- 2) CEQA requires that the EIR use accurate and detailed data in the analysis. But the EIR and its 1000+page Background Report are filled with errors, vague statements and outdated information.
- 3) CEQA demands that any policies that increase wildfire risk be analyzed. Yet the EIR doesn't even mention policies from the General Plan that will significantly increase fuel load in high fire risk areas.
- 4) CEQA requires that both direct and indirect impacts be analyzed. Yet the County simply fails to analyze the impact of competition for water supplies on agriculture, even though the EIR admits that the increased development resulting from the General Plan will result in less water for irrigation.

I2-2

I2-3

I2-4

A significant **indirect** impact required to be addressed by CEQA has not been analyzed in the development of the new General Plan. The County failed to analyze or propose mitigation for any indirect significant impacts on agriculture from the buildout that will occur from the 2040 General Plan.

As a resident of Ventura County and a committed Ventura County farmer^[1] for over 40 years, and a member of a Ventura County farming family for over 150 years, I have seen that complaints from encroaching urban uses will mandate changes in normal farming practices. This most recent example of this is the new hemp cultivation set back.

I2-5

As population grows, there will be more and more complaints of dust, odors, water use, types of crops grown. There will be more theft and vandalism^[2] - which increases costs to the farmer and cause the County to pass new rules that put more restrictions on agriculture.

The County did not discuss these indirect impacts in their analysis, and they did not propose any mitigation to reduce this impact. The County needs to fully evaluate how encroaching development will impact the long-term sustainability of agriculture in the County and propose mitigation that addresses impacts in a way that reduces restrictions on agriculture.

Based on the substantial flaws and deficiencies of the EIR relied on by the County in its design of the new General Plan, as a citizen and farmer, I demand that the County correct and re-circulate the EIR.

I2-6

Thank you for your attention to my concerns.

Alda L. Perry

[1] Our ranch has been contracted with the County for many years under the Williamson Act.

[2] Just last month our ranch suffered an avocado theft. See Crime Report Number 20-8138. In recent years we have had our well disabled **twice** in a thief’s effort to steal the copper wiring that runs from the electrical box to the submersible pump approximately 700 feet in the ground. Before that we had several hundred feet of chain-link fencing ripped out by a vandal who stole a neighbor’s tractor and ran it into the fence. Our ranch is in a very remote area, yet we still suffer from encroaching “civilization.”

|----------------------|------------------------------------------|
| Letter I2 | Alda L Perry February 26, 2020 |
|----------------------|------------------------------------------|

- I2-1 This comment regarding the adequacy of the analysis of impacts related to agricultural resources, water supply, and wildfire risk in the draft EIR is noted. The comment also states that proposed mitigation measures are infeasible; however, no specifics are provided. The California Environmental Quality Act (CEQA) requires that an EIR identify potentially feasible mitigation. The ultimate determination of mitigation feasibility will be made by the lead agency, in this case the County, at the time a decision is rendered about whether to approve the project. However, no specific issues related to the content, analysis, conclusions, or overall adequacy of the draft EIR are raised in this comment. Therefore, no further response is provided.

- I2-2 The commenter’s statement about the accuracy and level of detail in the Background Report are noted. Refer to Master Response MR-6 for discussion of how the County appropriately uses the Background Report to describe the existing environmental setting in the draft EIR.

- I2-3 The comment states that the draft EIR does not mention policies that would increase fuel load in high fire risk areas; the comment does not identify any specific policies that are missing from the draft EIR analysis. The comment’s statement is not correct. Section 4.9, “Hazards, Hazardous Materials and Wildfire,” in the draft EIR lists proposed policies and implementation programs related to wildfire risks on pages 4.9-6 through 4.9-10, including Policies HAZ-1.8, COS-1.15, COS-3.2, and Implementation Program C. Also, see response to comment O32-30 for a discussion of the potential for 2040 General Plan policies and programs that encourage tree planting and preservation to increase wildland fire hazard.

- I2-4 The comment states that the draft EIR does not analyze the impact of competition for water supplies on agriculture, and further states that the draft EIR does not include this analysis even though increased development under the 2040 General Plan would result in less water for irrigation.

Despite the framing in the comment, the draft EIR does not conclude that a reduction in available water resources for irrigation is a significant impact. This is provided as an example of an indirect impact in the draft EIR on page 4.2-3. A reduction in available water resources that causes the loss or conversion of farmland to non-agricultural use is not a potential impact of the project and is, therefore, appropriately excluded from the draft EIR impact discussion. First, it is important to note that the 2040 General Plan does not direct a certain amount of development; rather, it accommodates projected development. In terms of water demand, as explained in draft EIR Impact 4.17-4, Mitigation Measure UTL-1 would require that “water-demand projects,” as defined by State law, that require service from a public water system prepare a water supply assessment before project approval. Mitigation Measure UTL-1 demonstrates that new development accommodated by the 2040 General Plan would not take water supplies away

from existing users such as existing agricultural users. As a result, it is not expected that development facilitated by the 2040 General Plan would result in competition for water resources that would cause fallowing of farmland, conversion or loss of agricultural resources, or other impacts to agricultural resources. The draft EIR, therefore, properly excludes indirect impacts to agriculture from a reduction in available water resources.

I2-5

The comment states that the draft EIR does not analyze indirect impacts on agriculture resulting from buildout of the 2040 General Plan. The comment asserts that encroaching urban uses will result in changes in farming practices and that population growth will result increased in complaints about dust, odors, water use, types of crops grown, and result in more theft and vandalism.

The draft EIR analyzes the potential for development under the 2040 General Plan to result in conflicts with classified farmland in Impact 4.2-2 (starting at page 4.2-17) and conflicts with Land Conservation Act (LCA) contracts and Agricultural Preserves in Impact 4.2-3 (starting at page 4.2-18). The draft EIR explains that the County maintains a number of policies and programs to protect agriculture land uses and prevent conflict between agricultural and non-agricultural land uses. The 2040 General Plan also includes policies and programs to protect agricultural land uses from encroachment of adjacent non-agricultural land uses. Refer to draft EIR Impacts 4.2-2 and 4.2-3 for a discussion of nuisance issues that can arise from conflicts between agricultural and non-agricultural land uses; discussions of nuisance complaints can be found on pages 4.2-17 and 4.2-19 of the draft EIR. Policy AG-2.3 of the 2040 General Plan, listed on page 4.2-10 of the draft EIR, refers to the County's Right-to-Farm Ordinance, which shall be maintained and updated as needed to protect agricultural land uses from conflicts with non-agricultural uses, as well as to help land purchasers and residents understand the potential for nuisance (e.g., dust, noise, odors) that may occur as the natural result of living in or near agricultural areas. The County's Agricultural/Urban Buffer Policy, discussed on pages 4.2-18 and 4.2-20 of the draft EIR, protects the economic viability and long-term sustainability of agriculture in the unincorporated area. This policy conditions urban developments or non-agricultural uses to provide and maintain a 300-foot setback and chain-link fence on the non-agricultural property use, or a 150-foot buffer/setback if a vegetative screen is used. This policy would substantially lessen the potential conflict LCA contracts or agricultural preserves (AGP) by requiring buffers or screening between specified agricultural and non-agricultural land uses to prevent or minimize conflicts that may arise at the interface of agricultural lands and urban structures or ongoing non-farming activities.

Impact 4.2-2 concludes that:

Future development under the 2040 General Plan would not be expected to result in adverse impacts to agricultural uses by locating non-agricultural development near classified farmland due to policies and programs that limit conflicts to agricultural uses, establish buffers between crop production, orchard production, classified farmland and nonagricultural uses, to minimize agricultural land conversion. Future growth and development are expected to occur near or within existing

community boundaries and cities, pursuant to the Guidelines for Orderly development. Therefore, the potential for conflicts would be minimal. This impact would be less than significant (page 4.2-18).

Impact 4.2-3 concludes that:

No direct land use conflicts with existing LCA contracts would occur as a result of the land use diagram of the 2040 General Plan because it would not change the land use designation of any land under an existing LCA contract. No environmental impacts associated with residential development adjacent to any land under LCA/Williamson Act Contracts and AGP are expected to occur due to the protections and guidelines established in policies and programs that limit conflicts with agricultural uses and establishment of buffers between most agricultural and nonagricultural uses. Future growth and development are expected to occur near or within Existing Community area designation (boundary) and Urban area designation (boundary), pursuant to the Guidelines for Orderly development. This impact would be less than significant (page 4.2-20).

Regarding theft and vandalism, these impacts would not be significant because EIRs are not required to speculate about a project's environmental impacts (State CEQA Guidelines, § 15145). The commenter does not present evidence that theft and vandalism would occur to such an extent as a result of the 2040 General Plan that agricultural uses or operations would cease to exist, although the County acknowledges that such activities occur in the existing condition and may occur to some degree in the future (e.g., stolen equipment, illegal picking, litter tossed into fields). Moreover, the plan area includes law enforcement services (e.g., to address theft, vandalism). As a result, a discussion of the impacts of theft and vandalism on agriculture is appropriately excluded from Impact 4.2-2.

CEQA requires that an EIR "describe feasible measures which could minimize significant adverse impacts" (State CEQA Guidelines, § 15126.4(a)(1)). As described for Impact 4.2-2, indirect and direct conflicts between agriculture and adjacent non-agricultural uses as result of 2040 General Plan implementation would be less than significant. As described for Impact 4.2-3, conflicts between residential development and any land under LCA contract or AGP would also be less than significant. As a result, no mitigation is required.

Also refer to response to comment A13-3 regarding Urgency Ordinance 4558.

I2-6

Note that the draft EIR analyzes the potential environmental effects of implementing the 2040 General Plan; it was not used to design the plan under evaluation. Regarding the comment that the draft EIR should be recirculated, refer to Master Response MR-7, which explains in detail why recirculation of the draft EIR is not required, and the responses above that demonstrate the adequacy of the draft EIR with respect to the issues raised by the commenter.

Subject: Climate change has environmental impacts!

Letter
I3

CAUTION: If this email looks suspicious, DO NOT click. Forward to Spam.Manager@ventura.org

Susan Curtis,

Dear Ventura County Board of Supervisors and Planning Department,

Climate issues are something I feel worried about. Ventura County is warming faster than any county in the nation. Our ocean is acidifying faster. Drought and floods have hit us worse, and we can expect more extreme weather.

I3-1

My family and community are counting on you to assure analysis of the full scope of environmental impacts and mitigations in the Draft EIR.

First, it is necessary that all greenhouse gas emissions be counted based on the most current science.

