10~~.

Formatted: Font: Bold

| Watershed/Sub-watershed | Total Agricultural Demand (AF) | Total Municipal Demand (AF) | Total Demand (AF) |
|---------------------------------------------|---------------------------------------|------------------------------------|--------------------------|
| Hall Canyon/Arundel | 815 | 9,924 | 10,739 |
| Ormond Beach | 2,797 | 22,913 | 25,710 |
| Santa Clara River | 114,919 | 31,284 | 146,203 |
| <i>Subtotal (Rounded to nearest 100 AF)</i> | <i>118,500</i> | <i>64,100</i> | 182,600 |

Source: Hydrometrics 2015. Table 6.

~~Notable in Table 10~~ is the distribution of demands. Agricultural demand is estimated to be significantly higher than municipal demand.

Demand Management

~~Table 10~~ summarizes the various water conservation ~~efforts~~ ~~actions undertaken~~ in the Santa Clara River Watershed. ~~It Table 10~~ summarizes demand management measures ~~undertaken~~ under normal conditions and ~~those extra ordinary additional~~ efforts taken during drought periods.

Formatted: Font: Bold

Comparison of Supply and Demand

~~While it is difficult to quantify, it~~ is estimated that there is an annual supply of 158,400 AF to 202,700 AF in the Santa Clara Watershed. ~~This supply of course will vary given drought and operational conditions.~~ Estimated demand is approximately 182,600 AF and is outpacing the low-end estimate of annual supply. The high-end estimate of supplies assumes increased recycled water use, ~~the timing of which is uncertain. If the higher supply is achieved, supply could be a little less than 10 percent greater than demand.~~

Water-Related Challenges

Below are the water related challenges for the Santa Clara River Watershed as of late 2016:

**TABLE 10-14
DEMAND MANAGEMENT MEASURES IN SANTA CLARA RIVER WATERSHED**

| Agency | Conservation Measures in Effect at All Times | | | | | | | Conservation Measures that May Be Implemented in Drought | | | | |
|------------------------------------|----------------------------------------------|--------------------------|----------|----------------------|-----------------------------------------------|-----------------------------------------------|-------------------------|----------------------------------------------------------|--------------------------------------------|---------------------------------|-------|-------------------------------------|
| | Public Information and Outreach | Water Waste Prohibitions | Metering | Volume-Based Pricing | Water Efficiency Surveys Offered to Customers | Rebates for High Efficiency Plumbing Fixtures | Turf Removal Incentives | Drought Surcharge | Limitations on Irrigation/Outdoor Watering | Mandatory Reductions/Allocation | Fines | Suspension of new water connections |
| City of Fillmore | | X | X | X | | | | X | X | | | |
| City of Oxnard | X | X | X | X | | X | X | | X | X | X | X |
| City of Santa Paula | X | X | X | X | | | | | X | | | |

| United Water Conservation District | X | | X | X | | | | | | X* | X | |

*UWCD's groundwater allocation is subject to the Fox Canyon GMA. In the event of reductions from FCGMA, UWCD informs their retail agencies of the reductions.
Sources: City of Oxnard 2016; City of Ventura 2016b; United Water Conservation District 2016.

Coastal Groundwater Overdraft

~~As described earlier,~~ groundwater ~~underlying~~ the Oxnard Plain dropped below sea level as early as the 1940s. Overdraft conditions now persist in the southern and eastern portions of the ~~Oxnard~~ Plain ~~and~~, the annual overdraft is estimated to be 20,000 to 25,000 AFY (UWCD 2017b). ~~The is~~ ~~continued~~ ~~o~~verdraft allows ~~for~~ seawater intrusion and puts the area at risk of land subsidence.

Sea Water Intrusion

~~The~~ Low water levels ~~underlying~~ the Oxnard Plain allow ~~for~~ seawater ~~(chloride) intrusion to enter~~ into freshwater aquifers. The USGS and UWCD have documented the inland movement of seawater adjacent to the Hueneme and Mugu submarine canyons.

Water for Environmental Purposes

UWCD diverts Santa Clara River water at the Freeman Diversion to recharge groundwater basins and for direct delivery to agricultural users. UWCD provides bypass flows at the Freeman Diversion for the upstream and downstream migration of ~~S~~southern California Steelhead. In July 2008, the National Marine Fisheries Service (NMFS) issued a final Biological Opinion (BO) that concluded ~~that~~ operations at the Freeman Diversion were likely to jeopardize the continued existence of ~~S~~southern California Steelhead in the Santa Clara River. UWCD is ~~currently~~ developing a multi-species habitat conservation plan and is in consultation with NMFS. The resulting bypass flows are unknown, but it is estimated that the current bypass flow regime has decreased diversions (and hence water supply) by up to 22,500 ~~AFY~~, though this is highly variable from year to year (personnel communication, Robert Richardson, United Water Conservation District).

Quality

~~The Los Angeles~~ RWQCB has identified the Santa Clara River, downstream of Piru Creek, as having water quality impairments related to bacteria. ~~The Los Angeles RWQCB has identified r~~unoff from residential, industrial, and commercial areas ~~is identified as~~ the source of ~~the~~ bacteria. This includes fertilizer used for lawns and landscaping, organic debris from gardens, landscaping, and parks; trash such as food wastes; domestic animal waste; and human waste from areas inhabited by the homeless. The indicator bacteria point to the potential contamination of the Santa Clara River by pathogens or disease producing bacteria or viruses. Some waterborne pathogenic diseases include ear infections, dysentery, typhoid fever, viral and bacterial gastroenteritis, and hepatitis A. Elevated bacteria levels are an indicator that a potential health risk exists for individuals exposed to this water and therefore limit the recreational uses of the Santa Clara River.

Calleguas Creek Watershed

The Calleguas Creek Watershed is located in the southeastern portion of Ventura County and drains an ~~area of~~ approximately 343 ~~square mile~~ (219,520 acres) ~~area~~. The Santa Susana and Oak Ridge Mountains form the northern boundary ~~and~~; the southern boundary is delineated by the Simi Hills and Santa Monica Mountains. Major creeks and rivers include the Conejo Creek, Arroyo Simi, Arroyo Las Posas, Arroyo Santa Rosa, Calleguas Creek, Revolon Slough; and Mugu Lagoon.

Long-term monitoring by the ~~VCWPD~~ ~~Ventura County Watershed Protection District~~ shows that the Calleguas Creek Watershed cycles through wet and dry periods and does not have a ~~common~~ “normal” ~~season period~~.

Precipitation is in the form of rain and about 85 percent of the rainfall occurs from November to March (Calleguas Creek Steering Committee 2004). Near the coast, cool moist ocean winds moderate temperature with a summer high average of 64°F and winter low average of 53 °F (Calleguas Creek Steering Committee 2004). Inland temperatures can exceed 106 °F in the summer and drop below freezing in the winter (Western Regional Climate Center Station 048904 Thousand Oaks 1 SW).

The watershed includes the cities of Oxnard (portion), Port Hueneme, Camarillo, Moorpark, Simi Valley, Thousand Oaks, and unincorporated areas of Ventura County. According to the ~~WCV Watersheds Coalition of Ventura County~~ (2014), land uses in the watershed are as follows:

- Undeveloped land 50%
- Agriculture 25%
- Urban uses 25%

Surface Water

The major surface water features in the watershed are Lake Bard, the Arroyo Simi/Arroyo Las Posas/Calleguas Creek system, Conejo Creek system, and Honda Barranca/Beardsley Wash/Revolon Slough system.

Lake Bard. Lake Bard is an approximately 10,500--AF surface water reservoir constructed to store treated water from the Metropolitan Water District of Southern California. This water is used to meet emergency demands. Lake Bard is operated by Calleguas Municipal Water District (Calleguas Municipal Water District 2016).

Arroyo Simi/Arroyo Las Posas/Calleguas Creek. This series of creeks drain precipitation and urban runoff from the Simi Valley, the eastern Las Posas Valley, much of Pleasant Valley, and the eastern portion of the Oxnard Plain. In addition to precipitation and urban runoff, the Arroyo Simi also carries discharges from a series of dewatering wells operated by the City of Simi Valley and as well as treated effluent from the Simi Valley Water Quality Control Plant. Under certain conditions the Ventura County Waterworks District #1 Moorpark Wastewater Treatment and the Camrosa Water District Water Reclamation Facility may discharge effluent into Calleguas Creek (Calleguas Creek Steering Committee 2004).

Conejo Creek System. The Arroyo Santa Rosa, Arroyo Conejo, and Conejo Creek make up this drainage system. The Santa Rosa Valley, a portion of Pleasant Valley, Tierra Rejada Valley and the City of Thousand Oaks are drained by this system. This system carries precipitation, agricultural runoff, and effluent from the Hill Canyon Wastewater Treatment Plant and Camarillo Sanitary District Wastewater Reclamation Plant.

The Honda Barranca/Beardsley Wash/Revolon Slough. The western portion of the Las Posas valley, a portion of Pleasant Valley and a portion of the Oxnard Plain are drained by the Honda Barranca/Beardsley Wash/Revolon Slough. The majority of flow comes primarily from agricultural and storm water drainage (Calleguas Creek Steering Committee 2004).

Groundwater

There are multiple groundwater basins within the Calleguas Creek Watershed. These include the, Pleasant Valley Basin (DWR Basin 004-06), Arroyo Santa Rosa (DWR Basin 004-07), Las Posas Valley

(DWR Basin 4-008), Simi Valley (DWR Basin 4-009), ~~Tapo/Gillibrand (a portion of DWR Basin 4-009), and Tierra Rejada (DWR Basin 4-015). Several smaller basins also exist in the watershed but provide only a minor amount of supply due to low production or poor water quality (less than 500 AFY each basin).~~ As part of SGMA, the Pleasant Valley and Las Posas groundwater basins were deemed “high” priority ~~and the Arroyo Santa Rosa Valley deemed a “medium” priority basin.~~ The great dependency on groundwater in this area was a primary factor in the ranking. The Pleasant Valley basin was also listed as being in “critical overdraft.”

Formatted: Right: 0.09", Space Before: 4.55 pt

~~As described earlier,~~ The Fox Canyon C-GMA was created by state legislation in 1982 to manage local groundwater basins and resources in an ~~effort~~ manner to reduce overdraft of the Oxnard S~~ub~~basin and to stop seawater intrusion. ~~Besides the Oxnard subbasin, the Fox Canyon. The FCGMA has also~~ elected to be the ~~GSA groundwater sustainability agency~~ under SGMA for the Pleasant Valley and Las Posas Valley ~~B~~basins, ~~as well as the portion of the Arroyo Santa Rosa Basin within Fox Canyon GMA boundaries.~~

The Arroyo Santa Rosa Basin GSA, organized in 2016 under a Joint Powers Agreement between the Camrosa Water District and the County of Ventura, with participation from the City of Camarillo, has elected to become the ~~GSA groundwater sustainability agency~~ for the portion of the Arroyo Santa Rosa Groundwater Basin east of the Bailey Fault, outside of the ~~F~~Cox Canyon GMA jurisdiction.

Important Recharge Areas

Important recharge areas for the groundwater basins in the Calleguas Watershed include the Oxnard Forebay ~~area~~ of the Oxnard Plain ~~(described earlier)~~, Calleguas Creek, small tributary stream channels and drainages from the surrounding mountain fronts, and areas of bedrock outcrops (USGS 2003). In addition, Calleguas Municipal Water District conducts artificial recharge through injection of imported water in the East Las Posas Basin, as part of the Las Posas Aquifer Storage and Recovery (ASR) Project.

Imported Supplies

Calleguas Municipal Water District is a wholesale water provider for the Calleguas Creek Watershed and portions of the Santa Clara River Watershed on the Oxnard Plain. Calleguas distributes the water supplies to its 19 retail purveyors through 140 miles of pipeline operated and maintained by Calleguas. Calleguas is a member agency of the MWD. Calleguas anticipates receiving approximately 122,000 ~~-AF~~ imported water from MWD each year, ~~starting in 2020, but this will vary depending on climatic conditions, regulatory conditions and regional demands.~~ 86,971 ~~-AF~~ of imported water was supplied in 2015.

Other Supplies

~~Within the Calleguas Creek Watershed,~~ Camrosa Water District ~~produces and delivers recycled water~~ in conjunction with the City of Thousand Oaks, the City of Camarillo, Ventura County Waterworks District 8 (City of Simi Valley), Ventura County Waterworks District 1 (Moorpark), ~~produce and deliver recycled water.~~ In addition, recycled water produced by the Tapia Water Reclamation Facility in the Malibu Creek Watershed is delivered to users within the Conejo Valley.

Water Quality

The Los Angeles RWQCB has identified beneficial uses for the Calleguas Creek Watershed as well as its tributaries and industrial channels in the area as documented in **Table 10-15**. The following TMDLs are in place for portions of the Calleguas Creek Watershed:

Formatted: Font: Bold

- Calleguas Creek, Its Tributaries and Mugu Lagoon Metals and Selenium – approval of TMDL by SWRCB and US EPA pending.
- Calleguas Creek Salts – TMDL effective December 2, 2008
- Revolon Slough and Beardsley Wash Trash – TMDL effective March 6, 2008
- Calleguas Creek Toxicity – TMDL effective March 24, 2006
- Calleguas Creek Organochlorine Pesticides and PCBs - TMDL effective March 24, 2006
- Oxnard Drain 3 Pesticides, PCBs, and Sediment Toxicity – approved by EPA approval October 6, 2011
- Calleguas Creek Nitrogen Compounds and Related Effects – TMDL effective October 15, 2009

In addition to the existing TMDLs, other TMDLs may be developed. Identified impairments in the Calleguas Creek and its tributaries include ammonia, boron, copper, bacteria, nitrogen, nitrate, selenium, and sulfate, as well as insecticides and pesticides such as DDT, Dieldrin, and Toxaphene. The Channel Islands Harbor area is limited by lead and zinc in sediments and several Oxnard area beaches are limited by bacteria.

Available Supplies

The water supplies for the Calleguas Creek Watershed consist of imported water from Calleguas, groundwater, a minor amount of potable surface water, non-potable surface water provided by UWCD from the Freeman Diversion delivered to agricultural users in the Pleasant Valley Basin, and recycled water. A total estimate of supply in the Calleguas Creek Watershed is provided in **Table 10-17**.

Formatted: Font: Bold

Imported Water

Calleguas anticipates receiving approximately 122,000 AF imported water from MWD in each year starting in 2020, but this will vary depending on climatic conditions, regulatory conditions and regional demands (CMWD 2016). The City of Oxnard receives approximately 12,000 AFY of water from Calleguas but; this volume is included in the imported supplies in the Santa Clara Watershed and is not reflected in supplies for the Calleguas Creek Watershed.

E: Existing beneficial use

P: Potential beneficial use

I: Intermittent beneficial use

E, P, and I: shall be protected as required

* Asterisked MUN designations are designated under SB 88-63 and RB 89-03. Some destinations may be considered for exemption at a later date.

a: Waterbodies are listed multiple times if they cross hydrologic area or subarea boundaries. Beneficial use designations apply to all tributaries to the indicated waterbody, if not listed separately.

b: Waterbodies designated as WET may have wetlands habitat associated with only a portion of the waterbody. Any regulatory action would require a detailed analysis of the area.

c: Coastal waterbodies which are also listed in inland Surface Waters Tables (2-1) or in Wetlands Table (2-4).

d: Limited public access precludes full utilization.

e: One or more rare species utilizes all ocean, bays, estuaries, and coastal wetlands for foraging and/or nesting.

f: Aquatic organisms utilize all bays, estuaries, lagoons, and coastal wetlands, to a certain extent, for spawning and early development. This may include migration into areas which are heavily influenced by freshwater inputs.

o: Marine habitats of the Channel Islands and Mugu Lagoon serve as pinniped haul-out areas for one or more species (i.e. sea lions).

p: Habitat of the Clapper Rail.

Groundwater

There is not an accepted groundwater supply estimate for the Calleguas Creek Watershed. As part of the SGMA process stakeholders will evaluate long-term sustainable yield. Table 10-16 presents a high-level estimate of available groundwater based on available data. The difference in the high and low supply estimate documents the lack of data and consensus on groundwater supply. Table 10- does not include the approximately 3,500 AFY of groundwater that the City of Thousand Oaks is planning on developing from the Conejo Groundwater Basin.

Surface Water

The Conejo Creek system, owned and operated by Camrosa Water District, does supply some surface water. The average supply from this creek system is estimated to be 7,920--AF (FCGMA 2016). It is estimated that small private water users may divert and use as much as 3,400--AFY from local surface water (SWRCB eWRIMS database).

Recycled Water

Based on recently completed urban water management plans by water purveyors in the Calleguas Creek Watershed, an estimate of recycled water in the Calleguas Creek area has been prepared. This estimate uses supplies planned incorporates usage for the next 10 years (by 2025).

| TABLE 10-17 CURRENT (2016) ESTIMATE OF SUPPLY CALLEGUAS CREEK WATERSHED | |
|--------------------------------------------------------------------------------------|--------------------|
| Supply Source | Annual Volume (AF) |
| Surface Water, Conejo Creek Diversion ¹ | 11,324 |
| Imported Water Calleguas and UWCD Deliveries from Santa Clara Watershed ² | 119,417 |
| Recycled Water ³ | 13,931 |
| Groundwater (see Table 10-16) | 51,300 to 82,300 |
| <i>Low Estimate (rounded to nearest 100 AF)</i> | <i>196,000</i> |
| <i>High Estimate (rounded to nearest 100 AF)</i> | <i>227,000</i> |

1. FCGMA 2016. Preliminary Draft Pleasant Valley Groundwater Sustainability Plan Tasks 6 – 10 Report. May.
2. Supplies from Calleguas are anticipated imported water supplies less 12,000 AF expected to go to Oxnard in the Santa Clara Watershed (CMWD 2016, Oxnard 2016). Supplies from UWCD are on average 9,417 AF to the Calleguas Creek Area from the Santa Clara Watershed (FCGMA 2016).
3. Camrosa 2016; Camarillo 2016, VCWWD8 2016, and VCWWD1 2016.

Suppliers

There are nine major water suppliers (entities serving more than 1,000 persons) in the Calleguas Creek Watershed and as well as 52 smaller water systems and irrigation companies. Persons or businesses in the Watershed are also supplied by private wells and surface water diversions. The major urban suppliers, documented in Table 10-18 provide water to cities and the unincorporated County. These are also mapped in Figure 10-5.

Estimate of Demand

As described previously, in 2014, the VCWPD County of Ventura Watershed Protection District undertook an estimate of Countywide water demand, documented in the County of Ventura 2013 Water Supply and Demand (January 2015). Results of the study for the Calleguas Creek Watershed are provided in Table 10-19.

Formatted: Font: Bold

| TABLE 10-19 ESTIMATED CALLEGUAS CREEK WATERSHED DEMAND | | | |
|-----------------------------------------------------------|--------------------------------|-----------------------------|-------------------|
| Watershed/Sub-watershed | Total Agricultural Demand (AF) | Total Municipal Demand (AF) | Total Demand (AF) |
| Calleguas Creek | 112,701 | 89,335 | 202,036 |
| Malibu Creek | 1,083 | 19,291 | 20,374 |
| South Coast | 86 | 2,035 | 2,121 |
| Subtotal (rounded to nearest 100 AF) | 113,900 | 110,700 | 224,600 |

Source: Hydrometrics 2015. Table 6.

Comparison of Supply and Demand

Estimated supply in the Calleguas Creek Watershed ranges from 196,000 AF to 227,000 AF in any given year. This supply of course will vary given drought and operational conditions. Estimated demand is approximately 224,600 AF. If the low-end estimate of supply is correct, demand is outpacing supply. If the high-end supply estimate is correct, supply is only slightly greater (1%) than demand.

Water-Related Challenges

Below are the water related challenges for the Calleguas Creek Watershed as of late 2016.

Long-Term Groundwater Overdraft and Increased Salinity

The Pleasant Valley Basin is in long-term overdraft (UWCD 2017a). Declining groundwater levels and over-pumping in the southern portion of the basin has led to upwelling of brines from high chloride zones (UWCD 2017b). In the northern Pleasant Valley Basin, streambed recharge with treated wastewater has caused increased salinity in the vicinity of the Arroyo Las Posas.

Localize Pumping Depressions

Within the West Las Posas Basin, groundwater levels have dropped by 325 feet between 1950 and the early 1990s (LPUG 2012). There is concern regarding subsidence, increased pumping lifts, decreased production and, eventually, dry wells (LPUG 2012). In addition, depressed groundwater levels may induce inflows of poor-quality groundwater from surrounding areas.

Heavy Dependence on Imported Water by Urban Users

Imported water makes up roughly 20 percent of Ventura County water supply. Approximately 75 percent of the County population receives water imported by Calleguas. Drought, earthquakes, and environmental demands on the SWP system could limit or even interrupt this water supply. Calleguas Municipal Water District, the primary imported water wholesaler in the region, has taken proactive steps to mitigate supply disruptions, including the construction of a local surface water storage reservoir (Lake Bard), construction of facilities to store surface water in local groundwater basins as well as facilities to

extract this water if needed, obtaining and storing spare pipe for emergencies, and building multiple interconnections with other water suppliers.

SECTION 10.5 TRENDS AND FUTURE CONDITIONS

As documented above, Traditional water supplies are limited in the Ventura County area and it is necessary to develop different supplies for Ventura County. Trends going forward include:

- Increased use of brackish groundwater. Ventura County has abundant sources of groundwater in parts of the county, but particularly in the Calleguas Creek Watershed, much of it is too high in salts for municipal and agricultural use. Two brackish groundwater treatment plans are currently in operation in the county (Port Hueneme Water Authority’s Brackish Water Reclamation Demonstration Facility, Camrosa Round Mountain Desalter). Other additional desalters are proposed. Use of this brackish groundwater would require connection to salinity management pipeline such as that operated by the Calleguas Municipal Water District.
- Delivery of SWP water to western Ventura County. The City of Ventura, UWCD, Casitas Municipal Water District, and Calleguas are coordinating a study to build a connection to the SWP.
- Increased use of recycled water. The City of Oxnard has constructed the Advanced Water Purification Facility (AWPF)–sometimes called the AWPE, which intensively treats wastewater to produce water suitable for irrigation, industrial processes, groundwater recharge and potable– and could be used for use potable water in the future. Many oOther water agencies in Ventura County are proposing increased use of recycled water and many are building infrastructure to deliver recycled water to agriculture and other irrigation users. In June 2016, the City of Ventura launched the Recycled Water Mobile Reuse Program whereby business, residents and other property owners in the City can use the City’s recycled water fill station, fill their own containers, then haul the water for use within the City. Agencies are also actively pursuing groundwater recharge with recycled water and direct potable reuse of recycled water.
- Expanded conjunctive use. Conjunctive use is the coordinated and planned use and management of both surface water and groundwater resources to maximize the availability and reliability of water supplies. Conjunctive use involves planned and managed operation of a groundwater basin and a surface water storage system using coordinated conveyance infrastructure. When surface water is available it is recharged and stored in a groundwater basin for later use.
- Increased use of stormwater and dry weather runoff. Currently these are underutilized sources of supplies that could augment groundwater supplies. This will include stormwater detention in medians and along curbs, permeable pavement, and other means to retain and recharge runoff. Various agencies within Ventura County are planning and coordinating increased use of stormwater as documented in the Ventura Countywide Municipal Storm Water Resource Plan (September 2016).
- Ocean desalination. The City of Ventura, Channel Islands Beach Community Services District and Calleguas are exploring the feasibility of ocean desalination (City of Ventura 2016b; Citizens Journal 2015; Calleguas 2016).
- Increased call for urban water use efficiency. In May ~~9~~, 2016, Governor Brown issued Executive Order B-37-16, which called for the establishment of long-term water conservation measures. DWR and the SWRCB ~~are to publicly release~~ released a draft long-term conservation framework in April 2017 by January 2017. This framework ~~will~~ included new water use targets based on strengthened

standards for indoor residential water use, outdoor irrigation, commercial/institutional/industrial water use, and distribution system water loss.

- Increased call for agricultural water use efficiency. Grant-funded efforts are being developed and implemented to provide financial incentives for equipment upgrades and similar efforts will likely continue, dependent upon funding availability.
- Changes in the operation of surface water supplies to protect endangered species. Water users are likely to pay more to build and maintain habitat protection measures. There will likely be less water available for agriculture and urban users because more flow will need to be left in waterways to protect habitat.

SECTION 10.6 KEY TERMS

The following key terms used in this report are defined as follows:

303(d) List. References section 303(d) of the Clean Water Act whereby states, territories, and tribes are to develop lists of waterbodies that are polluted or otherwise degraded and not meeting water quality standards. The 303(d) List is used to develop Total Maximum Daily Loads and or identify other mechanisms to improve water quality.

Acre-feet (AF). The amount of water necessary to cover an acre (43,560 square feet) to a depth of one foot, or 43,560 cubic feet, which is equivalent to 325,828 gallons.

Adjudication: With regard to water rights, a legal decision that allocates water to parties in proceedings and is overseen by a court-appointed watermaster.

Aquifer. A subsurface geological formation sufficiently permeable to conduct groundwater and capable of yielding usable quantities of water to a well or surface water spring.

Beneficial Uses. The various purposes for which water or aquatic ecosystems may be used. Examples include municipal and domestic water supply, agricultural water supplies, preservation and protection of areas of special biological significance resources, freshwater habitat, commercial and sport fishing, estuarine habitat, freshwater replenishment, groundwater recharge, industrial supply, marine habitat, fish migration, navigation, preservation of rare and endangered species, recreation, shellfish harvesting, and wildlife habitat.

Best Management Practice (BMP). Any program, technology, process, siting criteria, operational methods or measures, or engineered systems, which when implemented prevent, control, remove, or reduce pollution.

Conjunctive Use. The practice of storing surface water in a groundwater basin (typically in wet years) and withdrawing it from the basin in later (typically dry) years.

Critical Overdraft. As defined in the Sustainable Groundwater Management Act a basin is subject to critical overdraft when continuation of present water management practices would probably result in significant adverse overdraft-related environmental, social, or economic impacts.

Coastal Zone. That portion of the land and water area of Ventura County as shown on the "Coastal Zone" maps adopted by the California Coastal Commission.

Groundwater Basin. An aquifer or system of aquifers that has reasonably well-defined boundaries and more or less definite areas of recharge and discharge. Refers to subsurface deposits and geologic formations that are capable of yielding usable quantities of water to a well or spring. The Sustainable Groundwater Management Act defines “basin” as a groundwater basin or subbasin identified and defined in Department of Water Resources Bulletin 118 or as modified pursuant to Section 10722 of the Act.

Integrated Regional Water Management. A comprehensive and collaborative approach for managing water to concurrently achieve social, environmental and economic objectives. This integrated approach delivers higher value for investments by considering all interests, providing multiple benefits, and working across jurisdictional boundaries at the appropriate geographic scale. Examples of multiple benefits include improved water quality, better flood management, restored and enhanced ecosystems, and more reliable water supplies” (Department of Water Resources 2014, California Water Plan Update 2013).

Mutual Water Company. A private corporation or association organized for the purposes of delivering water to its stockholders and/or members.

Permanent domestic water supply. A supply or supplies of potable water to be provided by a system or systems approved by a public health agency of the State of California or the Environmental Health Division of the Ventura County Resource Management Agency and the Ventura County Public Works Agency in a quantity sufficient to supply adequately and continuously the total domestic requirements of all consumers under maximum demand conditions.

Retail Water Supplier. A water agency that provides water to individual customers and end users such as homes and businesses.

Safe Yield. Commonly defined as the maximum quantity of water that can be continuously withdrawn from a reservoir or groundwater basin without causing adverse effects.

State Water Project. The SWP is the largest state-built, multi-purpose water project in the country. It was authorized by the California State Legislature in 1959, with the construction of most initial facilities completed by 1973. Today, the SWP includes 28 dams and reservoirs, 26 pumping and generating plants and approximately 660 miles of aqueducts. The primary water source for the SWP is the Feather River, a tributary of the Sacramento River. Storage released from Oroville Dam on the Feather River flows down natural river channels to the Sacramento-San Joaquin River Delta (Delta). While some SWP supplies are pumped from the northern Delta into the North Bay Aqueduct, the vast majority of SWP supplies are pumped from the southern Delta into the 444-mile-long California Aqueduct. The California Aqueduct conveys water along the west side of the San Joaquin Valley to Edmonston Pumping Plant, where water is pumped over the Tehachapi Mountains into Southern California.

Stormwater Pollution Control Plan. A plan identifying potential pollutant sources from a construction site and describing proposed design, placement and implementation of Best Management Practices to effectively prevent non-stormwater discharges and reduce pollutants in stormwater discharges to the storm drain system, to the maximum extent practicable during construction activities.

Stormwater Pollution Prevention Plan. A plan, as required by a State General Permit for Stormwater Discharges, identifying potential pollutant sources and describing the design, placement and implementation of Best Management Practices, to effectively prevent non-stormwater discharges and reduce pollutants in stormwater discharges during activities covered by the General Permit.

Stormwater Quality Master Plan. A plan that defines the strategy and describes the design, placement and implementation of Best Management Practices to effectively prevent non-stormwater discharges and reduce pollutants in stormwater discharges to the maximum extent practicable, for post-construction discharges to the stormdrain system.

Total Maximum Daily Load. A regulatory “pollution budget” based on a calculation of the maximum amount of a pollutant that can occur in a waterbody and still meet water quality standards so as to protect beneficial uses. The TMDL also allocates the necessary reductions to one or more pollutant sources. TMDLs can force the implementation of BMPs, infrastructure improvements, and other actions to limit pollution.

Watershed. A geographic region within which all water drains into a particular river, stream, or other waterbody. Also referred to as a catchment area.

Wholesale Water Supplier. A water agency that provides water to retail water agencies rather than directly providing water to the end user (homes, businesses, etc.).

APPENDIX 10.A: SGMA/CALIFORNIA GOVERNMENT CODE

65350.5. REVIEW AND CONSIDERATION OF GROUNDWATER REQUIREMENTS

Before the adoption or any substantial amendment of a city's or county's general plan, the planning agency shall review and consider all of the following:

(a) An adoption of, or update to, a groundwater sustainability plan or groundwater management plan pursuant to Part 2.74 (commencing with Section 10720) or Part 2.75 (commencing with Section 10750) of Division 6 of the Water Code or groundwater management court order, judgment, or decree.

(b) An adjudication of water rights.

(c) An order or interim plan by the State Water Resources Control Board pursuant to Chapter 11 (commencing with Section 10735) of Part 2.74 of Division 6 of the Water Code.

65352. REFERRAL OF PROPOSED GENERAL PLAN UPDATES TO OTHER AGENCIES

(a) Before a legislative body takes action to adopt or substantially amend a general plan, the planning agency shall refer the proposed action to all of the following entities:

(1) A city or county, within or abutting the area covered by the proposal, and any special district that may be significantly affected by the proposed action, as determined by the planning agency.

(2) An elementary, high school, or unified school district within the area covered by the proposed action.

(3) The local agency formation commission.

(4) An areawide planning agency whose operations may be significantly affected by the proposed action, as determined by the planning agency.

(5) A federal agency, if its operations or lands within its jurisdiction may be significantly affected by the proposed action, as determined by the planning agency.

(6) (A) The branches of the United States Armed Forces that have provided the Office of Planning and Research with a California mailing address pursuant to subdivision (d) of Section 65944, if the proposed action is within 1,000 feet of a military installation, or lies within special use airspace, or beneath a low-level flight path, as defined in Section 21098 of the Public Resources Code, and if the United States Department of Defense provides electronic maps of low-level flight paths, special use airspace, and military installations at a scale and in an electronic format that is acceptable to the Office of Planning and Research.

(B) Within 30 days of a determination by the Office of Planning and Research that the information provided by the Department of Defense is sufficient and in an acceptable scale and format, the office shall notify cities, counties, and cities and counties of the availability of the information on the Internet. Cities, counties, and cities and counties shall comply with subparagraph (A) within 30 days of receiving this notice from the office.

(7) A public water system, as defined in Section 116275 of the Health and Safety Code, with 3,000 or more service connections, that serves water to customers within the area covered by the proposal. The public water system shall have at least 45 days to comment on the proposed plan, in accordance with subdivision (b), and to provide the planning agency with the information set forth in Section 65352.5.

(8) Any groundwater sustainability agency that has adopted a groundwater sustainability plan pursuant to Part 2.74 (commencing with Section 10720) of Division 6 of the Water Code or local agency that otherwise manages groundwater pursuant to other provisions of law or a court order, judgment, or decree within the planning area of the proposed general plan.

(9) The State Water Resources Control Board, if it has adopted an interim plan pursuant to Chapter 11 (commencing with Section 10735) of Part 2.74 of Division 6 of the Water Code that includes territory within the planning area of the proposed general plan.

(10) The Bay Area Air Quality Management District for a proposed action within the boundaries of the district.

(11) A California Native American tribe that is on the contact list maintained by the Native American Heritage Commission and that has traditional lands located within the city's or county's jurisdiction.

(12) The Central Valley Flood Protection Board for a proposed action within the boundaries of the Sacramento and San Joaquin Drainage District, as set forth in Section 8501 of the Water Code.

(b) An entity receiving a proposed general plan or amendment of a general plan pursuant to this section shall have 45 days from the date the referring agency mails it or delivers it to comment unless a longer period is specified by the planning agency.

(c) (1) This section is directory, not mandatory, and the failure to refer a proposed action to the entities specified in this section does not affect the validity of the action, if adopted.

(2) To the extent that the requirements of this section conflict with the requirements of Chapter 4.4 (commencing with Section 65919), the requirements of Chapter 4.4 shall prevail.

65352.5. REQUIREMENT TO PROVIDE WATER-RELATED DOCUMENTS TO GENERAL PLAN AGENCY

(a) The Legislature finds and declares that it is vital that there be close coordination and consultation between California's water supply or management agencies and California's land use approval agencies to ensure that proper water supply and management planning occurs to accommodate projects that will result in increased demands on water supplies or impact water resource management.

(b) It is, therefore, the intent of the Legislature to provide a standardized process for determining the adequacy of existing and planned future water supplies to meet existing and planned future demands on these water supplies and the impact of land use decisions on the management of California's water supply resources.

(c) Upon receiving, pursuant to Section 65352, notification of a city's or a county's proposed action to adopt or substantially amend a general plan, a public water system, as defined in Section 116275 of the Health and Safety Code, with 3,000 or more service connections, shall provide the planning agency with the following information, as is appropriate and relevant:

(1) The current version of its urban water management plan, adopted pursuant to Part 2.6 (commencing with Section 10610) of Division 6 of the Water Code.

(2) The current version of its capital improvement program or plan, as reported pursuant to Section 31144.73 of the Water Code.

(3) A description of the source or sources of the total water supply currently available to the water supplier by water right or contract, taking into account historical data concerning wet, normal, and dry runoff years.

(4) A description of the quantity of surface water that was purveyed by the water supplier in each of the previous five years.

(5) A description of the quantity of groundwater that was purveyed by the water supplier in each of the previous five years.

(6) A description of all proposed additional sources of water supplies for the water supplier, including the estimated dates by which these additional sources should be available and the quantities of additional water supplies that are being proposed.

(7) A description of the total number of customers currently served by the water supplier, as identified by the following categories and by the amount of water served to each category:

(A) Agricultural users.

(B) Commercial users.

(C) Industrial users.

(D) Residential users.

(8) Quantification of the expected reduction in total water demand, identified by each customer category set forth in paragraph (7), associated with future implementation of water use reduction measures identified in the water supplier's urban water management plan.

(9) Any additional information that is relevant to determining the adequacy of existing and planned future water supplies to meet existing and planned future demands on these water supplies.

(d) Upon receiving, pursuant to Section 65352, notification of a city's or a county's proposed action to adopt or substantially amend a general plan, a groundwater sustainability agency, as defined in Section 10721 of the Water Code, or an entity that submits an alternative under Section 10733.6 shall provide the planning agency with the following information, as is appropriate and relevant:

(1) The current version of its groundwater sustainability plan or alternative adopted pursuant to Part 2.74 (commencing with Section 10720) of Division 6 of the Water Code.

(2) If the groundwater sustainability agency manages groundwater pursuant to a court order, judgment, decree, or agreement among affected water rights holders, or if the State Water Resources Control Board has adopted an interim plan pursuant to Chapter 11 (commencing with Section 10735) of Part 2.74 of Division 6 of the Water Code, the groundwater sustainability agency shall provide the planning agency with maps of recharge basins and percolation ponds, extraction limitations, and other relevant information, or the court order, judgment, or decree. Sustainable Groundwater Management Act, and related provisions (as chaptered) Page 6 As Effective January 1, 2016 [rev. 1/15/2016]

(3) A report on the anticipated effect of proposed action to adopt or substantially amend a general plan on implementation of a groundwater sustainability plan pursuant to Part 2.74 (commencing with Section 10720) of Division 6 of the Water Code.