I3-2

There are many ways to mitigate climate impacts, like a sunset plan for oil and gas production, decarbonization of transportation and buildings, zero waste, incentives for regenerative agriculture and water management, and reducing emissions from tailpipes.

I3-3

I want an EIR that covers major climate impacts via a systematic plan.

Thank you—

Ally Gialketsis

|----------------------|---------------------------------------------|
| Letter I3 | Ally Gialketsis February 22, 2020 |
|----------------------|---------------------------------------------|

I3-1 The comment expresses concern about climate change. The comment summarizes the anticipated consequences of anthropogenic climate change. The comment expresses a desire for “strong climate policy” in the 2040 General Plan and a goal of carbon neutrality by 2045. It is not related to the adequacy of the draft EIR. This comment is introductory in nature and does not raise a significant environmental issue for which a response is required.

The County has completed a California Environmental Quality Act-compliant analysis of the environmental impacts that can be reasonably anticipated to result from implementation of the 2040 General Plan. For a full discussion of the potential for development in the county to result in greenhouse gas (GHG) emissions that could contribute to climate change, refer to Section 4.8, “Greenhouse Gas Emissions,” in the draft EIR.

I3-2 The comment asserts that GHG emissions must be inventoried using the most current climate change science. GHG emissions for the unincorporated county in 2015 are summarized in Table 4.8-1 on page 4.8-5 of the draft EIR. Page 4.8-4 includes a discussion explaining the methodology used to determine these levels of emissions. To reiterate what is explained in the draft EIR, the 2015 community-wide GHG inventory was prepared using the U.S. Community Protocol for Accounting and Reporting of GHG Emissions, Version 1.1 with the most recent global warming potential (GWP) values derived from the Intergovernmental Panel on Climate Change’s Fifth Assessment Report, which is the most recently published assessment report. These global warming potential values represent the current climate change science and are appropriate for use in this analysis. The comment does specifically address the adequacy of the draft EIR. Therefore, no further response can be provided.

I3-3

The comment introduces potential mitigation that could be applied to sources of GHG emissions within the plan area such as a sunset plan for oil and gas production, decarbonization of transportation and buildings, zero waste, incentives for regenerative agriculture and water management, and reducing emissions from tailpipes. Similar policies and programs were considered by the County and integrated into the 2040 General Plan. The 2040 General Plan provides a systematic approach to reasonably attainable GHG emission reductions.

The draft EIR evaluates the environmental effects of the 2040 General Plan, which contains policies to reduce GHG emissions throughout the unincorporated county. The language of the 2040 General Plan is considered a component of the project description as defined by California Environmental Quality Act Guidelines, Section 15124. The draft EIR evaluates the efficacy of the 2040 General Plan policies under the assumption that these policies would be implemented as written and derives a significance conclusion based on these reductions.

The relevant 2040 General Plan policies and implementation programs that would reduce GHG emissions within the plan area are summarized on pages 4.8-11 through 4.8-37 of the draft EIR and, where feasible, these measures are quantified by GHG-emitting sector as shown in Table 4.8-6 of the draft EIR. See Master Response MR-1 for additional discussion of the draft EIR GHG emissions impact analysis and potential mitigation measures to address GHG emissions. Refer to Master Response MR-4, Section MR-J, “Potential to Stop Issuing Permits for New Wells (Phase Out Oil and Gas Operations), for response to the commenter’s request for a “sunset plan” for oil and gas production.

Ventura County Board of Supervisors
Attn: RMA Planning Division
General Plan Update
800 Victoria Avenue L#1740
Ventura, California 93009-1740

Letter
I4

Dear Board of Supervisors and Staff:

We are writing this letter to urge the Board of Supervisors to reconsider moving forward with the Draft General Plan EIR. The draft EIR has been accelerated to the point that too many issues and impacts have not been properly addressed or studied. These impacts and the corresponding mitigation measures will have severe impacts to land owners and especially those, like us in the agricultural industry and other productive economic segments.

I4-1

Our family has been involved in the agricultural industry for more than 100 years in Ventura County. We have owned numerous land holdings that remain in the family to this date. We have farmed throughout Ventura County and hope to continue to do so in the future.

The Draft EIR is deficient on many levels. CEQA requires that all mitigation measures must be technically and economically feasible. Numerous proposed mitigation measures are neither. We have in the past attempted to identify land and any owners that would be open to sell their development rights for land that was converting from agricultural to commercial use. Not only did we not find anyone that would do so, no one would even quote a price. The only positive response from numerous land owners were that you can buy my property for full market value and then you can do what you want. There is not a project that can be built by adding double land cost to the equation. This was very recently experienced based on proposed policies at LAFCo. These policies were eventually not enacted due to the inability to purchase development rights in an economical feasible manner. This was when LAFCo was contemplating an acre for acre ag preserve. The new policy that is proposed in the 2040 General Plan is requiring 2 acres for every 1 acre of land converted from ag to any other use. This will eliminate the ability to add any new required ag buildings or even farm worker housing. The Draft EIR must study these impacts, since they are not feasible.

I4-2

The Draft EIR also deals with water in a manner that is not properly studied. There is no analysis on increased water costs and diminishing availability of water. Without reasonable water costs and supply, there is no agricultural industry.

I4-3

The General Plan indicates that agriculture is a high priority in the County. However, new policies and requirements in the General Plan add additional mitigation measures that will make ag virtually impossible. These include new setbacks, limiting types of fumigants pesticides and fertilizers. The General Plan also requires the conversion of all farm equipment to be all electric. Again, not feasible. The

I4-4

costs to purchase new pumps, farm equipment and other existing fuel using equipment will increase operational costs to a point that the County crops will not be competitive in the open market. These new mitigation measures are not sufficiently studied and again are not economically feasible. I4-4 cont.

The Draft EIR is extremely difficult to read and understand. The background reports are lacking in depth of what has been studied other than numerous general statements and very poor mapping. Detailed studies must be added to sufficiently identify impacts and the related mitigation measures for both direct and indirect impacts on the agricultural industry. It is our understanding that reports and studies need to be timely prepared. However numerous studies are older than 5 years. Not timely. I4-5

After numerous devastating wildfires over the last few years, which significantly impacted ag, the General Plan continues to lay out limiting mitigation measures for fire prevention. The Wildlife corridor eliminates any ag operation or fire prevention in the proposed corridor areas. This is also a major concern not studied in the Draft EIR. I4-6

The Draft EIR for the 2040 General plan does not provide adequate analysis for the expansion of permanent bike paths and pedestrian walking trails throughout the County. These impacts are very severe due to constant conflicts from trail users and ag operations. Spraying, dust, odors from ag operations, along with impacts created by the trail users. These are usually theft, vandalism, litter and pet waste. The proposed mitigation measures require additional setbacks from these trails which renders additional land unusable for ag operations. I4-7

In addition to the above comments on the agricultural aspects and related land use concerns of the DEIR, the undersigned is also a mineral owner directly interested in the impacts on oil and gas production of the DEIR and related General Plan 2040 proposed provisions. In these documents there is a total failure to address the economic impacts of the various policies proposed in violation of the requirements for this process, including but not limited to the loss of royalty income to a large group of County residents. I join in the detailed comments on the various deficiencies and concerns identified in the DEIR as described in the concurrent submissions on behalf of Aera Energy and other operators delivered this week to the County. I4-8

Please look at the long-term consequences of these General Plan policies and mitigation measures. We formally request additional studies and a revised Draft EIR that will properly look at these and many more issues. The DEIR must be corrected with details of the revisions. Then it can be recirculated. I4-9

Sincerely, Andy Ehrhart

|------------------|------------------------------------------|
| Letter I4 | Andy Ehrhart February 25, 2020 |
|------------------|------------------------------------------|

I4-1 This comment regarding the adequacy of the draft EIR is noted. However, no specific issues related to the content, analysis, conclusions, or overall adequacy of the draft EIR are raised in this comment. Therefore, no further response is provided.

I4-2 The comment expresses concern about the feasibility of Mitigation Measure AG-2, including cost of implementation and potential to prohibit construction of structures that would support agricultural operation. Refer to Master Response MR-5 for a detailed discussion of this mitigation measure.

I4-3 The comment states that the draft EIR does not provide an analysis on increased water cost and diminishing availability of water. As explained in the “Methodology” subsection of Section 4.2, “Agriculture and Forestry Resources,” a reduction in available water resources for irrigation is considered an indirect impact on agricultural resources; this is provided as an example of an indirect impact in the draft EIR on page 4.2-3. A reduction in available water resources that causes conversion of Farmland is not a potential impact of the project and is, therefore, appropriately excluded from the draft EIR impact discussion. As explained in the discussion of Impact 4.17-4 in Section 4.17, “Utilities,” of the draft EIR, Mitigation Measure UTL-1 would require that water-demand projects that require service from a public water system shall prepare a water supply assessment prior to water approval. Mitigation Measure UTL-1 demonstrates that new development accommodated by the 2040 General Plan would not take water supplies away from existing users such as existing agricultural users. As a result, it is not expected that development facilitated by the 2040 General Plan would result in competition for water resources that would cause following of farmland, conversion or loss of agricultural resources, or other impacts to agricultural resources. Impacts to the cost of water due to development caused by implementation of the 2040 General Plan do not need to be addressed in the EIR unless there is a clear association with an adverse effect on the physical environment. The draft EIR therefore properly excludes impacts to agriculture from a reduction in available water resources. Refer to responses to comments A13-11 and O7-4 for further discussion of available water supplies and cost.

I4-4 The comment raises concerns with the economic feasibility of policies proposed in the 2040 General Plan that could affect agricultural operations. Although referenced in the comment as mitigation measures, the subject requirements are proposed in the 2040 General Plan. The draft EIR evaluates the potential physical effects on the environment that could result from implementation of the 2040 General Plan. As discussed further below, social and economic effects need only be considered in an EIR where there is a clear link between those economic or social effects and physical environmental changes. The financial concerns raised in this comment would not result in any adverse physical changes to the environment not already addressed in the draft EIR.

For clarity, Policy AG-5.2 and Policy AG-5.3, encourage a transition to electric- or renewable-powered agricultural equipment and electric- or renewable- powered irrigation pumps, respectively, and do not require conversion of all farm equipment to electric power. Moreover, to address the potential financial implications of these policies, the Agricultural Element of the 2040 General Plan includes Implementation Program J, through which the County would work to identify funding sources or financial incentives that would help offset the cost of the conversion. The economic impacts of these policies were not evaluated in the draft EIR because the California Environmental Quality Act (CEQA) does not require an evaluation of economic impacts of a project unless they result in a physical change in the environment (State CEQA Guidelines, § 15131(a)).