**Re: Comments on the Draft Environmental Impact Report for the County of Ventura
Draft 2040 General Plan**

Dear Ms. Curtis:

The California Native Plant Society (CNPS), a membership-based 501(c)(3) nonprofit corporation herein provide these comments on the proposed Ventura County 2040 General Plan (GP) and associated Draft Environmental Impact Report (DEIR). CNPS's comments are focused on the biological resources with the intent to ensure that they are appropriately conserved through land use planning and government actions and management at the discretion of the county.

General Comments:

There is no mention of information on the botanical resources of Ventura County that have been developed and made available to the public, such as by the Channel Islands Chapter of the California Native Plant Society (CNPSI), available online at <http://cnpsci.org/>, and by David Magney for the Ventura County flora (www.venturaflora.com). The GP mentions information provided by the California Department of Fish and Wildlife (CDFW) and the U.S. Fish and Wildlife Service (USFWS), which is a good starting point; however, so much more detail is available that would be helpful to decisionmakers and the public that the true picture of the incredible biodiversity and species richness found in Ventura County.

For example, there is no mention of bryophyte resources, nor any mention of lichens, which are generally referred to as nonvascular plants. Both of these groups are both diverse and important components of the biological resources of Ventura County.

Qualified Biologist – since there are no codified criteria that the VCPD uses consistently to determine who is qualified, CNPS highly recommends that the following be inserted under the definition of a qualified biologist:

Require use of a Certified Consulting Botanist for botanical resource assessments and surveys.

Require use of a Certified Restoration Ecologist or Certified Consulting Botanist for habitat restoration planning, mitigation, or implementation work.

Thresholds of Significance (page 4.4-13) uses the term “substantially”. “Substantially” is an ambiguous term that can be next to impossible to quantify, particularly if the impact appears to be small in some way. Without an actual metric, significant impacts could be considered less-than-significant by some biologists. Using actual numbers would be better, with some means to deviate if sufficient evidence is

provided to make a reasonable and sound, science-based argument for a different significance threshold number or metric.

For example, impacts to wetland habitat functions is identified as significant, if they are substantial. Measuring the total area of a wetland directly impacted is fairly straightforward; however, measuring the wetland functions that are impacted is more complex, and doing so for indirect impacts is even more challenging. It would be easier and fairer, and more accurate to use a tested assessment method, and set a significance threshold, say a 5% change, to determine if the impact would be significant. The only objective tool currently available to measure wetland functions is the U.S. Army Corps of Engineers' Hydrogeomorphic Assessment Method (HGM), which is described in more detail in comments below.

Policies

Following are the proposed General Plan (GP) Conservation and Open Space Element policies, with CNPS's assessment of their benefit in protecting biological resources and how they could be improved to better meet the stated objectives.

The Public Review Draft Policy Document, Section 6.1 – Biological Resources, provides a **very** general overview that hardly captures the richness, diversity, and uniqueness of the biological resources within Ventura County. At least a bit more information would be beneficial in expressing this fact since so much information about the biological resources of the county is readily available, much of it compiled in each biological assessment performed for every project that has gone through a CEQA assessment.

For example, expand the sentence “Ventura County contains a diverse range of elevations, biogeographic features and ecosystems” with “, which provides a large variety of habitats that supports 321 species of lichens, 97 species of bryophytes, 1,939 **native** vascular plants (Magney 2020 - <http://venturaflora.com/files/vcfloristics.htm>), 338 bird species, 11 amphibian species, 30 reptile species, several freshwater fish species, 50 mammal species, and an unknown (very high) number invertebrate species, but at least 117 species of butterflies.”

Policy COS-1.1: Protection of Sensitive Biological Resources. The County shall ensure that discretionary development that could potentially impact sensitive biological resources be evaluated by a qualified biologist to assess impacts and, if necessary, develop mitigation measures that fully account for the impacted resource. When feasible, mitigation measures should adhere to the following priority: avoid impacts, minimize impacts, and compensate for impacts. If the impacts cannot be reduced to a less than significant level, findings of overriding considerations must be made by the decision-making body.

This policy is good except there is no need or justification to insert “when feasible” regarding how to adhere to approaching mitigation measures for significant impacts. CEQA guidelines already provide the order of preference. The biggest challenge this policy faces is in how a “qualified biologist” is determined (see detailed comments and recommendations below).

Policy COS-1.2: Consideration of Sensitive Biological Resources. The County shall identify sensitive biological resources as part of any land use designation change to the General Plan Land Use Diagram or zone designation change to the Zoning Ordinance that would intensify the

uses in a given area. The County shall prioritize conservation of areas with sensitive biological resources.

This policy is good; however, the means and criteria that should be used to determine which biological resources are considered sensitive needs to be defined. This should not be left to the environmental consulting firms hired by project proponents that will almost certainly have an inherent bias against identifying sensitive resources that would harm their client's project interests.

Policy COS-1.7: Balancing Resource Preservation and Flood Protection. The County shall require that discretionary development and County-initiated projects balance the preservation of streams, wetlands, and riparian habitats with the need to adequately protect public safety and property from flooding hazards by incorporating natural or nature-based flood control infrastructure, (e.g., wetland restoration, soil conservation, vegetated levees), when feasible.

CNPS supports this policy.

Policy COS-1.8: Bridge Crossing Design. The County shall require discretionary development that includes new or modified road crossings over streams, wetlands and riparian habitats to include bridging design features with bridge columns located outside the riparian habitat areas, when feasible.

CNPS supports this policy.

Policy COS-1.9: Agency Consultation Regarding Biological Resources. The County shall consult with the California Department of Fish and Wildlife, the Regional Water Quality Control Board, the U.S. Fish and Wildlife Service, National Audubon Society, California Native Plant Society, National Park Service for development in the Santa Monica Mountains or Oak Park Area, and other resource management agencies, as applicable during the review of discretionary development applications to ensure that impacts to biological resources, including rare, threatened, or endangered species, are avoided or minimized.

This policy is good except consultation should cover the entire county, not just for the Santa Monica Mountains and Oak Park areas. The VCPD staff biologists have in the past convened the biologists from the above listed entities to review various discretionary projects under review to obtain guidance on impacts and mitigation measures. At a minimum, these entities should receive formal notice of all discretionary projects that may impact biological resources so that they have an opportunity to provide comments, on any project anywhere in the county. The VCPD should maintain a list of contacts of biologists with each of these entities as part of this policy.

Policy COS-1.10: Evaluation of Potential Impacts of Discretionary Development on Wetlands. The County shall require discretionary development that is proposed to be located within 300 feet of a wetland to be evaluated by a County-approved biologist for potential impacts on the wetland and its associated habitats pursuant to the applicable provisions of the County's Initial Study Assessment Guidelines.

This policy is good but it should be strengthened by including impacts to wetland functions, not just habitats. Indirect impacts that adversely affect one or more wetland functions needs to be included in

this policy. Also, the criteria for determining how the approved biologist is determined needs to be developed (see comments below about qualified biologists and wetland assessment methods).

Policy COS-1.11: Discretionary Development Sited Near Wetlands. The County shall require discretionary development to be sited 100 feet from wetland habitats, except as provided below. The 100-foot setback may be increased or decreased based upon an evaluation and recommendation by a qualified biologist and approval by the decisionmaking body based on factors that include, but may not be limited to, soil type, slope stability, drainage patterns, the potential for discharges that may impair water quality, presence or absence of endangered, threatened or rare plants or animals, direct and indirect effects to wildlife movement, and compatibility of the proposed development with use of the wetland habitat area by wildlife. Discretionary development that would have a significant impact on a wetland habitat shall be prohibited unless mitigation measures are approved that would reduce the impact to a less than significant level. Notwithstanding the foregoing, discretionary development that would have a significant impact on a wetland habitat on land within a designated Existing community may be approved in conjunction with the adoption of a statement of overriding considerations by the decision-making body.

This policy is good except the evaluation must be conducted by a Certified Wetland Scientist or a Certified Consulting Botanist. Since there are no standard or consistent methods used by the County to determine which biologists are actually qualified, such determinations are best made by professional peers, such as certification entities.”

Furthermore, the evaluation/assessment should use an objective assessment tool or model, such as the Hydrogeomorphic Assessment Method (HGM) regional models (<https://wetlands.el.ercd.dren.mil/pdfs/wrpde9.pdf>), which have been used successfully in Ventura County in the past using either the Santa Margarita River Riverine HGM model for low gradient streams and rivers or the South Coast Santa Barbara Riverine HGM model for high gradient streams. California Rapid Assessment Method (CRAM) models have only limited applicability in that CRAM does not measure wetland functions, only HGM models do. To determine significance, a percent change in wetland functions is an appropriate and unbiased approach. A 10% change threshold has been used successfully in such assessments in Ventura County using regional HGM models, but a 5% change may be more appropriate since a fully functioning wetland is extremely important for ecosystem health.

Policy COS-1.12: Discretionary Development and Landscaping. The County shall require landscaping associated with discretionary development, or subject to the California Water Efficient Landscape Ordinance (WELO), to be water-efficient and include native, pollinator-friendly plants consistent with WELO guidelines, as applicable. The planting of invasive and watch list plants as inventoried by the California Invasive Plant Council shall be prohibited, unless planted as a commercial agricultural crop or grown as commercial nursery stock.

The WELO ordinance was developed in San Mateo County and calls for 6 inches of compost and 3 inches of mulch in landscaping with the goal of conserving soil moisture from evaporation. This simplistic approach is not necessarily appropriate for landscaping using local native plants, and in many instances will kill them. The policy should be modified to include the development

of landscaping guidelines that are appropriate for Ventura County communities and native plants that meet the basic goals of WELO.

Policy COS-1.13: Partnerships for Protection of Natural and Biological Resources. The County shall continue to work in partnership with agencies, organizations, and entities responsible for the protection, management, and enhancement of the county's biological resources.

This policy is good, but listing of the entities would help eliminate potential for failure to notify select groups. Certainly, count CNPS in as both willing and able to work in partnership with the County to implement this policy.

Policy COS-1.14: Ecological Information Programs. The County shall support programs that encourage awareness and respect for the natural environment.

This policy sounds great; however, what level and types of support will the County provide? The policy language needs to go into greater depth on how the County will implement it.

Policy COS-1.15: Countywide Tree Planting. The County shall establish and support a countywide target for the County, cities in Ventura County, agencies, organizations, businesses, and citizens to plant two million trees throughout the county by 2040.

CNPS fully supports this policy, with the proviso that no invasive exotic tree species be planted under this policy, and that native (to Ventura County) tree species should be emphasized and prioritized.

Policy COS-2.1: Beach Erosion. The County shall strive to minimize the risk from the damaging effects of coastal wave hazards and beach erosion and reduce the rate of beach erosion.

CNPS supports this policy. However, how it is implemented is important in that some hardscaping actions could harm coastal biological resources. The County needs to take the bigger, longer-term perspective when deciding what beach erosion control projects are planned and approved. Sea level is rising and there is little the County can do to prevent it. Emphasis should be placed on natural processes, which should take priority over manmade structures (which require expensive maintenance). Furthermore, coastal species need to have places to migrate (inland) to as sea level rises; therefore, migration paths must be either created or maintained to accommodate that migration.

Policy COS-2.2: Beach Nourishment. The County shall support activities that trap or add sand through beach nourishment, dune restoration, and other adaptation strategies to enhance or create beaches in areas susceptible to sea-level rise and coastal flooding.

See comments for Policy COS-2.1 above.

Policy COS-2.4: Mining Activities. The County shall require discretionary development for all mining activities in County streams and rivers to incorporate all feasible measures to mitigate beach sand replenishment impacts.

CNPS supports this policy.

Policy COS-2.5: Shoreline Protective Structure Design. The County shall require all shoreline protective structures which alter natural shoreline processes to be designed to eliminate or mitigate adverse impacts on local shoreline sand supplies.

CNPS supports this policy. See comments for Policy COS-2.1 above.

Policy COS-2.9: Estuarine Protections. The County shall support efforts by other agencies and organizations to maintain and enhance estuarine systems in order to protect and enhance coastal fisheries and other marine resources.

CNPS supports this policy.

Policy COS-2.10: Saltwater Intrusion. The County shall work with Federal, State, and local jurisdictions, agencies, and organizations to monitor saltwater intrusion and take proactive steps to reduce intrusion, including:

- working to maintain and restore coastal wetlands buffers;
- enhancing groundwater management to prevent excessive pumping in order to restore groundwater levels needed to reduce saltwater intrusion; and
- implementing mitigation measures to prevent saltwater intrusion into estuaries and groundwater basins including, but not limited to, implementation of reactive barriers and use of pumps to divert saltwater.

CNPS generally supports this policy.

Policy COS-2.11: Dune Vegetation. Discretionary development which would result in the removal of dune vegetation shall be conditioned to replace the vegetation.

CNPS supports this policy. However, it would be preferable to avoid the impact if at all possible. The policy should reflect that avoidance of impacts to dune vegetation is preferred.

Policy COS 9.3: Open Space Preservation. The County shall place a high priority on preserving open space lands for recreation, habitat protection, wildlife movement, flood hazard management, public safety, water resource protection, and overall community benefit.

CNPS supports this policy.

The following California Environmental Quality Act (CEQA) policy language regarding compensatory mitigation: "When there is no other feasible alternative to avoiding an impact to a wetland habitat, the County shall require the discretionary development to provide restoration and/or replacement habitat as compensatory mitigation such that no overall net loss of wetland habitat results from the development. The restoration and/or replacement habitat shall be 'in kind' (i.e. same type and acreage) and provide wetland habitat of comparable biological value. On-site restoration and/or replacement shall be preferred wherever possible. A habitat restoration and/or replacement plan to describe and implement such compensatory mitigation shall be developed in consultation with all agencies that have jurisdiction over the resource.

Implementation Programs

- ☐ Program A: Standards for Compact Development. The County shall update the Non-Coastal Zoning Ordinance to include development standards for project design that features compact development adjacent to scenic or sensitive biological resources.

CNPS supports this policy.

- ☐ Program B: Update Initial Study Assessment Guidelines. The County shall update the Initial Study Assessment Guidelines to identify a range of mitigation measures for protected biological resources. This will include updating Section 4, Biological Resources, to include the following California Environmental Quality Act (CEQA) policy language regarding compensatory mitigation: “When there is no other feasible alternative to avoiding an impact to a wetland habitat, the County shall require the discretionary development to provide restoration and/or replacement habitat as compensatory mitigation such that no overall net loss of wetland habitat results from the development. The restoration and/or replacement habitat shall be ‘in kind’ (i.e. same type and acreage) and provide wetland habitat of comparable biological value. On-site restoration and/or replacement shall be preferred wherever possible. A habitat restoration and/or replacement plan to describe and implement such compensatory mitigation shall be developed in consultation with all agencies that have jurisdiction over the resource.

CNPS supports this policy program.

- ☐ Program C: Update Tree Protection Ordinance. The County shall update existing Tree Protection Regulations in the Non-Coastal Zoning Ordinance to further enhance conservation of our urban forests and the preservation of the County’s oak woodland resources. Updates shall include incorporation of Board-adopted recommendations from the Ventura County Oak Woodlands Management Plan (2007), which include tree replacement offsets for ministerial development projects that remove protected trees, revisiting mitigation ratios for tree removal and oak woodland impacts for discretionary development projects. The update shall also evaluate existing protections for invasive, non-native trees and consider the degree to which they provide habitat for a species during critical life stages (e.g., colonial roost sites, breeding sites, etc.). In addition, the evaluation shall also include anticipated effects of climate change on the urban forest environment.

CNPS supports this policy; however, the evaluation for any updates should include Certified Consulting Arborists (particularly those with experience in assessing the functions (not the values) of trees from a habitat/ecological function perspective and Certified Consulting Botanists.

- ☐ Program D: Research Feasibility of Updating Vegetation Maps. In partnership with other natural resource agencies and organizations, the County shall explore the feasibility of updating vegetation maps for unincorporated areas to facilitate the accurate analysis of potential impacts of development on vegetation communities and other sensitive biological resources. If necessary, the County shall develop or modify regulations and development standards to ensure adequate protections for vegetation communities.

There really is no need to “research the feasibility of updating vegetation maps” as there is an ongoing statewide program that CDFW and CNPS have been implementing for over a decade

now. The goal is to map all the natural vegetation of the state according to The Manual of California Vegetation classification system. Part of the county has already been so mapped, including the entire Ventura River floodplain (by David Magney Environmental Consulting [DMEC] through Aspen Environmental Group as part of the Matilija Dam Removal project), the Santa Monica Mountains (by CNPS and the National Park Service), the Santa Clara River 500-year floodplain (by TNC through the California State Coastal Conservancy), and a portion of the eastern end of the Santa Susana Mountains (by CNPS). In 2006, DMEC cobbled together all the existing (at that time) vegetation maps for VCPD as a starting point. That map, as a GIS database (which was used as the basis for Figure 8-4 Vegetation Communities on Page 8-27 of Appendix B of the DEIR but not fully credited), was intended to be updated with each vegetation mapping effort for each discretionary project submitted to VCPD, but a lack of funding impeded this effort. This policy should instead focus on identifying means to obtain the funding needed to update the vegetation map of the county in one consistent effort.

The County should collaborate with CDFW and federal land management agencies to obtain funding to update and complete the vegetation mapping of Ventura County.

- ☐ Program E: Update Non-Coastal Zoning Ordinance Standards for Vegetation Communities. Based on the results of Implementation Program COS-D, (updated vegetation mapping), the County shall develop or modify regulations and development standards to ensure adequate protections for vegetation mapping, if necessary.

CNPS supports this policy program.

- ☐ Program F: Evaluate Increase to Standard Setback from Wetland. The County shall evaluate whether a standard 200-foot setback from wetlands should apply to development in order to improve water quality, reduce the impacts of flooding and provide adequate protection for sensitive biological resources.

CNPS supports this policy program; however, the use of the appropriate regional HGM model can answer this basic question on a project-by-project basis. Studies have shown that a 300-foot setback buffer is better to protect may wetland and habitat functions, considerably more for some resources/functions (Robins 2002¹). DMEC's assessment of wetland function impacts for a single-family residence in the Ojai Valley that was to be placed within the County's wetland 100-foot setback zone provided an objective assessment of expected project impacts while also identifying specific mitigation measures that could be adopted that would significantly improve wetland functions onsite ([DMEC 2006](#)).

- ☐ Program G: Identification of Critical Habitats. The County shall continue to partner with state and federal agencies to identify those areas of the County that are considered to be

¹ Robins, James D. 2002. Stream Setback Technical Memo. 18 October 2002. Jones & Stokes Associates, Oakland, California. Prepared for Napa County Conservation Development and Planning Department, Napa, California.

critical habitats of endangered, threatened or rare species as well as for other significant biological resources.

Unfortunately, since politics too often prevents federal and state agency biologists from formally designating what habitat(s) are critical for listed species (it too often gets bumped up to Washington DC where development lobbyists are most powerful and the local experts recommendations are overruled), the County should include NGOs that have expertise with these listed species in the analyses of what habitats are indeed critical for the species continued existence in Ventura County. Those NGOs include CNPS, Audubon Society, The Wildlife Society, and others. For County planning purposes, the VCPD, through collaboration with agency and NGO expert biologists, should determine what area and habitats meet the definition of Critical Habitat rather than Washington or Sacramento political appointees. The County can use existing definitions for sensitive habitats that are already developed, such as Environmentally Sensitive Habitat (ESHA) for the Coastal Zone or Sensitive Ecological Areas (SEAs) in Los Angeles County.

☐ Program H: County Tree Planting Program. The County shall plant at least one thousand trees annually on County property.

This is a great policy; however, planting of invasive exotic tree species should be expressly prohibited. The policy should also be more inclusive as "County property" will likely become saturated with trees in a few years. Requiring trees to be included in landscape plans for all new homes and existing homes that request significant changes would increase the number of trees planted each year.

PFS-12 – To protect life and property through the efficient provision of fire prevention, suppression, and rescue services and facilities.

PFS-12.1 Collaboration Amount Partners. The County shall encourage the Fire Protection District to continue to develop relationships with local, state, and federal agencies and non-profit organizations to collaboratively inform and prepare citizens for wildland fires.

CNPS supports this policy and is willing to collaborate with the Fire Protection District.

PFS-12.4 Consistent Fire Protection Standards for New Development. The County, in coordination with local water agencies and the Fire Protection District, shall require new discretionary development to comply with applicable standards for fire flows and fire protection.

Considerable research has been conducted on what measures are most effective in protecting houses from wildfires, and removing natural vegetation more than 100 feet is away is not the solution. Require all new homes and homes being remodeled to incorporate effective measures such as vent screens with 1/16th inch mesh, not allow combustible materials within 3 feet of the home/building, installing rooftop sprinklers that are supported by municipal water supplies or pumped from a well or tank with a battery power backup in case of a power outage.

Planting with local low growing natives, appropriately spaced and maintained is preferable to clearings exotic annual grasses which are prone to fire when dry. Native plants should not be avoided on the assumption of flammability without adequate data and should be encouraged near natural areas. Zone

appropriate planting around structures, as described in the CNPS Fire Recovery Guide should be practiced around structures. <https://www.cnps.org/give/priority-initiatives/fire-recovery>

Zone 1: Within 0 - 30 feet of your home.

Make this area and your evacuation route “lean, clean, and green.”

- Create a 5-foot no-fuel zone around your house to deter fire under the eaves of your home. (Relocate wood piles, garbage cans, mulch, wooden fences, and flammable plant material.)
- Prevent trees and large shrubs from touching each other or hanging over structures. (Cal Fire currently instructs spacing of at least 10 feet.)
- Remove “laddering” plants that can spread a ground fire up to a tree’s crowns.
- Remove loose plant debris from gutters, roofs, and other structures.
- Remove dead or dying trees. (Note: Make sure a tree is actually dead. See page 29.)
- Break up continuous, flammable ground cover (e.g., grasses, mulch) with hardscaping and other fire-resistant features.
- Provide good access to water within 30 feet of your home.

Zone 2: Within 30 - 100 feet of your home, reduce fuels.

- Keep your yard clear of trash, natural debris, and dried grasses.
- Mow grasses before 10 a.m. and avoid mowing on hot, windy days.
- Use low-maintenance plants that require low water and pruning.
- Clear dead and diseased plants. (See page 29 for post-fire care of trees.)
- Create both horizontal and vertical spacing between plants. Avoid laddering understory plants; space trees and shrubs at one or two times their mature height.
- Periodically re-open gaps between plants as plants grow closer together.
- Consider expanding this zone up to 300 feet for steep slopes with flammable shrubs.

These guidelines/prescriptions are more appropriate than thick mulch (which can be flammable) and compost.

Coastal Area Plan Policies

- ☐ Section 30240 Environmentally Sensitive Habitat Areas, Adjacent Developments:
- ☐ ESHA shall be protected against any significant disruption of habitat values, and only uses dependent on those resources shall be allowed within those areas.
- ☐ Development in areas adjacent to ESHA and parks and recreation areas shall be sited and designed to prevent impacts which would significantly degrade those areas, and shall be compatible with the continuance of those habitat and recreation areas.

CNPS generally supports these policies; however, additional comments will be provided later.

Oak Park Area Plan

- ☐ Policy 1.3.2.2: Discretionary development shall be located to avoid the loss or damage to healthy mature trees and sensitive plant species, including: Catalina Mariposa Lily, Wind Poppy and Santa Susana ~~Tar Plant~~Tarplant and other rare or endangered species.

This policy is good; however, a mechanism needs to be included to determine what a “healthy mature tree” is. The only commonly used tool available to arborists is focused on assessing trees in the landscape setting and emphasizing hazard risk to humans and property, not the biological and habitat functions mature trees have. Furthermore, this policy should be included in all Area Plans, not just the Oak Park Area Plan.

- ☐ Policy 1.3.2.3: Where applicable, developers shall be required to submit an updated Oak Tree Report, covering all oaks located within 50 feet of any proposed grading or construction. Trees, along with identifying number, health and aesthetic grades, shall be shown on the grading plan.

All assessments of trees should be conducted by a Certified Consulting Arborist, such as by the International Society of Arboriculture. All assessments of impacts to special-status plants should be performed by a California Certified Consulting (or Field) Botanist. A “County-approved qualified biologist” is not sufficient for the reasons previously described. This policy should apply to the entire county, and in each Area Plan.

- ☐ Policy 1.3.2.4: All discretionary development shall comply with the oak tree preservation and mitigation requirements of the adopted Oak Park Development Plans.

Agreed.

Ojai Valley Area Plan

- ☐ Policy 1.4.2.7: Discretionary development ~~which-that~~ would result in a significant adverse impact to a Locally Important Plant Community shall be required to replace such Locally Important Plant Community proposed for removal on at least a 1:1 basis and will be required to monitor the success of such planting for a minimum of seven years. In lieu of replacement, developers may dedicate without compensation, acreage containing such Locally Important Plant Community to a government agency or non-profit organization (e.g., a homeowners' association, a land conservancy) provided such entity will provide assurances that the dedicated Locally Important Plant Community acreage will be retained in a permanent undeveloped state. Such dedicated lands shall be at least two times the acreage of the Locally Important Plant Community which is proposed for removal. The form of such dedication may be fee title, conservation easement or other instrument approved by the County.

This policy has some good elements; however, it also has some flaws that need to be corrected. Including a “homeowners’ association” with NGOs that can receive lands for the purposes of mitigating impacts to Locally Important Plant Communities is flawed in that there are very few, if any, homeowners’ associations that have either adequate funds, interest, or expertise to properly manage such property. Some NGOs do, such as land conservancies and some government agencies; however, government agencies, such as the U.S. Forest Service, National Park Service, California Department of Parks and Recreation, to not accept lands with dead restrictions or conservation easements, which are common tools used to protect properties with sensitive resources.

Lake Sherwood/Hidden Valley Area Plan

- ☐ Policy 2.1.2.8: No blasting shall be permitted from February 15 through June 30 unless a field survey determines that there are no nesting raptors (other than kestrels) within 1/2 mile of the blasting site or unless studies are conducted to the satisfaction of Ventura County which indicate that blasting in an area will have no significant impact on nesting raptors.

CNPS supports this policy.

- ☐ Policy 2.1.2.9: A field survey by a qualified biologist shall be done prior to destruction or modification of any rocky outcrops. Mitigation measures recommended by the survey shall be implemented.

CNPS supports this policy; however, since this habitat type is very special, the field survey and impact assessment should be performed by a California Certified Consulting Botanist, not just a “qualified biologist” for which there is not clear, defined, and consistent set of criteria to determine their qualifications.

The County shall include the following new implementation program in the 2040 General Plan.

Implementation Program COS-X: Protection of Sensitive Biological Resources

The County shall update the Initial Study Assessment Guidelines, Biological Resources Assessment report criteria to evaluate discretionary development that could potentially impact sensitive biological resources with the following:

- ☐ The qualified biologist shall conduct an initial data review to determine the sensitive biological resources (i.e., special-status plant, special-status wildlife, sensitive habitats [e.g., riparian habitat, sensitive plant communities, ESHA, coastal beaches, sand dunes, other sensitive natural communities], wetlands and other non-wetland waters, native wildlife nursery sites, or wildlife corridors) that have the potential to occur within the project footprint. This will include but not be limited to review of the best available, current data including vegetation mapping data, mapping data from the County and California Coastal Commission, and database searches of the CNDDDB and the CNPS Inventory of Rare and Endangered Plants of California.

This is a good start; however, there is no mention of searches of databases and checklists for locally rare/Locally Important Species as part of this initial assessment. The Initial data review MUST include the potential for presence onsite or adjacent to the project site for locally rare species as well. Two resources are available to identify locally rare and uncommon native plants of Ventura County, the Ventura County Flora website (www.venturafloora.com) and the CNPSCI website (www.cnpsci.org). A search of Calflora online tool (www.calflora.com) will provide all reported occurrences of all native and naturalized plants using its “What Grows Here” tool. A search of the California Consortium of California Herbaria (CCH on the UC Jepson Herbarium website) will provide links to all accessioned and uploaded voucher specimens that have been deposited into a participating herbarium. Magney’s Venturafloora.com website provides a checklist of all known native and naturalized vascular known to occur in Ventura County as well

as numerous local plant checklists. These resources should be part of every botanist's pre-site visit review to maximize detection of special-status plants that may occur on the project site.

- ☐ The qualified biologist shall conduct a reconnaissance-level survey for sensitive biological resources within the project footprint (including proposed access roads, proposed staging areas, and the immediate vicinity surrounding the project footprint) to determine whether sensitive biological resources identified during the initial data review have potential to occur.

CNPS is extremely concerned that this part of the implementation program is flawed as the timing of the reconnaissance survey and the expertise of the "qualified biologist" are absolutely critical to determining the potential for determining whether there is potential for sensitive biological resources present. Many species are simply not detectable for long periods of each year and almost certainly would not be detected during a reconnaissance-level survey. All site botanical surveys should be floristic in nature, and timed to maximize the opportunities to detect the presence of sensitive species.

- ☐ If the reconnaissance-level survey identifies no potential for sensitive biological resources to occur, the applicant will not be subject to additional mitigation measures.

CNPS strongly objects to the element of the implementation program. There are too many instances when even more thorough site surveys have failed to detect sensitive biological resources to simply claim, through a reconnaissance-level survey, that there is no potential for sensitive resources to be present onsite. There are very few circumstances when such a conclusion can be made, and then they should only be made by a Certified Consulting Botanist for botanical resources and a Certified Wildlife Biologist for wildlife resources.

- ☐ If sensitive biological resources are observed or determined to have potential to occur within or adjacent to the project footprint during the reconnaissance-level survey, then the following measures shall apply:

Special-Status Species

- ☐ If special-status species are observed or determined to have potential to occur within or adjacent to the project footprint, a qualified biologist shall conduct focused or protocol-level surveys for these species where established, current protocols are available (e.g., Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Natural Communities [CDFW 2018], Staff Report on Burrowing Owl Mitigation [CDFG 2012]). If an established protocol is not available for a special-status species, then the qualified biologist will consult with the County, and CDFW or USFWS, to determine the appropriate survey protocol.

CNPS basically supports this step. However, the consulting biologists should be Certified, not just a "qualified biologist".

- ☐ If special-status species are identified during protocol-level surveys, then the County shall require implementation of mitigation measures that fully account for the adversely

affected resource. When feasible, mitigation measures should adhere to the following priority: avoid impacts, minimize impacts, and compensate for impacts.

CNPS basically supports this step. However, the consulting biologists should be Certified, not just a "qualified biologist".

- ☐ If impacts on special-status species are unavoidable, then the project proponent shall obtain incidental take authorization from USFWS or CDFW (e.g., for species listed under ESA or CESA) prior to commencing development of the project site, apply minimization measures or other conditions required under incidental take authorization, and shall compensate for impacts to special-status species by acquiring or protecting land that provides habitat function for affected species that is at least equivalent to the habitat function removed or degraded as a result of project implementation; generally at least a 1:1 ratio. Compensation may include purchasing credits from a USFWS- or CDFW-approved mitigation bank or restoring or enhancing habitat within the project site or outside of the project site.

CNPS basically supports this step. However, the consulting biologists should be Certified, not just a "qualified biologist". Avoidance of the impact shall take precedence over other forms of mitigation as translocation of special-status species as mitigation is mostly experimental and what has been done has very low levels of success. For botanical resources, the impact assessment and mitigation plan and measures should be performed by a California Certified Consulting Botanist and by a Certified Wildlife Biologist for wildlife impacts.

These are some of CNPS's comments on the proposed GP update and DEIR; however, additional time is required (and previously requested) to be able to adequately review all the relevant documents and provide substantive and thoughtful comments and suggestions.

Please contact me via email at dmagney@cnps.org or by phone at 916/447-2677 ext. 205 if you have any questions.

Re: Comments Regarding Draft General Plan EIR

Dear Ms. Curtis:

I am writing to provide comments on the Draft General Plan EIR. The Background Report and the Draft EIR do not adequately address the impact of pesticide use in the agricultural sector. In its discussion of Environmental Impacts and Mitigation Measures, the Draft EIR identifies impacts associated with the use of pesticides as a concern. It describes the role of the County Agricultural Commissioner's office in evaluating the use of restricted materials but does not discuss the efficacy of the program beyond reference to the 2018 report of the Ventura County Grand Jury.¹ That Grand Jury report focused primarily on implementation of monitoring requirements, concluding that "the monitoring of fumigants like 1,3-D, methyl bromide and chloropicrin utilized in County agriculture demonstrates that levels of drift are below cumulative harmful levels."² The Draft EIR then concludes that pesticide exposure would not be addressed further.³ The draft Background Report likewise describes the restricted permitting process but does not evaluate its effectiveness.⁴

The Grand Jury report did not address the efficacy of the restricted materials permitting program. Two recent reports by researchers at UCLA evaluated the restricted materials permitting system. Those reports concluded the restricted permitting system throughout California, including in Ventura County, does not comply with two regulatory requirements established to implement the substantive requirements of CEQA. First, in approving the application of restricted materials, county officials fail to ensure the performance of meaningful alternatives analysis (AA), meaning systematic evaluation of safer alternatives such as more benign pesticides or cultural practices.⁵ Second, in assessing the impacts of restricted materials, county officials do not perform cumulative impacts assessment (CIA), defined as consideration of the additive or

¹ Draft Environmental Impact Report: Ventura County 2040 General Plan (January 2020) at 4.2-5 to 4.2-6.

² Ventura County Grand Jury, Final Report: Pesticide Monitoring Near Schools and Day-Care Centers (April 25, 2019) at 5.

³ Draft Environmental Impact Report: Ventura County 2040 General Plan (January 2020) at 4.2-5 to 4.2-6.

⁴ Ventura County 2040 General Plan Update Background Report (January 2020) at 9-39.

⁵ Timothy Malloy, *et al.*, *Governance on the Ground: Evaluating Pesticide Regulation in California* (2019).

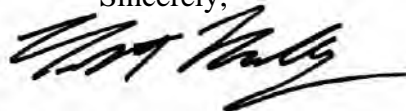

synergistic effects of exposing workers, bystanders and environmental receptors to multiple pesticides.⁶

The research focused on mixtures of three restricted materials — chloropicrin, Telone and metam salts — that are frequently used on high-value crops such as strawberries, tomatoes, tree nuts and stone fruits. The UCLA report demonstrated that their combined adverse effects can be greater because the materials may interact to increase damage to cells and can reduce the body's ability to remove or neutralize toxic substances. Using data from the Pesticide Research Institute, which collaborated with UCLA, the research examined the area near Rio Mesa High School in Ventura County from July 26 to August 3, 2013. The air modeling showed contemporaneous exposure to multiple pesticides at locations such as schools, day care centers and parks.⁷ The Ventura County Grand Jury report did not address the impact of cumulative exposure to mixtures of pesticides. Copies of the UCLA reports can be found at <https://law.ucla.edu/centers/environmental-law/emmett-institute-on-climate-change-and-the-environment/publications/governance-on-the-ground/> and <https://law.ucla.edu/centers/environmental-law/emmett-institute-on-climate-change-and-the-environment/publications/exposure-and-interaction/>

Given these identified deficiencies in the restricted materials permitting system, pesticide exposure should not have been excluded from further analysis in the Draft EIR. The EIR should examine how the existing deficiencies impact pesticide exposures and consider implementation of measures to mitigate these problems in the goals of the General Plan.

Thank you for your consideration. If you have any questions, please do not hesitate to contact me via e-mail at malloy@law.ucla.edu. (Please note that the comments represent my views only. Use of the UCLA letterhead is for identification purposes only.)

Sincerely,

Timothy F. Malloy

You have a NEW Comment

Name:

Derek McLaughlin

Contact Information:

760-579-1437 271 S Ventura Rd #299 Port Hueneme

Comment On:

Draft Environmental Impact Report

Your Comment:

Don't allow expansion of the port in Port Hueneme. I live about 1/3 of a mile east of it & often I & thousands of others are downwind of it. It already has far too much air pollution. At least make them have all large vessels plug into the grid upon arrival before any expansion is seriously considered or have to install excellent air pollution equipment on their exhaust, such as scrubbers like those on one of the Wallenius Wilhelmsen auto carriers.

Even without any thought of port expansion, cleaning up the port's air pollution & the ships while in port needs to be much further the list of county air pollution priorities. Many schools are downwind of the port & almost always people are downwind of it.

Quite putting so many new residential units in highly air polluted areas near freeways. Bad for the residents till we have much cleaner fleets of vehicles.

Try hard to avoid more of the coast being lined with rip-rap & seawalls. Keep the shoreline way more natural than that. Discussing when you go north of the city of Ventura. So much of the coast is rip-rap instead of natural beaches, dunes, wetlands, bluffs etc.

Regarding two things from Aug. 6, 2019 Board of Supervisor hearing, session I attended: one, Supervisor Parks idea on tree planting has a lot of good points though we must consider if more greenhouse gases will be produced than the trees make up for, by the transporting of water to water them & if water trucks will be used to water many of them. I've heard &/or read the Calif. Water Project is the largest user of electricity in the state & that's just one of the 3 large aqueduct systems that bring water to So. Calif. Water trucks should be electric, hydrogen or better, otherwise will also have air pollution from them. One fellow's 90 seconds comment that day addressed problem if the trees degrade the natural ecosystems of the county. I agree that's a serious concern though Parks said we should use drought tolerant trees which will help narrow the choice to natives & a few others. That's good. We could concentrate on replacing native trees where they have been removed with natives. I think eucalyptus tend to drop stuff on the ground that

prevent native plants from growing plus they blow over easy & aren't native & probably bad in fires.

2nd: I agree with all of supervisor Bennett's comments on climate change he mentioned on Aug. 6th. Not to downplay all the very important other considerations of the general plan, but I strongly feel that is the most important issue the county should address in the general plan.

Try to help insure we always have the Oxnard performing arts center

Ventura County Board of Supervisors
Attn: RMA Planning Division
General Plan Update
800 Victoria Avenue L#1740
Ventura, California 93009-1740

Dear Board of Supervisors and Staff:

We are writing this letter to urge the Board of Supervisors to reconsider moving forward with the Draft General Plan EIR. The draft EIR has been accelerated to the point that too many issues and impacts have not been properly addressed or studied. These impacts and the corresponding mitigation measures will have severe impacts to land owners and especially those, like us in the agricultural industry and other productive economic segments.

Our family has been involved in the agricultural industry for more than 100 years in Ventura County. We have owned numerous land holdings that remain in the family to this date. We have farmed throughout Ventura County and hope to continue to do so in the future.

The Draft EIR is deficient on many levels. CEQA requires that all mitigation measures must be technically and economically feasible. Numerous proposed mitigation measures are neither. We have in the past attempted to identify land and any owners that would be open to sell their development rights for land that was converting from agricultural to commercial use. Not only did we not find anyone that would do so, no one would even quote a price. The only positive response from numerous land owners were that you can buy my property for full market value and then you can do what you want. There is not a project that can be built by adding double land cost to the equation. This was very recently experienced based on proposed policies at LAFCo. These policies were eventually not enacted due to the inability to purchase development rights in an economical feasible manner. This was when LAFCo was contemplating an acre for acre ag preserve. The new policy that is proposed in the 2040 General Plan is requiring 2 acres for every 1 acre of land converted from ag to any other use. This will eliminate the ability to add any new required ag buildings or even farm worker housing. The Draft EIR must study these impacts, since they are not feasible.

The Draft EIR also deals with water in a manner that is not properly studied. There is no analysis on increased water costs and diminishing availability of water. Without reasonable water costs and supply, there is no agricultural industry.

The General Plan indicates that agriculture is a high priority in the County. However, new policies and requirements in the General Plan add additional mitigation measures that will make ag virtually impossible. These include new setbacks, limiting types of fumigants pesticides and fertilizers. The General Plan also requires the conversion of all farm equipment to be all electric. Again, not feasible. The costs to purchase new pumps, farm equipment and other existing fuel using equipment will increase operational costs to a point that the County crops will not be competitive in the open market. These new mitigation measures are not sufficiently studied and again are not economically feasible.

The Draft EIR is extremely difficult to read and understand. The background reports are lacking in depth of what has been studied other than numerous general statements and very poor mapping. Detailed studies must be added to sufficiently identify impacts and the related mitigation measures for both direct and indirect impacts on the agricultural industry. It is our understanding that reports and studies need to be timely prepared. However numerous studies are older than 5 years. Not timely.

After numerous devastating wildfires over the last few years, which significantly impacted ag, the General Plan continues to lay out limiting mitigation measures for fire prevention. The Wildlife corridor eliminates any ag operation or fire prevention in the proposed corridor areas. This is also a major concern not studied in the Draft EIR.

The Draft EIR for the 2040 General plan does not provide adequate analysis for the expansion of permanent bike paths and pedestrian walking trails throughout the County. These impacts are very severe due to constant conflicts from trail users and ag operations. Spraying, dust, odors from ag operations, along with impacts created by the trail users. These are usually theft, vandalism, litter and pet waste. The proposed mitigation measures require additional setbacks from these trails which renders additional land unusable for ag operations.

In addition to the above comments on the agricultural aspects and related land use concerns of the DEIR, the undersigned is also a mineral owner directly interested in the impacts on oil and gas production of the DEIR and related General Plan 2040 proposed provisions. In these documents there is a total failure to address the economic impacts of the various policies proposed in violation of the requirements for this process, including but not limited to the loss of royalty income to a large group of County residents. I join in the detailed comments on the various deficiencies and concerns identified in the DEIR as described in the concurrent submissions on behalf of Aera Energy and other operators delivered this week to the County.

Please look at the long-term consequences of these General Plan policies and mitigation measures. We formally request additional studies and a revised Draft EIR that will properly look at these and many more issues. The DEIR must be corrected with details of the revisions. Then it can be recirculated.

V
Sincerely,

Mary Kathleen McGrath

Re: Comments on Ventura County General Plan DEIR

Dear Ms. Curtis:

I represent and serve on the McLoughlin Family Committee, a group of family members that own approximately 300 acres of agricultural property off of Olivas Park Road in the County of Ventura, in proximity to the City of Ventura.

The McLoughlin family has farmed this land for generations. It remains our desire to continue this legacy. However, in the face of never-ending changes to the regulatory environment, we again find ourselves attempting to ascertain how new policies and programs as proposed in the draft 2040 General Plan will impact and challenge our ability to serve as stewards of this heritage.

It had been our hope that the DEIR would provide some clarity and insight into how the new policies and programs within the revised General Plan would impact our farming operation. However, that is not the case. Simply said, we believe the General Plan Update and subsequent Environmental Impact Report fail to adequately analyze or study impacts on the farming industry.

With that said, we would like to specifically present the following:

- The Background report Table 6-26: Transportation Department Planned Capital Projects lists sections of roadways the County plans for expanded capacity or widening, along with the scope of those enhancements. It also covers in length the plan to add bike paths and bike lanes in accordance with existing County wayfarer plans. However, the DEIR never analyzes the loss of farmland resulting from these changes in infrastructure – it’s not even mentioned as a possibility in the DEIR.

Olivas Park Road between Victoria and Harbor is listed as one of the areas planned for road widening, a stretch of roadway that borders the entire eastern portion of our farmland and property. While the impact on our farming operation and financial losses due to property loss are clearly quantifiable, the report fails to list or quantify these impacts.

- In Section 3-8, The DEIR states that because there will be no “substantive” change to the agricultural, open space, or rural designations, the General Plan Update (GPU) will be consistent with SOAR. However, no further details beyond this conclusory statement is provided. There is no way for the reader to come to his or her own conclusion on whether the GPU will result in inconsistencies with SOAR that might lead to physical environmental impacts. There is no description of the changes to the Agriculture, Open Space, and Rural policies to determine whether they are in fact non-substantive.

Given the length and breath of the Draft General Plan update and CEQA analysis, we made an attempt to focus our initial review and subsequent comments to issues specific to agriculture and

farming. However, it's clear that the 2040 General Plan will impact the Ventura County local economy across sectors – all of which influence the ability to live and work in this region. The DEIR's lack of analysis of those economic impacts, calls into question the legitimacy of both the draft General Plan update, and the CEQA analysis. As such, we respectfully request that the DEIR be recirculated in the hopes that further study will resolve these shortcomings.

I appreciate your consideration.

Laura McAvoy

Subject: Ventura County General Plan

Susan Curtis,

County failed to evaluate mitigation measure for feasibility- 500' set back for "sensitive receptors" from freeways and high traffic roads.

Mitigation Measure AQ-3 (Policy HAZ10-X) creates a minimum 500' set back for "sensitive receptors" from freeways and high traffic roads. Yet the County states in the Land Use section of the EIR that "the majority of the anticipated build out will be within the freeway corridors."

Has the County completed a "buildout study" to ensure that the establishment of this set back still leaves enough room for development to occur? Will this mitigation measure be economically feasible?

Subject: Ventura County General Plan comments

Sanger Hedrick, Chair
Agricultural Policy Advisory Committee (APAC) County of Ventura
800 S. Victoria Blvd.
Ventura, CA 93003

Re: 2040 General Plan Environmental Impact Report (EIR)

Dear Mr. Hedrick and Honorable Members of APAC:

Thank you for the opportunity to provide comments following today's presentation by Ventura County Planning staff on t

There are several issues with the 2040 General Plan EIR that CoLAB believes will negatively impact the viability of local ag

Proposed mitigation measure AG-2: The County proposes that any project that either directly or indirectly results in the l
into perpetual agricultural preservation twice the total of the farmland loss. This mitigation measure is infeasible. Contra

Planning staff today at the APAC meeting, the California Environmental Quality Act (CEQA) requires that all mitigation proposed under Section 21061.1 defines feasible as “capable of being accomplished in a successful manner within a reasonable period of time” (*emphasis added*). All mitigation measures proposed in an EIR must be shown to reduce impacts

and an infeasible mitigation measure, by definition, cannot and will not reduce impacts.

The EIR does not provide evidence of any of the following:

1. 1) Whether there is sufficient land available for purchase/conservation easement for each farmland category;
2. 2) The cost per acre to purchase each category of farmland;
3. 3) The anticipated cost of establishing a conservation easement for each category of farmland;
4. 4) The anticipated cost associated with managing each category of farmland under a conservation easement;
5. 5) The anticipated cost associated with monitoring these mitigation parcels scattered throughout the County and who will bear that cost;
6. 6) Any information that could constitute a “plan” for management of farmland in conservation easements;

February 19, 2020

Ventura County Coalition of Labor, Agriculture and Business / 1672 Donlon Street, Ventura, CA 93003 / 805-633-2260 / info@colabvc.org

Page 2 of 4

7. 7) An analysis of direct and indirect impacts caused by this mitigation measure (including impacts associated with increased urban-ag-interface);
8. 8) Whether the smallest possible mitigation acreage required will achieve the minimum to ensure viability of agricultural operations;
9. 9) Whether the proposed mitigation is in conflict with other ordinances and regulations, such as the County’s minimum lot sizes.

The County is already aware that this proposed mitigation measure is infeasible. On March 24, 2016, at a Local Agency Formation Study (LAFS) meeting, Supervisor Linda Parks attempted to establish an “Agricultural Mitigation Measure” through the LAFS project approval process. The measure would have required the 1-to-1 purchase of local farmland (half of what is proposed in the 2040 General Plan EIR) to replace farmland lost to proposed development. Ventura County Counsel, Michael Walker, informed both LAFS and Supervisor Parks that the measure did not meet the standard for economic feasibility, and, for that and other reasons, LAFS could not adopt Supervisor Parks’ proposal.

referenced a 2015 legal decision, *City of Irvine v. County of Orange*, in which the Court stated, “the sheer astronomical expense of the EIR that the purchase of an agricultural conservation easement is a non-starter.”

In addition to being infeasible, CoLAB does not believe that this mitigation measure will reduce impacts on agricultural land issues that will impact farmland under the 2040 General Plan: lack of economic sustainability, the increasing regulatory burden and competition for water resources, and increased compatibility conflicts from development.

Indirect Impacts

The EIR dismisses “indirect impacts” that will occur as a result of implementing the 2040 General Plan as “less than significant.”

Page 4.2-13 of the EIR states “AG-2.3 maintains the Right-to-Farm Ordinance to protect agricultural land uses from conflicts with residential development as to help land purchasers and residents understand the potential for nuisance, (e.g., dust, noise, odors) that may occur in agricultural areas...These sections of the code protect farmers engaged in agricultural activity from public nuisance claims by the community, including Important Farmlands and farms less than 10 acres, from developments that would inhibit their ability to produce agricultural production.”

Page 4.2-17 of the EIR states: “Residential growth in areas nearby agricultural lands has the potential to result in land uses that are generally more sensitive and prone to conflict with adjacent agricultural land uses than commercial or industrial land uses such as residences and schools, nearby classified farmland can negatively impact both uses due to conflict including odors and agricultural machinery. The countywide Right-to-Farm Ordinance protects existing agricultural and farming operations from conflicts with residential development...**Therefore, the potential for conflicts would be minimal. This impact would be less than significant**” (*emphasis added*)

This is simply not true. Historic and recent County actions have shown that the County has and will continue to create new and a significant impact on existing agricultural

Ventura County Coalition of Labor, Agriculture and Business / 1672 Donlon Street, Ventura, CA 93003 / 805-633-2260 / info@colabvc.org

Page 3 of 4

and farming operations because of conflicts attributed to residential development. The recent interim

urgency ordinance restricting hemp cultivation is one such example.

Contrary to statements made today by Ventura County Planning staff, an EIR, whether it is labeled as “programmatic” or “project,” must address the foreseeable consequences of the action that is proposed. For the 2040 General Plan EIR, the action proposed is the implementation of the 2040 General Plan within. Therefore, if the implementation of a policy in the 2040 General Plan will result in an impact, that impact must be addressed. The 2040 General Plan contains land use designation changes that will increase allowable housing density near agricultural land. It is CoLAB’s opinion that these changes will create more compatibility conflicts with normal farming operations. The impact of these compatibility conflicts is significant.

In 2014, the California Court of Appeal stated in a ruling that “[T]he fact that this EIR is labeled a ‘project’ rather than a ‘programmatic’ EIR as a program EIR ... does not by itself decrease the level of analysis otherwise required in the EIR. All EIRs must cover the same level of specificity of an EIR is determined by the nature of the project and the “rule of reason,” rather than any semantic label.”

It is CoLAB’s opinion that indirect impacts from increasing urban-ag interface are SIGNIFICANT and cannot be dismissed in the EIR.

Direct and indirect impacts of increased costs

The 2040 General Plan has policies that will increase the costs of normal farming operations. CoLAB believes that the most effective way to convert agricultural land to non-agricultural uses is to take active measures to allow farming to remain profitable. And even the most effective measures of farming reduces conversion of agricultural land in their discussion of the Williamson Act in Chapter 4.2 of the EIR.

But the County fails to analyze direct and indirect impacts of 2040 General Plan policies that will increase the cost of nor

- Policy AG-5.2: Electric- or Renewable-Powered Agricultural Equipment. The County shall encourage and support renewable-powered or lower emission agricultural equipment in place of fossil fuel-powered equipment when
- Policy AG-5.3: Electric- or Renewable-Powered Irrigation Pumps. The County shall encourage farmers to convert to systems powered by electric or renewable energy sources, such as solar power, and encourage electric utility charges.

Direct and indirect impacts of increased competition for water resources

The County fails to evaluate the impact of increased competition for water resources caused by development and either the conversion of agricultural land or the loss of agricultural lands through the loss of topsoil.

The EIR states on page 4.2-3 that "...a reduction in available water resources for irrigation" is an example of impact to loss of topsoil from increased wind and water erosion.

But the County fails to analyze or propose mitigation measures to address this significant impact.

Ventura County Coalition of Labor, Agriculture and Business / 1672 Donlon Street, Ventura, CA 93003 / 805-633-2260 / info@colabvc.org

Page 4 of 4

APAC is the expert charged with advising County decision-makers on agricultural issues in Ventura County. And the County APAC about the actual issues that will impact farmland under the 2040 General Plan: lack of economic sustainability, the agriculture, increased competition for water resources, and increased compatibility conflicts from development.

CoLAB encourages APAC to provide guidance to the County on appropriate and effective mitigation measures to prevent non-agricultural uses. These may include:

1. 1) Strengthen the Right-to-Farm ordinance to prevent nuisance complaints from being used to justify setbacks or regulatory restrictions on normal farming practices;
2. 2) Expand the Land Conservation Act Program to include Open Space zoned properties that are engaged in agriculture and
3. 3) Protect agricultural land from urban-ag interface encroachment and compatibility conflicts by establishing land that will restrict the construction of bike paths, public trails, and sensitive receptors within 2000'

Thank you again for the opportunity to provide comments on this issue. We appreciate your consideration and

Sincerely,

Louise Lampara Executive Director

In support of this letter-

Re: Comments to Draft EIR to Ventura County General Plan

Dear Ms. Curtis,

I find redundancy and flaws in the description and analysis of the 2040 General Plan released January 13, 2020 (Draft EIR) that significantly impact potential policy changes. I will specifically address two proposed new policy items associated with Section 4.12, Mineral and Petroleum Resources.

1. On page 4.2-8, the Draft EIR is proposing “**new policy**” as described as COS-7.2 (revised page 4.12-18): Oil Well Distance Criteria. Under this new policy the *“County shall require that new discretionary oil and gas wells be sited a minimum of 1,500 feet from the well head to sensitive use structures which include dwellings, childcare facilities, hospitals, health clinics, and school property lines.”* In light of the “significant and unavoidable” impact that COS-7.2 (DEIA page 4.12-22) would have on hampering or precluding access to petroleum resources in Ventura County and potentially exposing the County to liability for damages associated with precluding landowners the right to enjoy the benefit of the development of their mineral resources, the County should suspend the inclusion COS-7.2 until the State legislature has had the opportunity to deal with the matter and develop policy (i.e. AB345) which most probably will be in conflict with any form of COS-7.2 that the County develops.

In the last several years there has been an abundance of information published by setback advocates concerning setbacks from oil and gas production facilities. Health related studies of populations living in the vicinity of an oil and gas production facility are not conclusive, and may be significantly biased by knowledge that a facility, previously unknown, is “discovered” to exist. From my own review of the published sources, none conclusively establish an appropriate setback distance and, because wells and facilities differ, not one size fits all. A steam injection related facility on the Oxnard Plain is significantly different from a light oil and gas facility on the Oxnard Plain; both oil and gas, but each has radically differing impacts. The former having the lingering smell of tainted rotten eggs and the latter no noticeable emissions impacts at all. The majority of the published studies used by both the Los Angeles County and California Council on Science and Technology that were cited as support in the Draft EIR were performed in areas outside of California (i.e. TX, CO, PA etc.) where the regulatory requirements for emissions from oil and gas facilities are significantly less stringent than those required in California, of which the APCD in Ventura County has been ahead of the pack for over a decade.

In conclusion, suspending action of a setback requirement until the State has generated policy is a prudent course of action given the uncertainty associated with the implantation of COS-7.2 and the potential liability that the County could be exposed to in the future. Lastly, existing Ventura County policy has not been demonstrated to be inadequate.

2. On page 4.2-8, the Draft EIR is proposing “**new policy**” as described as COS-7.7 (revised page 4.12-31): Conveyance for Oil and Produced Water. Under this new policy the “*County shall require new discretionary oil wells to use pipelines to convey crude oil and produced water, if feasible. Trucking of crude oil and produced water may only be allowed if the proponent demonstrates that conveying the oil and produced water via pipeline is infeasible. In addition, trucking of crude oil and produced water is allowed in cases of emergency and for testing purposes consistent with federal, state and local regulations.*” The current VCNCZO establishes oil development guidelines and states that “An applicant should use the guidelines in the design of the project and anticipate their use as permit conditions, unless the applicant can demonstrate that they are not feasible or practicable” (VCNCZO §8107-5.5.) and further states that “Pipelines should be used to transport petroleum products off-site to promote traffic safety and air quality” (VCNCZO §8107-5.5.5.a).

As stated in the above, the requirement to utilize pipelines to transport petroleum products is based on the feasibility and practicality of utilizing a pipeline as oppose to other sources of transportation such as trucking. Feasibility and practicality include the economic feasibility of a pipeline in support of a project. I am cited on page 4.12-23 of the DEIR analysis where my firm, Renaissance Petroleum, LLC (RenPet), provided Ventura County an economic evaluation for the interconnection of RenPet’s Cabrillo Oil Field to a pipeline to transport crude oil. The DEIR correctly summarizes the findings that such a project would be uneconomic.

Figure 4.12-4 of the Draft EIR is fatally flawed. The map purportedly displays “Major Oil Transmission Pipelines” in yellow and includes an orange “2 Mile Setback” in an effort to show the proximity of the majority of the oil production in Ventura County to crude oil pipelines. As a significant flaw, the lines shown as yellow on Figure 4.12-4 **include gas transmission lines**. These gas transmission lines represent the majority of the “Major Oil Transmission Pipelines” shown on the map. Please refer to the Grand Jury sourced map attached to my 2016 memo for an accurate presentation of crude oil transmission pipelines in Ventura County (see attached). There is significantly less access to a crude oil pipeline than Figure 4.12-4 and its setback distance suggests, and south of SR 101 there is very limited access. The implantation of COS-7.7 could strand significant crude oil resources located south of SR 101 to the financial detriment of the landowners in this area and Ventura County. As a result, what is characterized as a potentially significant impact (DEIR page 4.12-31) **should be elevated to a significant impact, based on the flawed map included in the DEIR as Figure 4.12-4.**

Thank you very much for your consideration of my comments.

Respectfully submitted,

Marc Wade Traut
President

Subject: Cabrillo Oil Field Pipeline Options and Economic Feasibility

Ventura County (VC) Planning has requested that RenPet provide a discussion on the economic feasibility of transporting Cabrillo Oil Field (Cabrillo) crude oil from the field's Naumann Drillsite to market by way of a pipeline instead of by tanker truck. This request has been made to assess whether RenPet's activities at the Naumann Drillsite are consistent with the oil development guideline standards that are defined in the Ventura Non-Coastal Zoning Ordinance (VCNCZO) Section 8107-5.5. Importantly, the aforementioned reference states that these guidelines shall be "...applied whenever physically and economically feasible and practicable..." The guidelines include Section 8107-5.5.5.a that states "...Pipelines should be used to transport petroleum products off-site to promote traffic safety and air quality..." The following is RenPet's response to the request made by VC Planning.

Cabrillo crude oil has historically been transported by truck from the processing and storage hub for Cabrillo, which is the Naumann Drillsite located on Etting Road in the southern sector of the Oxnard Plain. From the Naumann Drillsite, the transportation route is by various VC roads north to SR 101 and then south to refineries in the Carson/Torrance area of southern California. Section 4.2.6 of the current version (10-20-2015) of the Ventura County General Plan, Public Facilities and Services Appendix (VC General Plan) provides a general discussion of the existence of oil pipelines in Ventura County. Not included in the current version of the VC General Plan is a map showing the location of these oil pipelines. Maps of oil pipeline locations had been included with earlier versions of the VC General Plan (i.e.1987). RenPet was able to locate a report prepared for the Ventura County Grand Jury in 2015 that included a map of oil pipelines within VC. The report was prepared to address concerns over pipeline safety within VC following the pipeline rupture and ensuing oil spill in Santa Barbara County in 2015. A copy of the pipeline map included with the VC Grand Jury report is attached to this memo. Oil pipelines are shown as solid red lines. Also attached to this memo is an enlargement of the same map that shows the location of oil pipelines in relation to the Naumann Drillsite.

The enlargement of the VC pipeline map shows the location of three oil pipeline interconnection possibilities that represent the nearest options for RenPet to interconnect Cabrillo to the existing oil pipeline system. These interconnections are considered possibilities. RenPet has never had contact with any of the pipeline owners to explore if pipeline access is feasible and to determine what the tariff would be for pipeline access and crude oil transport. Each of these three options is described in the following:

- Oil pipeline interconnection Option 1 is approximately 8.1 miles from the Naumann Drillsite. The interconnection point is at the intersection of Los Angeles Avenue (SR 118) and Santa Clara Avenue. The oil pipeline is owned and operated by Crimson and serves to transport crude oil east and ultimately south from the Ventura Avenue Oil Field area to Los Angeles area refineries.
- Oil pipeline interconnection Option 2 is approximately 6.6 miles from the Naumann Drillsite. The interconnection point is at the intersection of Santa Clara Avenue and Central Avenue. The owner of the pipeline is unknown; however that oil pipeline serves the Santa Clara Avenue Oil Field and interconnects with an oil pipeline that was formerly owned by Union Oil Company that transports crude oil eastwards along the Santa Clara River and ultimately south to Los Angeles area refineries.
- Oil pipeline interconnection Option 3 is approximately 10.6 miles from the Naumann Drillsite. The interconnection point is west of Harbor Boulevard in the vicinity of the Mandalay Beach generating plant. The owner of the pipeline is unknown; however that oil pipeline serves the West Montalvo Oil Field and appears to interconnect with the same oil pipeline that was formerly owned by Union Oil Company that transports crude oil eastwards along the Santa Clara River and ultimately south to Los Angeles area refineries.

All three of the oil pipeline interconnection options for Cabrillo that are shown on the attached enlargement face challenges. For Options #1 and #2, the largest hurdle is an undercrossing of SR 101. For options #1, #2 and #3, the Cal Trans, VC, and city of Oxnard road right-of-ways could be used for pipeline placement as the routes would use common segments of Etting Road, Rice Road, and Santa Clara Avenue. Interconnection Option #3 would use part of the same right-of-way as options #1 and #2, but would cut west through the city of Oxnard, and then into the VC Coastal Zone, and then north and west to the possible interconnection point in the vicinity of Mandalay Beach.

Based on pro forma cost estimates, the three oil pipeline interconnection options described above would cost 1.2 to 1.5 million dollars per mile. The estimated average cost for the three options is 11.4 million dollars for permitting, design, engineering, and construction. The necessary lead time for any of these options would be 4 to 5 years.

The economic feasibility of any pipeline project would be based on the differential savings between the cost of transporting Cabrillo oil by pipeline versus the cost of transporting Cabrillo oil by tanker truck after consideration of the capital investment of pipeline construction. RenPet pays approximately \$2.50 per barrel to transport its Cabrillo crude oil from the Naumann Drillsite to markets in southern California. An estimated tariff to transport Cabrillo crude via pipeline is \$0.50 per barrel. The estimated net savings realized by utilizing a pipeline for crude oil transport instead of truck transport is \$2.00 per barrel.

Cabrillo crude oil has been trucked from the Naumann Drillsite from inception of activities there in 1992. The highest rate of production achieved to date for Cabrillo was a rate of approximately 12,500 barrels of oil per month beginning in late 2010. The production rate declined rapidly. Cabrillo oil production is currently approximately 1800 barrels of oil per month. The exponential decline over the past five years is typical for the Cabrillo reservoir.

A discounted cash flow analysis was performed to determine the net present value (NPV) of a hypothetical Cabrillo pipeline project on a go forward basis, that is, from the current level of production forecasted out for 25 years. The assumptions are as follows:

1. Pipeline Capital Investment: \$11,385,000
2. Net Crude Transportation Savings per barrel: \$2.00
3. Discount Rate: 5%
4. Project life: 25 years; years 6-31
5. Future production decline: Exponential ($y=80221x^{-0.673}$)

The NPV of the pipeline project with the above assumptions is (\$10,512,490).

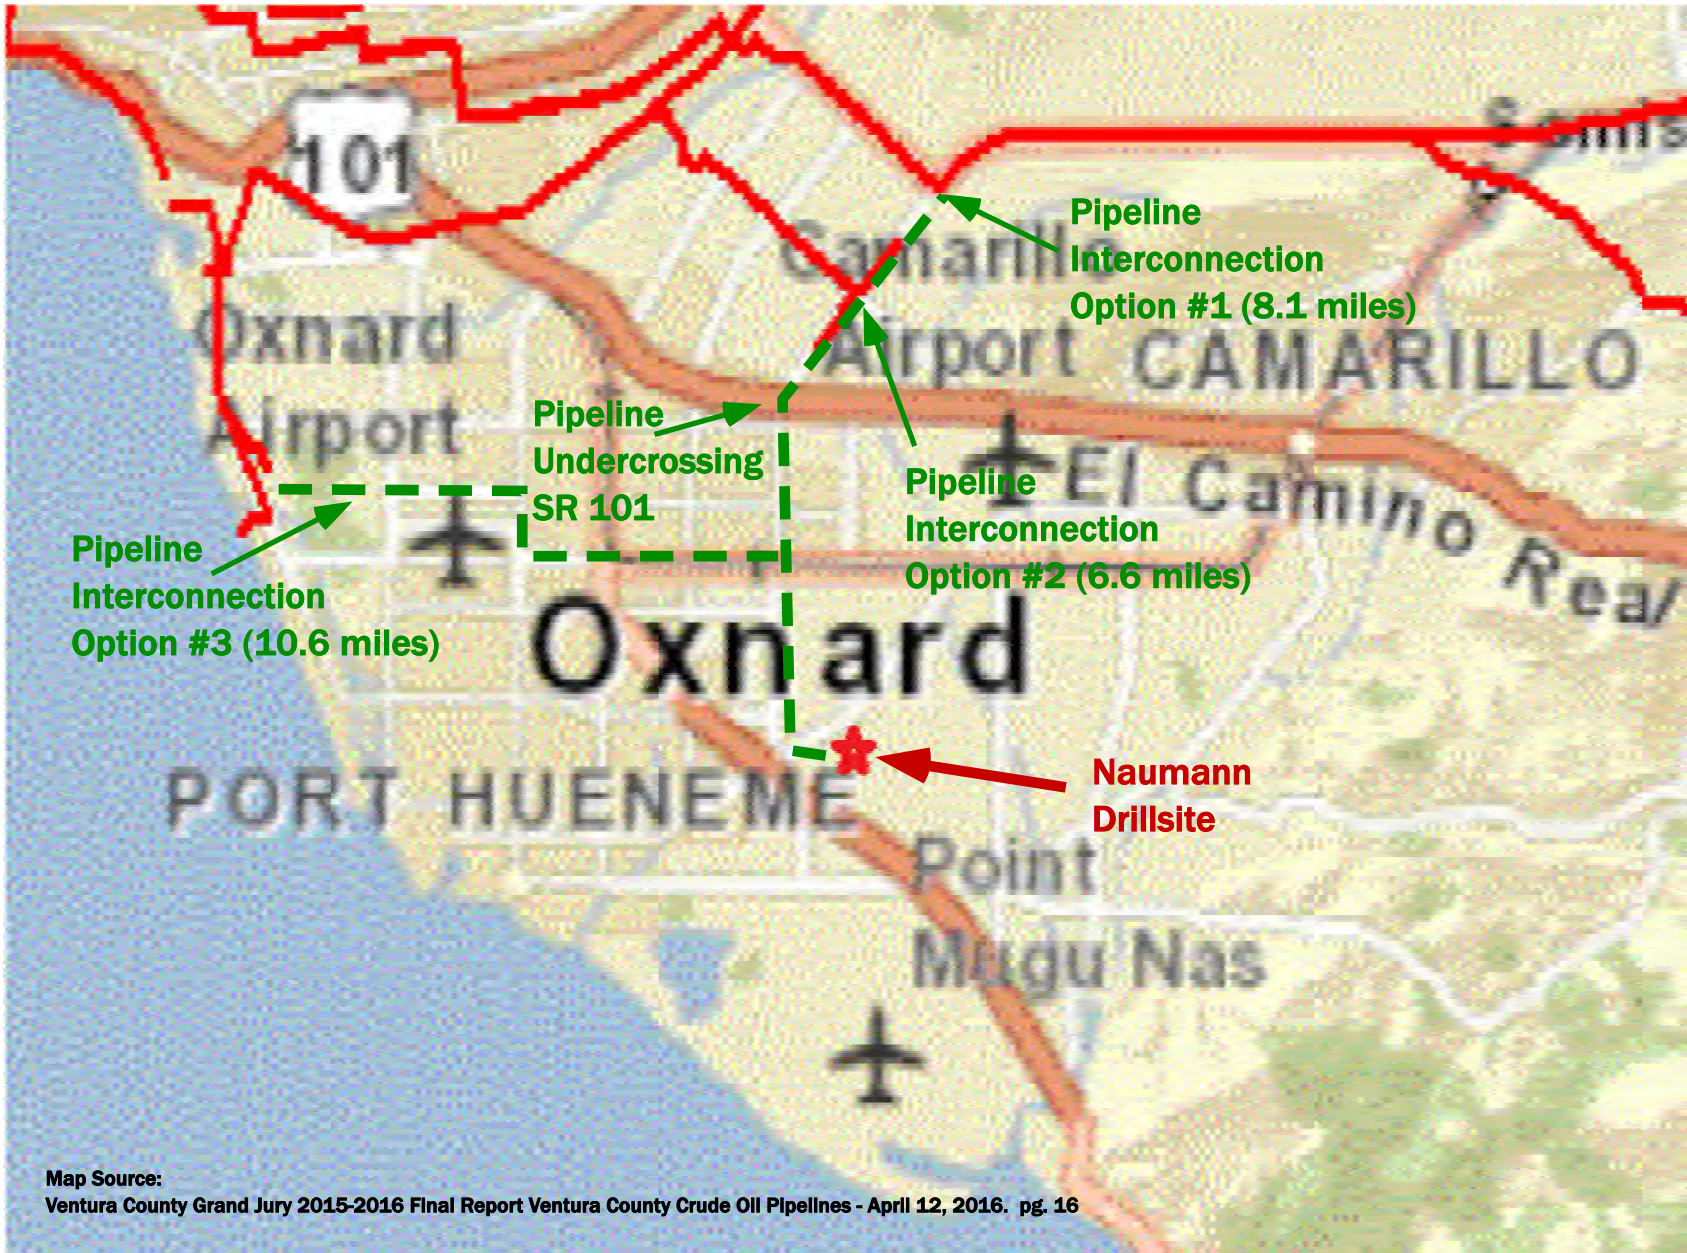

A second discounted cash flow analysis was performed to determine the NPV of a hypothetical Cabrillo pipeline project on the basis of a restart of the Cabrillo production rate achieved in 2011 as a starting point and then declining out for 25 years. The assumptions are as follows:

1. Pipeline Capital Investment: \$11,385,000
2. Net Crude Transportation Savings per barrel: \$2.00
3. Discount Rate: 5%
4. Project life: 25 years; years 1-25
5. Future production decline: Exponential ($y=80221x^{-0.673}$)

The NPV of the pipeline project with the above assumptions is (\$10,176,737). Note that there is a slight improvement in NPV over the first analysis, as a result of the addition of an early period of higher initial production rates. Nonetheless, the pipeline project is still completely uneconomic. To meet basic financial criteria for the project to be considered economically feasible, the NPV would have to be no less than \$0 which equates to a 5% rate of return on the original capital investment.

A third discounted cash flow analysis was performed as a sensitivity to the second case to determine the initial annual production rate required to drive the NPV to \$0. The assumptions were the same as the second case above. The initial annual production rate required to drive the NPV to \$0 is 1,305,808 barrels of oil. This hypothetical volume is more than 16 times the previous annual Cabrillo production rate peak of 80,221 that was realized in 2011. This sensitivity serves to demonstrate the extremely large volume of oil production required to begin to enter a discussion regarding a Cabrillo pipeline interconnection. Until other options become available, a pipeline project as described above to transport Cabrillo crude oil from the Naumann Drillsite by pipeline is not economically feasible or justifiable. As a result, RenPet's plan for Cabrillo and the Naumann Drillsite is to continue to transport Cabrillo crude oil by tanker truck.

MEMORANDUM

DATE: February 27, 2020

TO: Susan Curtis RMA Manager
County of Ventura

FROM: Sergio Vargas, Deputy Director, Watershed Protection District, PWA S.V.

SUBJECT: PL17-0141 Ventura County 2040 General Plan Update
Draft Environmental Impact Report
INCOMPLETE

Pursuant to your request dated January 13, 2020, this office has reviewed the submitted materials and provides the following comments.

PROJECT LOCATION:

All unincorporated areas within Ventura County

PROJECT DESCRIPTION:

The proposed project is a comprehensive update of the County of Ventura General Plan, also known as the 2040 General Plan. The 2040 General Plan will set forth the County's vision of its future and identify the goals, policies, and implementation programs that will guide future decisions concerning a variety of issues, including but not limited to land use, climate change, agriculture, transportation, hazards, public facilities, health and safety, environmental justice, and resource conservation out to the year 2040. The County, as the lead agency, has prepared an EIR in accordance with CEQA. The County requests that interested persons review and provide comments on significant environmental issues, mitigation measures, and range of reasonable alternatives addressed in the EIR. The 2040 General Plan is anticipated to be adopted in 2020. With implementation of the 2040 General Plan, development may occur on or near site(s) identified in one of the regulatory databases compiled pursuant to Government Code Section 65962.5

APPLICATION COMPLETENESS:

INCOMPLETE from our area of concern.

COMMENTS:

Coastal Wave and Beach Erosion Hazards:

It is noted in the currently available documents that climate change will be incorporated into the General Plan Update. The existing general plan notes goals, policies, and programs related to coastal hazards and erosion. Consistent with the Policies of the California Coastal Commission the General Plan Update should consider expanding this section to address the hazards of sea level rise as it relates to discretionary development. The current policy: *“Discretionary development in areas adjacent to coastal beaches shall be allowed only if the Public Works Agency with technical support from the Ventura County Watershed Protection District, determines from the applicant’s submitted Wave Run-up Study that wave action and beach erosion are not hazards to the proposed development, or that the hazard would be mitigated to a less-than-significant level, and that the project will not contribute significantly to beach erosion.”* The General Plan Update and associated environmental documentation should address sea level rise as a component of the wave run-up and beach erosion hazard analysis.

References to the District’s Design Hydrology Manual:

Document references the 2006 version of this manual instead of the latest 2017 version. Please revise.

If you have any questions, please feel free to contact me by email at Sergio.Vargas@ventura.org or by phone at (805) 650-4077.

Subject: **Ventura Water Comments on the Draft Environmental Impact Report for the Ventura County 2040 General Plan**

Dear Ms. Curtis:

Thank you for the opportunity to comment on the Draft EIR for the Ventura County 2040 General Plan dated January 13, 2020. The City of Ventura's water and wastewater department, Ventura Water, has two comments on the Utilities section under Impact 4.17-4.