Furthermore, Policy AG-5.2 and Policy AG-5.3 would be implemented via Implementation Program I, Fossil Fuel-powered Equipment Replacement, in the

Agricultural Element. This implementation program requires that “[t]he County coordinate with [Ventura County Air Pollution Control District (VCAPCD)] and electric utilities to develop a program to establish a countywide fossil-fuel powered equipment conversion target, track progress on conversions to renewable energy sourced electric powered systems and provide technical assistance to users considering replacement of pumps.” The requirements of this implementation program are undefined to the point that reasonably foreseeable impacts cannot be determined at this time. The implementation program only requires coordination to establish a target, track progress, and provide technical assistance. The 2040 General Plan contains no requirement for mandatory provisions to be included in the program. Additionally, the County does not have jurisdiction over many types of agricultural equipment, and VCAPCD’s jurisdiction is limited (e.g., it has no authority to regulate mobile emission sources). Therefore, it is not possible to predict a mix of actions—either mandatory and voluntary—and the economic effects of such a program. Moreover, to address the potential financial implications of these policies and programs, the Agriculture Element of the 2040 General Plan includes Implementation Program J, through which the County would work to identify funding sources or financial incentives that would help offset the cost of the conversion. As a result, any economic impacts cannot be characterized and any physical impacts resulting from economic impacts cannot be defined. These impacts are not reasonably foreseeable. Any evaluation of these impacts would be considered speculative under CEQA because of the number of ways such a program could take shape after consultation with the VCAPCD and utilities, and because it is unknown whether any actions would even be mandatory. Therefore, the draft EIR correctly excludes consideration of impacts of Policy AG-5.2 and Policy AG-5.3 from the agricultural impact discussion.

Policies AG-3.2 and AG-3.3 do not limit the use of specific pesticides, fumigants, and fertilizers, but rather encourage and support the use of integrated pest management practices and provide information for how to do so. Similarly, Policy AG-5.1 encourages the use of inorganic, nitrogen-based fertilizers to reduce nitrogen emissions, but does not explicitly require it. The comment does not provide additional information to support the assertion that economic feasibility of these policies will make agriculture “virtually impossible” and cause existing agricultural uses or operations to cease to exist. As discussed above, a lead agency need not speculate about environmental impacts (State CEQA Guidelines, § 15145) and therefore a discussion of the economic impacts of Policies AG-3.2, AG-3.3, and AG-5.1 is excluded from the draft EIR.

- 14-5 The comment expresses concern about the quality and age of the data used in the existing setting to establish the baseline for the CEQA analysis. Refer to Master Response MR-6 for a discussion of the accuracy, timeliness, and level of detail in the Background Report. The comment refers to unspecified detailed studies that must be added to identify impacts and mitigation measures for “the agricultural industry” but it is not clear from the comment what the scope of such studies should be or their relation to the draft EIR analysis of agricultural resources impacts in Section 4.2, “Agriculture and Forestry Resources.” As a result, no further response can be provided.

- I4-6 The comment states that the draft EIR offers limited mitigation related to fire prevention. The draft EIR included a program-level, qualitative assessment of impacts related to wildfires in the Section 4.9, “Hazards, Hazardous Materials, and Wildfire.” There are no mitigation measures proposed in the analysis that would limit agricultural operations to promote fire prevention. There is also no mitigation proposed in Section 4.4, “Biological Resources,” that would limit vegetation management necessary to manage fire risk. Note that the County’s Habitat Connectivity and Wildlife Corridor ordinances, which were adopted in March of 2019 to provide protections for areas designated as important wildlife corridors within the non-coastal unincorporated area, are separate from the 2040 General Plan currently under review.
- Impact 4.9-6 on page 4.9-19 of the draft EIR recognizes exposure of people to risk by wildfire due to the location of development in a High Fire Hazard Area/Fire Hazard Severity Zone as a significant and unavoidable impact. However, federal, State, and local plans and regulations would reduce the risk of wildfire in the plan area by requiring vegetation management and compliance with applicable building codes that require access to adequate fire suppression infrastructure and specify the materials and construction methods for protection against exterior wildfire exposure. Specifically, the 2015 Ventura County Multi-Hazard Mitigation Plan and the Ventura County Community Wildfire Protection Plan contain additional policies, regulations and procedure for handling wildfires and identifies mitigation strategies to minimize impacts related to wildfires. In addition, the 2040 General Plan includes a suite of policies and implementation programs that address a full spectrum of wildfire prevention standards for new development including vegetation management, fire suppression equipment, discouraging development in fire hazard areas, and education programs to prevent wildfires. It should be noted that wildlife corridors are subject to all existing fire prevention regulations of the Ventura County Fire Protection District. See response to comment O32-30 for additional discussion of the potential for 2040 General Plan policies and programs that encourage tree planting and preservation to increase wildland fire hazard.
- I4-7 Refer to response to comment O7-8 regarding potential incompatibilities of agricultural uses with adjacent bicycle and pedestrian paths. The potential for development under the 2040 General Plan to directly cause conversion of farmland to non-agricultural use is addressed in Impact 4.2-1. The draft EIR concludes that impacts would be significant and unavoidable, even after implementation of Mitigation Measures AG-1 and AG-2. This conclusion covers all development undertaken pursuant to the 2040 General Plan, and therefore includes development of bicycle paths.
- I4-8 The commenter refers to letters submitted by Aera Energy. See responses to Letters O5 and O6.
- I4-9 The commenter’s request for additional study of the issues raised in this letter, revision of the draft EIR, and subsequent recirculation is noted. However, no specific issues related to the content, analysis, conclusions, or overall adequacy of the draft EIR are raised in this comment. Refer to Master Response MR-7, which explains in detail why recirculation of the draft EIR is not required.

Ventura County Board of Supervisors
Attn: RMA Planning Division
General Plan Update
800 Victoria Avenue L#1740
Ventura, California 93009-1740

Dear Board of Supervisors and Staff:

We are writing this letter to urge the Board of Supervisors to reconsider moving forward with the Draft General Plan EIR. The draft EIR has been accelerated to the point that too many issues and impacts have not been properly addressed or studied. These impacts and the corresponding mitigation measures will have severe impacts to land owners and especially those, like us in the agricultural industry and other productive economic segments.

I5-1

Our family has been involved in the agricultural industry for more than 100 years in Ventura County. We have owned numerous land holdings that remain in the family to this date. We have farmed throughout Ventura County and hope to continue to do so in the future.

The Draft EIR is deficient on many levels. CEQA requires that all mitigation measures must be technically and economically feasible. Numerous proposed mitigation measures are neither. We have in the past attempted to identify land and any owners that would be open to sell their development rights for land that was converting from agricultural to commercial use. Not only did we not find anyone that would do so, no one would even quote a price. The only positive response from numerous land owners were that you can buy my property for full market value and then you can do what you want. There is not a project that can be built by adding double land cost to the equation. This was very recently experienced based on proposed policies at LAFCo. These policies were eventually not enacted due to the inability to purchase development rights in an economical feasible manner. This was when LAFCo was contemplating an acre for acre ag preserve. The new policy that is proposed in the 2040 General Plan is requiring 2 acres for every 1 acre of land converted from ag to any other use. This will eliminate the ability to add any new required ag buildings or even farm worker housing. The Draft EIR must study these impacts, since they are not feasible.

I5-2

The Draft EIR also deals with water in a manner that is not properly studied. There is no analysis on increased water costs and diminishing availability of water. Without reasonable water costs and supply, there is no agricultural industry.

I5-3

The General Plan indicates that agriculture is a high priority in the County. However, new policies and requirements in the General Plan add additional mitigation measures that will make ag virtually impossible. These include new setbacks, limiting types of fumigants pesticides and fertilizers. The General Plan also requires the conversion of all farm equipment to be all electric. Again, not feasible. The costs to purchase new pumps, farm equipment and other existing fuel using equipment will increase operational costs to a point that the County crops will not be competitive in the open market. These new mitigation measures are not sufficiently studied and again are not economically feasible.

I5-4

The Draft EIR is extremely difficult to read and understand. The background reports are lacking in depth of what has been studied other than numerous general statements and very poor mapping. Detailed studies must be added to sufficiently identify impacts and the related mitigation measures for both direct and indirect impacts on the agricultural industry. It is our understanding that reports and studies need to be timely prepared. However numerous studies are older than 5 years. Not timely.

I5-5

After numerous devastating wildfires over the last few years, which significantly impacted ag, the General Plan continues to lay out limiting mitigation measures for fire prevention. The Wildlife corridor eliminates any ag operation or fire prevention in the proposed corridor areas. This is also a major concern not studied in the Draft EIR.

I5-6

The Draft EIR for the 2040 General plan does not provide adequate analysis for the expansion of permanent bike paths and pedestrian walking trails throughout the County. These impacts are very severe due to constant conflicts from trail users and ag operations. Spraying, dust, odors from ag operations, along with impacts created by the trail users. These are usually theft, vandalism, litter and pet waste. The proposed mitigation measures require additional setbacks from these trails which renders additional land unusable for ag operations.

I5-7

In addition to the above comments on the agricultural aspects and related land use concerns of the DEIR, the undersigned is also a mineral owner directly interested in the impacts on oil and gas production of the DEIR and related General Plan 2040 proposed provisions. In these documents there is a total failure to address the economic impacts of the various policies proposed in violation of the requirements for this process, including but not limited to the loss of royalty income to a large group of County residents. I join in the detailed comments on the various deficiencies and concerns identified in the DEIR as described in the concurrent submissions on behalf of Aera Energy and other operators delivered this week to the County.

I5-8

Please look at the long-term consequences of these General Plan policies and mitigation measures. We formally request additional studies and a revised Draft EIR that will properly look at these and many more issues. The DEIR must be corrected with details of the revisions. Then it can be recirculated.

I5-9

Sincerely,

Ann C. Cooluris

To: Susan Curtis-

County failed to evaluate mitigation measure for feasibility- 500' set back for "sensitive receptors" from freeways and high traffic roads.

Mitigation Measure AQ-3 (Policy HAZ10-X) creates a minimum 500' set back for "sensitive receptors" from freeways and high traffic roads. Yet the County states in the Land Use section of the EIR that "the majority of the anticipated build out will be within the freeway corridors."