Comment #1

As discussed in the Utilities section under Impact 4.17-4, the City of Ventura understands that the 2040 General Plan could potentially adversely impact available water supplies. The City currently has at least two ordinances in place to mitigate this impact in line with the proposed mitigation measure UTL-1 in the Draft EIR.

The Water Rights Dedication, Water Resource Net Zero Fee, and Water Resource Net Zero Requirements (Ordinance 2016-004) was adopted to ensure that new development does not adversely affect the water supply or water supply reliability of the City's existing customers and/or approved new development. The Ordinance requires subject projects to offset new or increased water demand through several compliance options. The fee proceeds shall be used to acquire additional water rights or develop water resources for new potable supplies for use by the City. The Ordinance is codified in San Buenaventura Municipal Code Chapter 22.180.

In addition, the City has a policy on water connections outside of City limits but within the City's Sphere of Influence per San Buenaventura Municipal Code Section 22.110.055, Water Connections Outside City Limits.

Comment #2

Ventura Water suggests striking the following language from Mitigation Measure UTL-1:

Implementation Program WR-X: Demonstrate Adequate Water Supply during Normal, Single-Dry, and Multiple-Dry Years

Water-demand projects (as defined in Section 15155 of the State CEQA Guidelines) that require service from a public water system shall prepare a water supply assessment prior to project approval. If the projected water demand associated with the project was not accounted for in the most recently adopted urban water management plan, or the public water system has no urban water management plan, the water supply assessment must address the public water system's total projected water supplies available during normal, single-dry, and multiple-dry water years for a 20-year projection. The assessment shall describe if the new water service will be sufficiently met under this 20-year projection. The water supply assessment shall be prepared to the satisfaction of and approved by the governing body of the affected public water system and the County. ~~If, as a result of its assessment, the public water system concludes that its water supplies are, or will be, insufficient, the public water system shall provide to the County its plans for acquiring additional water supplies.~~ A water-demand project that includes a new water service from a public water system shall not be approved unless adequate water supplies are demonstrated.

We think this sentence should be removed for two reasons. First, the water supply assessment should already include a discussion of the public water system's plans to acquire additional water supplies, to the extent that discussion is relevant or necessary for the water-demand project. Second, if the water supply assessment concludes that adequate water supplies are not available for the water-demand project, then the burden should be on the applicant to demonstrate additional water supplies available for the water-demand project – the burden should not be on the public water system.

Conclusion

If you have any questions about the above, please let us know. We also plan on submitting comments on the Public Review Draft 2040 General Plan by the March 30, 2019 deadline.

Sincerely,

Susan Rungren
General Manager
Ventura Water

Dear General Plan team,

My name is Erik Fruth, I'm a Camarillo resident and a MSc student of Environmental Planning. I'd like to submit some comments on the Ventura County Draft General Plan ("Public Review Draft 2040 General Plan" on <https://vcrma.org/vc2040.org/review/documents>).

Please find my comments in the attached document.

Thank you,

Erik Fruth (he/him)

MSc Student in [Environmental Planning](#) | *Technische Universität Berlin*
efruth@callutheran.edu / esfruth@protonmail.com (secure) / +1 805 657-9378 (cell) / +856 20 95 466575 (WhatsApp)

While I appreciate the inclusion of environmental justice as a cross-cutting issue that is addressed throughout the various sections of the Plan, I see opportunities in nearly every written goal/objective to make social justice, environmental justice, and inclusivity a stronger focus. I've only examined Section 10 due to personal time constraints, but would likely have many comments on other sections if there are public comment periods in the future.

Within Section 10 on Economic Vitality, I suggest the following edits:

- EV-1.2 should read "The County shall prioritize investment in infrastructure, services, safety net programs and other assets that are critical to future economic vitality, including public safety, healthcare, library services, water supply and quality, transportation, energy, and environmental resources. This investment shall **improve** equity in investment opportunities to designated disadvantaged communities, including designated Opportunity Zones under the federal Tax Cuts and Jobs Act of 2017. The focus of these efforts shall be to improve social equity and opportunity for all. (FB, SO) [Source: VCEVSP Policy A.3, E. 1, modified]"
- EV-1.3 should read: "The County shall continue to work with cities and community organizations to implement, **assess, and improve** best practices, pursue funding to improve housing affordability, and implement programs that **a) reduce the cost of housing in order to retain and attract employers, employees, and young graduates and professionals, b) improve the number of affordable housing units accessible to the most vulnerable/disadvantaged communities, and c) meaningfully address the underlying causes of unaffordable housing in Ventura County.** (MPSP, IGC) [Source: VCEVSP Policy F.1, modified]"
- EV-1.4 should read: "The County shall promote **socioeconomic inclusivity and** business-friendliness in the regulatory and permitting environment throughout Ventura County through collaboration **(especially with existing local organizations that serve vulnerable/disadvantaged groups)**, exchange of ideas and best practices, improvement in clarity and efficiency in the permitting process, taking advantage of opportunities for streamlining in the development process, **promoting cooperative and nonprofit business models and supporting their growth in Ventura County, and improving** consistency in policy and practice among cities and the County. (RDR, IGC) [Source: VCEVSP Policy F.3, modified]"
- EV-1.6 should read: "The County shall work with local chambers of commerce, countywide economic development organizations, and businesses to support the appropriate **and socially inclusive expansion of the local economy that improves the standard of living for the most vulnerable/disadvantaged communities in Ventura County first and foremost and also leads to the creation of environmentally sustainable and cutting-edge jobs for long-term economic prosperity,** particularly in Existing Communities and unincorporated Urban Areas where zoning allows. (MPSP, JP) [Source: New Policy]"
- EV-1.7 should read: "The County shall strive to attract industries based on existing and projected workforce demographics, educational attainment, skills, and commute patterns, and which provide opportunities to residents living in designated disadvantaged communities. **The County shall equip designated disadvantaged communities with the educational attainment, skills, and commute patterns that allow them to be highly competitive in the industries that develop in Ventura County in the future.** (MPSP, JP) [Source: New Policy]"
- EV-1.8 should read: "The County shall coordinate and work with cities in the county to enhance the efficiency of development of remaining vacant commercial and industrial sites and encourage infill and revitalization of underutilized sites **so that nearby neighborhoods become more walkable, green, cohesive, and affordable.** (MPSP, IGC) [Source: VCEVSP A5]"
- EV-1.9 should read: "The County shall **facilitate** the development of a range of commercial uses in urban areas and Existing Communities, where zoning allows, that **not only** fulfill the daily needs of residents and visitors **but also make the communities more walkable, cohesive, affordable, and vibrant.** (MPSP, JP) [Source: Existing GPP Goal 3.4.1.1, modified]"
- EV-1.10 should read: "The County shall strive to attract and retain high-quality, full-service, **affordable, and culturally appropriate** grocery stores and other healthy food purveyors **to fill local**

needs in Existing Communities and adjacent urban areas, particularly in underserved areas. (MPSP, JP) [Source: New Policy]"

- EV-3.2 should read: "The County should promote and expand existing small business and women-owned business development programs by identifying partnerships between industry and educational organizations, and identifying potential mentoring, job training, networking, and professional development opportunities between these organizations and by supporting and promoting efforts of the Small Business Administration to provide technical assistance to small business owners and employees through classes and assistance in the areas of business management, marketing, and legal assistance. The County should allow entrepreneurs to use government property or facilities to test new products and services that are beneficial to the public good for micro enterprises of five employees or fewer to encourage economic and social opportunities in low-income areas. (IGC, JP) [Source: New Policy]"
- EV-3.5 should read: "The County shall support local efforts to attract firms in key industries from outside the county that have a history of positive social, environmental, and economic charity. The County shall facilitate the entrepreneurial development of new firms and cooperative business models within the county as well as support the necessary training to develop entrepreneurship and innovation in the local workforce. (IGC, JP) [Source: VCEVSP Strategy C, modified]"
- EV-4.2 should read: "The County shall support the development of industries and businesses that promote and enhance environmental sustainability, greenhouse gas reductions, decarbonization, climate change adaptation, resiliency, and renewable energy generation, storage, and transmission, including solar power, wind power, wave energy and other appropriate renewable sources. The County shall promote the efforts of existing businesses that meet green business criteria and encourage them to become more diverse and inclusive in their daily operations, organization, and local impact; provide job training in green building techniques and regenerative farming and trainings on starting social enterprises built on cooperative business models; and strive to build green technologies into and decarbonize existing government buildings and facilities. (MPSP, JP) [Source: New Policy]"
- EV-4.3 should read: "The County shall encourage the development and expansion of businesses and business models (eg. cooperatives) that advance social equity, inclusivity and fairness, environmental quality, and economic sustainability, as well as capitalize on key industry strengths. Economic sustainability includes planning and preparation for disaster response and long-term resiliency of businesses and economic assets in the county. (JP) [Source: New Policy]"

Within the Climate Action Plan, I see opportunities to make Ventura County a stronger leader in both reducing our contribution to the climate crisis as well as addressing social/environmental injustice. One urgent need in the Climate Action Plan is to establish a framework for making the implementation (and success) of the Plan observable and measurable so that the public can hold polluters and public officials accountable if they fail to meet the goals established in the Plan – that framework should include some details on the specific indicators chosen to measure implementation/success of the Plan. I would suggest that the planners and decision-makers working on this update establish close contact with CFROG (Climate First: Replacing Oil and Gas) to set up an appropriate framework. The framework should also have a robust public outreach component where local stakeholders are invited into the assessment and monitoring of the Climate Action Plan on an iterative basis. The public outreach component of the monitoring protocol should center around the needs of Ventura County's vulnerable, disadvantaged, and/or historically marginalized communities and meaningfully include their voices.

A friend of mine sent the following comments but the email bounced back. I am re-sending it on his behalf. Commenters name is "Walt Beil". His email is docdoggr@gmail.com. Please respond to him.

27 February 2020

Ventura County Resource Management Agency
800 S. Victoria Ave
Ventura, CA 93009

To whom it may concern:

My name is Walt. I have worked in the local oil and gas industry for many years. I am writing because many local oil and gas employees have expressed deep concern about the overall direction that the 2040 General Plan Update appears to be taking. I have reviewed the Draft Environmental Impact Report (DEIR) document and believe it unfairly targets the industry with the goal of shutting down local oil and gas production completely.

The DEIR recognizes the importance of the oil and gas industry when it states, "The County shall promote the extraction of mineral resources locally to minimize economic costs and environmental effects associated with transporting these resources." With this in mind, it is troubling that the DEIR then proposes several new policies that would further restrict local production, therefore jeopardizing the livelihoods of hundreds of workers in our industry.

Policy COS-7.8, for example, essentially prohibits oil and gas producers from flaring except in emergency cases. Flaring is an industrywide practice that operators use to burn off excess natural gas that cannot be captured or used in other ways. It is used as a safety practice used to safeguard workers on site and preserve local air quality. It is the most environmentally friendly alternative to releasing excess natural gas into the atmosphere or back into the ground. The alternatives do not adequately explain the impacts of restricting flaring.

The DEIR acknowledges that the policies included in the General Plan Update would result in the construction and operation of new pipelines (Page 4.8-38). The DEIR does not go far enough to show that construction and operation of new pipelines for the conveyance of oil, gas and produced water is feasible and will result in GHG emissions reductions. In addition, the policies promoting new pipelines are contradictory to proposed policies related to fault lines.

The General Plan is critical to the county's future success. API Coastal Chapter firmly believes that it should be used to strike a balance between economic vitality and environmental protection, not unfairly regulate the oil and gas industry out of the county.

With regards,

Walt Beil
Ventura

Subject: Ventura County Planning

Hello Ventura leaders,

My name is Michael Hayes, and over the weekend I had the familiar, yet infrequent pleasure of spending time in Ventura county; coming from what can often seem like the other side of the state (Los Angeles) Ventura county isn't always conveniently accessible.. I wish I could more easily and regularly enjoy the splendors of Ventura county; but that's not the point of this message. Unfortunately, the motivation for this message is about my concern with what I had seen over the weekend.

Nobody wants unsolicited advice or critique, so I apologize for being obtuse, if not flat-out disrespectful; but I feel so strongly about these issues that it really frustrates me to think about the colossal planning mistakes that have taken place in America over the past 60 years, mistakes that I really *really* hope Ventura will not continue to make. That grand failure of American society is truly senseless and completely vapid suburban sprawl.

Without making this some sort of Manifesto... a brief recap of the default planning guidelines introduced in the late '50s. Sprawl has negatively affected the health of, now car-dependent, Americans; the air quality of the, now-smog filled, skies, the foundation of low density residential creates an exhaustive network of financially burdensome infrastructure and public services without an adequate tax base to properly maintain itself; siphoning funds from more essential civic services. Sprawl prohibits the ability to provide affordable housing in job rich areas, it disconnects people from a sense of place and it separates American's into political factions. Controversial or looney as it may seem, I truly believe SPRAWL is the single largest cause of a deflated American Spirit and the harbinger of collapsed American Ideals.

Anyone reading this message that has been in California for at least ~20 years has witnessed the insatiable consumption and the destruction of such beautiful and fertile land. In my short lifetime, I've seen Oxnard, Camarillo and Ventura transform from agrarian paradises and small town havens into an extension of West Covina or San Bernardino. Farms, Bungalows, Main streets, paved over and replaced by beige stucco boxes, banal shopping centers and other characterless vestiges of suburban sprawl. Already frustrated beyond words about the approval and early stage construction of LA County's "Newhall Ranch" I drove along the 126 to see a handful of new Riverside County-esque subdivisions, tracts of homes, the *United States of Generica*-style shopping centers that follow them, freeway-width "roads" and of course the suffocating and unavoidable traffic that comes in thereafter.

I spent an entire day just walking around Fillmore and Santa Paula enjoying the "small town" feel, talking with shop owners, all of whom couldn't believe how the area was changing for the worse. The city and county websites are full of pictures of the area's rich agricultural past, "Last Small Town..." yet at the same time, you're willing to pave over that history and beauty with some garbage cheap homes from KB Homes or Lennar?

I know Ojai as being the quintessential success story for staving off the plague of sprawl and its associated "Generica" monotony. It's a destination within the region precisely because it's different, it's charming, it's human-oriented, it embraces its agricultural roots. So, why isn't the rest of the county following in those footsteps? What is the recourse for city and county to prevent the spread of sprawl and the destruction of the otherwise beautiful landscapes? And most importantly, is this even a priority for leadership?

If this type of "growth" is at all a concern, there are really only 2 options. A) halting all growth or B) changing the way in which we grow. A moratorium would seem like the easy route, but a foolish decision in the long run. The real solution is hidden in planning guidelines of yesteryear; the solution is in higher density, village-like, transit oriented communities. Places that are walkable and are rich with character, individuality and some distinguishable uniqueness. A convenient and manageable concentration of people that create an identity and a community. Luckily for Ventura county, its cities and towns already possess many of these qualities, I'd hope that they expand on that identity, rather than erase it.

The foundation for any *great* city, town or village is formed by its accessibility and mobility. After 60 years of planning exclusively for car mobility, we've witnessed its major shortcomings. If there were one piece of transformative infrastructure that could drastically improve access, convenience, quality of life, economic opportunity and preserve open space in Ventura it would be reactivating the rail ROW from Ventura to Piru and operating a Light Rail (perhaps similar to San Diego's Sprinter or LA's E line) this vein could have the capacity to alleviate transit woes for thousands of residents / commuters and contain and concentrate manageable growth around stations allowing for characterful neighborhoods to flourish.

There is so much to love and enjoy about Ventura County and the cities within it, I'd hope those characteristics that make it lovable are preserved, cherished and expanded upon, not dismantled and paved over like the rest of southern California.

All the best and thank you for your commitment to bettering the lives of the people you represent!

-m

RE: Response to Ventura County 2040 General Plan EIR (SCH No. #2019011026)

Dear Ms. Curtis:

Thank you for the opportunity to review and comment on the Draft Environmental Impact Report (EIR) for the Ventura County 2040 General Plan that has been prepared by the County of Ventura for public review pursuant to the California Environmental Quality Act (CEQA) Guidelines. After reviewing the EIR, we submit the following comments for your consideration.

Agricultural Land and Buffers to Protect Sensitive Receptors

City's Position: The EIR should require buffers around City jurisdictions and require farming techniques that will protect existing sensitive receptors from strong, unpleasant odors associated with hemp farming.

Reasoning: The EIR only addresses agricultural odors from the standpoint of ensuring that new sensitive receptors are not placed in proximity to existing agricultural uses without providing disclosure to new uses and that it does not limit the right to farm. The EIR should address odor impacts associated with types of agricultural crops – and how they are farmed – that may have a substantial odor impact on existing sensitive receptors. The County should ensure that existing sensitive receptors will not be adversely impacted based on the introduction of new types of crops being farmed such as industrial hemp.

Very Low Density Residential (VLDR)

City's Position: To ensure that development in the County adjacent to development in the City is compatible, the VLDR designation should have a maximum density of three units per acre.

Reasoning: The General Plan Land Use Element proposes a land use category of predominantly Very Low Density Residential (VLDR) within the Camarillo Sphere of Influence north of the City limits. Page 2-21 of the County Land Use and Community Character Element indicates this designation would have a maximum density of four dwelling units per acre with a minimum lot size of 10,000 square feet. This is in conflict with Page 2-36, which indicates the VLDR designation has a maximum density of three dwelling units per acre. The City of Camarillo

General Plan Land Use Element designates this area in the Sphere of Influence, north of the City limits, as Rural Density Residential (2.5 dwelling units per acre). This is consistent with the designation of most of the land that is in the City adjacent to the City boundary line, which is designated Rural Density Residential.

Local Infrastructure

City's Position: Policies in the County General Plan should ensure new development on County land within and adjacent to the City Sphere of Influence is compatible with surrounding land uses in the City and that the use will not adversely impact local infrastructure.

Reasoning: The increase in density and 10,000 square foot minimum lot size in the VLDR designation adjacent to City limits within the City's Sphere of Influence needs to be analyzed in the EIR with respect to land use compatibility with adjacent development within the City, and impacts on City utilities and streets, as these areas may be annexed and connected to City infrastructure.

Wireless Communication Facilities

City's Position: The General Plan should encourage cooperation between the County and Cities for the proper placement and design of wireless communication facilities.

Reasoning: The City has provided comments to the County to oppose the placement of an 80-foot tall mono-Eucalyptus along Pleasant Valley Road at Bridgehampton Way, which divides the City and County boundaries. Pleasant Valley Road is a designated scenic corridor in the Camarillo General Plan Community Design Element and the proposed wireless facility would not be consistent with the City General Plan. The County should have policies discouraging new macro wireless facilities adjacent to City boundaries, unless they are stealth and consistent with height structures in the surrounding area. The County General Plan should have policies to ensure new wireless facilities are properly sited and designed to avoid land use incompatibility; that it will not be inconsistent with the City General Plan; and that it will not result in an adverse aesthetic impact.

SCAG Data Forecasts

City's Position: The County should use data consistent with the SCAG population forecasts.

Reasoning: Table 5-2 – Forecasted Growth of Incorporated Cities within Ventura County indicates Camarillo's population to be 79,900 in 2040. The City has verified that SCAG has incorporated the data provided to SCAG during the Local Input Process for the 2020 RTP/SCS. The population forecasts that are being used by SCAG are: 75,240 in 2035 and 76,093 in 2045.

Thank you, once again, for the opportunity to comment.

Respectfully,

Dave Norman
City Manager

REC'D FEB 27 2020

VIA ELECTRONIC MAIL: GeneralPlanUpdate@ventura.org

February 25, 2020

Ventura County Board of Supervisors
Attn: RMA Planning Division
General Plan Update
800 Victoria Avenue L#1740
Ventura, California 93009-1740

Dear Board of Supervisors and Staff:

We are writing this letter to urge the Board of Supervisors to reconsider moving forward with the Draft General Plan EIR. The draft EIR has been accelerated to the point that too many issues and impacts have not been properly addressed or studied. These impacts and the corresponding mitigation measures will have severe impacts to land owners and especially those, like us in the agricultural industry and other productive economic segments.

Our family has been involved in the agricultural industry for more than 100 years in Ventura County. We have owned numerous land holdings that remain in the family to this date. We have farmed throughout Ventura County and hope to continue to do so in the future.

The Draft EIR is deficient on many levels. CEQA requires that all mitigation measures must be technically and economically feasible. Numerous proposed mitigation measures are neither. We have in the past attempted to identify land and any owners that would be open to sell their development rights for land that was converting from agricultural to commercial use. Not only did we not find anyone that would do so, no one would even quote a price. The only positive response from numerous land owners were that you can buy my property for full market value and then you can do what you want. There is not a project that can be built by adding double land cost to the equation. This was very recently experienced based on proposed policies at LAFCo. These policies were eventually not enacted due to the inability to purchase development rights in an economical feasible manner. This was when LAFCo was contemplating an acre for acre ag preserve. The new policy that is proposed in the 2040 General Plan is requiring 2 acres for every 1 acre of land converted from ag to any other use. This will eliminate the ability to add any new required ag buildings or even farm worker housing. The Draft EIR must study these impacts, since they are not feasible.

The Draft EIR also deals with water in a manner that is not properly studied. There is no analysis on increased water costs and diminishing availability of water. Without reasonable water costs and supply, there is no agricultural industry.

The General Plan indicates that agriculture is a high priority in the County. However, new policies and requirements in the General Plan add additional mitigation measures that will make ag virtually

impossible. These include new setbacks, limiting types of fumigants pesticides and fertilizers. The General Plan also requires the conversion of all farm equipment to be all electric. Again, not feasible. The costs to purchase new pumps, farm equipment and other existing fuel using equipment will increase operational costs to a point that the County crops will not be competitive in the open market. These new mitigation measures are not sufficiently studied and again are not economically feasible.

The Draft EIR is extremely difficult to read and understand. The background reports are lacking in depth of what has been studied other than numerous general statements and very poor mapping. Detailed studies must be added to sufficiently identify impacts and the related mitigation measures for both direct and indirect impacts on the agricultural industry. It is our understanding that reports and studies need to be timely prepared. However numerous studies are older than 5 years. Not timely.

After numerous devastating wildfires over the last few years, which significantly impacted ag, the General Plan continues to lay out limiting mitigation measures for fire prevention. The Wildlife corridor eliminates any ag operation or fire prevention in the proposed corridor areas. This is also a major concern not studied in the Draft EIR.

The Draft EIR for the 2040 General plan does not provide adequate analysis for the expansion of permanent bike paths and pedestrian walking trails throughout the County. These impacts are very severe due to constant conflicts from trail users and ag operations. Spraying, dust, odors from ag operations, along with impacts created by the trail users. These are usually theft, vandalism, litter and pet waste. The proposed mitigation measures require additional setbacks from these trails which renders additional land unusable for ag operations.

In addition to the above comments on the agricultural aspects and related land use concerns of the DEIR, the undersigned is also a mineral owner directly interested in the impacts on oil and gas production of the DEIR and related General Plan 2040 proposed provisions. In these documents there is a total failure to address the economic impacts of the various policies proposed in violation of the requirements for this process, including but not limited to the loss of royalty income to a large group of County residents. I join in the detailed comments on the various deficiencies and concerns identified in the DEIR as described in the concurrent submissions on behalf of Aera Energy and other operators delivered this week to the County.

Please look at the long-term consequences of these General Plan policies and mitigation measures. We formally request additional studies and a revised Draft EIR that will properly look at these and many more issues. The DEIR must be corrected with details of the revisions. Then it can be recirculated.

Sincerely,

Mary Ellen Gravel

Subject: 2040 General Plan

Dear Ms Curtis,

I think the board's assessment of Ventura County's vulnerability is out of date. In 2018 the IPCC released a revised report of the climate crisis and the projection is far more dire. We are already suffering the effects of global warming and we have only a few years to make a difference in our planet's fate. You have plans that extend to 2040, 2050, and 2090! This will be far too little far too late. I believe you should take a much stronger approach to your net zero emissions goals, and I would like to see real quantifiable plans explaining how you will reach net zero.

I believe you have a responsibility to begin shutting down the fossil fuel industry in our county. I do understand how costly it will be, but I also understand the economic cost and the cost to human lives, and to our planet if you allow the drilling to continue.

Sincerely,

Martha Brown

Susan.Curtis@ventura.org

Dear Planning Division:

In reviewing the 2040 General Plan Environmental Impact Report (EIR), I have some grave concerns that were not addressed and will affect many people in this county. I have listed some below for your review and response:

1. Wildfire risk – EIR states that “managing fuel through activities such as vegetation removal and controlled burns, the County and other agencies would be directly reducing the chance of wildfire as well as fuels that would feed wildfires. This statement does not take into regard that it is in *direct opposite* of County Policies COS-3.2, COS-1.15, Implementation Program COS-H, Implementation Program COS-C and the recent restrictions on brush removal in the Wildlife Corridor. All of these Policies and restrictions will increase wildfire risk and in order to comply with the EIR, must be removed or re-written.
2. CEQA requires that indirect impacts be analyzed: Specifically, the impact on agriculture from the buildout planned in the 2040 General Plan. As the population grows, there will be more interactions with farm land. Presently, in most cases, this leads to more costs for the farmer and can cause a negative effect on this industry in this county.
3. The EIR states that the policies in the 2040 General Plan will decrease water supply for irrigation, but the County has not evaluated this impact. Reducing water supply for irrigation, or even increasing cost to obtain water, will remove ag lands from production which will affect the County significantly.
4. The EIR also does not address the impact of the General Plan that will require ag to use all electric equipment and pumps. This is very expensive and will impact this industry considerably.
5. The General Plan does not seem to take into effect that agriculture is a major industry in the County and will affect the County's revenues if it does not analyze the negative effects that these new policies will have on this industry.

Respectfully submitted,

Heather Gilchrist-Wise

Re: Comments on Ventura County General Plan DEIR

Dear Ms. Curtis:

I am a part of the McLoughlin Family. We have been farming in Ventura County for approximately 150 years. We currently own 300 acres of agricultural property off of Olivas Park Road in the County of Ventura near the Ventura Marina on Harbor Rd, in proximity to the City of Ventura.

The McLoughlin family has farmed this land and other parcels for generations going back to 1863. It remains our desire to continue this legacy, however, in the face of never-ending changes to the regulatory environment, we again find ourselves attempting to ascertain how new policies and programs as proposed in the draft 2040 General Plan will impact and challenge our ability to serve as stewards of this heritage.

It had been our hope that the DEIR would provide some clarity and insight into how the new policies and programs within the revised General Plan would impact our farming operation. That, however, is not the case. Simply said, we believe the General Plan Update and subsequent Environmental Impact Report fail to adequately analyze or study impacts on the farming industry.

With that said, we would like to specifically present the following:

- The Background report Table 6-26: Transportation Department Planned Capital Projects lists sections of roadways the County plans for expanded capacity or widening, along with the scope of those enhancements. It also covers in length the plan to add bike paths and bike lanes in accordance with existing County wayfarer plans. The DEIR, however, never analyzes the loss of farmland resulting from these changes in infrastructure – it's not even mentioned as a possibility in the DEIR.

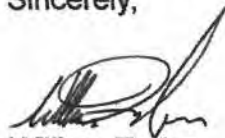

Olivas Park Road between Victoria and Harbor is listed as one of the areas planned for road widening, a stretch of roadway that borders the entire eastern portion of our farmland and property. While the impact on our farming operation and financial losses due to property loss are clearly quantifiable, the report fails to list or quantify these impacts.

- In Section 3-8, The DEIR states that because there will be no "substantive" change to the agricultural, open space, or rural designations, the General Plan Update (GPU) will be consistent with SOAR. No further details beyond this conclusory statement are provided. There is no way for the reader to come to his or her own conclusion on whether the GPU will result in inconsistencies with SOAR that might lead to physical environmental impacts. There is no description of the changes to the Agriculture, Open Space, and Rural policies to determine whether they are in fact non-substantive.

Given the length and breath of the Draft General Plan update and CEQA analysis, we made an attempt to focus our initial review and subsequent comments to issues specific to agriculture and farming. It's clear that the 2040 General Plan will impact the Ventura County local economy across sectors – all of which influence the ability to live and work in this region. The DEIR's lack of analysis of those economic impacts, calls into question the legitimacy of both the draft General Plan update, and the CEQA analysis. As such, we respectfully request that the DEIR be recirculated in the hopes that further study will resolve these shortcomings.

I appreciate your consideration.

Sincerely,

William Taylor

Kasey Taylor

February 25, 2020

Ventura County Board of Supervisors

Attn: RMA Planning Division

General Plan Update

800 Victoria Avenue L#1740

Ventura, California 93009-1740

Dear Board of Supervisors and Staff:

We are writing this letter to urge the Board of Supervisors to reconsider moving forward with the Draft General Plan EIR. The draft EIR has been accelerated to the point that too many issues and impacts have not been properly addressed or studied. These impacts and the corresponding mitigation measures will have severe impacts to land owners and especially those, like us in the agricultural industry and other productive economic segments.

Our family has been involved in the agricultural industry for more than 100 years in Ventura County. We have owned numerous land holdings that remain in the family to this date. We have farmed throughout Ventura County and hope to continue to do so in the future.

The Draft EIR is deficient on many levels. CEQA requires that all mitigation measures must be technically and economically feasible. Numerous proposed mitigation measures are neither. We have in the past attempted to identify land and any owners that would be open to sell their development rights for land that was converting from agricultural to commercial use. Not only did we not find anyone that would do so, no one would even quote a price. The only positive response from numerous land owners were that you can buy my property for full market value

and then you can do what you want. There is not a project that can be built by adding double land cost to the equation. This was very recently experienced based on proposed policies at LAFCo.

These policies were eventually not enacted due to the inability to purchase development rights in an economical feasible manner. This was when LAFCo was contemplating an acre for acre ag preserve. The new policy that is proposed in the 2040 General Plan is requiring 2 acres for every 1 acre of land converted from ag to any other use. This will eliminate the ability to add any new required ag buildings or even farm worker housing. The Draft EIR must study these impacts, since they are not feasible.

The Draft EIR also deals with water in a manner that is not properly studied. There is no analysis on increased water costs and diminishing availability of water. Without reasonable water costs and supply, there is no agricultural industry.

The General Plan indicates that agriculture is a high priority in the County. However, new policies and requirements in the General Plan add additional mitigation measures that will make ag virtually impossible. These include new setbacks, limiting types of fumigants pesticides and fertilizers. The General Plan also requires the conversion of all farm equipment to be all electric. Again, not feasible. The costs to purchase new pumps, farm equipment and other existing fuel using equipment will increase operational costs to a point that the County crops will not be competitive in the open market. These new mitigation measures are not sufficiently studied and again are not economically feasible.

The Draft EIR is extremely difficult to read and understand. The background reports are lacking in depth of what has been studied other than numerous general statements and very poor mapping. Detailed studies must be added to sufficiently identify impacts and the related mitigation measures for both direct and indirect impacts on the agricultural industry. It is our understanding that reports and studies need to be timely prepared. However numerous studies are older than 5 years. Not timely.

After numerous devastating wildfires over the last few years, which significantly impacted ag, the General Plan continues to lay out limiting mitigation measures for fire prevention. The Wildlife corridor eliminates any ag operation or fire prevention in the proposed corridor areas. This is also a major concern not studied in the Draft EIR.

The Draft EIR for the 2040 General plan does not provide adequate analysis for the expansion of permanent bike paths and pedestrian walking trails throughout the County. These impacts are very severe due to constant conflicts from trail users and ag operations. Spraying, dust, odors from ag operations, along with impacts created by the trail users. These are usually theft, vandalism, litter and pet waste. The proposed mitigation measures require additional setbacks from these trails which renders additional land unusable for ag operations.

In addition to the above comments on the agricultural aspects and related land use concerns of the DEIR, the undersigned is also a mineral owner directly interested in the impacts on oil and gas production of the DEIR and related General Plan 2040 proposed provisions. In these documents there is a total failure to address the economic impacts of the various policies proposed in violation of the requirements for this process, including but not limited to the loss of royalty income to a large group of County residents. I join in the detailed comments on the various deficiencies and concerns identified in the DEIR as described in the concurrent submissions on behalf of Aera Energy and other operators delivered this week to the County.

Please look at the long-term consequences of these General Plan policies and mitigation measures. We formally request additional studies and a revised Draft EIR that will properly look at these and many more issues. The DEIR must be corrected with details of the revisions. Then it can be recirculated.

Sincerely,

Simmons, Carrie

Subject: VC2040 General Plan Input Re Climate Change Mitigation

Dear Ms. Susan Curtis,

As a member of the Ventura County Climate Hub, I have signed my name to the very thorough petition sent by the organization regarding the climate change mitigation- related components of the VC2040 Draft General Plan (and EIR). I also wanted to add a emphasize a few more points personally, covering some core areas regarding the urgent and vital climate change mitigation work we need to do, especially in the next decade.

Community Collaboration

Establish a Citizen Advisory Committee, to work with the Board of Supervisors (and relevant County staff), to help both give input to climate change mitigation efforts, as well as advise the County on critical community resilience- building work.

Sustainable Transport

Since the transportation sector is a core contributor to carbon emissions, we need to follow the lead of model green cities (such as Portland, Oregon), and establish cycling/walking linkages throughout core routes in our cities. I live in Ventura, and believe people here are desperate for more sustainable and healthy transport options.

Food Security

Please include edible, fire-mitigating, and indigenous trees in Supervisor Parks' 'two million trees' planting campaign.

Water Security

Please support community water resilience- building projects, such as one the Climate Hub is planning, called 'Transition Streets'

Thank you for your critical work,
Diana Kubilos

Subject: draft EIR

We are in a climate emergency. Humanity is facing an existential threat.

In October 2018, the United Nations Intergovernmental Panel on Climate Change sounded the alarm bells in a dire report, warning that governments everywhere, much take "rapid, far-reaching and unprecedented changes in all aspects of society" to dramatically cut emissions by 2030 if we hope to avoid climate catastrophe. And by all governments, that includes Ventura County. So we've got just ten years, and likely even less than that, since more sobering findings regarding tipping points and feedback loops have come out in recent months. As Bill McKibben puts it, "Winning slowly is the same as losing" when it comes to climate change.

Since we neglected to take the necessary actions decades ago, we no longer have the luxury to take small incremental steps; the magnitude and urgency of the crisis requires big, bold, swift action. It means no more business as usual, no more kicking the can down the road, no more catering to fossil fuel interests, no more short-term thinking, no more excuses. It means coming together and working

toward our collective common good. It means a moon shot, putting a stake in the ground and committing to achieving it.

The good news is that solutions are readily available, we just need to start acting on them.

The current draft EIR of the general plan update does not meet the urgency of action that the climate crisis demands. All policy decisions must be seen through a climate impact and mitigation lens.

Subject: County buildout study

To: Susan Curtis-

County failed to evaluate mitigation measure for feasibility- 500' set back for "sensitive receptors" from freeways and high traffic roads.

Mitigation Measure AQ-3 (Policy HAZ10-X) creates a minimum 500' set back for "sensitive receptors" from freeways and high traffic roads. Yet the County states in the Land Use section of the EIR that "the majority of the anticipated build out will be within the freeway corridors."

Has the County completed a "buildout study" to ensure that the establishment of this set back still leaves enough room for development to occur? Will this mitigation measure be economically feasible?

Subject: 2040 General Plan Draft EIR Comment

Regarding the 2040 General Plan,

The County failed to analyze the impact of allowing alternative fuel production in an Industrial area.

The County must analyze any impact that creates hazards on public health and safety through the transport, use or disposal of HazMat and HazWaste.

The County failed to evaluate Policy CTM-6.4 (alternative fueling stations) and has failed to even mention Policy LU-11.X (alternative fuel production) or Implementation Program LU-Program X (County shall allow the production of alternative fuel). These policies were not analyzed for impacts - and yet the County claims, without having conducted a complete and thorough analysis, that the impact will be less than significant (pg. 4.9-12 and 4.9-14).

This analysis was grossly inadequate and needs to be corrected and the EIR needs to be recirculated.

Sincerely yours,

Simmons, Carrie

Susan,

I feel there is a great opportunity to improve the Food Security (8.4) section of our General Plan. I've included a link to the Santa Barbara Food Action Plan for your review. From this plan I've gleaned language which I feel is vital for your consideration!

<https://www.sbcfoodaction.org/wp-content/uploads/2016/09/SBC-Food-Action-Plan-2016FinalReport-update.pdf>

INVEST IN OUR FOOD ECONOMY

Invest in Our Food Economy calls us to support a new, diverse generation of food and farming entrepreneurs with training, education, preferential purchasing policies, and investments in food distribution infrastructure. These upstream investments are designed to pay increasing dividends over time as these entrepreneurs build local businesses and create jobs.

- Support the next generation of farmers and food system entrepreneurs by creating or expanding agriculture and vocational education at the high school and community college level.

INVEST IN OUR HEALTH & WELLNESS

Invest in Our Health & Wellness

Calls us to address the continuing diet-related challenges in our community by creating networks of neighbor-to-neighbor support, and by engaging employers, teachers, and physicians as partners to promote healthy living. The strategies focus on the information gaps that make it hard to make good health choices.

- Facilitate the adoption and implementation of workplace wellness policies that include support for healthy eating behaviors and access to healthy foods.

Thank you,

Adam

GeneralPlanUpdate@ventura.org

Dear Ms. Curtis:

I am writing to call your attention to significant flaws in the process, data, and conclusions of the Ventura County General Plan, Draft EIR, and supplemental documents.

My great grandfather, Mark McLoughlin (1843-1914), was a true Ventura County pioneer, purchasing his first 318 acres of undeveloped land in Ventura County in 1875. He was a hard-working visionary, revered by his community. With his son—my grandfather, James Patrick McLoughlin—he raised livestock and farmed the land, providing jobs and feeding the growing towns of Oxnard and Ventura.

Our land, in a vitally important location on Olivas Park Drive across from the Ventura Marina, has been in the family, and part of the economic fabric of the community, for 100 years. And we want it to be part of the future of this community, with a flourishing economy, a thriving job market, and unsurpassed quality of life for its residents.

But the General Plan and DEIR do not describe a viable path for us as landowners going forward.

I will begin with some specific issues regarding language in the Coastal Area Plan, 4-82-83 and 4-94-95. Part of our land is located in the Central Coastal Zone, adjacent to the Ventura Marina, on Olivas Park Drive at Harbor Blvd. The only conclusion the Plan draws about our land is the statement that, “unlike the Preble area, services are not readily available to the Olivas lands.” This is false. Our property has access to all utilities, water, main roads, and the freeway. Indeed, easements on our property serve surrounding areas with utilities.

The Plan also claims that our property is “not included in the City’s sanitation district because of problems with water pressure.” This language is irrelevant and incorrect. There is no evidence that there are water pressure issues, and the sanitation district’s pipelines actually traverse our property.

While we do not know the original source of these misstatements, such misrepresentations—now repeated in the Plan—threaten to diminish the value of our land in relation to the Preble property. And, of course, they undermine the goal and the value of the Plan itself.

The General Plan also speaks of the widening of Olivas Park Drive, our southern boundary. This would have a direct impact on our property. But the Plan does not address how this would happen or how it would affect our land.

Damaging misstatements about our property also appear in the DEIR. Contrary to the portrayal in the DEIR, our property has significant infrastructure in place, as well as prime accessibility to the highway and the harbor. In fact, with easy access to the marina and beach community, and with the railroad as part of our eastern boundary, our land is uniquely suited to be an important part of future economic development in the area. We are entitled to have all these matters corrected.

I would also like to raise some additional concerns:

1. The General Plan and DEIR continue to ignore the 28% increase in the homeless population in our community.
2. According to the General Plan, if we were to build an acre of low income / worker housing we would need to buy two replacement acres of same Ag land to be placed into perpetual agricultural preservation. This is unrealistic and infeasible, and certainly not in line with the State government's housing policies.
3. The EIR does not adequately address the enormous "indirect impacts" that will occur as a result of implementing the General Plan, calling them "less than significant."
4. The General Plan contains policies that will increase the costs of normal farming operations, making it difficult for farming to remain profitable.
5. The Plan does not adequately evaluate the impacts of increased competition for water in our community.

The EIR is a flawed document, full of errors, that does not disclose all impacts, direct and indirect, caused by the General Plan. It was obviously rushed—completed in six weeks. It is inaccurate and incomplete, and fails to provide members of the community with the information that they are legally entitled to. This EIR should be corrected and reconsidered, and a reasonable time period should be allowed for meaningful and thoughtful community input.

Sincerely,

Simmons, Carrie

Your Comment:

We need a climate action plan with measurable targets and outcomes. The current policies aren't measurable or enforceable, and are not sufficient to drive the kind of change necessary to meet the greenhouse gas reduction targets.

To Whom It May Concern,

Climate change is here, its effects are already evident in our county. The General Plan update fails to provide enough emissions reduction to meet the state-mandated goals. A robust plan, with the help of technical and scientific input, needs to be included for the 2040 General Plan, including a strong defense of the five pound air emissions limit for the Ojai Valley.

Sincerely,
Scott Hirsch
Ojai, CA

Re: County of Ventura 2040 General Plan Update and DEIR

Dear Susan,

I am writing to express my support of comments on the 2040 General Plan Update and DEIR submitted by Dr. Steven Colomé and also those comments submitted by Climate First: Replacing Oil & Gas (CFROG). As I recall, when the County conducted an early outreach effort on the General Plan Update, results came back showing a very high level of residents' concern about climate change. Since then, we've had extraordinary and damaging wildfires including the Thomas Fire and the Woolsey Fire; we've also had the County's commissioned report on sea level rise finding the County is highly susceptible both to the impending sea level rise as well as storm surge flooding. Yet, the County still cannot bring itself to adequately address and meet greenhouse gas (GHG) reduction goals of the State or even the County's own stated General Plan goals.

Ventura County oil and gas production is one of the highest in the state. So, this sector – oil and gas development, including existing operations – is where we must plan and execute a huge reduction of GHG emissions over the next 20 years. The problems with the baseline inventory of GHG emissions, emission forecasting, lack of effective, meaningful policies, inadequate mitigations, and failure to produce an effective CAP (Climate Action Plan) are laid out in the comments from Dr. Colomé and CFROG.

The County is failing to take hold of the power of a General Plan and use it - to implement necessary and important change – to reduce our GHG emissions. In particular, the County must incorporate mitigation measures to: 1) prohibit all new oil well drilling, 2) prohibit all flaring, and 3) phase out all non-conforming/antiquated facilities and operations through amortization.

Please remember and embrace the residents' concern about climate change at the outset of the General Plan process and show leadership in this time of climate crises. You must act in the best interests of Ventura County residents.

Sincerely,
Kathryn Lottes

I would urge the County to include how the agency would establish a "preponderance of evidence that the resource is not archaeologically or culturally significant." See below. How would this be done and could it be appealed?

The number of archaeological sites in Ventura County is decreasing at a rapid rate and the definition of archaeological significance should be revised, "that all Native American archaeological sites, should be considered significant since the prehistoric identity of the Indigenous groups is tied solely to archaeological evidence." Loss of any sites would irrevocably result in loss of significant portions of their culture.

Thank you for your consideration.

John M. Foster, RPA
President, Greenwood and Associates

For the purpose of this draft EIR, implementation of the 2040 General Plan would have a significant impact on cultural, tribal cultural, or paleontological resources if it would:

Demolish or materially alter in an adverse manner those physical characteristics of an archaeological resource that account for its inclusion in a local register of historical resources pursuant to Section 5020.1(k) requirements of Section 5024.1(g) of the PRC, unless the public agency reviewing the effects of the project establishes by a preponderance of evidence that the resource is not archaeologically or culturally significant. Demolish or materially alter in an adverse manner those physical characteristics of an archaeological resource that convey its archaeological significance and that justify its eligibility for inclusion in the California Register of Historical Resources as determined by a lead agency for purposes of CEQA. Demolish or materially alter in an adverse manner those physical characteristics of an historical resource that convey its historical significance and that justify its inclusion in, or eligibility for, inclusion in the California Register of Historical Resources. Demolish or materially alter in an adverse manner those physical characteristics that account for its inclusion in a local register of historical resources pursuant to Section 5020.1(k) of the PRC or its identification in a historical resources survey meeting the requirements of Section 5024.1(g) of the PRC, unless the public agency reviewing the effects of the project establishes by a preponderance of evidence that the resource is not historically or culturally significant. Cultural, Tribal Cultural, and Paleontological Resources Ventura County 4.5-6 2040 General Plan Draft Environmental Impact Report Demolish or materially alter in an adverse manner those physical characteristics of a historical resource that convey its historical significance and that justify its eligibility for inclusion in the California Register of Historical Resources as determined by a lead agency for purposes of CEQA. Demolish or materially alter in an adverse manner those physical characteristics of a historical resource that convey its historical significance and that justify its eligibility for inclusion in the California Register of Historical Resources as determined by a lead agency for purposes of CEQA. Cause a substantial adverse change in the significance of a tribal cultural resource as defined in PRC Section 21074. Result in the disturbance of human remains, including those interred outside of formal cemeteries. Result in grading and excavation of fossiliferous rock (identified as "Moderate to High" or "High" on Table D.2 of the ISAG) or increase access opportunities and unauthorized collection of fossil materials from valuable sites.

RE: Ventura County 2040 General Plan Update and Climate Action Plan

Dear Ms. Curtis,

SoCalGas appreciates the opportunity to submit comments on County's Preliminary Public Review Draft General Plan (Draft Plan). We have been continually engaged in the development of the Draft Plan and further appreciate the opportunities to attend public workshops, planning commission meetings, and participate in online surveys as means to submit feedback throughout the planning process. We believe this document will provide valuable direction for the County to pursue effective, long-term sustainable planning goals. SoCalGas especially supports the County's direction to pursue policies that promote furtherance of renewable energy development and expansion while also contributing to regional and local resiliency. We support many of the policies currently included in the Draft Plan and look forward to partnering with the County to achieve these ambitious strategies and actions. We do believe the Draft Plan could benefit from active identification and incorporation of the following takeaways:

- **The Draft Plan can be greatly enhanced by pursuing significant synergies between production and use of renewable natural gas (RNG) and the County's renewable energy goals, waste reduction/diversion targets, and emission reduction strategies.**
- **Because the pipeline system that delivers RNG is inherently resilient to aboveground climate events, it can greatly help increase the resiliency of County infrastructure and operations to climate hazards and impacts.**

Most prominently, we are excited at the potential opportunities that exist between the county's waste reduction and diversion targets, as stated in the Draft Plan, and development and use of RNG resources that can drive and incentivize their attainment. RNG can be produced from existing waste streams within the County, including organic waste, green waste, and agricultural waste. This aligns with the goals of Strategy PFS-5.5 – "support the beneficial reuse of agricultural wastes...such as energy generation" and PFS-5.6 – "promote value-added alternatives to solid waste management, such as...energy." Further, the organic waste diversion incentives generated by RNG production would also help the County achieve the organic waste diversion targets mandated under SB 1383. Similarly, use of existing waste

resources to produce RNG aligns with the County's emphasis to increase the use of renewable energy as stated in Policy COS-8 and its supporting strategies that advocate promoting development and use of renewable energy resources (including bioenergy) and transitioning to zero net energy buildings (Strategies COS-8.1 and 8.5, respectively). We are ecstatic to see that such synergies are acknowledged in the GHG Mitigation and Climate Adaptation Measures in the County's Draft Climate Action Plan, Appendix B of the Draft Plan, such as in Policy AG-L which prompts the County to develop a program to coordinate public-private local investment in biogas control systems.

Because RNG is produced from existing methane sources that are otherwise being emitted into the air, unabated, capturing these emissions to produce RNG helps reduce both regional and local methane and GHG emissions. As a short-lived climate pollutant, methane has a greater global warming potential than carbon dioxide—specifically, methane is approximately 28 times more potent than carbon dioxide in the atmosphere^{1,2}. From a lifecycle perspective, because RNG production removes a greater quantity of more potent GHG emissions from the air than what it produces at end uses, its production is a **carbon negative process**, and can be used to offset other uses that cannot achieve carbon neutrality. As the County is aware, SoCalGas recently filed a request with the California Public Utilities Commission seeking to offer RNG to all customers, which would have significant potential to significantly reduce both local and regional GHG emissions. In fact, replacing only 20% of existing natural gas supply with RNG achieves the same emissions reductions as electrifying the entire building sector by 2030, but at one-third of the cost.³ For these reasons, we recommend that the Draft Plan include additional policies and supportive strategies to promote both production and use of RNG as an incentive mechanism to enhance organic waste reduction/diversion, in addition to use as a renewable fuel option for decarbonizing the building and transportation sectors.

The underground natural gas system is more resilient than the aboveground electric system

Use of RNG as a renewable energy source also has synergies with County resilience goals and targets. As stated at the recent Planning Commission General Plan Update Workshop on June 13th, 2019, County staff directly acknowledged the dual importance of decarbonizing energy supplies but while also keeping in mind the critical importance of energy reliability. As we know, the impacts of global climate change are set to continually increase in severity, which will result in more severe wildfires, storms, and floods. Wildfire risk, specifically, is one of the most prominent climate change hazards facing the County, especially as just over the past two years Southern California has experienced two of the largest wildfires in the State's history that burned millions of acres and destroyed thousands of homes and property, a significant portion of which occurred within Ventura County. To this end, SoCalGas supports the draft policies

¹ IPCC. Global Warming Potential Values https://www.ghgprotocol.org/sites/default/files/ghgp/Global-Warming-Potential-Values%20%28Feb%2016%202016%29_1.pdf

³ PR Newswire. New Study Advises Policymakers to Consider Renewable Natural Gas for Low-Carbon Buildings Strategy. August 8, 2018. <https://www.prnewswire.com/news-releases/new-study-advises-policymakers-to-consider-renewable-natural-gas-for-low-carbon-buildings-strategy-300691318.html>

aimed at enhancing local adaptive capacity such as Policy HAZ-11.4, which supports education and outreach efforts to inform local communities about climate change impacts, and Policy HAZ-P, which aims to identify critical infrastructure vulnerable to extreme heat.

As seen in the recent wildfires and mudslides that ravaged Southern California, energy system vulnerability is a significant factor that affects local resilience to such hazards. As the electric system is almost entirely aboveground, it is significantly more exposed to threats and, when impacted, can not only leave hundreds to thousands of residents without power at their homes, but also affect operation of critical facilities. For example, in 2017 the Thomas Fire damaged electric power lines throughout the City of Ventura. Because the City's water pumps to supply water to firefighters ran on electricity without any other form of backup power, firefighters were unable to get water from the pumps to put out burning residences⁴. If the water pumps had been connected to a backup power system, such as a natural gas generator, firefighters would have been able to access the water.

In contrast, as the natural gas system is mostly underground, it is very resilient to extreme weather events. For example, in 2012, after Superstorm Sandy, the entire natural gas system in the Northeast was essentially intact, allowing residents to support back-up generators, cook, and keep warm. Businesses with natural gas-powered fuel cells were able to operate and compressed natural gas (CNG) buses in New Jersey were used to shuttle residents to safety⁵. Further, when Hurricane Harvey temporarily disabled almost 30% of the nation's refining capacity, CNG shuttles were able to continue operating, and hospitals that had on-site combined heat and power systems were able to provide urgently needed medical attention, despite flooding. These examples demonstrate the critical role natural gas infrastructure can play in supporting local and regional energy supply resilience in the face of extreme climate events and use of renewable natural gas can achieve additional co-benefits in reducing GHG emissions.

SoCalGas has been engaging with stakeholders and consultants to conduct case studies and risk assessments of the natural gas system with the intent to demonstrate the security and resilience of our system. SoCalGas intends to use this information to help local and regional cities and counties undertake similar efforts to identify system and infrastructure vulnerability. We also offer our annual Climate Adaptation and Resilience Grant⁶ to local cities and counties to help fund efforts to update and develop local adaptation and resilience plans. We greatly appreciate recognition of our grant in the Draft Climate Action Plan and encourage the County to apply during this year's application period.

⁴ ICF. Case Studies of Natural Gas Sector Resilience Following Four Climate-Related Disasters in 2017. <https://www.socalgas.com/1443742022576/SoCalGas-Case-Studies.pdf>

⁶ SoCalGas Climate Adaptation and Resiliency Planning Grant Program. <https://www.socalgas.com/smart-energy/sustainability-at-socalgas/climate-grant>

Looking forward, we believe renewable natural gas will play an important role in the County's renewable energy plans and help it achieve State GHG emission reduction goals, organic waste diversion goals, as well as climate resiliency goals. Decarbonizing our natural gas delivery system keeps intact the inherent energy efficiencies of direct uses of natural gas, at lower carbon-content, while also demonstrating synergies with County waste reduction goals by boosting efforts to enhance organic waste management and recycling. SoCalGas appreciates the opportunities provided by the County to engage throughout the formation of this Draft Plan and hopes to continue communication for the duration of the planning process. If you have any questions, please do not hesitate to reach out via telephone or email. Thank you!

Sincerely,

Hello -

Please find the attached Word document containing my comments on the 2040 General Plan.

Thank you,

Wayne Morgan
Ventura, CA

Dear County Supervisors and members of the Planning Commission:

I am deeply concerned about our future if we do not take significant action to curb green house gas emissions. Fossil fuel use is driving climate change. The impacts associated with climate change include droughts, fires, forced migration of animal and humans (which is one of the threats to national security), sea level rise, spread of disease and threats to biodiversity, to name a few. Also fossil fuels threaten the ocean ecosystem (because of acidification), reduce air quality, pose threats to our water supplies, are a fire threat (note recent refinery fires), and threaten economic stability because of volatile fossil fuel markets. Current levels of CO₂ are at historic highs yet we still put more into the atmosphere. The scary thought to me is that it takes decades for nature to take CO₂ out of the atmosphere. Estimates range from 30 – 90 years (Ref: *Archer, David (2009). "Atmospheric lifetime of fossil fuel carbon dioxide". Annual Review of Earth and Planetary Sciences. 37. pp. 117–34*). Other literature cites ranges from 20 – 200 years. So even if we stop all GHG emissions today, the earth will still be coasting to a warmer climate for decades.

Oil Production

I am concerned that Ventura has oil operations that I feel pose a risk. Some financial advisors are advising investment firms to be wary of fossil fuel investments. As renewable and green energy become increasingly less costly than fossil fuels and the projected displacement of petrol fueled cars by EVs, the market for fossil fuels will drop dramatically in the 2020s causing many oil operations to drop out of the market, leaving stranded assets. (Ref: See works by authors Ross Tessian and Tony Seba. Blackrock Investments.) So, not only could oil operations in Ventura become uneconomical, there is a risk to Ventura that cleanup of abandoned operations will be dropped on Ventura's doorstep.

Oil production threatens the health of residents located close oil operations. Benzene, toluene, and hydrogen sulfide, among others, pose health risks, especially to children. To many in the community this is an environmental justice issue. Wells must be properly shutdown to insure safe environment for the community.

I recommend phasing out oil operations in the county as soon as possible and cleaning up the operation sites before they become a County financial liability.

Transportation

Technology will disrupt transportation in the 2020s. Many transportation experts are predicting economics will price petrol-fueled vehicles out of the market mid 2020s. Why, because EV's will be cheaper to produce, cheaper per mile to drive and much cheaper to maintain. (They have typically about 18 moving parts compared to 1,000+ moving parts for a petrol car.) Also, battery improvements will lead to cheaper, longer range, faster charging and longer lasting batteries. Already there are many Teslas that have more than 250,000 miles on their batteries and Tesla estimates that their new batteries will last to about 1 million miles). Note that electric vehicles don't use much, if any, oil for lubrication. This will lessen the roadway oil runoff and its associated impacts. And EVs are quieter.

Autonomous electric vehicles will start to come online in the 2020s. This will start a dramatic change in the transportation model. Ride hailing of autonomous vehicles will become the norm. In the future, most people will not own cars – It will be cheaper to just hail a ride with your smartphone. Just tell your phone where you want to go and when, and the ride hailing service will send an autonomous vehicle to pick you up. I envision most future urban transportation will be done this way. (Ref [Three Revolutions: Steering Automated, Shared and Electric Vehicles to a Better Future](#) by Daniel Sperling, 2018).

This revolution will mean less land is needed for parking and many parking lots may be repurposed. Transportation over long distances could be done with rail lines and the last miles be done with hailed autonomous vehicles. Rail lines could be built in the medians of many of the existing highways. One specific project could be a light rail connecting CSUCI to the 101 Freeway (Camarillo MetroLink Station). Autonomous trains could provide continuous and on demand service to greatly increase travel convenience. This could be modeled after airport transportation light rails, such as at Hartsfield Airport in Atlanta. (An aside, rail service should be used where possible in place of vehicles with rubber tires to reduce hazardous air particulates). Because of the coming changes, the County should carefully look at the wisdom of investing in road expansions with the possibility that fewer cars will be on the roads in the future.

Also note that the authors Ross Tessian and Tony Seba, to name a few, predict that these changes to will occur quicker than we think, maybe less than a decade.

Economics

Many of the investments in renewal energy will pay for themselves in less than a decade. Implementation of renewable projects should be viewed as an investment. To me it is a no-brainer.

I would encourage the County to assist home owners, builders and apartment owners to find financing for renewal and energy saving investments. Maybe bundling, facilitated by government agencies, would create opportunities for more and less expensive funds to be available.

Renewables have few external costs, whereas fossil fuels have many such as climate change impacts, air pollution, water pollution, health hazards, fire hazard, security costs (domestic and foreign), subsidies, spills, and oil runoff from vehicles to name a few. We all pay for these hidden costs. Considering these costs make the renewables even more attractive.

Other

In the future homes and buildings should run only on electricity – Use heat pumps for heating and cooling, hybrid electrical water heaters and electrical cooking appliances.

Solar panels on rooftops & batteries for housing increases grid stability, reliability and security. It reduces electrical distribution costs and reduces the need for peaker plants. Peaker plants will be a thing of the past.

Environmental justice is a problem in the County, especially near oil operations. Environment justice should be given a heavy weight in considering the future projects to protect Ventura citizens, especially the children.

Comments on some specifics:

CTM-6.6 Policy CTM-6.5: Electric Vehicle Charging Stations.

Comment: Electric vehicles could offer electrical grid stabilization at a low capital cost by utilizing part of their storage to supply power during high electrical demand or when other renewals are not available. This applies to EVs used for personal as well as ride hailing services. As such, charging during daylight hours becomes very desirable and thus charging stations

should be required at all public buildings and parking lots. Businesses should also offer charging at their facilities. Charging hubs that have storage capability to allow for very rapid charging, say, less than 10 minutes, should be built and possibly located at under utilized sites.

Policy COS-8.10: Battery Energy Storage Systems.

Comment: County buildings and critical services should be backed-up using battery storage. This battery storage could be part of a Virtual Power Plant concept (need to coordinate with electrical utilities) and could bring revenue to the County by supply excess capacity during peak demand. Back-up has become very important due to disruptions in electrical service due to fires and fire prevention. These comments also apply to **Implementation Program T: Energy Consumption Performance.**

Policy PFS-7.6: Smart Grid Development.

Comment: Smart grid development is vitally needed to stabilize the grid through both load leveling and utilizing electrical storage efficiently. Battery storage can instantly respond to load variations which will greatly improve efficiency and reduce reserve power levels from variable sources. County building should be equipped with storage and made part of the smart grid.

Thank you for you time and consideration.

Respectfully,

Wayne Morgan

Re: *Comments on Ventura County 2040 General Plan Draft Environmental Report (State Clearinghouse No. #2019011026)*

Dear Ms. Curtis,

The California Independent Petroleum Association (CIPA) appreciates the opportunity to submit comments on the Draft Environmental Impact Report (DEIR) prepared for the County of Ventura's (County) proposed update to its existing general plan (GP 2040). While we appreciate the County's efforts to comply with the California Environmental Quality Act (CEQA) in preparing the DEIR, our review of the DEIR reveals that it contains numerous legal defects. Many sections of the DEIR must be substantially revised, and the DEIR must be recirculated, before it can be considered for certification.

CIPA represents several independent oil and gas producers in the County. CIPA's producer members actively contribute to the County's economic base, provide myriad local employment opportunities and produce oil and gas resources within the County in an environmentally responsible manner.

CIPA seeks to promote greater understanding and awareness of the critical role domestic oil and gas production plays in powering the County's vibrant economy. Local oil and natural gas producers provide both the energy and the building blocks of nearly every material that County residents utilize on a daily basis, and we recognize that the affordability, reliability and resilience of those supplies will largely determine whether the County achieves a more vibrant

and inclusive economy, a more equitable society, and continued improvements in environmental quality.

The policies and additional restrictions proposed in the general plan (GP 2040) will devastate the vitality of the County of Ventura by: eliminating thousands of high-paying, middle-class jobs; costing the County tens of billions of dollars; relinquishing tens of millions of dollars in local tax revenues; raising the cost of living for all Ventura residents; and threatening the economy and the livelihoods of Ventura residents by increasing dependence on unreliable foreign sources of oil.

The DEIR not only lacks proper analysis on the economic impacts said restrictions and policies will have on the residents of Ventura County, but relies on factually incorrect and underpin assumptions to complete its analysis.

For these reasons and many others, we urge the County to revise the DEIR and recirculate before it's considered for certification.

CEQA COMMENTS:

1. CIPA joins in the comments submitted by Aera Energy LLC.

CIPA member Aera Energy LLC has submitted a number of comments concerning the legal adequacy of the DEIR, and CIPA joins in those comments.

2. CIPA joins in the comments submitted by Western States Petroleum Association.

The Western States Petroleum Association (WSPA) has also submitted numerous comments on the DEIR. CIPA joins in those comments as well.

3. The DEIR's GHG emissions analysis is legally flawed.

To reduce the production of greenhouse gas (GHG) emissions we must decrease our reliance on energy imports for over 90% of our natural gas, 70% of our oil and 30% of our electricity needs. GP 2040 proposes adoption of policies that will significantly increase Ventura's dependence on imported energy, meaning that Ventura is delegating its environmental leadership to other states, countries and regimes that do not share our environmental, labor, and human rights standards.

The DEIR concedes that adoption of GP 2040 will cause the County to rely on imported energy, but fails to quantify, evaluate or propose mitigation for the resulting increase in GHG emissions. In section 4.12, the DEIR states that "the demand for California-produced oil and gas would be satisfied through the importation of additional oil and gas from other countries and Alaska, which in turn could have indirect environmental impacts such as those associated with transporting the oil and gas from outside of Ventura County." This is extremely alarming since

the increase of imported energy has a clear and direct impact on our environment, much more than from the result of local production. The DEIR makes no attempt to analyze this impact. The DEIR must evaluate this known adverse impact and propose feasible mitigation measures.

4. Factually incorrect and unsupported assumptions underpin much of the DEIR's analysis.

The DEIR assumes that new discretionary permits will be issued for oil and gas wells, but fails to recognize the fact that oil and gas operations within the GP 2040 boundary will continue to operate under, valid and vested entitlements. To the extent the DEIR assumes that such operations will be subject to further discretionary review and the imposition of additional mitigation measures and/or conditions, that assumption is incorrect as a matter of law, and all analysis flowing from it is flawed.

GP 2040 Policies COS 7.2 and COS 7.3 are presented in the DEIR as limiting effects on human health. The DEIR cites a County of Los Angeles 2018 report as the basis for assuming that stated limiting effect on human health. What the Draft EIR fails to mention or quantify in any substantial manner, is the fact that the County of Los Angeles 2018 report's conclusions and recommendations lack grounding scientific research. The report lacks objective scientific data from the County of Los Angeles; reviews other jurisdictions outside of California when making recommendations or claims; uses weak, unsubstantiated, misleading language and science; excludes the County of Los Angeles Department of Health's own data and previous studies.

The Draft EIR also makes reference to the 2019 City of Los Angeles Oil and Gas Health Report. That report clearly states, "There is a lack of empirical evidence correlating oil and gas operations within the City of Los Angeles to widespread negative health impacts. The lack of evidence of public health impacts from oil and natural gas operations has been demonstrated locally in multiple studies by the Los Angeles County Department of Public Health, the Los Angeles County Oil & Gas Strike Team, the South Coast Air Quality Management District and the comprehensive Kern County Environmental Impact Report and Health Risk Assessment." Lastly, the DEIR relies in part on unsettled legislation, Assembly Bill 345. Assembly Bill 345 is not law and the DEIR cannot treat it as such.

We thank the County for this opportunity to review and comment on the DEIR for GP 2040, and we ask that these comments be included in the record of proceedings in this matter. As set forth above and further articulated in the comments submitted by Aera Energy LLC and WSPA, the DEIR suffers from numerous legal defects. These defects must be cured and the DEIR must be recirculated

Sincerely,

Comments on COS-7.2 setback requirements for oil and gas wells, **DEIR for GPU 2040**

From: Carol Holly, 10508 Sulphur Mountain Road, Ojai, CA 93023

Proposed General Plan 2040 Policy:

- **COS-7.2: Oil Well Distance Criteria.** The County shall require new discretionary oil wells to be located a minimum of 1,500 feet from residential dwellings and 2,500 from any school. (RDR) [Source: New Policy]

The DEIR suggests a mitigation measure to the above policy to decrease the setback from schools (and to include day care centers) from 2500' to 1500'. The reasoning in the DEIR for this decrease in setback is to allow a potential operator in the future who perhaps wanted to drill an oil well without directional drilling to place the well on the drill pad anywhere they want. The DEIR stretches common sense with this argument. If the future operator can drill horizontally 1500' as stated in the DEIR, why not 2500'? There is a difference in the cost of drilling, but the risk to the health and safety of young children far outweighs the small economic cost to an operator or two.

I was an elementary school principal in Ojai Unified School District for 22 years. In my role, among other things, I was responsible for ensuring the health and safety of children assigned to my school. Many young children suffer from asthma and skin allergies. All children love to run and play at recess. It is critical that those sensitive children are protected from unwanted and unnecessary exposure to air toxins that may cause serious complications leading to poor school attendance and miserable days of recovery time.

In my last assignment before retiring, I was principal at a school with three classrooms of special needs children, some of whom were medically fragile and who suffered from life-threatening childhood illnesses. This latter group of children were often highly sensitive to changes in their environment and the reactions they suffered were sometimes immediate and very serious. I remember asking one mother of such a child, "when would you like me to call 911?" Her response was, "any time you want to." As chilling as that sounds, it was real.

Air toxins are dangerous to anyone in close proximity to the source of the emissions, but they are especially dangerous to young children. Children who are medically fragile may find them intolerable.

Bad Accidents Happen

In 2006, oil well #36 in the Ojai Oil Field began spewing a mixture of brine water and oil at the rate of 210 gallons per minute (5 barrels) after a 3.1 magnitude earthquake on the San Cayetano Fault (see attached DOGGR report). Summit School at that time had a population of approximately 80 K-6 grade students. The school is cited about 1000' from well #36 (see attached map). The well continued to spew a toxic mix of brine water and unknown other

chemicals used in the capping process onto the land for three months. The well casing break was very difficult to get under control. Finally, after accruing a cost of 4 million dollars, the flow was stopped. During the entire time the well was being worked on by teams of international well control experts no one at the school was notified of the disaster unfolding on the hillside upwind from the school. Children continued to play on the playground, teachers taught physical education, parents with babies dropped off and picked up their students. **No one knew.** Where was the Ventura County Environmental Health Department? Where was DOGGR? Where was the fire department whose station is just a few hundred feet east of Summit School? Were any tests done on air quality near the school?

After the well was capped and the drill rigs and heavy equipment all cleared out, a parent of children at the school was told of the disaster by a worker from the oilfield. The story spread and we were collectively horrified. There was never any follow-up study or even a quick check-in to see how the children of Summit School were doing. No one knows if the school attendance went down, or if there are students with lasting health issues caused by breathing toxic chemicals for three months. No one knows because no one asked.

If staff and the industry assert in response to this comment that there is no evidence that anyone was sick or hurt by the break in well #36, be aware. How can there be evidence when 1) no one knew of the emergency in real time, 2) no studies were ever done to look for possible effects of the spill to human health at the school and 3) the air quality at the school was never tested?

A setback distance of 2,500', roughly 1/3 of a mile, is about all we can do to protect the health of young children at a school near active or idled oil and gas activities.

I can assure you that no one with a medically fragile child would ever rent or buy a house 1500' from an active oil well if they could possibly avoid it, why would they have to send their child to a school 1500' from such a well?

Please reject the mitigation measure and retain the 2500' setback from schools and day care centers.

Thank you,

Carol Holly,

Retired Elementary School Principal, Ojai Unified School District,

MS Educational Administration

ABANDONMENT OF WELL “OJAI” 36

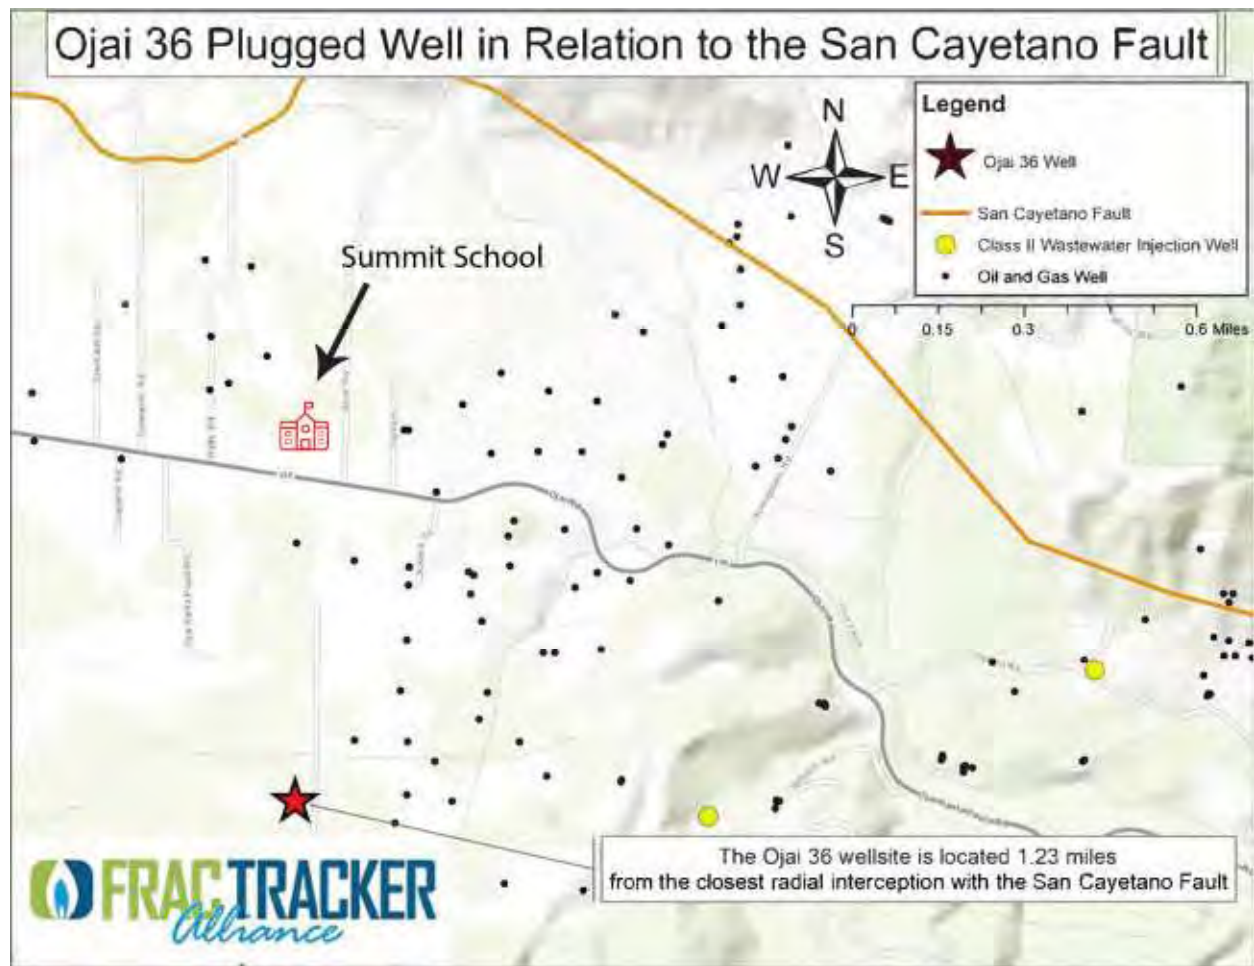

On March 3, 2006, immediately following a seismic event along the San Cayetana fault in the Sespe oil field, idle-well “Ojai” 36, located approximately five miles west along this same fault zone in the Sisar Creek Area of the Ojai oil field, began to flow water at a rate of five barrels per minute. Well records indicated the well penetrated a fault and had encountered a high-pressure water sand. The operator, VPC, contracted with international well-control specialists Boots and Coots to begin emergency operations to secure the well site and bring the well under control. Division staff were on location daily to witness operations. The well was eventually killed with 20 pound-per-gallon mud and permanently plugged and abandoned by May 1st at a cost of approximately \$4 million (Photos 1 and 2).

Re: Comments on County General Plan and Climate Action Plan

Dear Ms. Curtis:

I appreciate the opportunity to review and comment on the County's General Plan and the integrated Climate Action Plan. It is a very significant undertaking and I wanted to recognize that staff has made great strides in incorporating the diversity of interests and often conflicting perspectives.

I have attached comments to this letter and divided them into comments specifically addressing a Policy/Program and an additional more generic set of comments, resources and research that I relied on as part of my evaluation or I was unsure which section or sections to include them in. Hopefully the additional context will assist in the refinement of the GP and CAP.

There is an overreliance on state legislation as a source of emissions reductions in the early years. Local efforts need to be more robust given the urgency of the issue and the potential that the IPPC targets are not substantive enough given the latest scientific analysis. Please see the CFROG letter from June 5, 2019 for a more comprehensive overview. To avoid redundancy, I am not replicating all the CFROG comments. However, I am including them as part of my comments by reference.