Has the County completed a "buildout study" to ensure that the establishment of this set back still leaves enough room for development to occur? Will this mitigation measure be economically feasible?

| | |
|----------------------|-------------------------------------------|
| Letter 16 | Anna Chambers February 27, 2020 |
|----------------------|-------------------------------------------|

I6-1

The comment asserts that the draft EIR does not evaluate the feasibility of Mitigation Measure AQ-3. As discussed in response to comment O6-12, the California Air Resources Board’s 2017 Technical Advisory: Strategies to Reduce Air Pollution Exposure Near High-Volume Roadways, suggests that people living as much as 1,000 feet from freeways have been adversely affected by poor air quality at night and in the early morning because near-roadway pollution exposure had been previously underestimated. Recognizing this health risk, the draft EIR includes Mitigation Measure AQ-3, which would require that land uses that include sensitive receptors to be setback from specified heavily traveled transportation corridors or undergo a health risk assessment. As explained in the response to comment O6-12, the County has revised Mitigation Measure AQ-3 to reflect the 1,000 foot-setback distance. The mitigation measure does not prevent development from occurring within the setback distance; it requires that a site-specific health risk assessment first be prepared.

Section 4.11, “Land Use and Planning,” does not include the text quoted in the comment as a description of the project under analysis. The impact analysis (page 4.11-18) does describe that “[t]he land use diagram of the 2040 General Plan would accommodate future development of relatively higher intensity residential, commercial, mixed use, and industrial land uses within the Existing Community area designation (boundary) and the Urban area designation (boundary). These are areas with existing residential, commercial, and/or industrial uses developed with urban building intensities generally located adjacent to the boundaries of incorporated cities or along highway corridors such as SR 33, SR 118, SR 126, and Highway 101.”

Re: 2040 General Plan Environmental Impact Report (EIR)

Dear Mr. Hedrick and Honorable Members of APAC:

Thank you for the opportunity to provide comments following today's presentation by Ventura County Planning staff on the 2040 General Plan EIR.

I7-2

There are several issues with the 2040 General Plan EIR that CoLAB believes will negatively impact the viability of local agriculture.

Proposed mitigation measure AG-2: The County proposes that any project that either directly or indirectly results in the loss of farmland must obtain and place into perpetual agricultural preservation twice the total of the farmland loss. This mitigation measure is infeasible. Contrary to statements made by County Planning staff today at the APAC meeting, the California Environmental Quality Act (CEQA) requires that all mitigation proposed in an EIR be feasible. CEQA Section 21061.1 defines feasible as "capable of being accomplished in a successful manner within a reasonable period of time, **taking into account economic, environmental, social, and technological factors**" (*emphasis added*). All mitigation measures proposed in an EIR must be shown to reduce impacts and an infeasible mitigation measure, by definition, cannot and will not reduce impacts.

I7-3

The EIR does not provide evidence of any of the following:

- 1) Whether there is sufficient land available for purchase/conservation easement for each farmland category;
- 2) The cost per acre to purchase each category of farmland;
- 3) The anticipated cost of establishing a conservation easement for each category of farmland;
- 4) The anticipated cost associated with managing each category of farmland under a conservation easement;
- 5) The anticipated cost associated with monitoring these mitigation parcels scattered throughout the County and who will bear that cost;
- 6) Any information that could constitute a "plan" for management of farmland in conservation easements;

Page 2 of 4

- 7) An analysis of direct and indirect impacts caused by this mitigation measure (including impacts associated with LU compatibility conflicts and increased urban-ag-interface);
- 8) Whether the smallest possible mitigation acreage required will achieve the minimum to ensure viability of agriculture on the parcel; and
- 9) Whether the proposed mitigation is in conflict with other ordinances and regulations, such as the County's Zoning Ordinance and the County's minimum lot sizes.

The County is already aware that this proposed mitigation measure is infeasible. On March 24, 2016, at a Local Agency Formation Commission (LAFCo) hearing, Supervisor Linda Parks attempted to establish an "Agricultural Mitigation Measure" through the LAFCo project approval process. The mitigation measure would have required the 1-to-1 purchase of local farmland (half of what is proposed in the 2040 General Plan EIR) to replace farmland that would be impacted by any proposed development. Ventura County Counsel, Michael Walker, informed both LAFCo and Supervisor Parks that the proposed mitigation measure did not meet the standard for economic feasibility, and, for that and other reasons, LAFCo could not adopt Supervisor Park's proposed mitigation measure. He referenced a 2015 legal decision, *City of Irvine v. County of Orange*, in which the Court stated, "the sheer astronomical expense of land supports the finding of the EIR that the purchase of an agricultural conservation easement is a non-starter."

I7-3
cont.

In addition to being infeasible, CoLAB does not believe that this mitigation measure will reduce impacts on agricultural land, as it does not address the actual issues that will impact farmland under the 2040 General Plan: lack of economic sustainability, the increasing regulatory demands on agriculture, increased competition for water resources, and increased compatibility conflicts from development.

Indirect Impacts

The EIR dismisses "indirect impacts" that will occur as a result of implementing the 2040 General Plan as "less than significant."

Page 4.2-13 of the EIR states "AG-2.3 maintains the Right-to-Farm Ordinance to protect agricultural land uses from conflicts with non-agricultural uses, as well as to help land purchasers and residents understand the potential for nuisance, (e.g., dust, noise, odors) that may occur as the natural result of living in or near agricultural areas...These sections of the code protect farmers engaged in agricultural activity from public nuisance claims...This protects the farming community, including Important Farmlands and farms less than 10 acres, from developments that would inhibit their ability to continue agricultural production."

I7-4

Page 4.2-17 of the EIR states: "Residential growth in areas nearby agricultural lands has the potential to result in land use conflicts. Residential land uses are generally more sensitive and prone to conflict with adjacent agricultural land uses than commercial or industrial land uses. The placement of sensitive land uses, such as residences and schools, nearby classified farmland can negatively impact both uses due to conflict including odor nuisances and noise from agriculture machinery. The countywide Right-to-Farm Ordinance protects existing agricultural and farming operations from conflicts attributed to residential development...Therefore, the potential for conflicts would be minimal. This impact would be less than significant" (*emphasis added*).

This is simply not true. Historic and recent County actions have shown that the County has and will continue to create new restrictions and ordinances that have a significant impact on existing agricultural

Page 3 of 4

and farming operations because of conflicts attributed to residential development. The recent interim urgency ordinance restricting hemp cultivation is one such example.

I7-4
cont.

Contrary to statements made today by Ventura County Planning staff, an EIR, whether it is labeled as “programmatically” or “project”, must analyze all reasonably foreseeable consequences of the action that is proposed. For the 2040 General Plan EIR, the action proposed is the implementation of all policies and programs within. Therefore, if the implementation of a policy in the 2040 General Plan will result in an impact, that impact must be analyzed. For example, the 2040 General Plan contains land use designation changes that will increase allowable housing density near agricultural land. It is reasonably foreseeable that more houses will create more compatibility conflicts with normal farming operations. The impact of these compatibility conflicts must be addressed in the EIR.

I7-5

In 2014, the California Court of Appeal stated in a ruling that “[T]he fact that this EIR is labeled a ‘project’ rather than a ‘program’ EIR matters little....Designating an EIR as a program EIR ... does not by itself decrease the level of analysis otherwise required in the EIR. All EIRs must cover the same general content. The level of specificity of an EIR is determined by the nature of the project and the “rule of reason,” rather than any semantic label accorded to the EIR.”

It is CoLAB’s opinion that indirect impacts from increasing urban-ag interface are SIGNIFICANT and cannot be dismissed in the EIR.

Direct and indirect impacts of increased costs

The 2040 General Plan has policies that will increase the costs of normal farming operations. CoLAB believes that the most effective way to minimize conversion of agricultural land to non-agricultural uses is to take active measures to allow farming to remain profitable. And even the County admits that reducing the cost of farming reduces conversion of agricultural land in their discussion of the Williamson Act in Chapter 4.2 of the EIR.

But the County fails to analyze direct and indirect impacts of 2040 General Plan policies that will increase the cost of normal farming operations, such as:

I7-6

- Policy AG-5.2: Electric- or Renewable-Powered Agricultural Equipment. The County shall encourage and support the transition to electric- or renewable-powered or lower emission agricultural equipment in place of fossil fuel-powered equipment when feasible.
- Policy AG-5.3: Electric- or Renewable-Powered Irrigation Pumps. The County shall encourage farmers to convert fossil fuel-powered irrigation pumps to systems powered by electric or renewable energy sources, such as solar power, and encourage electric utilities to eliminate or reduce standby charges.

Direct and indirect impacts of increased competition for water resources

The County fails to evaluate the impact of increased competition for water resources caused by development allowed in the 2040 General Plan on either the conversion of agricultural land or the loss of agricultural lands through the loss of topsoil.

I7-7

The EIR states on page 4.2-3 that “...a reduction in available water resources for irrigation” is an example of indirect impacts on agricultural land due to loss of topsoil from increased wind and water erosion. But the County fails to analyze or propose mitigation measures to address this significant impact.

Page 4 of 4

APAC is the expert charged with advising County decision-makers on agricultural issues in Ventura County. And the County should be seeking guidance from APAC about the actual issues that will impact farmland under the 2040 General Plan: lack of economic sustainability, the increasing regulatory demands on agriculture, increased competition for water resources, and increased compatibility conflicts from development.

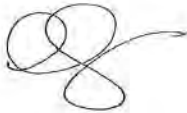

CoLAB encourages APAC to provide guidance to the County on appropriate and effective mitigation measures to prevent the conversion of agricultural land to non-agricultural uses. These may include:

- 1) Strengthen the Right-to-Farm ordinance to prevent nuisance complaints from being used to justify the creation or expansion of setbacks or regulatory restrictions on normal farming practices;
- 2) Expand the Land Conservation Act Program to include Open Space zoned properties that are engaged in farming (including grazing); and
- 3) Protect agricultural land from urban-ag interface encroachment and compatibility conflicts by establishing setbacks on NON-AE-zoned land that will restrict the construction of bike paths, public trails, and sensitive receptors within 2000' of any land zoned A/E.

I7-8

Thank you again for the opportunity to provide comments on this issue. We appreciate your consideration and leadership at this time.

Sincerely,

Louise Lampara
Executive Director

Anna M Chambers

Ventura County Resource Management Agency, Planning Division
Attn: Susan Curtis, Manager, General Plan Update Section
800 South Victoria Avenue, L#1740
Ventura, CA 93009-1740

Re: Comments on Ventura County General Plan DEIR

Dear Ms. Curtis:

I represent and serve on the McLoughlin Family Committee, a group of family members that own approximately 300 acres of agricultural property off of Olivas Park Road in the County of Ventura, in proximity to the City of Ventura.