Sincerely,

A handwritten signature in blue ink that reads "John Brooks". The signature is written in a cursive style with a long horizontal stroke at the end.

John Brooks

Climate Change Resources & Comments

Specific comments on sections of the CAP

LU-11.4 Change Shall to Require

LU-16.5 Change Shall to Require

LU-18.5 – “encourage stakeholders” and “have opportunity to learn about” is a pretty low bar. Please upgrade to County shall conduct programs/outreach in their neighborhoods or community gatherings and include multi-lingual capabilities as needed to reach out to the Hispanic and Mixteco populations.

PFS-1.2 & 1.3 – The County should adopt a policy of considering the 100-year projections when evaluating infrastructure since these facilities have significant sunk costs and it is significantly cheaper to upgrade when planning a facility versus retrofitting an existing building.

PFS-2.3 State law requires commercial buildings to be zero net energy (ZNE) in 2030. The County should show leadership, by requiring all new buildings to be ZNE and existing buildings to be in substantial compliance if the County is leasing greater than 50% of the building space.

PFS-E – The County procurement policies should be updated to require all suppliers, vendors and consultants to disclose the sustainability of their operations. The County could award as little as one point to this category, however, the requirement to disclose will have a significant effect on the adoption of policies and procedures that are environmentally beneficial. The County could develop a one-page form checklist that they submit with their bids. Alternatively, large corporations can share their corporate sustainability or ISO certifications and smaller ones can show that they follow the [Ventura County Green Business](#) practices if they have already completed those more comprehensive processes.

COS-8.1 – include promotion of microgrids as both a carbon reduction and resiliency measure for PSPS events.

COS-8.9 - Change Shall to Require and have a list of recommended shade trees appropriate for that region and tolerant of parking lot conditions. This could assist with stormwater mitigation measures and help reduce financial impacts to the County from flow into the public ROW.

COS-H – Ensure that the goal is net additional trees beyond replacement of dead/dying trees or mitigation trees for a project. Recommend that preference be given for tree planting in EJ or low-income communities.

COS-M – In addition, oil companies should pay an extraction fee per barrel for an insurance mitigation fund to ensure that abandoned wells and sites owned by bankrupt companies do not become a burden to taxpayers.

COS-Z – These should be online with easily understandable charts or graphs enabling the public to understand the data and compare to the projected savings to determine if individual measures are being met.

COS-CC I commend the recommendation to establish a Climate Emergency Council to advise the Board.

COS-DD – A critical component to assist in the development and implementation. An Office of Sustainability should be established within the CEO’s office and the primary staffperson in charge of this effort should be a direct report to the CEO recognizing both the critical and cross-cutting nature of this work and ensure the full cooperation of all County offices.

COS-EE - Measures should be incorporated to ensure that projects continue to implement requirements after the project is finished and occupancy is granted or face substantial penalties. For example, if they bypassed one or more measures, they could agree upfront to a penalty of 10x the carbon wasted with the funds going to assist in low-income areas of the county to weatherize or otherwise reduce their carbon footprint.

Haz-1.4 – The County should develop reach fire codes for the urban-wildland interface to minimize both property damage and the danger to emergency responders trying to protect structures in the new fire environment.

Haz-10.7 Change to read that the County will purchase ZEVs, unless they are not readily available in the vehicle class or purpose needed or the lifetime cost of the vehicle including purchase, fuel and maintenance exceeds 15% of the cost of a non-ZEV. The County needs to show leadership and these vehicles are a very public way to showcase the transition to the low-carbon economy.

HAZ-11.6 What provisions will be made to identify and transport those without transportation and the elderly or disabled who cannot afford or do not have access to AC to cooling centers? Will the cooling centers be open 24/7? One of the problems is that the nights are heating up faster than the days so residents may need to stay overnight. Will animals be allowed in these facilities?

PSPS/Wind Events

PSPS outages – need to be prepared for 3-7 days of electricity outages. These are not considered emergencies by the Red Cross, so they will not staff shelters. If a substantial part of the county is without power, we will need cooling shelters (with power) which can be a mix of day use only and overnight shelters. The centers will need to have robust electrical charging stations to run oxygen tanks and other medical equipment. Medicines may need to be refrigerated and monitored. Have the shelters been retrofitted with generators or are they wired correctly for three-phase generators? Where will generators be located to quickly deploy especially if routes like the 101 freeway are closed?

A power outage may do the following:

- Disrupt communications, water, and transportation
- Close retail businesses, grocery stores, gas stations, ATMs, banks, and other services
- Cause food spoilage and water contamination
- Prevent use of medical devices and operations or medical/senior center facilities

From [Ready LA County](#)

A spike in generator purchases and rentals by people unfamiliar with their safe operation is likely and may result in carbon monoxide poisoning.

7.13 Wildfire – The County should adopt reach codes for fire.

Although Santa Anas have decreased in frequency and severity of extreme wind events, the Santa Ana window or primary season is moving to Nov-Jan. This could result in more fires in this period, particularly in dry years¹.

7.13 P – Should also include infrastructure at risk that the County does not control but relies on.

7.13 Does not include anything related to the more intense rains and flooding expected from less frequent, but more intense storms.

In addition, wildfire has profound effects on storm runoff, erosion, and sedimentation in the complex terrain within Ventura County. For several years following a fire, runoff rates can more than double due to fire-driven changes in soil properties that render it water-repellant and reduce infiltration rates (USGS 2005; USGS 2019). Short-duration, high-intensity precipitation under these conditions increases surface runoff that can cause movement of ash, burned vegetation, soil, rocks, and other debris. This material is scoured from steep channels and moved downslope where it may impact communities or infrastructure below as a debris flow.

9.8 G – The County should adopt a policy to establish parcel-based water budgets to prepare for the implementation of the state water efficiency mandates “Making Water Conservation a Way of Life”. This will ensure that parcels that use more than their fair share are targeted for outreach and punitive measures as necessary to comply with the state law.

10 Economic Vitality

EV-4.2 Economic Development Opportunity

California and Ventura County are well-positioned to be leaders in the development and deployment of greenhouse gas (GHG) reduction solutions that will assist in the transition to a low-carbon economy. Because of California’s size and early adoption of significant environmental controls, Cap & Trade, AB 32, and mandatory organics recycling, the state is already a key player in finding sustainable solutions that include cleaner emission vehicles, energy efficient appliances, and green chemistry requirements. These are also the types of jobs and opportunities we need to develop locally to provide opportunities for our youth and to sustain our region.

The aerospace sector was a huge boost to the Southern California region in the 70s. The Bay area has developed the Silicon Valley, and North Carolina has the Research Triangle. What were the key components that enabled these areas to develop into such well-known powerhouses? How can we leverage the transition to a green economy and position Ventura County as a regional Green Innovation Hub?

[Next 10](#) in November 2014, published the [Regional Clean Economy Series](#) of five reports highlighting five sectors of the state that are forming and nurturing regional clean economy sectors focused on the “core clean economy.” Next 10 is an independent, nonpartisan organization that focuses on the environment, the economy, and the quality of life for all Californians.

¹ Ventura_Climatechange_Review_Oakley.pdf slide 28

They define the core clean economy as, *“businesses that provide the cutting-edge products and services that allow the entire economy to transition away from fossil fuels and use natural resources more efficiently.”*

The regions and core clean economy focus for their reports include:

1. Los Angeles and Orange – advanced transportation
2. Sacramento – electric vehicles, building energy efficiency and solar, waste-to-energy
3. San Diego and Imperial – smart grid and biorenewables
4. San Francisco Bay Area – advanced transportation, energy storage, building energy efficiency
5. San Joaquin Valley – water-agriculture, renewable energy

General Comments

Requested Policy – Each County department should prepare a Climate Action Plan that evaluates their footprint, mitigation measures, risks to their clientele and mitigation or outreach measures that they will adopt. A substantial portion of this may be done by centralized staff. However, the department staff need to understand the issues and incorporate mitigation measures into their routine activities. This could be the Public Works department, the County Health Department. Climate changes will impact their day-to-day operations and they need to start recognizing, planning for and accommodating those changes.

Economic Related issues

Requested Policy - The Pacific Coast Highway in the Malibu region and the 101 between Ventura and Santa Barbara are both vulnerable. Short-term shutdowns would be disruptive. However, if the corridor was closed for multiple months this would significantly impact traffic and may result in substantial economic impacts. Critical infrastructure should be evaluated regardless of ownership and mitigation plans prepared as warranted.

Article related to Ventura County

[Fires, floods and free parking: California's unending fight against climate change](#) – Scott Wilson, Washington Post December 5, 2019

Since 1895, the average temperature in Santa Barbara County has warmed by 4.1 degrees Fahrenheit, according to The Post's analysis. Neighboring Ventura County has heated up even more rapidly. With an average temperature increase of 4.7 degrees Fahrenheit since preindustrial times, Ventura County ranks as the fastest-warming county in the Lower 48 states. [Some climate scientists believe that there is an error in the Post's projections].

Public Health

Climate change has been called “the biggest global health threat of the 21st century” (Costello et al. 2009). In the LA region, the health impacts of climate change are far-reaching, including direct and indirect impacts related to extreme heat, poor air quality, wildfires, infectious diseases, floods and mudslides, mental health concerns, and increasing disparities caused by disproportionate impacts to vulnerable populations. (NOTE: LA Region includes Ventura County in the analysis) ...

The number of extreme heat days in southern California is expected to increase considerably by the middle of the century as a result of climate change (pp. 11–12). Extreme heat is one of the most significant health impacts of climate change and already causes more deaths each year in the United States than floods, storms, and lightning combined (Berko et al. 2014). Exposure to extreme heat can cause direct heat-related illness (heat cramps, heat exhaustion, and heat stroke) and death, and can also exacerbate certain existing medical conditions. Heat waves are associated with increases in the number of people seeking emergency medical care for a variety of health conditions, though the magnitude of this effect depends on many factors, including geographic location, demographics, and availability of adaptive strategies such as air conditioning. During California's 2006 heat wave, there were 16,166

excess emergency department visits and 1,182 excess hospitalizations across the state, with increases in visits for kidney related diseases, diabetes, and cardiovascular disease (Knowlton et al. 2009)².

While all residents are affected to some extent by extreme heat, certain populations are more vulnerable to severe impacts. These include (a) low-income communities and communities of color, which often experience a greater urban heat island effect due to a lack of trees and other vegetation, and which have lower access to air conditioning (Reid et al. 2009a); (b) older adults, young children, people with chronic medical conditions, and people taking certain medications, who are physiologically vulnerable to the effects of heat (Kenny et al. 2010; Reid et al. 2009a; Tsuzuki-Hayakawa, Tochiara, and Ohnaka 1995); and (c) outdoor workers (Bethel and Harger 2014), people experiencing homelessness (Harlan et al. 2013), and others who spend a significant amount of time outside and are more exposed to extreme heat. Unlike cities that have consistently experienced extreme heat in the past, the housing stock in LA is not designed for extreme heat. Approximately 51% of households in the LA-Long Beach area have central air conditioning (American Housing Survey 2015). While California code requires that landlords provide adequate heating facilities in homes, air conditioning is not a requirement. Moreover, the LA region's affordable housing crisis may prevent many renters from being able to move to air-conditioned homes where they would be less impacted by heat. Access to air-conditioned spaces may be additionally limited by factors such as mobility, vehicle ownership, perceptions of neighborhood safety, and distance to transit. These factors can prevent vulnerable populations from implementing adaptive and health protective strategies, such as getting to cooling centers or other air-conditioned locations.³

Do we know the percentage of our houses without AC? Although many resident's dependent on social security or other limited income may not turn on the AC even if they have it in their homes due to financial concerns it would be a starting point.

Climate change may impact mental health through various pathways, including but by no means limited to (a) increases in the frequency and severity of extreme weather events; (b) increasing economic instability; and (c) uncertainty about the future of the planet. Extreme weather events such as fires and floods can have acute mental health impacts. Clear links exist between extreme weather events and anxiety and depression (Kar and Bastia 2006), post-traumatic stress disorder (Neria, Nandi, and Galea 2008; Kar and Bastia 2006), and suicide (Krug et al. 1999).⁴

Public transit infrastructure - *Transit design can mitigate human exposure to extreme heat (p. 44). Exposure to extreme heat can result in heat-related illnesses such as heat cramps, heat stroke, and heat exhaustion, and can also exacerbate pre-existing conditions. Further, extreme heat may discourage transit use altogether. Environmental exposure results from access and waiting. Transit users from areas with low residential density, limited high capacity roadways, and irregular street networks not located along direct paths between major activity centers, are likely to experience prolonged access and/or waiting times (Fraser and Chester 2017a).... The placement of transit stops impacts how long passengers are exposed to the environment, and, coupled with walking, may leave them at risk for negative heat-*

² Fourth Climate Change Assessment – LA Region pg 21

³ Fourth Climate Change Assessment – LA Region pg 22

⁴ Fourth Climate Change Assessment – LA Region pg 24

*related outcomes. Walking times can vary significantly by age and physical condition. They can increase by up to 30% for the slowest age group (Bohannon and Williams Andrews 2011).*⁵

Human health effects of extreme heat

Climate change poses a threat to public health. Heat causes more reported deaths per year on average in the United States than any other weather hazard (NOAA, 2017). In addition to the long-recognized health impacts of extreme heat, hospital admissions and emergency room visits, deaths and other adverse health outcomes have been associated with the warm season in California.

In 2006, dramatic increases in many heat-related illnesses and deaths were reported in California following a record-breaking heat wave. During the summer months, large urbanized areas can experience higher temperatures compared to nonurban outlying regions. "Urban heat islands" create health risks both because of the increased temperatures and because of the enhanced formation of air pollutants. Warming temperatures can amplify the transmission of mosquito-borne diseases (such as West Nile Virus) and make conditions more hospitable for invasive species that may transmit diseases.

While difficult to track using indicators, climate change can impact human well-being in many ways, including injuries and fatalities from extreme events, and respiratory stress from poor air quality (Mellilo et al., 2014).⁶

[Climate Change is a Health Emergency](#) – Coalition of health organizations

[Yale Climate Connections on Health](#)

Information on the health effects of climate change from the [Third National Climate Assessment's Health Chapter](#).

Mental Health

People's anxiety and distress about the implications of climate change are undermining mental health and well-being, according to a new federal report reviewing existing research on the topic. Issued by the U.S. Global Change Research Program, the report is the first time the federally mandated group has published an assessment solely focused on climate change and health.

The report is notable for another reason, too: It contains a chapter devoted to mental health and well-being, a significant step forward for an assessment of this type, says lead author Daniel Dodgen, PhD, a clinical psychologist at the U.S. Department of Health and Human Services, Office of the Assistant Secretary for Preparedness and Response. "I think people realize that if you're going to talk about health, you have to talk about mental health," he says.

The report also found that:

Exposure to climate- and weather-related natural disasters can result in mental health consequences such as anxiety, depression and post-traumatic stress disorder. A significant proportion of people affected by those events develop chronic psychological dysfunction.

⁵ Fourth Climate Change Assessment – LA Region pg 50

⁶ Indicators of Climate Change in California pg 161

Some people are at higher risk for mental health consequences from weather-related disasters. Among them are children, pregnant and postpartum women, people with pre-existing mental illness, people who are economically disadvantaged, those who are homeless and first responders to the disaster.

Representations of climate change in the media and popular culture can also influence a person's stress response and mental well-being.

[Climate change is threatening mental health](#) -- American Psychological Association

1. Target populations of Concern
2. Outside workers (including County staff)
3. Children
4. Medically fragile, asthmatics, etc.
5. Pregnant women

[Pregnancy effects](#) According to [research published](#) in *Nature Climate Change*, birth rates were 5% higher on days when the temperature exceeded 90 degrees Fahrenheit. And, perhaps more concerning, births on those days occurred up to two weeks earlier — and 6.1 days earlier on average — than they would have otherwise.

“That’s enough to take somebody from what’s considered to be a pretty healthy pregnancy into a ‘we are somewhat worried’ pregnancy,” said Alan Barreca, a UCLA professor of environment and human health and lead author of the study.... Early delivery could cause long-term harm to the affected infants. Previous research has shown that early deliveries are linked to cognitive differences later in childhood, though it’s unclear whether this applies to heat-related early deliveries specifically. Another study found a direct link between mothers experiencing extreme heat during their third trimester of pregnancy and reduced income for their offspring once they reach adulthood. That might be due in part to earlier deliveries, too.

Air Quality - Hotter future temperatures (Section 2.2) will act to increase surface ozone concentrations both due to chemistry producing more ozone and higher rates of biogenic emissions, while increases of water vapor also influence chemistry by increasing ozone production in already polluted areas (Steiner et al. 2006). It’s been estimated that ozone could increase up to 5-10 parts per billion (ppb) by 2050 in LA (Jacobson 2008; Pfister et al. 2014), and the number of days with ozone over 90 ppb could increase between 22-33 days (Abdullah Mahmud et al. 2008).⁷

Water

Drought

Anticipate a 64% decrease in snowpack by end of century⁸

By virtue of its Mediterranean climate and location along the periphery of the Pacific subtropical high, California experiences warm and dry summers with wet winters. During the wet winter months, which in Southern California typically begin in November and terminate in March, the bulk of precipitation arrives in a few, large storms (Dettinger et al. 2011; Oakley et al. 2018b). Should these storms not arrive due to

⁷ Fourth Climate Change Assessment – LA Region pg 20

⁸ Ventura_Climatechange_Review_Oakley.pdf slide 20

*the presence of a persistent blocking ridge of high pressure in the North Pacific Ocean, precipitation deficits will be large (Cook et al. 2018). These deficits will be superimposed with climatologically high evaporative demands and may be exacerbated by above-normal winter season temperatures. Such dry years occur commonly in California, and multi-year periods of severe drought are not uncommon. However, evidence from various locations in California and throughout the southwestern United States indicates that extreme droughts lasting decades to several centuries have occurred numerous times since the end of the last ice age (e.g., Stine 1994; Benson et al. 2002; Woodhouse et al. 2010; Dingemans et al. 2014). The most recent extreme and persistent droughts occurred during the Medieval period, approximately 800-1000 years ago, with locally warm and dry conditions inferred from paleoproxy evidence provided by sedimentary cores taken from Zaca Lake in the San Rafael Mountains of Santa Barbara County (Dingemans et al. 2014). These droughts indicate that such extreme periods of aridity can occur under natural conditions (i.e., independent of human-driven changes in greenhouse gas concentrations) implying consideration of extended drought is prudent to sustainable water resource management, especially if projected warming increases drought risk Hatchett et al. 2015). Modeling studies of the Central Sierra Nevada have shown these droughts to be of comparable precipitation deficits to the most recent California Statewide drought that began in winter 2012 and ended in January of 2017 (Hatchett et al. 2015). The severity of the recent drought was exacerbated by anomalously warm temperatures driving a surplus in atmospheric evaporative demand and reducing the fraction of precipitation falling as snow in mountain regions (Williams et al. 2015b; Hatchett et al. 2017). The duration and severity of the recent drought varied statewide, with Ventura County being one of the first regions to go into drought conditions and one of the last to emerge (U.S. Drought Monitor 2019).*⁹

Rain

4.2 Implications of Changes in Precipitation

- *The number of dry days increases in the spring and fall (Fig. 4.6); however, there is little change projected in precipitation totals for these seasons (Fig. 4.2), implying some intensification of precipitation in these seasons, although these increases grow with time (Appendix A). Prolonged dry periods are associated with wildfire activity (e.g., Nauslar et al. 2018). With more dry days there may be potential for a longer wildfire season due to additional opportunities for persistence of dry conditions.*
- *Groundwater recharge is projected to decrease in the Southwest in a warming climate (Niraula et al. 2017) and may in part be related to increasing rainfall intensities (Dettinger and Earman 2007). Precipitation intensification at the seasonal to sub-daily timescales may have implications for the methods by which groundwater recharge occurs or how surface water is conveyed, captured, and stored.*
- *Roughly half of models project more frequent days exceeding historic 85th percentile daily precipitation totals (Fig. 4.7), resulting in more days with storm water management concerns if these outcomes are realized.*
- *Intensification of sub-daily precipitation (Figs. 4.8-16) raises concerns for increased flash flooding (Modrick and Georgakakos 2015), landslides, and debris flows (e.g., Oakley et al. 2018a) in a warming climate. In addition to the potential for increased threats to life and property, this may have impacts on infrastructure design and water resource management.*

⁹ Ventura Climate 2019_Bookmarked.pdf pg 51-52

- *Potential for storms with similar atmospheric characteristics to historic events to produce greater event total precipitation due to warming and ability for greater amounts of water vapor to be present in the atmosphere (Figs. 4.17-18; Prein et al. 2017).*

- *With uncertainty in annual precipitation changes, potential for increasing dry days, and increased temperatures (Section 3) and evapotranspiration (Section 5), diversified water supply portfolios will likely allow for more resilient water management (Sterle et al. 2019).¹⁰*

Atmospheric rivers (ARs) show a 20-50% increase in frequency of ARs along west coast and studies suggest fewer, but stronger and longer duration ARs in SoCal.¹¹ ARs can transport ten times the volume of the Mississippi River in water vapor and release a significant amount of the water when they rise over the coastal mountains.

Moreover, the peak season of atmospheric rivers may also lengthen, which could extend the flood-hazard season in California. The current generation of GCMs project a nearly 40% increase in precipitation during atmospheric river events over southern California by the late-21st century under RCP8.5. The number of atmospheric river events is also projected to increase in the future, possibly around a doubling of days by the end of the century (Warner et al. 2015; Hagos et al. 2016; Gao et al. 2015¹²).

Short-duration, high intensity rainfall

Because of their ability to trigger flash floods and mass movements, short duration, high intensity precipitation events pose a major threat to life and property in Ventura County.¹³

Floods 1.5-2x more likely to exceed top 0.05% of historic hourly precipitation¹⁴.

If these rains occur after a significant fire then widespread flooding, mud flows and/or slope failure could result.

Evaporative Demand

Evapotranspiration represents the fluxes, or transfer, of moisture from open water and soil moisture (evaporation), and plant transpiration of water to the atmosphere under ambient conditions....

Historically, positive changes in ETO have been associated with increased water demand (Hobbins and Huntington 2017), increased wildfire activity (Abatzoglou and Williams 2016), and ecosystem impacts (Schwinning and Sala 2004). Thus, with projected ETO increases, the following impacts may be anticipated:

- *All seven models project county-wide increases in annual ETO, with minimum increases of at least 2 in. and maximum increases of approximately 6.5 in, which may impact water demand for crops (Hall et al. 2018), ecosystems, and municipal water use.*

¹⁰ VenturaClimate2019_Bookmarked.pdf pg 31

¹¹ Ventura_Climatechange_Review_Oakley.pdf slide 19

¹² Fourth Climate Change Assessment – LA Region pg 14

¹³ VenturaClimate2019_Bookmarked.pdf pg 6

¹⁴ Ventura_Climate_Projections_Hatchett.pdf slide 35

- *The greater thirst of the atmosphere will deplete soil and plant moisture leading to faster rates of fuel moisture decline and longer periods of dry vegetation. This will increase the susceptibility of landscapes to wildfire and drought, as there is the potential for vegetation to dry more quickly and for longer periods of time.*
- *Reductions in soil moisture associated with increased ETO may reduce runoff production in some areas. The greatest increases in ETO (and thus reductions in soil moisture) are projected to occur in inland elevated terrain.¹⁵*

Although the greatest changes in absolute ETO occur during summer (Fig. 5.2c), percentage-wise, the largest increases (between 4–8%) are observed during fall in terms of spatial extent and magnitude (Fig. 5.3d). This will add stress to vegetation, decrease fuel moisture, and increase fire risk. Dry conditions extending into the late fall and early winter have a greater chance to coincide with Santa Ana winds. These conditions can lead to destructive wildfires such as the December 2017 Thomas Fire (Nauslar et al. 2018) and the November 2018 Woolsey Fire. Spring and summer show similar magnitudes of change and are consistent in the locations of change, though the core regions of greatest percentage increases shift westward from the Santa Clara River watershed (Fig. 5.3b) to the Ventura River watershed (Fig. 5.3c) during summer¹⁶.

Beyond Los Angeles: Imported Water Availability

The LA region is intimately connected to other Western U.S. watersheds. Water supply agencies rely on imported water for a majority of regional water supply (Gold et al 2015; Porse et al. 2017). Three main water sources supply metropolitan LA water agencies: the California Aqueduct as part of the State Water Project, the Colorado River Aqueduct that supplies southern California’s allocation of Colorado River water, and the LA Aqueduct that imports water from the Owens Valley. Imported sources comprise a majority of water demands. For instance, in LA County, imported sources meet 55-60% of annual urban water demands, with the remaining amount supplied by groundwater (35-40%) and recycled water for nonpotable uses such as irrigation. From 2000-2010, these water agencies received an annual average of 810,000 acre-ft from MWD’s imported sources, through in recent years averaging closer to 700,000 acre-ft. The entire American Southwest is expected to see increased drought and reduced availability of future water for agriculture and growth (MacDonald 2010). Such large-scale changes across a broad geography, which includes California, will pose unique risks for each of the massive infrastructure systems that import water to LA.

A substantial portion of Ventura County’s water comes from the State Water Project through MWD.

The State Water Project of California brings water from the northern and western Sierra Nevada mountains south through the Sacramento-San Joaquin Delta to urban and agricultural users in southern California. Historically, the State Water Project contributed the majority of water supply to MWD’s sources (53% from 1976-2010). Numerous studies have documented the likely shifts in precipitation regimes that will result from climate change in California, including reductions in snowpack, advances in the timing of runoff leading to reduced seasonal capture and storage capacity, and hotter coastal and

¹⁵ VenturaClimate2019_Bookmarked.pdf pg 45-46

¹⁶ VenturaClimate2019_Bookmarked.pdf pg 48

inland temperatures increasing demand (Anderson et al. 2007; Brekke et al. 2004; N. L. Miller, Bashford, and Strem 2003; Tanaka et al. 2006; Vicuna and Dracup 2007; Dracup and Vicuna 2005). Additionally, the system of reservoirs will face increasing operational risks in managing more extreme rainfall events and preventing floods (Brekke et al. 2009). Applying such projections in planning can be challenging, given longterm uncertainties and sunk costs in current infrastructure (Groves, Yates, and Tebaldi 2008). Given these long-term likelihoods, the reliability of water deliveries from northern California will likely stir significant continued political debate and uncertainties, especially regarding future management alternatives for critical habitat and conveyance areas of the California Delta (Madani and Lund 2010).¹⁷

CASE STUDY | MANAGING FOR SCARCITY TO WEATHER THE DROUGHT Caryn Mandelbaum

The Inland Empire Utilities Agency (IEUA) water and energy optimization is a great example of climate resiliency in one of the hottest areas of southern California. The IEUA's service area covers 242 square miles where Riverside and San Bernardino Counties meet and where summer temperatures soar to over 110°F (43°C). The IEUA distributes imported and regionally-produced water and provides industrial/municipal wastewater collection and treatment services to more than 830,000 people throughout its nine member agencies.

How, you might ask, did they manage to have surplus water during the state's worst-ever drought? The short answer is they had been managing for scarcity for the past 20 years. Leadership had the foresight to establish a grant writing department that matched every dollar spent with grants for efficiency projects. They invested nearly \$500 million in developing regional water supplies, including state-of-the-art recycled water and groundwater recharge facilities, water use efficiency programs, and infrastructure improvements that avoided leaks.

They also developed close ties with their customers through public affairs staff and communications campaigns. This allowed the water agencies to enforce water budgets for each ratepayer. The budget provided a specific monthly allowance of water, depending on the number of occupants and outdoor footprint. The outdoor space was measured aerially to the square foot. They learned about how their consumption patterns measured up to prior use and that of their neighbors. When customers exceeded their budget, they were penalized and provided with tools for conservation. Armed with information and tools, ratepayers were able to better control their water consumption.

Remarkably, while the IEUA developed surplus water during California's historic drought, they were also becoming one of the most energy-efficient utilities in the state. In 2010, the agency installed the world's largest fuel cell system powered by renewable biogas and reduced energy consumption by nearly 25% upgrading operations. In 2017, they launched an advanced energy storage system designed by Tesla that integrates solar, wind, biogas, and grid resources to optimize renewable generation, reduce demand, and lower energy costs. Together with dynamically controlling consumption, IEUA is on track to go gridless by 2020 with almost no capital investment by the Agency.

¹⁷ Fourth Climate Change Assessment – LA Region pg 62-63

Earthquake/levee collapse threats to water supply

“The problem becomes almost intractable,” he continued. “Keep in mind, one failure took \$100 million to fix, and now we’re looking at scores of failures, so the water managers for the state are petrified of this. They are not sure they can ever get this system up and running, or at the very least, it’s going to take multiple years. So this is pretty serious.”

“The [State Water Project](#) is essential, both from the volume standpoint as it provides a lot of our water, and from a water quality perspective, as the water quality is quite good from it. As currently configured, the levees are highly vulnerable, not necessarily for San Andreas events but for the local events directly beneath. The repair time is uncertain; it’s almost certainly very long. They don’t even know how long it would take, and I think by any measure, it is not resilient, and this is the problem.”

<https://mavensnotebook.com/2018/01/03/earthquake-resilience-southern-californias-water-distribution-systems/>

Making Water Conservation a California Way of Life

“Making Water Conservation a California Way of Life” (Governor’s Executive Order B-37-16) replaces and increases water conservation requirements. AB 1668 (Friedman, 2018) and SB 606 (Hertzberg, 2018) implement various provisions of the Governor’s Executive Order including the establishment of long-term urban water use efficiency standards, an indoor water budget of 55 gpcd which decrease over time, and outdoor allocations based on irrigated or irrigable landscaped area.

Based on industry recommendations the state set a provisional standard for indoor water use of 55 gallons per person, per day. This standard was based on a report produced by the Water Research Foundation. To ensure that this standard is reasonable the state will be funding a research study to determine an appropriate budget.

Also, the state is developing an outdoor water usage standard based on irrigated area and other factors like local climate conditions.

Based on these standards, all water districts will be given a maximum water budget for their agency. The budgets are being developed currently, with a draft budget expected January 2021, and the final budget at the end of 2021. While the state is developing the standards, we will be developing the tools and processes necessary to track and stay within the budget.

Proposals also include a requirement for each agency to develop a five-year drought plan, including conservation strategies necessary to achieve conservation levels that range from ten percent up to, and beyond, fifty percent reduction in water usage.

Each agency must document the steps to be taken in the event of a water conservation reduction of:

- 10%
- 20%
- 30%
- 40%
- 50%
- Beyond 50%

How climate change could threaten our water supply

Published 11:00 a.m. PT July 8, 2017 |

Gov. Jerry Brown announces that California will host a global climate summit.

SACRAMENTO - When it comes to California and climate change, the predictions are staggering: coastal airports besieged by floodwaters, entire beaches disappearing as sea levels rise.

Another disturbing scenario is brewing inland, in the sleepy backwaters of the Sacramento-San Joaquin Delta. It's a threat to the Delta's ecosystem that could swallow up a significant portion of California's water supply.

Scientists from government and academia say rising sea levels caused by climate change will bring more saltwater into the Delta, the hub of California's water-delivery network. As a result, millions of gallons of fresh water will have to be flushed through the Delta, and out into the ocean, to keep salinity from inundating the massive pumping stations near Tracy. **That will leave less water available for San Joaquin Valley farmers and the 19 million Southern Californians and Bay Area residents who depend on Delta water — eventually as much as 475,000 acre-feet of water each year, enough to fill Folsom Lake halfway, according to one study by the Public Policy Institute of California.**

"With rising sea levels, with climate change, that creates additional pressure coming in from the ocean," said Michael Anderson, the state's climatologist, in a recent interview. "Sea level rise is going to become more of an influence."

It figures to become a pocketbook issue for practically any Californian who drinks water that runs through the Delta. A 2010 study by scientists from the University of California, Davis said rising seas, coupled with the inundation of some islands in the western Delta, will translate into higher costs for purifying water for human use. The additional cost could go as high as \$1 billion a year, "making the Delta less desirable as a conventional water source," the study said.

That cost doesn't include the \$17.1 billion Gov. Jerry Brown proposes to spend on the Delta tunnels, his controversial plan for reshaping the estuary's plumbing system.

Brown's administration is heralding the threat from climate change as one of the reasons for building the tunnels, which would increase water bills for urban Southern Californians and San Joaquin Valley farmers. An environmental impact statement released by state and federal officials in December said the tunnels are needed to prevent a significant cutback in water deliveries from the Delta.

Without the tunnels, the ability to pump water south "will be reduced under future climate and sea level rise conditions," state and federal officials wrote. "Delta exports would be reduced by as much as 25 percent by the end of the century."

Complicating the issue, climate scientists also agree a warmer climate will mean more rain and less snow. The Sierra snowpack serves as a giant reservoir that naturally releases water long after the rainy season ends. If more of California's precipitation falls as rain instead of snow, much of that water will flow to the ocean in winter and spring, while it's still raining. That will leave less water available in summer to satisfy human needs and to offset salinity in the Delta.

Saltwater is already a problem at the Contra Costa Water District, which serves 500,000 residents in eastern and central Contra Costa County. Its location near the spot where water becomes brackish in the Delta puts Contra Costa on the front lines of the battle against salinity from the ocean. One of its four main intake pipes at the western edge of the Delta is precariously close to the point where water becomes too salty to drink without substantial treatment.

The agency has invested millions on intake pipes that are further and further away from the ocean. In 1997 it opened an intake along the Old River closer to the heart of the Delta. In 2010 it spent \$80 million building another intake a few miles east of the Old River facility. It considered building a desalination plant a few years ago, but the project, estimated to cost \$175 million, has been tabled.

Contra Costa's main weapon against salinity is Los Vaqueros Reservoir, a 19-year-old man-made lake. Though it's in the southwest Delta, it feeds off a pipeline from a San Joaquin River tributary from the east. Its purpose is to hold 160,000 acre-feet of fresh water that Contra Costa uses to dilute the supply that washes in from the Pacific.

"Things can get very salty for prolonged periods of time," said Maureen Martin, the agency's senior water resources specialist, during a recent tour of Los Vaqueros.

Contra Costa has spent nearly \$560 million on Los Vaqueros, and it isn't done yet. Working with 11 other Bay Area agencies, it's developing a plan to expand Los Vaqueros' capacity by two-thirds, an \$800 million project.

Martin said her agency doesn't consider sea-level rise "an imminent threat to Delta water quality." But the scientific projections are influencing Contra Costa's long-term planning on Los Vaqueros and other facilities.

Climate change "would probably cause the Delta to become saltier," she said. If climatologists are correct, the just-ended drought gave Delta residents a taste of things to come. In 2015, when the drought was at its worst and relatively little fresh water was trickling through the estuary, state officials worried about a surge of saltwater gushing in. The Department of Water Resources built a temporary rock barrier on the West False River, near the heart of the Delta, to hold back the salty ocean water.

The price was \$37 million, including the expense of removing the 150,000 tons of rocks when the rainy season started. State officials declared it a successful investment. The barrier helped the state avoid releasing 90,000 acre-feet of water from upstream reservoirs to flush out the salinity.

Over the long haul, state officials believe keeping the salt at bay will be crucial to the viability of the State Water Project and the federal government's Central Valley Project, the delivery networks that move much of Northern California's water through the Delta to the water agencies of Southern California and the San Joaquin Valley.

It's a task that could become increasingly difficult as sea levels rise. Not only will higher waters bring a generally higher volume of salt into the estuary, they will put more stress on the 1,100 miles of levees protecting Delta farms and homes. A levee breach could inundate the SWP and CVP pumping stations with saltwater, forcing them to shut down and reduce operations.

It represents one of the state's arguments for the tunnels project: By diverting a portion of the Sacramento River's flow at Courtland, at the northern fringe of the Delta, and piping it directly to the

Tracy pumps, the state and federal water projects can sidestep much of the saltwater and keep pumping water more reliably.

“The location of the north Delta diversion facility is further inland, making it less vulnerable to salinity intrusion,” officials wrote in the environmental report last December.

Tunnels opponents aren’t swayed by that argument.

They don’t dispute that rising seas will bring more salt to the Delta. But they say the tunnels would actually worsen the problem and make Delta water dangerously salty for farming and drinking water needs. By pulling some of the fresh water out of the Sacramento at the upstream location, opponents fear it will increase the salt concentration in the remaining water flowing through the Delta. In that respect, they’re insulted that the threat from global warming is being used to justify the project.

“Whatever the truth might be about the extent or arrival of (climate) changes, the theory is being used as one more arrow shot at us,” said John Herrick, attorney for the South Delta Water Agency.

“There isn’t a shadow of a doubt in our minds that once they’re able to take water from up north, they’d doom us,” he added.

Hello,

I would urge the County to include how the agency would establish a "preponderance of evidence that the resource is not archaeologically or culturally significant." How would this be done, by whom would it be done, and could any decisions be appealed?