The McLoughlin family has farmed this land for generations. It remains our desire to continue this legacy. However, in the face of never-ending changes to the regulatory environment, we again find ourselves attempting to ascertain how new policies and programs as proposed in the draft 2040 General Plan will impact and challenge our ability to serve as stewards of this heritage.

18-2

It had been our hope that the DEIR would provide some clarity and insight into how the new policies and programs within the revised General Plan would impact our farming operation. However, that is not the case. Simply said, we believe the General Plan Update and subsequent Environmental Impact Report fail to adequately analyze or study impacts on the farming industry.

With that said, we would like to specifically present the following:

- The Background report Table 6-26: Transportation Department Planned Capital Projects lists sections of roadways the County plans for expanded capacity or widening, along with the scope of those enhancements. It also covers in length the plan to add bike paths and bike lanes in accordance with existing County wayfarer plans. However, the DEIR never analyzes the loss of farmland resulting from these changes in infrastructure – it’s not even mentioned as a possibility in the DEIR.

18-3

Olivas Park Road between Victoria and Harbor is listed as one of the areas planned for road widening, a stretch of roadway that borders the entire eastern portion of our farmland and property. While the impact on our farming operation and financial losses due to property loss are clearly quantifiable, the report fails to list or quantify these impacts.

- In Section 3-8, The DEIR states that because there will be no “substantive” change to the agricultural, open space, or rural designations, the General Plan Update (GPU) will be consistent with SOAR. However, no further details beyond this conclusory statement is provided. There is no way for the reader to come to his or her own conclusion on whether the GPU will result in inconsistencies with SOAR that might lead to physical environmental impacts. There is no description of the changes to the Agriculture, Open Space, and Rural policies to determine whether they are in fact non-substantive.

18-4

Given the length and breath of the Draft General Plan update and CEQA analysis, we made an attempt to focus our initial review and subsequent comments to issues specific to agriculture and farming. However, it’s clear that the 2040 General Plan will impact the Ventura County local economy across

18-5

sectors – all of which influence the ability to live and work in this region. The DEIR’s lack of analysis of those economic impacts, calls into question the legitimacy of both the draft General Plan update, and the CEQA analysis. As such, we respectfully request that the DEIR be recirculated in the hopes that further study will resolve these shortcomings.

18-5
cont.

I appreciate your consideration.

Anna M Chambers*

| | |
|----------------------|-------------------------------------------|
| Letter 18 | Anna Chambers February 27, 2020 |
|----------------------|-------------------------------------------|

- 18-1 The comment references an attachment to the main body of the letter. The County has reviewed the attachment and determined that it raises significant environmental issues for which a response is required. The County’s responses to these issues are provided below.
- 18-2 The comment provides a description of the McLoughlin Family Committee and history of the McLoughlin Family and an opinion of the adequacy of the 2040 General Plan and draft EIR with respect to analysis of impacts on the farming industry. This comment is introductory in nature and does not raise a significant environmental issue for which a response is required.
- 18-3 Table 6-26 in the Background Report summarizes the capital improvement projects for fiscal years 2018 through 2021 identified in the Ventura County Transportation Department’s Capital Improvements Program (CIP). As explained on page 6-87 of the Background Report, the CIP “is an internal programming document that identifies all capital improvement projects (e.g., roads and bridges) the County intends to build, replace or improve over a 20-year horizon...The CIP provides a means for the County to determine the capital improvement projects and funding priorities over a 20-year horizon.” One of the CIP projects listed in Table 6-26 is a feasibility study for widening of Olivas Park Drive from Telephone Road to Seaborg Drive to improve traffic safety. This feasibility study is a project ranked #9 in the Strategic Master Plan, a Ventura County Public Works document that identifies needs and transportation improvements recommended for programming. These are existing infrastructure planning processes that are separate from the 2040 General Plan; therefore, an analysis of the potential effects of these projects is not appropriate in the draft EIR.

The 2040 General Plan does not include any policies specific to Olivas Park Drive or the property owned by McLoughlin Family Committee. Policy PFS-1.6 would prioritize capital improvements that repair and replace inadequate facilities, while Policy AG-2.2 would specifically require that transportation and other capital improvements are planned to “avoid or mitigate impacts to important farmland to the extent feasible.”

- 18-4 The comment raises concerns about the potential for inconsistencies of the 2040 General Plan with the Save Open Space and Agricultural Resources (SOAR) initiative that could result in physical environmental impacts, citing Section 3.2.2, “Relationship to Other Plans and Regulations,” of the draft EIR, which explains that the County SOAR initiative’s Agricultural, Open Space, and Rural goals and policies “are included in the 2040 General Plan with only technical, non-substantive revisions for clarification and internal consistency with the rest of the 2040 General Plan” (draft EIR page 3-8).

The draft EIR does not highlight specific policy language differences between SOAR and the 2040 General Plan; however, the 2040 General Plan does include notes regarding the source of each policy. To ensure consistency with SOAR, all lands in the existing General Plan with a land use designation of Agricultural, Open Space, or Rural located outside of Existing Community and Urban designated areas are maintained unchanged in the 2040 General Plan (see draft EIR page 3-5). Subsequent projects must comply with the 2040 General Plan, as well as SOAR, which is part of the 2040 General Plan itself. Compliance with regulatory requirements is assumed in the draft EIR analysis.

Refer also to Master Response MR-2 regarding the 2040 General Plan’s consistency with SOAR.

- 18-5 The comment anticipates that implementation of the 2040 General Plan would result in broad economic impacts that have not been evaluated in the draft EIR and requests recirculation of the draft EIR.

EIRs are not required to treat a project’s economic or social effects as significant effects on the environment (State CEQA Guidelines, § 15131). Economic effects need only be considered in an EIR where there is a clear link between those effects and physical environmental changes. The comment does not provide evidence to link the general economic issues raised in this comment to any adverse physical changes to the environment not already addressed in the draft EIR. Therefore, no revisions to the draft EIR have been made in response to this comment.

Refer to Master Response MR-7, which explains in detail why recirculation of the draft EIR is not required.

I support the attached letter.

I 19-1

Anna M. Chambers

Ventura County Resource Management Agency, Planning Division
Attn: Susan Curtis, Manager, General Plan Update Section
800 S. Victoria Ave., L #1740
Ventura, CA 93009-1740

GeneralPlanUpdate@ventura.org

Dear Ms. Curtis:

I am writing to call your attention to significant flaws in the process, data, and conclusions of the Ventura County General Plan, Draft EIR, and supplemental documents.

My great grandfather, Mark McLoughlin (1843-1914), was a true Ventura County pioneer, purchasing his first 318 acres of undeveloped land in Ventura County in 1875. He was a hard-working visionary, revered by his community. With his son—my grandfather, James Patrick McLoughlin—he raised livestock and farmed the land, providing jobs and feeding the growing towns of Oxnard and Ventura.

19-2

Our land, in a vitally important location on Olivas Park Drive across from the Ventura Marina, has been in the family, and part of the economic fabric of the community, for 100 years. And we want it to be part of the future of this community, with a flourishing economy, a thriving job market, and unsurpassed quality of life for its residents.

But the General Plan and DEIR do not describe a viable path for us as landowners going forward.

I will begin with some specific issues regarding language in the Coastal Area Plan, 4-82-83 and 4-94-95. Part of our land is located in the Central Coastal Zone, adjacent to the Ventura Marina, on Olivas Park Drive at Harbor Blvd. The only conclusion the Plan draws about our land is the statement that, "unlike the Preble area, services are not readily available to the Olivas lands." This is false. Our property has access to all utilities, water, main roads, and the freeway. Indeed, easements on our property serve surrounding areas with utilities.

The Plan also claims that our property is "not included in the City's sanitation district because of problems with water pressure." This language is irrelevant and incorrect. There is no evidence that there are water pressure issues, and the sanitation district's pipelines actually traverse our property.

19-3

While we do not know the original source of these misstatements, such misrepresentations—now repeated in the Plan—threaten to diminish the value of our land in relation to the Preble property. And, of course, they undermine the goal and the value of the Plan itself.

The General Plan also speaks of the widening of Olivas Park Drive, our southern boundary. This would have a direct impact on our property. But the Plan does not address how this would happen or how it would affect our land.

I9-3
cont.

Damaging misstatements about our property also appear In the DEIR. Contrary to the portrayal in the DEIR, our property has significant infrastructure in place, as well as prime accessibility to the highway and the harbor. In fact, with easy access to the marina and beach community, and with the railroad as part of our eastern boundary, our land is uniquely suited to be an important part of future economic development in the area. We are entitled to have all these matters corrected.

I9-4

I would also like to raise some additional concerns:

1. The General Plan and DEIR continue to ignore the 28% increase in the homeless population in our community.
2. According to the General Plan, if we were to build an acre of low income / worker housing we would need to buy two replacement acres of same Ag land to be placed into perpetual agricultural preservation. This is unrealistic and infeasible, and certainly not in line with the State government's housing policies.
3. The EIR does not adequately address the enormous "indirect impacts" that will occur as a result of implementing the General Plan, calling them "less than significant."
4. The General Plan contains policies that will increase the costs of normal farming operations, making it difficult for farming to remain profitable.
5. The Plan does not adequately evaluate the impacts of increased competition for water in our community.

I9-5

I9-6

I9-7

I9-8

I9-9

The EIR is a flawed document, full of errors, that does not disclose all impacts, direct and indirect, caused by the General Plan. It was obviously rushed—completed in six weeks. It is inaccurate and incomplete, and fails to provide members of the community with the information that they are legally entitled to. This EIR should be corrected and reconsidered, and a reasonable time period should be allowed for meaningful and thoughtful community input.

I9-10

Sincerely,

*I support this letter -
Anna M Chambers*

| | |
|----------------------|-------------------------------------------|
| Letter I9 | Anna Chambers February 27, 2020 |
|----------------------|-------------------------------------------|

- I9-1 The comment references an attachment to the main body of the letter. The County has reviewed the attachment and determined that it raises significant environmental issues for which a response is required. The County’s responses to these issues are provided below.
- I9-2 The history of the McLoughlin family and their land in Ventura County is noted. This comment is introductory in nature and does not raise a significant environmental issue for which a response is required.
- I9-3 The comment addresses statements in the Coastal Area Plan, which is a component of the General Plan, relative to property owned by the commenter and is not related to the adequacy of the draft EIR. Therefore, no response is required. Note also that no changes were made to the Coastal Area Plan as part of the preparation of the 2040 General Plan. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan. Refer to response to comment I8-3 for a discussion of widening of Olivas Park Drive, which is not a component of the 2040 General Plan.
- I9-4 The comment expresses general concern about the portrayal of a specific property in the draft EIR with respect to access to infrastructure. This property is not specifically described in the draft EIR. The comment does not provide sufficient detail about where such misstatements occur to permit identification and correction. Therefore, no further response is provided.
- I9-5 The comment states that the 2040 General Plan and draft EIR ignore the 28 percent increase in the homeless population in the community. While the origin of this 28 percent figure is unclear, it appears that the commenter is concerned about an existing social condition that the commenter would like the 2040 General Plan to rectify. This comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.

The comment is not related to the adequacy of the draft EIR because the homeless population is an existing condition and EIRs are not required to treat a project’s social effects as significant effects on the environment (State CEQA Guidelines, § 15131). Social effects need only be considered in an EIR where there is a clear link between those social effects and physical environmental changes. The homelessness issues raised in this comment would not result in any adverse physical changes to the environment not already addressed in the draft EIR.
- I9-6 Refer to Master Response MR-5 regarding the feasibility of Mitigation Measure AG-2.

I9-7 The comment states that the draft EIR does not adequately address the indirect impacts of implementing the 2040 General Plan and labels such impacts as, “less than significant.” It’s not clear if the commenter is referring to the entire draft EIR or to specific analysis. As explained in the “Approach to Environmental Analysis” (page 4-3 of the draft EIR):

Adverse physical impacts to the environment associated with implementation of the 2040 General Plan are the focus of this environmental analysis. Physical changes could result from subsequent development pursuant to land use designations established in the 2040 General Plan, implementation of policies and implementation programs identified in the 2040 General Plan, and offsite or indirect development that is necessitated by the 2040 General Plan (e.g., new facilities, infrastructure upgrades). For the purpose of this environmental analysis, the types of actions that could result in physical changes to the environment under the 2040 General Plan are referred to collectively as “future development.”

By analyzing the entire “program,” the draft EIR does address the direct and indirect impacts of the project.

I9-8 The comment asserts that the General Plan policies would increase the cost of normal farming operations, which would “make it difficult for farming to remain profitable.” The comment does not provide clear link between this economic effect and physical environmental changes, such as conversion of farmland. EIRs are not required to treat a project’s economic or social effects as significant effects on the environment (State CEQA Guidelines, § 15131). The economic issues raised in this comment would not result in any adverse physical changes to the environment not already addressed in the draft EIR. For further discussion of specific policies in the 2040 General Plan that could have an economic effect on farming operations, including programs that would provide economic support to agricultural operations, refer to response to comment I4-4.

I9-9 The comment asserts that the impacts of “increased competition for water” are not adequately evaluated in the draft EIR but does not offer specifics about what information is missing or how consideration of additional materials could affect the environmental analysis. The commenter is referred to Section 4.10, “Hydrology and Water Quality,” for an evaluation of the potential effects of implementing the 2040 General Plan on groundwater and surface water quantity and quality, and Section 4.17, “Utilities,” for a discussion of water supply. See also response to comment I4-3. No changes to the draft EIR have been made in response to this comment.

I9-10 This comment regarding the adequacy of the draft EIR is noted. However, no specific issues related to the content, analysis, conclusions, or overall adequacy of the draft EIR are raised in this comment. Therefore, no further response is provided. Refer to Master Response MR-7, which explains in detail why recirculation of the draft EIR is not required.

Subject: Comments on draft General Plan

**Letter
I10**

Ventura County RMA Planning Division,

I'd like to start by thanking the staff for putting this complicated document together and for receiving my input. My name is Aubrey E."Bud" Sloan, I am a local rancher with a significant stake in the outcome of this draft. My main concerns are the potential negative impacts on our county's history: local agriculture.

I10-1

After reviewing the draft EIR, I found Background Report on agriculture to be inadequate, vague and using outdated information. Many of the tables and figures, such as Fig 9-6, table 9-7 are using old data. While this older data can be important in providing background, the EIR references the Background Report as the current conditions, despite this data not being more current than 2015. The Background Report must be updated to reflect current data.

I10-2

There is also an issue with the map (Fig 9-7) which is of such poor quality that is it cannot be used to show any information. This map must be replaced with a higher quality map.

Another major area that leaves the Background Report and document as inadequate is the lack of information around project water demand, supply and pumping costs. This is left out of the Background Report and the entire EIR. This must include analysis on the effects of increased competition of water supplies due to development planning in the General Plan.

I10-3

I ask that these issues be taken into consideration and addresses appropriately.

Thank you,
 Aubrey E."Bud" Sloan

|-----------------------|--------------------------------------------|
| Letter I10 | Aubrey E Sloan February 25, 2020 |
|-----------------------|--------------------------------------------|

- I10-1 This comment is introductory in nature and expresses concern related to local agriculture history. The comment does not raise a specific significant environmental issue for which a response is required.
- I10-2 The comment indicates that data presented in the Background Report and used to describe the existing setting for the analysis of potential impacts to agricultural resources in the draft EIR should be refined and updated to reflect the most current data available. Refer to Master Response MR-6 for discussion of how the County appropriately uses the Background Report to describe the existing environmental setting in the draft EIR.

The data of concern to the commenter includes Figure 9-6, a pie chart depicting the sources of water used for agriculture in 2013; Table 9-7, which provides a summary of the market value of agricultural products between 2005 and 2015; and Figure 9-7, which shows agricultural areas and watersheds for the entire

county with sufficient clarity to illustrate the spatial relationship between the resources. While this information provides context for the analysis in the draft EIR, it does not directly influence the analysis of potential impacts on farmland and agricultural resources pursuant to the thresholds of significance established in Appendix G of the California Environmental Quality Act Guidelines and the County's Initial Study Assessment Guidelines. Furthermore, the comment provides no evidence that the most current data would substantially differ from that presented or change the analysis in the draft EIR. The data characterizing agricultural land use in the county provides a reasonable representation of conditions to inform an analysis of potential effects. No revisions to the draft EIR have been made in response to this comment.

I10-3

The comment asserts that the Background Report and draft EIR do not adequately discuss water demand, supply, and pumping costs, and indicates that an analysis of the effects of increased competition for water should be included in the draft EIR. The commenter is referred to Section 4.10, "Hydrology and Water Quality," for an evaluation of the potential effects of implementing the 2040 General Plan on groundwater and surface water quantity and quality, and Section 4.17, "Utilities," for a discussion of water supply.

Pumping costs are not specifically discussed because EIRs are not required to treat a project's economic or social effects as significant effects on the environment (State CEQA Guidelines, § 15131). Social and economic effects need only be considered in an EIR where there is a clear link between those economic or social effects and physical environmental changes. The economic issues raised in this comment would not result in any adverse physical changes to the environment not already addressed in the draft EIR.

Specific to the commenter's stated area of concern, increased pumping costs would only be relevant where there is substantial evidence that they would indirectly result in the loss of agricultural resources. As explained in the "Methodology" subsection of Section 4.1, "Agriculture and Forestry Resources," a reduction in available water resources for irrigation is considered an indirect impact on agricultural resources (see page 4.2-3 of the draft EIR). Indirect effects are evaluated under Impact 4.2-1 (Loss of Prime Farmland, Farmland of Statewide Importance, Unique Farmland, and Farmland of Local Importance) in Section 4.2, "Agriculture and Forestry Resources," of the draft EIR. Consistent with the County's Initial Study Assessment Guidelines, the subsequent discussion focusses on indirect loss of agricultural soils and land use conflicts. The analysis concludes that the impact to farmland would be significant and unavoidable because "any direct or indirect loss of Important Farmlands would be considered a permanent loss of a valuable resource," and there "are no actions or policies that the County could feasibly mandate to fully replace the loss of Important Farmland" (see page 4.2-17 of the draft EIR). Additional discussion of potential indirect effects related to pumping cost would be speculative and would not significantly change the analysis or conclusions of the draft EIR. No changes to the draft EIR have been made in response to this comment.

Ventura County Board of Supervisors
Attn: RMA Planning Division
General Plan Update
800 Victoria Avenue L#1740
Ventura, California 93009-1740

Letter
I11

Dear Board of Supervisors and Staff:

We are writing this letter to urge the Board of Supervisors to reconsider moving forward with the Draft General Plan EIR. The draft EIR has been accelerated to the point that too many issues and impacts have not been properly addressed or studied. These impacts and the corresponding mitigation measures will have severe impacts to land owners and especially those, like us in the agricultural industry and other productive economic segments.

I11-1

Our family has been involved in the agricultural industry for more than 100 years in Ventura County. We have owned numerous land holdings that remain in the family to this date. We have farmed throughout Ventura County and hope to continue to do so in the future.

The Draft EIR is deficient on many levels. CEQA requires that all mitigation measures must be technically and economically feasible. Numerous proposed mitigation measures are neither. We have in the past attempted to identify land and any owners that would be open to sell their development rights for land that was converting from agricultural to commercial use. Not only did we not find anyone that would do so, no one would even quote a price. The only positive response from numerous land owners were that you can buy my property for full market value and then you can do what you want. There is not a project that can be built by adding double land cost to the equation. This was very recently experienced based on proposed policies at LAFCo. These policies were eventually not enacted due to the inability to purchase development rights in an economical feasible manner. This was when LAFCo was contemplating an acre for acre ag preserve. The new policy that is proposed in the 2040 General Plan is requiring 2 acres for every 1 acre of land converted from ag to any other use. This will eliminate the ability to add any new required ag buildings or even farm worker housing. The Draft EIR must study these impacts, since they are not feasible.

I11-2

The Draft EIR also deals with water in a manner that is not properly studied. There is no analysis on increased water costs and diminishing availability of water. Without reasonable water costs and supply, there is no agricultural industry.

I11-3

The General Plan indicates that agriculture is a high priority in the County. However, new policies and requirements in the General Plan add additional mitigation measures that will make ag virtually

I11-4

impossible. These include new setbacks, limiting types of fumigants pesticides and fertilizers. The General Plan also requires the conversion of all farm equipment to be all electric. Again, not feasible. The costs to purchase new pumps, farm equipment and other existing fuel using equipment will increase operational costs to a point that the County crops will not be competitive in the open market. These new mitigation measures are not sufficiently studied and again are not economically feasible.