The number of archaeological sites in Ventura County is decreasing at a rapid rate and the definition of archaeological significance should be revised, "that all Native American archaeological sites, should be considered significant since the prehistoric identity of the Indigenous groups is tied solely to archaeological evidence." Loss of any sites would irrevocably result in loss of significant portions of their culture.

Thank you for your consideration.

Re: Ventura County 2040 General Plan: Draft Environmental Impact Report

Dear Chair Bennett and Supervisors,

Thank you for the opportunity to comment on the Draft Environmental Impact Report (DEIR) for the Ventura County General Plan Update. The Community Environmental Council (CEC) is working with dozens of partners on many climate solution projects throughout Ventura County, including electric vehicle readiness, energy efficiency planning, renewable energy and energy storage development, food waste reduction, and carbon farming and sequestration activities.

Ventura County is the fastest warming county in the lower 48 United States, and is already experiencing a range of devastating and expensive impacts¹. While language in the DEIR is careful to point out that federal policy lacks support for strong emissions regulation and that most local GHG emissions will come from current development, the State of California is leading with innovative programs to drive down emissions and the County should implement the most effective local policies that will curb emissions, mitigate impacts, and build community resilience in the current climate crisis.

CEC strongly urges the County to set higher carbon reduction goals, as well as incorporate a carbon neutrality goal at or before 2045, as guided by Executive Order B-55-18, mandating that California reaches carbon neutrality by 2045. CEC suggests the County of Ventura adopt a similar goal as the County of Santa Barbara, planning for a 50% reduction of greenhouse gas emissions from 1990 levels by 2030. CEC also encourages the County to set aggressive carbon neutrality goals, such as the City of San Luis Obispo's current Climate Action Plan seeking carbon neutrality by 2035.

¹ <https://www.washingtonpost.com/graphics/2019/national/climate-environment/climate-change-california/>

As acknowledged in the draft General Plan (page 4.8-40), the County will not reach the goal of reducing emissions to 41.3% of 2015 baseline levels by 2030 through the policies outlined. Although the County's goal is to reach the 2030 goals for GHG emissions reductions, the DEIR only quantifies approximately 30% of those emissions reductions and leaves the rest to mostly voluntary actions. Further, the DEIR indicates that the climate impacts of GHG emissions resulting from growth over the next 20 years will be "significant and unavoidable", yet presents very few quantifiable mitigation actions to reduce them. As a result, the County is at a very high risk for failing to meet its own GHG emissions reduction goals, the state's goals of Carbon Neutrality by 2045, and for experiencing increased climate impacts.

In response, CEC suggests modifying existing policies or creating new policies to include more quantifiable targets to support the following:

- An oil and gas tax on new and existing operations that seeks to slowly phase out oil and gas production by 2045, in line with State carbon neutrality goals, while creating revenue to fund climate action programs
- Parking and pricing policies that disincentivize driving
- Electrification of light duty and medium-heavy duty vehicles
- Increased zero-emissions vehicle miles traveled
- Electrification of the county fleet
- An actionable food waste reduction plan that supports SB 1383
- An unincorporated county zero waste goal
- Restrictions on new oil and gas development
- Elimination of existing oil and gas operations within environmental justice communities
- Programs to sequester carbon in our natural and working lands

Adopting these enforceable policies will have a measurable impact that can be accurately assessed in the EIR.

In 2019, CEC partnered with the Ventura County Regional Energy Alliance and the Ventura County Air Pollution Control District to develop an Electric Vehicle Readiness Blueprint² that outlined targets and strategies for a county-wide transition to zero emissions vehicles in-line with State mandates. We suggest that the County refer to this document as a reasonable guide for setting policy goals with quantifiable impacts. The County can leverage its role as an employer of approximately 8,000 people to enact measures such as building charging stations at all county facilities and establishing programs to help employees adopt EVs at a faster rate than the general population.

The County can lead by example by emulating the State's mandates for zero emissions vehicles in its general services department³. The County can also look to the City of San Luis Obispo's goal of replacing

² <https://www.vcenergy.org/electric-vehicle-blueprint/>

³ <https://green.ca.gov/fleet/about/initiatives/>

26 West Anapamu St., 2nd Floor, Santa Barbara, CA 93101
tel: 805.963.0583 fax: 805.962.9080 • www.cecsb.org

40% of VMT with electric miles by 2030 for setting its own similar target in the unincorporated County areas.

As it stands, Appendix B is not an actionable climate action plan. It kicks the can down the road by proposing a Climate Emergency Council (CEC), established under COS-CC, to consider future policies. Instead, actionable policies should be included by the County through this planning process.

CEC would like to recognize the efforts of the general plan team to incorporate Environmental Justice themes throughout the draft General Plan; however, there is a glaring lack of accountability to Ventura County's environmental justice and frontline communities in the DEIR as well as a lack of prioritizing projects that would correct these historic injustices. Specifically, there is no analysis or mitigation strategy to support the plan's Environmental Justice guiding principle to "...protect disadvantaged communities from a disproportionate burden posed by toxic exposure and risk...". Failure to deeply analyze which communities face disproportionate impacts, beyond the SB 244 definition of a "disadvantaged unincorporated community" creates a gap in addressing their needs outside of the parameters of basic environmental protection outlined in LU-17.3.

CEC recommends that the County establish a more substantial, locally relevant definition of an Environmental Justice Community with both qualitative and quantitative elements. The County should also prioritize specific mitigation measures for disproportionately impacted communities, or set enhanced mitigated measures for growth in those communities, and incorporate them into the EIR.

While the draft plan and draft EIR are stated to be in line with state mandates for GHG emissions reductions, they fall short of meeting the bold and drastic changes needed to help our communities be truly adaptive and resilient. The draft General Plan fails to adequately mitigate for climate change impacts, finding a significant and avoidable impact. Other communities have adopted more complete Climate Action Plans that calculate mitigation measure that allow these agencies to reduce their emissions in line with State goals. The County of Ventura's planning fails in these areas and needs significant revision before the EIR can be certified and the General Plan adopted.

Sincerely,

A handwritten signature in black ink, appearing to read "Sigrid Wright", written over a faint dotted line.

800 Victoria Avenue L#1740
Ventura, California 93009-1740

Dear Board of Supervisors and Staff:

We are writing this letter to urge the Board of Supervisors to reconsider moving forward with the Draft General Plan EIR. The draft EIR has been accelerated to the point that too many issues and impacts have not been properly addressed or studied. These impacts and the corresponding mitigation measures will have severe impacts to land owners and especially those, like us in the agricultural industry and other productive economic segments.

Our family has been involved in the agricultural industry for more than 100 years in Ventura County. We have owned numerous land holdings that remain in the family to this date. We have farmed throughout Ventura County and hope to continue to do so in the future.

The Draft EIR is deficient on many levels. CEQA requires that all mitigation measures must be technically and economically feasible. Numerous proposed mitigation measures are neither. We have in the past attempted to identify land and any owners that would be open to sell their development rights for land that was converting from agricultural to commercial use. Not only did we not find anyone that would do so, no one would even quote a price. The only positive response from numerous land owners were that you can buy my property for full market value and then you can do what you want. There is not a project that can be built by adding double land cost to the equation. This was very recently experienced based on proposed policies at LAFCo. These policies were eventually not enacted due to the inability to purchase development rights in an economical feasible manner. This was when LAFCo was contemplating an acre for acre ag preserve. The new policy that is proposed in the 2040 General Plan is requiring 2 acres for every 1 acre of land converted from ag to any other use. This will eliminate the ability to add any new required ag buildings or even farm worker housing. The Draft EIR must study these impacts, since they are not feasible.

The Draft EIR also deals with water in a manner that is not properly studied. There is no analysis on increased water costs and diminishing availability of water. Without reasonable water costs and supply, there is no agricultural industry.

The General Plan indicates that agriculture is a high priority in the County. However, new policies and requirements in the General Plan add additional mitigation measures that will make ag virtually

impossible. These include new setbacks, limiting types of fumigants pesticides and fertilizers. The General Plan also requires the conversion of all farm equipment to be all electric. Again, not feasible. The costs to purchase new pumps, farm equipment and other existing fuel using equipment will increase operational costs to a point that the County crops will not be competitive in the open market. These new mitigation measures are not sufficiently studied and again are not economically feasible.

The Draft EIR is extremely difficult to read and understand. The background reports are lacking in depth of what has been studied other than numerous general statements and very poor mapping. Detailed studies must be added to sufficiently identify impacts and the related mitigation measures for both direct and indirect impacts on the agricultural industry. It is our understanding that reports and studies need to be timely prepared. However numerous studies are older than 5 years. Not timely.

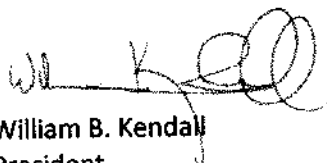

After numerous devastating wildfires over the last few years, which significantly impacted ag, the General Plan continues to lay out limiting mitigation measures for fire prevention. The Wildlife corridor eliminates any ag operation or fire prevention in the proposed corridor areas. This is also a major concern not studied in the Draft EIR.

The Draft EIR for the 2040 General plan does not provide adequate analysis for the expansion of permanent bike paths and pedestrian walking trails throughout the County. These impacts are very severe due to constant conflicts from trail users and ag operations. Spraying, dust, odors from ag operations, along with impacts created by the trail users. These are usually theft, vandalism, litter and pet waste. The proposed mitigation measures require additional setbacks from these trails which renders additional land unusable for ag operations.

In addition to the above comments on the agricultural aspects and related land use concerns of the DEIR, the undersigned is also a mineral owner directly interested in the impacts on oil and gas production of the DEIR and related General Plan 2040 proposed provisions. In these documents there is a total failure to address the economic impacts of the various policies proposed in violation of the requirements for this process, including but not limited to the loss of royalty income to a large group of County residents. I join in the detailed comments on the various deficiencies and concerns identified in the DEIR as described in the concurrent submissions on behalf of Aera Energy and other operators delivered this week to the County.

Please look at the long-term consequences of these General Plan policies and mitigation measures. We formally request additional studies and a revised Draft EIR that will properly look at these and many more issues. The DEIR must be corrected with details of the revisions. Then it can be recirculated.

Sincerely,

William B. Kendall
President
Epic Group

**Draft Programmatic Environmental Impact Report for the Ventura
County Draft 2040 General Plan (PL17-0141)**

Dear Ms. Curtis:

The Santa Monica Mountains Conservancy (Conservancy) supports much of the Ventura County (County) proposed Draft 2040 General Plan Update as analyzed in the Draft Environmental Impact Report (draft EIR).

Specifically, the Conservancy supports the County's inclusion of new policies established by the County's Wildlife Corridor Policy as related to Conservation and Open Space Elements COS-1.3 *Wildlife Corridor Crossing Structures*, COS-1.4 *Consideration of Impacts to Wildlife Movement*, and COS-1.5 *Development Within Habitat Connectivity and Wildlife Corridors*.

The Conservancy also commends the County for proposing COS-1.6 *Discretionary Development on Hillsides and Slopes* that would require development on slopes greater than 20-percent to be sited and designed in a manner to avoid significant impacts to sensitive biological resources to the extent feasible and COS-1.8 *Bridge Crossing Design* to require new or modified road crossings over streams, wetlands, and/or riparian habitat to site bridge columns outside the riparian habitat areas, when feasible.

The inclusion of COS-1.15 *Countywide Tree Planting* to establish and support a countywide target to plan two million trees throughout the County by 2040 is commendable and an opportunity for community engagement and cooperation among public agencies, private organizations, and local businesses to help mitigate against concurrent impacts of climate change.

Further, the Conservancy fully supports the Public Facilities, Services, and Infrastructure Element PFS-10: To develop and maintain a comprehensive system of parklands and recreational facilities that meet the active and passive recreational needs of residents and visitors, as funding is available. The Conservancy has been dedicated to this goal since its

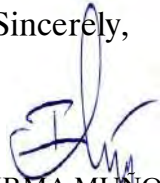

Ventura County Resource Management Agency, Planning Division
Draft Programmatic Environmental Impact Report for the Ventura County Draft 2040
General Plan (PL17-0141)
February 24, 2020
Page 2

inception in 1980 and looks forward to coordinating with the County to help expand trails, parklands, and accessible amenities in the western Santa Monica Mountains and within the Rim of the Valley Trail Corridor.

The Conservancy also recognizes the constraints that specific zoning classifications impose on “using” open space lands as parks and recreational opportunities. Thus, the Conservancy also supports the proposed *Implementation Program N* to establish a new Open Space zone for public lands that will be limited to parks and recreational uses.

Thank you for your consideration. Should you have any questions, please contact Paul Edelman, Deputy Director Natural Resources and Planning, at (310) 589-3200 ext. 128, edelman@smmc.ca.gov, or at the above letterhead address.

Sincerely,

A handwritten signature in blue ink, appearing to read 'IRMA MUNOZ', with a large, stylized flourish above the name.

Re: General Plan Amendment Environmental Impact Report

Dear Honorable Members of the Board of Supervisors:

We are heartened to see more comprehensive environmental protection measures included the General Plan objectives, as outlined in the Environmental Impact Report, but disappointed that so much focus is still placed on aesthetics as opposed to true health and safety concerns. We also feel that the General Plan Amendment falls short of tackling the full extent of the climate crisis and its likely impact on Ventura County. The new General Plan should provide a blueprint to guide us into the future, but in elevating aesthetics to equal standing with true health and safety issues, it fails as a roadmap to navigate the growing environmental and social challenges of the future.

1. For example, when it comes to telecommunications towers, the emphasis on disguising or hiding them, including protecting the view of the ridgelines, does a great disservice to community health, because cell towers are safest when located away from people. Ridgelines that provide excellent coverage, but are not located near schools, businesses or homes are an ideal location for telecommunications towers, far safer than flagpoles, church steeples, and strip mall facades. This is particularly true as the cell phone carriers migrate to 5G which emits far more EMF and RF than the earlier versions of transmission.

2. While maintaining open space is important, the SOAR initiative allows those with existing homes to veto new development, particularly low income and affordable housing, which is desperately needed to provide shelter for our service worker sector. If lower wage earners cannot afford to live near where they work, the commute required increases congestion and air pollution, deteriorating the quality of life for the whole community.

3. Given that the General Plan is projected to take us to 2040, and the existential threat the climate crises poses, we think far more needs to be done to cease fossil fuel extraction and transition to 100% renewables in the short term. We need to have a comprehensive public transit system based on renewable energy, methods for harvesting rain water so

less storm water runoff goes to the sea, and planning on what portions of our coast line we may have to abandon to sea level rise.

4. The book, *Drawdown: The Most Comprehensive Plan Ever Proposed to Reverse Global Warming*, edited by Paul Hawken (Penguin Books, 2017), compiles the results of research from hundreds of the world's top scientists and climate experts, and identifies specific actions that governments and local communities can take to reverse global warming. Our General Plan should incorporate those drawdown solutions that can be undertaken on a local level, many of which are surprisingly simple. For example, reduced food waste and encouraging people to adopt a more plant-rich diet can have a profound effect on reducing green house gasses. So can good family planning clinics and incentives to reduce procreation rates. A most effective and inexpensive drawdown action would be to implement regenerative agricultural methods here in Ventura County. By transitioning away from chemical fertilizer and pesticide use, no-till land management, and building soil with organic material, including biochar, we can sequester carbon in the soil while building its quality and productivity, eliminating contamination of ground and surface water, and improving air quality.

5. We do not have to invent solutions to address the current and growing environmental and social challenges. Other forward thinking regions are tackling these challenges and can provide us with a template that can be tailored to our own local conditions. For example, on Salt Spring Island in British Columbia, the community is faced with a housing crisis similar to our own in Ventura County. Strict development restrictions and limited residential units have priced housing beyond the reach of many residents. Meror Krayenhoff, a global consultant on rammed earth building methods and featured on *The Nature of Things* with David Suzuki, suggested that a compliance driven, as opposed to vision driven, policy paradigm can result in anarchic, subversive response when the populace thumbs their noses at regulations that don't represent the will and needs of the population. He proposes a number of innovative solutions, including encouraging the use of local, renewable materials in building. Ventura County, with access to rock, sand, straw bales and other renewables, can become a beacon for permitted home building solutions for the rest of California, and the nation. Green projects could get reduced permitting fees and priority in the permit queue, with a single point advisor. For example, composting toilets should not only be permitted, but encouraged, as it is wasteful in the extreme to use precious potable water to flush away human waste.

6. We suggest Ventura County consider concepts implemented elsewhere, such as Seattle granting a 25-30% increase in allowable floor area and increased height limits for Living Building Challenge ("LBC") projects (See <https://living-future.org/lbc/>); or New Zealand's SIREWALL community center project, which made approval contingent upon demonstrating reconciliation with Maoris, training opportunities for youth, a high environmental standard that the community (of all ages) supported, that it would elevate the well-being of the community, and encourage responsible tourism. (See https://www.nzherald.co.nz/northern-advocate/news/article.cfm?c_id=1503450&objectid=12076863)

7. Ventura County can embrace LBC requirements that buildings be net positive in terms of water, energy, sewage and liquid waste, and contain no red-listed toxic materials, express beauty in terms of spirit, inspiration, and education, create health and happiness through such things as biophilia, among other inspiring attributes.

8. While the General Plan is intended to cover the length of a generation, it would not be at all unsound to at least contemplate the next seven generations, consistent with indigenous cultural tradition. Measuring progress with such a long term view will require a different framework than juggling one climate or housing emergency after another. Priorities and decision-making can be measured in a rational and holistic manner, with careful thought for the generations yet to come.

9. The General Plan should explicitly reflect the County's Climate Action Plan and its evolution. Achieving net zero CO2 emissions (and sequestration) will require a rapid ending to oil and natural gas extraction (and certainly no expansion, no granting new leases, new pipeline permits, etc. It should encourage green energy generation and storage in both distributed and centralized manners.

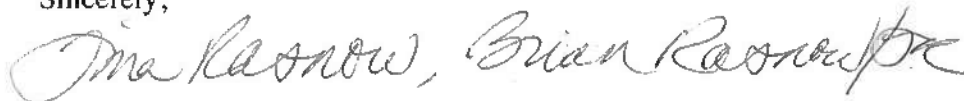

10. Wildfires are clearly changing in their severity and nature. The County should lead in research and experimentation with methods of fire protection and damage mitigation, such as (un)controlled small burns, and unconventional methods advocated by <http://californiachaparral.com> – including ember barriers and sprinklers, which are more effective and ecologically sound than enormous denuded hillsides.

11. Our General Plan needs to steer our county toward good land and resource stewardship. To recap, aesthetics play far too important a role in our land use planning, particularly because “beauty is in the eye of the beholder,” and what one person sees as creative genius, another sees as a monstrosity. Land use regulations should be focused on environmental safeguards that protect air, water, and soil while at the same time meeting the food and shelter needs of our communities.

12. As Meror Krayenhoff has stated, “We are in a time when the scale of the emergencies we face need to be addressed with solutions of a corresponding scale. These emergencies also have urgency. . . . [W]ithout governance that can act with pace, boldness, courage and the power to implement, we are wasting our time.” We hope that Ventura County acts with such pace and boldness to adopt a General Plan that guides us in a new direction of carbon drawdown, while promoting innovation in design, building, and conservation for generations to come.

Thank you for your kind consideration.

Sincerely,

Tina Rasnow and Dr. Brian Rasnow on behalf of the
Rasnow Family

The County did not conduct a complete analysis of impacts in regard to conversion of farmland.

The EIR erroneously and without supporting evidence states "the General Plan would not result in any other changes that due to location and nature would result in conversion of farmland."

This statement is simply not true and the EIR itself contradicts this statement.

The EIR acknowledges the impacts of both economic burdens and decrease in water supply for irrigation (page 4.2-3). As water supplies decrease and costs to obtain that water increase, land will be removed from agricultural use. This is a direct significant impact that will convert ag land.

Actual issues impacting agriculture in Ventura County that contribute to the conversion of ag land are:

- 1) water
- 2) economics (extremely expensive area to do ag)
- 3) lack of farmworker supply and housing
- 4) increased regulatory burden from increasing compatibility issues from urban/ag interface.

County analyzed NONE of these issues. And proposed no mitigation to address any of these issues.

The EIR needs to be corrected and recirculated.

Re: Comments on Ventura County General Plan DEIR

Dear Ms. Curtis:

I represent and serve on the McLoughlin Family Committee, a group of family members that own approximately 300 acres of agricultural property off of Olivas Park Road in the County of Ventura, in proximity to the City of Ventura.

The McLoughlin family has farmed this land for generations. It remains our desire to continue this legacy. However, in the face of never-ending changes to the regulatory environment, we again find ourselves attempting to ascertain how new policies and programs as proposed in the draft 2040 General Plan will impact and challenge our ability to serve as stewards of this heritage.

It had been our hope that the DEIR would provide some clarity and insight into how the new policies and programs within the revised General Plan would impact our farming operation. However, that is not the case. Simply said, we believe the General Plan Update and subsequent Environmental Impact Report fail to adequately analyze or study impacts on the farming industry.

With that said, we would like to specifically present the following:

- The Background report Table 6-26: Transportation Department Planned Capital Projects lists sections of roadways the County plans for expanded capacity or widening, along with the scope of those enhancements. It also covers in length the plan to add bike paths and bike lanes in accordance with existing County wayfarer plans. However, the DEIR never analyzes the loss of farmland resulting from these changes in infrastructure – it's not even mentioned as a possibility in the DEIR.

Olivas Park Road between Victoria and Harbor is listed as one of the areas planned for road widening, a stretch of roadway that borders the entire eastern portion of our farmland and property. While the impact on our farming operation and financial losses due to property loss are clearly quantifiable, the report fails to list or quantify these impacts.

- In Section 3-8, The DEIR states that because there will be no “substantive” change to the agricultural, open space, or rural designations, the General Plan Update (GPU) will be consistent with SOAR. However, no further details beyond this conclusory statement is provided. There is no way for the reader to come to his or her own conclusion on whether the GPU will result in inconsistencies with SOAR that might lead to physical environmental impacts. There is no description of the changes to the Agriculture, Open Space, and Rural policies to determine whether they are in fact non-substantive.

Given the length and breath of the Draft General Plan update and CEQA analysis, we made an attempt to focus our initial review and subsequent comments to issues specific to agriculture and farming. However, it's clear that the 2040 General Plan will impact the Ventura County local economy across

sectors – all of which influence the ability to live and work in this region. The DEIR's lack of analysis of those economic impacts, calls into question the legitimacy of both the draft General Plan update, and the CEQA analysis. As such, we respectfully request that the DEIR be recirculated in the hopes that further study will resolve these shortcomings.

I appreciate your consideration.

RE: Flawed General Plan Environmental Impact Report (EIR)

To Whom It May Concern:

Vertical Wellness, a California-based farming operation, would like to formally submit our position that as written, the 2040 General Plan Environmental Impact Report (EIR) was a rushed job that is severely flawed and inadequate, and must be corrected and recirculated to protect a fair and compliant planning process for Ventura County.

There are several issues with the General Plan that Vertical Wellness believes severely and negatively impacts the welfare of local agriculture here in Ventura County, including our own operations.

The California Environmental Quality Control Act (CEQA) requires that all proposed mitigation be technically and economically feasible. **The EIR does not meet this standard.** For example, AG-2 proposes that any project that either directly or indirectly results in the loss of farmland must obtain and place into perpetual agricultural preservation twice the total of the farmland loss. The county has not conducted any sort of feasibility report, which if conducted, would likely show that this standard is unrealistic in terms of economic feasibility for farmers. Furthermore, there are no details on how the county will implement or monitor this program, especially taking into account they are not the local experts in agriculture. You can be certain, however, that if this mitigation measure is put into effect, Vertical Wellness will likely find it economically infeasible to operate in Ventura County.

CEQA also requires that the mitigation not make the impacts worse. **The EIR does not meet this standard.** For example, shortage of farm worker housing was identified as one of the biggest issues facing ag in Ventura County. However, farm operators like Vertical Wellness will have no incentive to build more farm housing and alleviate the shortage if we are forced to purchase considerable additional land for preservation on top of the house building costs. You are essentially punishing responsible operators who are trying in good faith to help mitigate the problem.

CEQA requires that the EIR contain enough detailed information to allow the reader to understand and evaluate the County's impact analysis. **The EIR does not meet this standard.** The EIR and accompanying background report are filled with errors, vague statements, outdated information and conflicting ideas. As written, Vertical Wellness would be utterly lost and confused with how to comply with issues that should be clear to follow like water supply for irrigation.

Most recently, Vertical Wellness has been dealing with the financial loss associated with the new Hemp Ordinance that impedes our ability to grow Hemp this upcoming season. The County's own Right to Farm Ordinance has carried absolutely no weight with the County. Instead, it has been completely dismissed. Thus, the County's assumption in the EIR that the Right to Farm Ordinance would reduce impacts to Ag to "less than significant" and will suddenly prevent the County from creating or expanding more setbacks and operational restrictions on agriculture is completely unsupported. In light of the current actions of the County and the Board of Supervisors to place severe set-backs on hemp cultivation and create economic injury to farmers, for the EIR to assert that the County will utilize the Right to Farm Ordinance to protect agricultural operations from nuisance complaints is misguided and inappropriate, at best. All analysis flowing from the County's erroneous assumption are flawed. The analysis of impacts to Ag from nuisance complaints must be corrected and the EIR recirculated.

The EIR is a flawed document that has failed to achieve its primary purpose. In no way is it a tool of disclosure of all impacts caused by the 2040 General Plan. Vertical Wellness urges the County to take the time to correct and re-circulate the EIR instead of continuing to shortcut the process to the detriment of the community members.

Thank you,

A handwritten signature in black ink, appearing to read "Elyse Kaplan". The signature is fluid and cursive, with a long, sweeping tail that extends to the right.

Elyse Kaplan

If lower wage earners cannot afford to live near where they work, the commute required increases congestion and air pollution, deteriorating the quality of life for the whole community.

3. Given that the General Plan is projected to take us to 2040, and the existential threat the climate crisis poses, we think far more needs to be done to cease fossil fuel extraction and transition to 100% renewables in the short term. We need to have a comprehensive public transit system based on renewable energy, methods for harvesting rain water so

less storm water runoff goes to the sea, and planning on what portions of our coast line we may have to abandon to sea level rise.

4. The book, *Drawdown: The Most Comprehensive Plan Ever Proposed to Reverse Global Warming*, edited by Paul Hawken (Penguin Books, 2017), compiles the results of research from hundreds of the world's top scientists and climate experts, and identifies specific actions that governments and local communities can take to reverse global warming. Our General Plan should incorporate those drawdown solutions that can be undertaken on a local level, many of which are surprisingly simple. For example, reduced food waste and encouraging people to adopt a more plant-rich diet can have a profound effect on reducing green house gasses. So can good family planning clinics and incentives to reduce procreation rates. A most effective and inexpensive drawdown action would be to implement regenerative agricultural methods here in Ventura County. By transitioning away from chemical fertilizer and pesticide use, no-till land management, and building soil with organic material, including biochar, we can sequester carbon in the soil while building its quality and productivity, eliminating contamination of ground and surface water, and improving air quality.

5. We do not have to invent solutions to address the current and growing environmental and social challenges. Other forward thinking regions are tackling these challenges and can provide us with a template that can be tailored to our own local conditions. For example, on Salt Spring Island in British Columbia, the community is faced with a housing crisis similar to our own in Ventura County. Strict development restrictions and limited residential units have priced housing beyond the reach of many residents. Meror Krayenhoff, a global consultant on rammed earth building methods and featured on *The Nature of Things* with David Suzuki, suggested that a compliance driven, as opposed to vision driven, policy paradigm can result in anarchic, subversive response when the populace thumbs their noses at regulations that don't represent the will and needs of the population. He proposes a number of innovative solutions, including encouraging the use of local, renewable materials in building. Ventura County, with access to rock, sand, straw bales and other renewables, can become a beacon for permitted home building solutions for the rest of California, and the nation. Green projects could get reduced permitting fees and priority in the permit queue, with a single point advisor. For example, composting toilets should not only be permitted, but encouraged, as it is wasteful in the extreme to use precious potable water to flush away human waste.

6. We suggest Ventura County consider concepts implemented elsewhere, such as Seattle granting a 25-30% increase in allowable floor area and increased height limits for Living Building Challenge ("LBC") projects (See <https://living-future.org/lbc/>); or New Zealand's SIREWALL community center project, which made approval contingent upon demonstrating reconciliation with Maoris, training opportunities for youth, a high environmental standard that the community (of all ages) supported, that it would elevate the well-being of the community, and encourage responsible tourism. (See https://www.nzherald.co.nz/northern-advocate/news/article.cfm?c_id=1503450&objectid=12076863)

7. Ventura County can embrace LBC requirements that buildings be net positive in terms of water, energy, sewage and liquid waste, and contain no red-listed toxic materials, express beauty in terms of spirit, inspiration, and education, create health and happiness through such things as biophilia, among other inspiring attributes.

8. While the General Plan is intended to cover the length of a generation, it would not be at all unsound to at least contemplate the next seven generations, consistent with indigenous cultural tradition. Measuring progress with such a long term view will require a different framework than juggling one climate or housing emergency after another. Priorities and decision-making can be measured in a rational and holistic manner, with careful thought for the generations yet to come.

9. The General Plan should explicitly reflect the County's Climate Action Plan and its evolution. Achieving net zero CO2 emissions (and sequestration) will require a rapid ending to oil and natural gas extraction (and certainly no expansion, no granting new leases, new pipeline permits, etc. It should encourage green energy generation and storage in both distributed and centralized manners.

10. Wildfires are clearly changing in their severity and nature. The County should lead in research and experimentation with methods of fire protection and damage mitigation, such as (un)controlled small burns, and unconventional methods advocated by <http://californiachaparral.com> – including ember barriers and sprinklers, which are more effective and ecologically sound than enormous denuded hillsides.

11. Our General Plan needs to steer our county toward good land and resource stewardship. To recap, aesthetics play far too important a role in our land use planning, particularly because “beauty is in the eye of the beholder,” and what one person sees as creative genius, another sees as a monstrosity. Land use regulations should be focused on environmental safeguards that protect air, water, and soil while at the same time meeting the food and shelter needs of our communities.

12. As Meror Krayenhoff has stated, “We are in a time when the scale of the emergencies we face need to be addressed with solutions of a corresponding scale. These emergencies also have urgency. . . . [W]ithout governance that can act with pace, boldness, courage and the power to implement, we are wasting our time.” We hope that Ventura County acts with such pace and boldness to adopt a General Plan that guides us in a new direction of carbon drawdown, while promoting innovation in design, building, and conservation for generations to come.

Thank you for your kind consideration.

Sincerely,

Susan Curtis,

Dear Ventura County Board of Supervisors and Planning Department,

Climate issues are something I feel worried about. Ventura County is warming as fast or faster than any county in the nation. Our ocean is acidifying faster. Drought, fire and floods have hit us worse, and we can expect more extreme weather.

My family and community are counting on you to assure analysis of the full scope of environmental impacts and mitigations in the Draft EIR.

First, it is necessary that all greenhouse gas emissions be counted based on the most current science.

There are many ways to mitigate climate impacts, like a sunset plan for oil and gas production, decarbonization of transportation and buildings, zero waste, incentives for regenerative agriculture and water management, and reducing emissions from tailpipes.

I want an EIR that covers major climate impacts via a systematic plan.

Thank you—

Paul Aist

Appendix D

Revised Draft EIR Appendix D
GHG Calculations

The following discussion is a supplement to the Master Response MR-1 to public comments made on the draft EIR.

Discussion of Revisions to the GHG Emission Calculations in the Draft EIR

This appendix has been revised pursuant to comments made on the draft EIR. These comments expressed concern over the methodology used to quantify and forecast stationary source emissions and solid waste emissions, indicating that estimates were not consistent with relative trends in oil production and landfill operations (Comments O6-27, O6-29, O6-30, O20-4, O20-7, O37-16, O37-17). Commenters also expressed a desire to see more explicit explanations of the calculation methodologies (Comments O37-15, O20-4). These comments are summarized in Table 1.

Table 1 Summary of Comments Made Concerning the GHG Emissions Calculations in the Draft EIR

| Comment Number | Comment Summary Warranting Changes to the Draft EIR |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| O6-27 | Noted that oil and gas emissions, associated with the stationary source sector, are inconsistent with California Air Resources Board's Mandatory Reporting Rule reports |
| O6-29 | Noted inconsistent forecasts in solid waste emissions from Simi Valley Landfill and Toland Road Landfill relative to their anticipated landfill closure dates. |
| O6-30, O37-16, O37-17, O20-7 | Expressed concern regarding the methodology used to forecast stationary source emissions. Noted inconsistency of oil and gas forecasts through the draft EIR's use of historical oil production back through 2008 compared with historical oil production back through 1980. Expressed concern over using top-down method to estimate county's share of emissions from state level data. |
| O20-4 | Requested methodology discussion for all sectors |
| O37-15 | Requested clarification of emission inventory and forecast methodology. |

In response to these comments, two major changes were made to the emissions inventory and forecast estimates. Solid waste emissions forecasts were adjusted to account for corrections to scaling factors used for two major landfills. The stationary source emissions inventory and forecast were also revised following concerns over the original methodology used in the draft EIR that was based on a top-down method that scaled state-level emissions to the county level using the county's proportion of oil production in the state. In this final EIR, stationary source emissions have been revised to account for county-specific emissions from the California Air Resources Board (CARB) and oil production data from the California Department of Conservation.

These changes resulted in an overall reduction in emissions estimates compared to the total GHG emissions calculated in the draft EIR and in the emissions gap needed to be closed to meet the county's mass GHG emissions targets. Table 2 summarizes the differences between the draft EIR and final EIR versions of the GHG inventory and forecasts. A more detailed version of Table 2 showing emissions broken down by sector is provided in the modeling data that follows.

Table 2 Comparison of Total Greenhouse Gas Emissions Estimates between the Draft EIR and Final EIR (MT CO₂e).

| | 2015 | 2020 | 2030 | 2040 |

| Legislatively-Adjusted Business As Usual Forecast | | | | |
| Draft EIR | 1,897,112 | 1,793,971 | 1,627,124 | 1,540,630 |
| Final EIR | 1,939,238 | 1,772,537 | 1,549,522 | 1,375,898 |
| Difference from Draft EIR | 42,126 | -21,434 | -77,603 | -164,732 |
| Percent Change from Draft EIR | 2% | -1% | -5% | -11% |

Source: Ascent Environmental 2020

Most of the changes shown in Table 2 were due to changes in the methodology and data used to calculate emissions from the stationary source sector, namely from oil and gas production. Corrections made to the solid waste forecasts accounted for these changes to a lesser extent. Minor corrections were made to the off-road and water and wastewater emissions forecasts to adjust forecasts by the correct scaling factors. In the draft EIR, off-road and water and wastewater emissions were incorrectly calculated to be constant into the future. These factors have been corrected in the final EIR to account for the anticipated growth in the county. The changes made to the off-road and water and wastewater emissions were made following a review of the calculations of the draft EIR and were not related to comments on the draft EIR.

The overall reduction in emissions forecasts, shown in Table 3, decreases the emissions gap needed to close for the county to reach its GHG targets. Table 3 presents the comparison between the gap analyses in the draft EIR and this final EIR.

Table 3 Comparison of GHG Reductions Needed to meet Targets between Draft EIR and Final EIR

| | 2020 | 2030 | 2040 |
|---------------------------------------------------------------------------|-----------|-----------|-----------|
| Target Percent Reduction from 2015 Values ¹ | 2.1% | 41.3% | 60.9% |
| Draft EIR BAU Emissions with Legislative Reductions (MTCO ₂ e) | 1,793,971 | 1,627,124 | 1,540,630 |
| Draft EIR Mass Emission Targets (MTCO ₂ e) | 1,856,620 | 1,113,972 | 742,648 |
| Draft EIR Reductions Needed to Meet Targets (MTCO ₂ e) | -62,649 | 513,153 | 797,982 |
| Final EIR BAU Emissions with Legislative Reductions (MTCO ₂ e) | 1,772,537 | 1,549,522 | 1,375,898 |
| Final EIR Mass Emission Targets (MTCO ₂ e) | 1,897,847 | 1,138,708 | 759,139 |
| Final EIR Reductions Needed to Meet Targets (MTCO ₂ e) | -125,310 | 410,813 | 616,760 |
| Change in Reductions Needed (MTCO ₂ e) | -62,661 | -102,339 | -181,223 |

Note: Negative reductions needed indicate that anticipated. BAU = business-as-usual

¹ Calculated from the statewide reduction targets to achieve 1990 levels by 2020, 40 percent below 1990 levels by 2030, and 60 percent below 1990 levels by 2040 and adjusting these targets relative to 2015 based on the state's emissions in 1990 and 2015.

Although the revised inventory would reduce the amount of emissions needed to meet the County’s GHG targets, which would result in minor modifications to the draft EIR analysis (as provided in Chapter 3, “Revisions to the Draft EIR”). These revisions clarify and support the analysis and conclusions in the draft EIR, they would not result in new or more severe significant impacts. The GHG reduction policies and programs of the 2040 General Plan identified in the draft EIR analysis would not be affected and forecasted GHG emissions would still result in significant and unavoidable impacts.