I11-4
cont.

The Draft EIR is extremely difficult to read and understand. The background reports are lacking in depth of what has been studied other than numerous general statements and very poor mapping. Detailed studies must be added to sufficiently identify impacts and the related mitigation measures for both direct and indirect impacts on the agricultural industry. It is our understanding that reports and studies need to be timely prepared. However numerous studies are older than 5 years. Not timely.

I11-5

After numerous devastating wildfires over the last few years, which significantly impacted ag, the General Plan continues to lay out limiting mitigation measures for fire prevention. The Wildlife corridor eliminates any ag operation or fire prevention in the proposed corridor areas. This is also a major concern not studied in the Draft EIR.

I11-6

The Draft EIR for the 2040 General plan does not provide adequate analysis for the expansion of permanent bike paths and pedestrian walking trails throughout the County. These impacts are very severe due to constant conflicts from trail users and ag operations. Spraying, dust, odors from ag operations, along with impacts created by the trail users. These are usually theft, vandalism, litter and pet waste. The proposed mitigation measures require additional setbacks from these trails which renders additional land unusable for ag operations.

I11-7

In addition to the above comments on the agricultural aspects and related land use concerns of the DEIR, the undersigned is also a mineral owner directly interested in the impacts on oil and gas production of the DEIR and related General Plan 2040 proposed provisions. In these documents there is a total failure to address the economic impacts of the various policies proposed in violation of the requirements for this process, including but not limited to the loss of royalty income to a large group of County residents. I join in the detailed comments on the various deficiencies and concerns identified in the DEIR as described in the concurrent submissions on behalf of Aera Energy and other operators delivered this week to the County.

I11-8

Please look at the long-term consequences of these General Plan policies and mitigation measures. We formally request additional studies and a revised Draft EIR that will properly look at these and many more issues. The DEIR must be corrected with details of the revisions. Then it can be recirculated.

I11-9

Sincerely,

915 Las Palmas Drive
Santa Barbara, CA 93110

CAUTION: If this email looks suspicious, DO NOT click. Forward to Spam.Manager@ventura.org

Dear Board of Supervisors:

No doubt about it. Climate change is here. According to a recent study of data by the Washington Post, with an average temperature increase of 2.6 degrees Celsius since preindustrial times, Ventura ranks as the fastest-warming county in the Lower 48 states. However the good news is that General Plan Update gives us all the opportunity to begin workable and effective plans to mitigate it.

It is imperative that The Climate Action Plan (CAP) include the technical and scientific input needed for a meaningful CAP from teams qualified in solving the problem and able to produce a robust plan capable of meeting the greenhouse Gas (GHG) emission reduction goals.

Much of Climate change is caused by fossil fuel production and consumption. Ventura County needs to meet the goals of the Paris Climate Agreement, eliminating fossil fuel production and protecting its residents from harmful local pollution.

It's not going to be easy, but it's not easy to watch our county burn from climate change induced drought, or flood as a result of global warming. The crisis is upon us but so is the opportunity. I urge you to develop a general plan based on science and faces the crisis from climate change.

Thank you,

Barb Miller

| Letter I12 | Barb Miller February 25, 2020 |
|-----------------------|-----------------------------------------|

I12-1 The comment expresses a desire to address anticipated effects of climate change through the 2040 General Plan and is not related to the adequacy of the draft EIR. The comment states that the data and policies of the 2040 General Plan should be supported by science. Refer to response to comment I3-2 and Master Response MR-1 for discussion of the methods and science used to support development of the 2040 General Plan policies and programs related to greenhouse gas emissions.

The comment also asserts that to meet the goals of the Paris Climate Agreement, oil and gas production will need to be curtailed. See Master Response MR-4 for additional discussion of oil and gas production within the plan area and the 2040 General Plan's relationship to this industry.

**Letter
I13**

To: Ventura County Board of Supervisors

From: Barbara Leighton

4102 Greenwood St.

Newbury Park, CA 91320

As a resident of Ventura County, I am very concerned about the future of our region and life on earth due to worsening climate change impacts.

Ventura County's General Plan is an opportunity to address these serious threats to human health and safety. If business as usual continues, impacts are bound to quicken the pace of becoming more and more severe. This is the time to make beneficial changes before conditions worsen – both locally and globally.

I agree with recommendations made by CFROG and the 350 Ventura County Climate Hub!

We need to muster our strength to shape a better future for generations to come. If we work together, I believe we can overcome the obstacles that block a thriving life-filled future.

Thank you for taking time to consider this matter carefully.

Re: Comments on Ventura County General Plan DEIR

Dear Ms. Curtis:

I represent and serve on the McLoughlin Family Committee, a group of family members that own approximately 300 acres of agricultural property off of Olivas Park Road in the County of Ventura, in proximity to the City of Ventura.

The McLoughlin family has farmed this land for generations. It remains our desire to continue this legacy. However, in the face of never-ending changes to the regulatory environment, we again find ourselves attempting to ascertain how new policies and programs as proposed in the draft 2040 General Plan will impact and challenge our ability to serve as stewards of this heritage.

It had been our hope that the DEIR would provide some clarity and insight into how the new policies and programs within the revised General Plan would impact our farming operation. However, that is not the case. Simply said, we believe the General Plan Update and subsequent Environmental Impact Report fail to adequately analyze or study impacts on the farming industry.

With that said, we would like to specifically present the following:

- The Background report Table 6-26: Transportation Department Planned Capital Projects lists sections of roadways the County plans for expanded capacity or widening, along with the scope of those enhancements. It also covers in length the plan to add bike paths and bike lanes in accordance with existing County wayfarer plans. However, the DEIR never analyzes the loss of farmland resulting from these changes in infrastructure –it’s not even mentioned as a possibility in the DEIR.

Olivas Park Road between Victoria and Harbor is listed as one of the areas planned for road widening, a stretch of roadway that borders the entire eastern portion of our farmland and property. While the impact on our farming operation and financial losses due to property loss are clearly quantifiable, the report fails to list or quantify these impacts.

- In Section 3-8, The DEIR states that because there will be no “substantive” change to the agricultural, open space, or rural designations, the General Plan Update (GPU) will be consistent with SOAR. However, no further details beyond this conclusory statement is provided. There is no way for the reader to come to his or her own conclusion on whether the GPU will result in inconsistencies with SOAR that might lead to physical environmental impacts. There is no description of the changes to the Agriculture, Open Space, and Rural policies to determine whether they are in fact non-substantive.

Given the length and breath of the Draft General Plan update and CEQA analysis, we made an attempt to focus our initial review and subsequent comments to issues specific to agriculture and farming. However, it’s clear that the 2040 General Plan will impact the Ventura County local economy across sectors – all of which influence the ability to live and work in this region. The DEIR’s lack of analysis of those economic impacts, calls into question the legitimacy of both the draft General Plan update, and the CEQA analysis. As such, we respectfully request that the DEIR be recirculated in the hopes that further study will resolve these shortcomings.

I appreciate your consideration.

Subject: Comments on General Plan/EIR

Letter
115

Sanger Hedrick, Chair
Agricultural Policy Advisory Committee (APAC) County of Ventura
800 S. Victoria Blvd.
Ventura, CA 93003

Re: 2040 General Plan Environmental Impact Report (EIR)

Dear Mr. Hedrick and Honorable Members of APAC:

Thank you for the opportunity to provide comments following today’s presentation by Ventura County Planning staff on the 2040 General Plan EIR.

I115-1

There are several issues with the 2040 General Plan EIR that CoLAB believes will negatively impact the viability of local agriculture.

Proposed mitigation measure AG-2: The County proposes that any project that either directly or indirectly results in the loss of farmland must obtain and place into perpetual agricultural preservation twice the total of the farmland loss. This mitigation measure is infeasible. Contrary to statements made by County Planning staff today at the APAC meeting, the California Environmental Quality Act (CEQA) requires that all mitigation proposed in an EIR be feasible. CEQA Section 21061.1 defines feasible as “capable of being accomplished in a successful manner within a reasonable period of time,” (emphasis added). All mitigation measures proposed in an EIR must be shown to reduce impacts and an infeasible mitigation measure, by definition, cannot and will not reduce impacts.

The EIR does not provide evidence of any of the following:

1. 1) Whether there is sufficient land available for purchase/conservation easement for each farmland category;
2. 2) The cost per acre to purchase each category of farmland;
3. 3) The anticipated cost of establishing a conservation easement for each category of farmland;
4. 4) The anticipated cost associated with managing each category of farmland under a conservation easement;
5. 5) The anticipated cost associated with monitoring these mitigation parcels scattered throughout the County and who will bear that cost;
6. 6) Any information that could constitute a “plan” for management of farmland in conservation easements;

I115-2

February 19, 2020

Ventura County Coalition of Labor, Agriculture and Business / 1672 Donlon Street, Ventura, CA 93003 / 805-633-2260 / info@colabvc.org

Page 2 of 4

- 7. 7) An analysis of direct and indirect impacts caused by this mitigation measure (including impacts associated with LU compatibility conflicts and increased urban-ag-interface);
- 8. 8) Whether the smallest possible mitigation acreage required will achieve the minimum to ensure viability of agriculture on the parcel; and
- 9. 9) Whether the proposed mitigation is in conflict with other ordinances and regulations, such as the County's Zoning Ordinance and the County's minimum lot sizes.

The County is already aware that this proposed mitigation measure is infeasible. On March 24, 2016, at a Local Agency Formation Commission (LAFCo) hearing, Supervisor Linda Parks attempted to establish an "Agricultural Mitigation Measure" through the LAFCo project approval process. The mitigation measure would have required the 1-to-1 purchase of local farmland (half of what is proposed in the 2040 General Plan EIR) to replace farmland that would be impacted by any proposed development. Ventura County Counsel, Michael Walker, informed both LAFCo and Supervisor Parks that the proposed mitigation measure did not meet the standard for economic feasibility, and, for that and other reasons, LAFCo could not adopt Supervisor Park's proposed mitigation measure. He referenced a 2015 legal decision, *City of Irvine v. County of Orange*, in which the Court stated, "the sheer astronomical expense of land supports the finding of the EIR that the purchase of an agricultural conservation easement is a non-starter."

I15-2
cont.

In addition to being infeasible, CoLAB does not believe that this mitigation measure will reduce impacts on agricultural land, as it does not address the actual issues that will impact farmland under the 2040 General Plan: lack of economic sustainability, the increasing regulatory demands on agriculture, increased competition for water resources, and increased compatibility conflicts from development.