Summary of Changes Made to the Draft EIR

Table 4 lists the changes made to the Ventura County 2015 GHG Inventory and Forecast that follows. The tab titles are shown at the top of each page starting on Page 15. A detailed explanation of the changes made to the solid waste and stationary source emissions calculations are included after Table 4.

Note that no changes were made to the proposed GHG reduction measure calculations, because those measures did not overlap with the sectors revised in the final EIR.

Table 4 Summary of Changes Made to the Ventura County 2015 GHG Inventory and Forecast in Appendix D of the Draft EIR

| Tab Title | Changes Made to Appendix D of the Draft EIR |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| All Tabs | Made formatting more consistent and easier to read. Added notes describing scaling factors and calculation methods for each of the calculation tabs |
| Summary | No change |
| Targets | This tab was removed because its contents are already included in the gap |
| Forecast-Leg Adjusted | Revised all stationary source emissions, solid waste forecasts, water and wastewater forecasts, off-road forecasts, and emissions totals. |
| Forecast-BAU | Revised all stationary source emissions, solid waste forecasts, water and wastewater forecasts, off-road forecasts, and emissions totals. |
| Demographics | Added 2050 estimates that were not included in this tab in the draft EIR. 2050 estimates are shown in other tabs. Some 2050 calculations are used to interpolate 2040 estimates. |
| Building Energy | Formatted table headers and descriptions to clarify contents |
| Transportation | Formatted table headers and descriptions to clarify contents |
| Off-Road Equipment | Corrected forecast calculations to account for population and employment scaling factors. Previously, calculations were incorrectly scaled, resulting in no change from 2015 emissions. |
| Solid Waste | Added another table set for legislatively adjusted business as usual results Edited headers and descriptions Revised calculation of Waste-in-Place emissions for Toland Road Landfill and Simi Valley Landfill, such that each landfill’s waste-in-place emissions were individually modeled in CARB’s Landfill Emissions Tool and the resulting forecasts were adjusted by the 2015 waste-in-place emissions reported by EPA’s FLIGHT database. Previous estimates for Toland Landfill and Simi Valley Landfill were using incorrect tonnage data and landfill history data. See added footnotes. Removed diversion rate table that was not used for calculation. |
| Imported Water | Corrected calculations to link to the demographics table to scale forecasts by population. Previous calculations were incorrectly linked, resulting in no forecasted growth. |
| Wastewater | Corrected forecast calculations to account for population scaling factors. Previously, calculations were incorrectly scaled. |
| Agriculture | Added scaling factor notes. |
| Stationary Source | Moved forecast table to the top of the sheet to be consistent with the formatting of the other sectors. |

| Tab Title | Changes Made to Appendix D of the Draft EIR |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| | <p>Removed irrelevant oil and production numbers from non-Ventura counties.</p> <p>Removed top-down scaled county emissions from statewide oil and gas emissions.</p> <p>Revised 2015 oil and gas emissions to be consistent with Ventura County-specific reports in a 2013 CARB oil and gas industry survey report for 2007 data. 2015 values were scaled from 2007 based on the relative change in oil production in the county.</p> <p>Revised forecasts for oil and gas emissions based on oil production. Based the forecast on historical data from 1980 to 2018. Trends seemed to indicate the declining end of the Hubbert curve, which is used in predicting resource extraction trends. The set of data could be represented by an exponential curve. Added the anticipated production numbers.</p> |
| Assumptions Tab | Removed extraneous rows under GWP that were not being used for calculation. |
| EMFAC | No changes |

GHG Inventory and Forecasting Methodology for Solid Waste and Stationary Source Emissions

Solid Waste

Multiple comments received during the public review of the draft EIR addressed the transparency of the methodology used to quantify emissions from the solid waste sector. Solid waste emissions consist of methane (CH₄) emissions generated by the anaerobic decay of organic material within a landfill. This sector consists of two types of emissions sources: waste generation and waste-in-place. The comments on the solid waste emissions methodology for the GHG inventory and GHG forecast are discussed further below.

Waste generation emissions refer to CH₄ related to the waste disposed in open landfills during the baseline year of emissions inventory. Using Equation SW.4.1 from the ICLEI U.S. Communities Protocol, an emissions factor of 0.041 metric tons of CH₄ per ton is used to quantify emissions from the disposal tonnage rates for each landfill in the county, which were available from CalRecycle. This formula also accounts landfills that have systems to capture fugitive methane emissions in place. Information on which landfills have landfill gas capture systems were available from the Landfill Gas Energy Project Data from U.S. Environmental Protection Agency's (EPA) Landfill Methane Outreach Program (LMOP) database (EPA 2016a). Forecasted waste generation emissions were scaled from 2015 based on the anticipated change in the county's population.

Waste-in-place emissions refer to CH₄ emissions from waste stored in place at a landfill since the landfill first accepted waste, excluding waste deposited in its first year. Emissions generated by a landfill rise over time as more waste is deposited into the landfill. Once that landfill reaches its maximum capacity and closes to additional disposal, the rate of methane emissions from the waste-in-place at landfills reaches its peak then declines over time as the organic material left to decay is exhausted. Emissions from "waste-in-place" can occur from both open and closed landfills, depending on how recently the landfills were closed.

In the draft EIR, the 2015 waste-in-place emissions for two of the largest landfills in Ventura County (Simi Valley Landfill and Toland Road Landfill) were available from the U.S. Environmental Protection Agency's (EPA) Facility Level Information on Greenhouse Gases Tool (FLIGHT) database (EPA 2016b). The 2015 waste-in-place emissions inventory for other smaller landfills and forecasts of all waste-in-place emissions were based on landfill total tonnages and landfill open and past or anticipated closure dates. This information was input into CARB's Landfill Emissions Tool (LET) (November 2011 Version), assuming a constant rate of annual disposal, in order to estimate 2015 and post-2015 emissions. For Simi Valley Landfill and Toland Road Landfill, waste-in-place emission forecasts were scaled from their

FLIGHT 2015 emissions by the relative decay anticipated in CARB’s LET based on the disposal rates and open and closure dates for those landfills. This was done to ensure consistency with landfill-specific emissions calculations from FLIGHT, which accounts for any landfill gas capture systems, and the anticipated decay rates in the LET model.

Comments correctly pointed out inconsistencies for the GHG emission forecasts for Simi Valley Landfill and Toland Road Landfill in the solid waste emission calculations in Appendix D of the draft EIR. This inconsistency was due to the following errors. For Toland Road Landfill, the draft EIR incorrectly forecasted methane emissions by scaling the landfill’s 2015 emissions by waste-in-place emissions for a landfill outside the county. For Simi Valley Landfill, forecasts were based on an annual decay rate of 0.059 percent per year which was incorrectly calculated from the LET. This low decay rate resulted in a much slower decay forecast for Simi Valley Landfill than Toland Road Landfill.

The methodology intended for forecasting waste-in-place emissions in the draft EIR and recalculated in the final EIR is as follows. For Simi Valley Landfill and Toland Road Landfill, waste-in-place emission forecasts were scaled from their FLIGHT 2015 emissions by the relative decay anticipated in CARB’s LET based on the disposal rates and open and closure dates for those landfills. This method was used for consistency with landfill-specific emissions calculations from FLIGHT, which accounts for any landfill gas capture systems, and the anticipated decay rates in the LET model.

Table 5 compares the results for these two landfills between the draft EIR and final EIR. The revised forecast shows much lower emissions, consistent with the anticipated decay in organic waste at each landfill.

Table 5 Draft EIR and Final EIR GHG Emissions Forecasts for Toland Road Landfill and Simi Valley Landfill (Business-as-Usual Scenario) (Metric Tons of Carbon Dioxide Equivalent [MTCO2e])

| | 2020 | 2030 | 2035 | 2040 | 2050 |
|-----------------------------|-------|-------|-------|-------|--------|
| Toland Road Landfill | | | | | |
| Draft EIR | 2,366 | 1,937 | 1,777 | 1,618 | 1,244 |
| Final EIR | 2,794 | 2,842 | 2,572 | 2,327 | 1,905 |
| Difference | 428 | 905 | 795 | 709 | 661 |

| Difference | 310 | 457 | -148 | -694 | -1,630 |
| % Difference | 5% | 8% | -2% | -11% | -27% |

Source: Ascent Environmental 2020

Stationary Sources

The stationary sources sector is represented by emissions generated from fixed applications that are not related to electricity generation or consumer natural gas combustion, which are already accounted for in the building energy sector of the inventory. In the county, the major stationary sources are related to oil and gas production and processing. Emissions from oil and gas, accounted for in this inventory, include emissions from on-site combustion (e.g.,

flaring) of oil and associated gas (natural gas produced as a by-product from the processing of oil) as well as fugitive emissions from the processing and extraction of oil and gas. According to CARB, combustion sources are equipment burning fuel for energy, vented emissions are intentional releases of vapors to the atmosphere, and fugitive emissions are unintentional releases of vapors to the atmosphere (CARB 2013). Further description of the types of emissions generated by oil and gas production can be found in CARB's oil and gas survey report, which is cited in CARB's California GHG inventory documentation (CARB 2013).

This inventory does not include emissions related to the combustion of products sold by the oil and gas producers, such as vehicular fuels or other petroleum products, nor does the inventory include supply chain-related emissions, such as the transport of oil via rail or maritime tankers. Emissions from combustion of vehicular fuels and rail and maritime activity are already captured in the transportation and off-road sectors, as they pertain to activity within the jurisdictional boundary of the County. The process of organizing emissions this way is recommended by the ICLEI U.S. Communities Protocol (ICLEI 2013:12). Emissions occurring outside of the county's jurisdictional boundary are subject to inclusion in the emissions inventory of the respective jurisdiction(s).

Previous estimates of GHG emissions from oil and gas production were based on scaling state-level emissions to Ventura County based on the county's respective production of oil and gas. However, commenters have raised concerns about using this method in terms of how the county's emissions could be reflective of statewide emission rates.

Emissions Inventory

The estimates of the County's 2015 GHG emissions from stationary sources included in the draft EIR were based on scaling State-level emissions to the county based on the county's respective production of oil and gas. However, comments on the draft EIR raised concerns about the appropriateness of using this method to estimate GHG emissions associated with oil and gas production in the county. In response to these comments, both the 2015 inventory and forecasted oil and gas emissions have been recalculated in the final EIR to reflect county-specific emissions. The methods used to recalculate GHG emissions from oil and gas production in the GHG inventory and forecast are described below.

In 2013, CARB published a report that measured the GHG emissions from "upstream crude oil and natural gas production, processing, and storage operations" based on survey results that captured 97 percent of the crude oil and natural gas production in the state (CARB 2013). According to this report, in 2007, 276,793 MTCO_{2e} (adjusted for the Intergovernmental Panel on Climate Change's Fifth Assessment Report's global warming potential factors) were emitted within the jurisdiction of the Ventura County Air Pollution Control District (VCAPCD), which has the same geographic boundaries as Ventura County. For the purposes of this calculation the County has assumed that all oil and gas extraction within VCAPCD jurisdiction occurs in the unincorporated county. These emissions resulted from on-site combustion of fuels and fugitive (including vented) emissions generated during crude oil and gas production and processing. These 2007 emissions were scaled to 2015 levels based on the change in oil and gas production in the county between 2007 and 2015 according to the California Department of Conservation (California Department of Conservation 2020). From 2007 to 2015, oil production in the county increased slightly from 7.3 to 8.4 million barrels, a 14.6 percent increase. Based on this change, the emissions were estimated to increase from 276,793 MTCO_{2e} in 2007 to 317,222 MTCO_{2e} in 2015. This scaling method is supported by CARB's documentation of California's GHG Inventory, where the emission factors for the oil and gas sector remained constant between 2007 and 2015, suggesting that emissions would change in

proportion to oil production. See the Revised Appendix D, Attachment to the final EIR for additional calculation details.

Note that gas production is excluded from scaling of emissions because there is no reported natural gas production in the county. Additionally, associated gas production is gas produced as a byproduct of oil production.

Forecasts

Commenters also raised concerns that the historical oil and gas production data in the county used in the draft EIR to forecast GHG emissions did not reflect the overall trends in production in the county and cited the county’s historical production data dating back to 1980. In the draft EIR, the county’s historical production data starting from 2008 were originally intended to determine production trends for GHG forecasting. However, the formulas in the calculation spreadsheet were not tied to the calculated average annual growth rate from 2008 and, instead, forecasts for years after 2020 were incorrectly linked to other growth rates.

Notwithstanding the errors associated with the incorrectly linked growth rates, the County has reviewed the county’s historical oil and gas production data from the California Department of Conservation starting from 1980, and noted an anomalous spike in oil and gas production occurred between 2008 and 2018, likely due to the effects of the global recession at the start of that period. This spike occurred in contrast to the overall decline in oil and gas production in the county. Since 1980, oil and gas production in the county has decreased by approximately 60 percent, following an inverted growth curve pattern characteristic of oil production decline similar to that of the Hubbert Curve. The Hubbert Curve, which is similar to a bell curve, approximates the rate of production over time of finite resources, like fossil fuels. To forecast how this trend in production would continue through 2050, these historical production values were plotted and fitted based on an exponential function for the period between 1980 and 2018. The “Oil Production in Ventura County (1980-2050)” graph in the attached shows this trend through 2018 and the anticipated production through 2050, based an exponential regression calculator (CASIO Computer 2020). The forecasted oil production values were then used as scaling factors to scale the county’s 2007 oil and gas emission from CARB’s 2013 oil and gas survey report to future years.

Table 6 shows the difference in the 2015 inventory and forecasts for emissions from stationary sources between the draft EIR and final EIR. The revised emissions show higher estimates for 2015, but substantially lower forecasts through 2050 compared to the draft EIR estimates.

Table 6 Draft EIR and Final EIR GHG Emissions Inventory and Forecast for Stationary Source Emissions (Business-as-Usual Scenario) (MTCO_{2e})

| | 2015 | 2020 | 2030 | 2040 | 2050 |
|-------------|---------|---------|----------|----------|----------|
| Draft EIR | 275,096 | 287,845 | 314,526 | 343,679 | 375,535 |

Ventura County 2015 GHG Inventory Update and 2040 Forecast

Updated 6/11/2020

Workbook Description

This workbook contains the calculations for Ventura County's 2015 Greenhouse Gas (GHG) inventory and forecast through 2040.

Tab Descriptions and Update Instructions

| Tab Name | Description | Category |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------|
| Inventory and Forecast | This tab consolidates and summarizes the results from all emissions sectors for the business-as-usual (BAU) and Adjusted BAU (ABAU), or legislative adjusted, scenarios. Charts and inventory summaries are located further down on the sheet. This tab also calculates emissions forecasts for some sources (e.g., septic systems). | Summary |
| Demographics | This tab houses the population, housing, and employment data and forecasts from 2015 through 2040. This tab also calculates the unincorporated County's portion of this data by subtracting out Vandenberg Air Force Base and UC Ventura values. | Demographics |
| Transportation | This tab calculates on-road transportation based on Vehicle Travelled. | Calculations |
| Building Energy | This tab calculates the emissions from residential, commercial, industrial, and agricultural energy use. | Calculations |
| Offroad | This tab calculates the emissions from off-road equipment. | Calculations |
| Solid Waste | This tab calculates the emissions from waste generation and waste-in-place. | Calculations |
| Imported Water | This tab calculates emissions from water imported to the unincorporated County. | Calculations |
| Wastewater | This tab calculates the emissions from wastewater treatment processes from centralized wastewater treatment facilities and septic systems. | Calculations |
| Agriculture | This tab summarizes the emissions from agricultural sources. | Calculations |
| Stationary Source | This tab calculates provides the data for major stationary sources in the County. | Calculations |
| Assumptions | Includes reference material necessary for GHG calculations, including: Conversion factors, mode split, global warming potential (GWP) factors, electricity emission factors (provided by EPA eGRID), electricity emission factors as-calculated for each utility, natural gas emission factors, and more. | Background Data and Calculations |
| EMFAC | Includes emission factor outputs and calculations for on-road vehicles from CARB's Emissions FACTors model. | Background Data and Calculations |

Targets

| GHG Reduction Targets | | | |
|-----------------------|---------------------------------------------------|----------------------------------------------------------------------|---------------------------------------------------------------------|
| Milestone Year | Statewide Existing and Target Emissions (MMTCO2e) | Statewide Target Percent Reduction below 1990 levels by Target Years | Adjusted Target Percent Reduction below 2015 levels by Target Years |
| 1990 (Historical) | 431 | NA | NA |
| 2015 (Historical) | 440 | NA | NA |
| 2020 (Target) | 431 | 0% | 2.1% |
| 2030 (Target)* | 258.60 | 40.0% | 41.3% |
| 2040 (Target) | 172.40 | 60.0% | 60.9% |

Note: No propane usage is assumed because the number of SoCal Gas residential customers in 2015 (32,717) is more than the number of households in the unincorporated area according to the County's background report (32,191). This means there could be more than one natural gas bill sent to a household considered by the County (See the Demographics tab).

Source: Data requests from SoCal Gas and Southern California Edison for customers in the unincorporated County.

* Industrial electricity use was not available due to CPUC 15/15 rule that states that any data provided by a utility must have more than 15 customers and no single customer's data accounts for more than 15 percent of total aggregated data.

*Source: Jim Damkowitz 11/7/2018 - Email to Ascent Environmental. Note: This VMT only includes light duty and heavy duty vehicle trips. It is assumed that this VMT does not include bus trips. Bus VMT is added separately.

** There is only one bus route in Ventura County that stops in the unincorporated area: Line 16 of Gold Coast Transit. The distance travelled by that route within the unincorporated area is about 10 miles. It travels along Ventura Ave between Ventura and Ojai, with stops in between. There are 17 northbound trips and 16 southbound trips daily, according to Gold Coast Transit route schedules. This results in an annual VMT of 120,450 VMT per year. This excludes bus VMT not associated with this route.

Note: The Regional Transportation Advisory Committee's recommended approach to calculating VMT is based on CARB's guidance for MPOS (https://www.arb.ca.gov/cc/sb375/staff_report_sb375_targets_update.pdf)

Transportation

Adjustment for I-X trips north of Ventura*

| | Source | 2010 | 2012 | 2020 | 2040 | 2015 (Interpolated) | 2030 | 2035 | 2050 |
|-----------------------------------------------------------------------------|------------|--------|------------|------------|------------|---------------------|------------|------------|---------------|
| Daily VMT I-X/X-I Santa Barbara County - Entire Ventura County (SB/VC)** | SBCAG | 62,920 | | 74,342 | 97,186 | 68,631 | 85,764 | 91,475 | 108,608 |
| Daily VMT I-X/X-I South and East Areas - Entire Ventura County (SE/VC)** | VCTC Model | | 15,537,451 | 15,962,939 | 17,026,660 | 15,697,009 | 16,494,799 | 16,760,729 | 17,558,519.61 |
| Ratio of SB/VC to SE/VC *** | Calculated | | | 0.00466 | 0.00571 | 0.00437 | 0.00520 | 0.00546 | 0.00619 |

*According to Jim Damkowitz, the VCTC model excludes trips north of Ventura County because the VCTC model is based on SCAG's model which does not include Santa Barbara County

** Includes unincorporated areas AND cities

*** This ratio is applied to SB/VC VMT to estimate the VMT between SB County and Unincorporated Ventura County

Unincorporated VMT Adjustment

VMT Split by Boundary Method According to HPMS data

Average year of closed LFs 1969 2022

* Tonnage data for landfills with "?" were not available. Based on the sparse documentation available for these individual landfills, many of these landfills without tonnage data are small unpermitted sites or military disposal sites. It is assumed that waste-in-place emissions from these landfills are minimal. Thus, calculations exclude landfills without tonnage data.

** GHG emissions calculated from CARB's LET Model based on landfill's open and closure dates and average annual tons disposed. The LET reports emissions in MTCO2e assuming a GWP factor of 21 for CH4. Annual tons disposed were input for each year that the landfill was open. The model calculated the decay after the closure of the landfill. Results were taken for the 2015 output year.

*** GHG emissions from EPA reports in the Facility Level Information on GreenHouse gases Tool (FLIGHT) database (https://ghgdata.epa.gov/ghgp/main.do?site_preference=normal)

Source: CalRecycle, EPA LMOP Database, EPA Greenhouse Gas Emissions from Large Facilities, CARB Landfill Emissions Tool model (<https://www.arb.ca.gov/cc/landfills/tool.htm>)

Note: Excludes composting facilities, transfer stations, inert debris disposal sites, and planned landfills not yet in operation.

Waste In Place Forecast

| Landfill/Disposal Site | 2020 | | 2030 | | 2035 | | 2040 | | 2050 | |
|-----------------------------------|---------------|----------------|---------------|----------------|--------------|----------------|--------------|----------------|--------------|----------------|
| | MT CH4 | MT CO2e | MT CH4 | MT CO2e | MT CH4 | MT CO2e | MT CH4 | MT CO2e | MT CH4 | MT CO2e |
| Bailard Landfill* | 1,598 | 44,731 | 1,308 | 36,623 | 1,183 | 33,137 | 1,071 | 29,984 | 808 | 22,611 |
| Ozena Modified Sanitary Landfill* | 2 | 49 | 1 | 40 | 1 | 36 | 1 | 33 | 1 | 25 |
| Toland Road Landfill** | 2,794 | 78,240 | 2,842 | 79,589 | 2,572 | 72,015 | 2,327 | 65,162 | 1,905 | 53,350 |
| Simi Valley Landfill** | 6,437 | 180,230 | 6,548 | 183,337 | 5,925 | 165,890 | 5,361 | 150,104 | 4,389 | 122,895 |
| Total | 10,830 | 303,251 | 10,700 | 299,589 | 9,681 | 271,079 | 8,760 | 245,283 | 7,103 | 198,881 |

*Emission forecasts for these landfills were taken directly from results from CARB's Landfill Emissions Tool (LET) model, given the current disposal tonnage at each landfill and the open and closure dates.

**Emissions forecasts for these landfills are scaled from 2015 levels using results from the LET model. Note that the LET model is used for decay forecast rates only and not used to estimate 2015 emissions. 2015 emissions for Toland and Simi Valley were based on reported fugitive emissions from the EPA. The LET model does not account for any fugitive methane capture or other landfill management methods and, thus, has very different 2015 emissions estimates. Bailard and Ozena results for 2015 and forecasts were taken directly from the LET model due to lack of reported data. This approach assumes that fugitive methane and other landfill management methods will continue in proportion to the on-site waste volume.

Waste in Place Estimates Using CARB's Landfill Emissions Tool

| Landfill/Disposal Site | 2015 | 2020 | 2030 | 2035 | 2040 | 2050 |
|------------------------|--------|--------|--------|--------|--------|--------|
| | MT CH4 | MT CH4 | MT CH4 | MT CH4 | MT CH4 | MT CH4 |
| Toland Road Landfill | 5,332 | 5,585 | 5,682 | 5,141 | 4,652 | 3,808 |
| Simi Valley Landfill | 14,780 | 15,481 | 15,748 | 14,250 | 12,894 | 10,556 |

Additional Background Data and Assumptions

Method for Calculating Solid Waste Generation Emissions

| Equation SW.4.1 Methane Emissions | | |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------|--------------------------------------|
| $CH_4 \text{ Emissions} = GWP_{CH_4} * (1 - CE) * (1 - OX) * M + \sum_i P_i * EF_i$ | | |
| Where: | | |
| Term | Description | Value |
| CH ₄ emissions | = Community generated waste emissions from waste M (mtCO ₂ e) | Result |
| GWP _{CH₄} | = CH ₄ global warming potential | |
| M | = Total mass of waste entering landfill (wet short ton) | User Input |
| P _i | = Mass fraction of waste component i | User Input |
| EF _i | = Emission factor for material i (mtCH ₄ /wet short ton) | Table SW.5 |
| CE | = Default LFG Collection Efficiency | No Collection, 0 Collection, 0.75 |
| OX | = Oxidation rate | 0.10 |
| Source: As developed by ICLEI staff and Solid Waste Technical Advisory Committee. Emissions factors from U.S. EPA Municipal Solid Waste Publication (2008) available at http://www.epa.gov/epawaste/nonhaz/municipal/pubs/msw2008data.pdf | | |

Note: Assumes municipal and industrial water use is proportional to population. Assumes all agricultural water use takes place in the unincorporated County. Agricultural water deliveries are assumed to use non-potable, untreated, water.

Note: Calleguas purchases water from the Metropolitan Water District of Southern California, which gets its water from surface water, SWP, CRA, and the LA Aqueduct.

Percent of Unincorporated Centralised WW treated aerobically 88%
 Percent of Unincorporated Centralised WW treated anaerobically 12%

Residential Wastewater Methods

Data Source: Total unincorporated population. Percentage breakdown of population served by Septic and Sewer systems. Percent breakdown of aerobic and anaerobic

Domestic Wastewater CH₄ Emission Estimates from EPA Inventory of US Greenhouse Gas Emissions and Sinks: 1990-2014

$$\begin{aligned} \text{Emissions from Septic Systems} &= A \\ &= US_{POP} \times (\% \text{ onsite}) \times (EF_{SEPTIC}) \times 1/10^9 \times \text{Days} \end{aligned}$$

$$\begin{aligned} \text{Emissions from Centrally Treated Aerobic Systems} &= B \\ &= [(\% \text{ collected}) \times (\text{total BOD}_5 \text{ produced}) \times (\% \text{ aerobic}) \times (\% \text{ aerobic w/out primary}) + (\% \text{ collected}) \times \\ &(\text{total BOD}_5 \text{ produced}) \times (\% \text{ aerobic}) \times (\% \text{ aerobic w/primary}) \times (1 - \% \text{ BOD removed in prim. treat.})] \times (\% \\ &\text{operations not well managed}) \times (B_0) \times (\text{MCF-aerobic_not_well_man}) \end{aligned}$$

$$\begin{aligned} \text{Emissions from Centrally Treated Anaerobic Systems} &= C \\ &= [(\% \text{ collected}) \times (\text{total BOD}_5 \text{ produced}) \times (\% \text{ anaerobic}) \times (\% \text{ anaerobic w/out primary}) + (\% \text{ collected}) \\ &\times (\text{total BOD}_5 \text{ produced}) \times (\% \text{ anaerobic}) \times (\% \text{ anaerobic w/primary}) \times (1 - \% \text{ BOD removed in prim. treat.})] \\ &\times (B_0) \times (\text{MCF-anaerobic}) \end{aligned}$$

$$\begin{aligned} \text{Emissions from Anaerobic Digesters} &= D \\ &= [(\text{POTW_flow_AD}) \times (\text{digester gas}) / (\text{per capita flow})] \times \text{conversion to m}^3 \times (\text{FRAC_CH}_4) \times (365.25) \times \\ &(\text{density of CH}_4) \times (1 - \text{DE}) \times 1/10^9 \end{aligned}$$

$$\text{Total CH}_4 \text{ Emissions (kt)} = A + B + C + D$$

where,

$$US_{POP} = \text{U.S. population}$$

| | |
|---------------------------------|---------------------------------------------------------------------------------------------------------|
| % onsite | = Flow to septic systems / total flow |
| % collected | = Flow to POTWs / total flow |
| % aerobic | = Flow to aerobic systems / total flow to POTWs |
| % anaerobic | = Flow to anaerobic systems / total flow to POTWs |
| % aerobic w/out primary | = Percent of aerobic systems that do not employ primary treatment |
| % aerobic w/primary | = Percent of aerobic systems that employ primary treatment |
| % BOD removed in prim. treat. | = 32.5% |
| % operations not well managed | = Percent of aerobic systems that are not well managed and in which some anaerobic degradation occurs |
| % anaerobic w/out primary | = Percent of anaerobic systems that do not employ primary treatment |
| % anaerobic w/primary | = Percent of anaerobic systems that employ primary treatment |
| EF _{SEPTIC} | = Methane emission factor (10.7 g CH ₄ /capita/day) – septic systems |
| Days | = days per year (365.25) |
| Total BOD ₅ produced | = kg BOD/capita/day × U.S. population × 365.25 days/yr |
| B ₀ | = Maximum CH ₄ -producing capacity for domestic wastewater (0.60 kg CH ₄ /kg BOD) |
| 1/10 ⁶ | = Conversion factor, kg to kt |
| MCF-aerobic_not_well_man. | = CH ₄ correction factor for aerobic systems that are not well managed (0.3) |
| MCF-anaerobic | = CH ₄ correction factor for anaerobic systems (0.8) |
| DE | = CH ₄ destruction efficiency from flaring or burning in engine (0.99 for enclosed flares) |
| POTW_flow_AD | = Wastewater influent flow to POTWs that have anaerobic digesters (MGD) |
| digester gas | = Cubic feet of digester gas produced per person per day (1.0 ft ³ /person/day) |
| per capita flow | = Wastewater flow to POTW per person per day (100 gal/person/day) |
| conversion to m ³ | = Conversion factor, ft ³ to m ³ (0.0283) |
| FRAC_CH ₄ | = Proportion CH ₄ in biogas (0.65) |
| density of CH ₄ | = 662 (g CH ₄ /m ³ CH ₄) |
| 1/10 ⁹ | = Conversion factor, g to kt |

Process CH₄ Emissions from Anaerobic and facultative treatment lagoons

Equation 10.4 from the LGOP

| | |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------|
| Equation 10.4 | Process CH ₄ from Wastewater Treatment Lagoons (default values) |
| Annual CH ₄ emissions (metric tons CO ₂ e) = | |
| $((P \times F_{\text{ind-com}}) \times \text{BOD}_5 \text{ load} \times (1-F_p) \times \text{Bo} \times \text{MCF}_{\text{anaerobic}} \times 365.25 \times 10^{-3}) \times \text{GWP}$ | |

Where:

| Term | Description | Value |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------|------------------|
| P | = population served by lagoons adjusted for industrial discharge, if applicable [person] | user input |
| F _{ind-com} | = factor for industrial and commercial co-discharge waste into the sewer system | 1.25 |
| BOD ₅ load | = amount of BOD ₅ produced per person per day [kg BOD ₅ /person/day] | 0.090 |
| F _p | = fraction of BOD ₅ removed in primary treatment, if present | 0.325* |
| Bo | = maximum CH ₄ -producing capacity for domestic wastewater [kg CH ₄ /kg BOD ₅ removed] | 0.6 |
| MCF _{anaerobic} | = CH ₄ correction factor for anaerobic systems | 0.8 |
| 365.25 | = conversion factor [day/year] | 365.25 |
| 10 ⁻³ | = conversion from kg to metric ton [metric ton/kg] | 10 ⁻³ |
| GWP | = Global Warming Potential | 21 |

Process N₂O Emissions from WWTP with Nitrification/Denitrification

Equation 10.7 from the LGOP

| | |
|--------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------|
| Equation 10.7 | Process N ₂ O Emissions from WWTP with Nitrification/Denitrification |
| Annual N ₂ O emissions (metric tons CO ₂ e) = | |
| $((P_{\text{total}} \times F_{\text{ind-com}}) \times \text{EF nit/denit} \times 10^{-6}) \times \text{GWP}$ | |

Where:

| Term | Description | Value |
|----------------------|---------------------------------------------------------------------------------------------------------------------|------------------|
| P _{total} | = total population that is served by the centralized WWTP adjusted for industrial discharge, if applicable [person] | user input |
| F _{ind-com} | = factor for industrial and commercial co-discharge waste into the sewer system | 1.25 |
| EF nit/denit | = emission factor for a WWTP with nitrification/denitrification [g N ₂ O/person/year] | 7 |
| 10 ⁻⁶ | = conversion from g to metric ton [metric ton/g] | 10 ⁻⁶ |
| GWP | = N ₂ O Global Warming Potential | 310 |

Source: EPA *Inventory of US Greenhouse Gas Emissions and Sinks: 1990-2007*, Chapter 8, 8-13 (2009).Process N₂O Emissions from Effluent Discharge (default N load data)

Equation 10.10 from the LGOP

| | |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------|
| Equation 10.10 | Process N ₂ O Emissions from Effluent Discharge (default N load data) |
| Annual N ₂ O emissions (metric tons CO ₂ e) = | |
| $((P_{\text{total}} \times F_{\text{ind-com}}) \times (\text{Total N Load} - \text{N uptake} \times \text{BOD}_5 \text{ load}) \times \text{EF effluent} \times 44/28 \times (1 - F_{\text{plant nit/denit}}) \times 365.25 \times 10^{-3}) \times \text{GWP}$ | |

Where:

| Term | Description | Value |
|----------------------------|--------------------------------------------------------------------------------------------------|--------------------|
| P _{total} | = population served [person] | user input |
| F _{ind-com} | = factor for industrial and commercial co-discharge waste into the sewer system | 1.25 |
| Total N Load ²⁷ | = total nitrogen load [kg N/person/day] | 0.026 |
| N uptake ²⁸ | = nitrogen uptake for cell growth in aerobic system (kg N/kg BOD ₅) | 0.05 ¹ |
| | = nitrogen uptake for cell growth in anaerobic system (e.g., lagoon) (kg N/kg BOD ₅) | 0.005 ¹ |
| BOD ₅ load | = amount of BOD ₅ produced per person per day [kg BOD ₅ /person/day] | 0.090 |
| EF effluent | = emission factor [kg N ₂ O-N/kg sewage-N produced] | 0.005 |
| 44/28 | = molecular weight ratio of N ₂ O to N ₂ | 1.57 |
| F plant nit/denit | = fraction of nitrogen removed for the centralized WWTP with nitrification/denitrification | 0.7 ¹ |
| | = fraction of nitrogen removed for the centralized WWTP w/o nitrification/denitrification | 0.0 ¹ |
| 365.25 | = conversion factor [day/year] | 365.25 |
| 10 ⁻³ | = conversion from kg to metric ton [metric ton/kg] | 10 ⁻³ |

| 2040 | 4,268,642 | 2,940,818 | Forecast based on non-linear trends from 1980-2018 |
| 2050 | 3,459,670 | 2,100,568 | Forecast based on non-linear trends from 1980-2018 |

Source: https://www.conservation.ca.gov/calgem/pubs_stats/annual_reports/Pages/annual_reports.aspx

Note: Trends between 1980 and 2020 are indicative of the declining segment of the Hubbert Curve (similar to a bell curve), which approximates the rate of finite resource production over time. This prediction assumes that production follows the Hubbert Curve post-peak. A linear curve would predict zero barrels of oil produced between 2030 and 2040. Curve fitting for the segment of data analyzed is based on an exponential trend.

Ventura County is not a major producer of non-associated gas.

| The Climate Registry 2017 Default Emission Factors | | |
|----------------------------------------------------|----------------------------------|---------------------------------------|
| Fuel Type | Carbon Content (Per Unit Energy) | CO2 Emission Factor (Per Unit Volume) |
| Fuels Measured in Gallons | kg C / MMBtu | kg CO2 / gallon |
| Gasoline | 19.2 | 8.78 |
| Diesel Fuel | 20.2 | 10.21 |
| Aviation Gasoline | 18.9 | 8.31 |
| Jet Fuel (Jet A or A-1) | 19.7 | 9.75 |
| Kerosene | 20.5 | 10.15 |
| Residual Fuel Oil No. 5 | 19.9 | 10.21 |
| Residual Fuel Oil No. 6 | 20.5 | 11.27 |
| Crude Oil | 20.3 | 10.29 |
| Biodiesel (B100) | 20.1 | 9.45 |
| Ethanol (E100) | 18.7 | 5.75 |
| Methanol | n/a | 4.10 |
| Liquefied Natural Gas (LNG)* | n/a | 4.48 |
| Liquefied Petroleum Gas (LPG) | 17.2 | 5.68 |
| Propane (Liquid) | 16.8 | 5.72 |
| Ethane | 17.1 | 4.11 |
| Isobutane | 17.7 | 6.30 |
| Butane | 17.8 | 6.54 |
| Fuels Measured in Standard Cubic Feet | kg C / MMBtu | kg CO2 / Standard cubic foot |
| Compressed Natural Gas (CNG)* | 14.47 | 0.054 |
| Propane (Gas) | 16.76 | 0.1546 |

Source: Heat content and default emission factors are from EPA Final Mandatory Reporting of Greenhouse Gases Rule Table C-1.
Carbon content derived using the heat content and default emission factor. Except those marked * are from EPA Climate Leaders, Mobile Combustion Guidance, Tables B-4, B-5, (2008). A fraction oxidized value of 1.00 is from the IPCC, *Guidelines for National Greenhouse Gas Inventories* (2006). Methanol emission factor is calculated from the properties of the pure compounds.
Note: Carbon contents are calculated using the following equation: (Emission Factor / (44/12)) / Heat Content x Conversion Factor. Heat content factors are based on higher heating values (HHV). NA = data not available.

| Vehicle Type / Fuel Type | CH4 (g / gallon) | N2O (g / gallon) |
|--------------------------------------|------------------|------------------|
| Ships and Boats | | |
| Residual Fuel Oil | 0.11 | 0.60 |
| Diesel Fuel | 0.74 | 0.45 |
| Gasoline | 0.06 | 0.22 |
| Locomotives | | |
| Diesel Fuel | 0.80 | 0.26 |