Indirect Impacts

The EIR dismisses "indirect impacts" that will occur as a result of implementing the 2040 General Plan as "less than significant."

Page 4.2-13 of the EIR states "AG-2.3 maintains the Right-to-Farm Ordinance to protect agricultural land uses from conflicts with non-agricultural uses, as well as to help land purchasers and residents understand the potential for nuisance, (e.g., dust, noise, odors) that may occur as the natural result of living in or near agricultural areas...These sections of the code protect farmers engaged in agricultural activity from public nuisance claims...This protects the farming community, including Important Farmlands and farms less than 10 acres, from developments that would inhibit their ability to continue agricultural production."

I15-3

Page 4.2-17 of the EIR states: "Residential growth in areas nearby agricultural lands has the potential to result in land use conflicts. Residential land uses are generally more sensitive and prone to conflict with adjacent agricultural land uses than commercial or industrial land uses. The placement of sensitive land uses, such as residences and schools, nearby classified farmland can negatively impact both uses due to conflict including odor nuisances and noise from agriculture machinery. The countywide Right-to-Farm Ordinance protects existing agricultural and farming operations from conflicts attributed to residential development...Therefore, the potential for conflicts would be minimal. This impact would be less than significant" (emphasis added).

This is simply not true. Historic and recent County actions have shown that the County has and will continue to create new restrictions and ordinances that have a significant impact on existing agricultural

Ventura County Coalition of Labor, Agriculture and Business / 1672 Donlon Street, Ventura, CA 93003 / 805-633-2260 / info@colabvc.org

Page 3 of 4

and farming operations because of conflicts attributed to residential development. The recent interim urgency ordinance restricting hemp cultivation is one such example.

I15-3
cont.

Contrary to statements made today by Ventura County Planning staff, an EIR, whether it is labeled as “programmatic” or “project”, must analyze all reasonably foreseeable consequences of the action that is proposed. For the 2040 General Plan EIR, the action proposed is the implementation of all policies and programs within. Therefore, if the implementation of a policy in the 2040 General Plan will result in an impact, that impact must be analyzed. For example, the 2040 General Plan contains land use designation changes that will increase allowable housing density near agricultural land. It is reasonably foreseeable that more houses will create more compatibility conflicts with normal farming operations. The impact of these compatibility conflicts must be addressed in the EIR.

I15-4

In 2014, the California Court of Appeal stated in a ruling that “[T]he fact that this EIR is labeled a ‘project’ rather than a ‘program’ EIR matters little.... Designating an EIR as a program EIR ... does not by itself decrease the level of analysis otherwise required in the EIR. All EIRs must cover the same general content. The level of specificity of an EIR is determined by the nature of the project and the “rule of reason,” rather than any semantic label accorded to the EIR.”

It is CoLAB’s opinion that indirect impacts from increasing urban-ag interface are SIGNIFICANT and cannot be dismissed in the EIR.

Direct and indirect impacts of increased costs

The 2040 General Plan has policies that will increase the costs of normal farming operations. CoLAB believes that the most effective way to minimize conversion of agricultural land to non-agricultural uses is to take active measures to allow farming to remain profitable. And even the County admits that reducing the cost of farming reduces conversion of agricultural land in their discussion of the Williamson Act in Chapter 4.2 of the EIR.

I15-5

But the County fails to analyze direct and indirect impacts of 2040 General Plan policies that will increase the cost of normal farming operations, such as:

- Policy AG-5.2: Electric- or Renewable-Powered Agricultural Equipment. The County shall encourage and support the transition to electric- or renewable-powered or lower emission agricultural equipment in place of fossil fuel-powered equipment when feasible.
- Policy AG-5.3: Electric- or Renewable-Powered Irrigation Pumps. The County shall encourage farmers to convert fossil fuel-powered irrigation pumps to systems powered by electric or renewable energy sources, such as solar power, and encourage electric utilities to eliminate or reduce standby charges.

Direct and indirect impacts of increased competition for water resources

The County fails to evaluate the impact of increased competition for water resources caused by development allowed in the 2040 General Plan on either the conversion of agricultural land or the loss of agricultural lands through the loss of topsoil.

I15-6

The EIR states on page 4.2-3 that “...a reduction in available water resources for irrigation” is an example of indirect impacts on agricultural land due to loss of topsoil from increased wind and water erosion. But the County fails to analyze or propose mitigation measures to address this significant impact.

Ventura County Coalition of Labor, Agriculture and Business / 1672 Donlon Street, Ventura, CA 93003 / 805-633-2260 / info@colabvc.org

Page 4 of 4

APAC is the expert charged with advising County decision-makers on agricultural issues in Ventura County. And the County should be seeking guidance from APAC about the actual issues that will impact farmland under the 2040 General Plan: lack of economic sustainability, the increasing regulatory demands on agriculture, increased competition for water resources, and increased compatibility conflicts from development.

CoLAB encourages APAC to provide guidance to the County on appropriate and effective mitigation measures to prevent the conversion of agricultural land to non-agricultural uses. These may include:

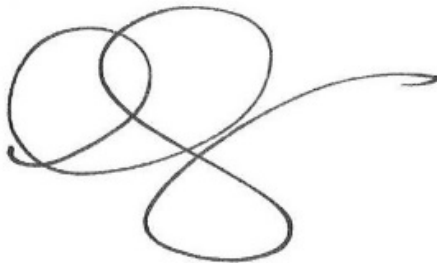

1. 1) Strengthen the Right-to-Farm ordinance to prevent nuisance complaints from being used to justify the creation or expansion of setbacks or regulatory restrictions on normal farming practices;
2. 2) Expand the Land Conservation Act Program to include Open Space zoned properties that are engaged in farming (including grazing); and
3. 3) Protect agricultural land from urban-ag interface encroachment and compatibility conflicts by establishing setbacks on NON-AE-zoned land that will restrict the construction of bike paths, public trails, and sensitive receptors within 2000' of any land zoned A/E.

I15-7

Thank you again for the opportunity to provide comments on this issue. We appreciate your consideration and leadership at this time.

Sincerely,

Louise Lampara Executive Director

In support of this letter-

**Letter
I16**

To: Susan Curtis-

County failed to evaluate mitigation measure for feasibility- 500' set back for "sensitive receptors" from freeways and high traffic roads.

Mitigation Measure AQ-3 (Policy HAZ10-X) creates a minimum 500' set back for "sensitive receptors" from freeways and high traffic roads. Yet the County states in the Land Use section of the EIR that "the majority of the anticipated build out will be within the freeway corridors."

Has the County completed a "buildout study" to ensure that the establishment of this set back still leaves enough room for development to occur? Will this mitigation measure be economically feasible?

Ventura County Resource Management Agency, Planning Division
 Attn: Susan Curtis, Manager, General Plan Update Section
 800 S. Victoria Ave., L #1740
 Ventura, CA 93009-1740

GeneralPlanUpdate@ventura.org

Dear Ms. Curtis:

I am writing to call your attention to significant flaws in the process, data, and conclusions of the Ventura County General Plan, Draft EIR, and supplemental documents.

My great grandfather, Mark McLoughlin (1843-1914), was a true Ventura County pioneer, purchasing his first 318 acres of undeveloped land in Ventura County in 1875. He was a hard-working visionary, revered by his community. With his son—my grandfather, James Patrick McLoughlin—he raised livestock and farmed the land, providing jobs and feeding the growing towns of Oxnard and Ventura.

I17-1

Our land, in a vitally important location on Olivas Park Drive across from the Ventura Marina, has been in the family, and part of the economic fabric of the community, for 100 years. And we want it to be part of the future of this community, with a flourishing economy, a thriving job market, and unsurpassed quality of life for its residents.

But the General Plan and DEIR do not describe a viable path for us as landowners going forward.

I will begin with some specific issues regarding language in the Coastal Area Plan, 4-82-83 and 4-94-95. Part of our land is located in the Central Coastal Zone, adjacent to the Ventura Marina, on Olivas Park Drive at Harbor Blvd. The only conclusion the Plan draws about our land is the statement that, “unlike the Preble area, services are not readily available to the Olivas lands.” This is false. Our property has access to all utilities, water, main roads, and the freeway. Indeed, easements on our property serve surrounding areas with utilities.

The Plan also claims that our property is “not included in the City’s sanitation district because of problems with water pressure.” This language is irrelevant and incorrect. There is no evidence that there are water pressure issues, and the sanitation district’s pipelines actually traverse our property.

I17-2

While we do not know the original source of these misstatements, such misrepresentations—now repeated in the Plan—threaten to diminish the value of our land in relation to the Preble property. And, of course, they undermine the goal and the value of the Plan itself.

The General Plan also speaks of the widening of Olivas Park Drive, our southern boundary. This would have a direct impact on our property. But the Plan does not address how this would happen or how it would affect our land.

Damaging misstatements about our property also appear in the DEIR. Contrary to the portrayal in the DEIR, our property has significant infrastructure in place, as well as prime accessibility to the highway and the harbor. In fact, with easy access to the marina and beach community, and with the railroad as part of our eastern boundary, our land is uniquely suited to be an important part of future economic development in the area. We are entitled to have all these matters corrected.

I17-3

I would also like to raise some additional concerns:

1. The General Plan and DEIR continue to ignore the 28% increase in the homeless population in our community.
2. According to the General Plan, if we were to build an acre of low income / worker housing we would need to buy two replacement acres of same Ag land to be placed into perpetual agricultural preservation. This is unrealistic and infeasible, and certainly not in line with the State government's housing policies.
3. The EIR does not adequately address the enormous "indirect impacts" that will occur as a result of implementing the General Plan, calling them "less than significant."
4. The General Plan contains policies that will increase the costs of normal farming operations, making it difficult for farming to remain profitable.
5. The Plan does not adequately evaluate the impacts of increased competition for water in our community.

I17-4

I17-5

I17-6

I17-7

I17-8

The EIR is a flawed document, full of errors, that does not disclose all impacts, direct and indirect, caused by the General Plan. It was obviously rushed—completed in six weeks. It is inaccurate and incomplete, and fails to provide members of the community with the information that they are legally entitled to. This EIR should be corrected and reconsidered, and a reasonable time period should be allowed for meaningful and thoughtful community input.

I17-9

Sincerely,
Beverly Chambers de Nicola

Letter
I18

February 24, 2020

Ventura County Board of Supervisors
Attn: RMA Planning Division
General Plan Update
800 Victoria Avenue L#1740
Ventura, California 93009-1740

Dear Board of Supervisors and Staff:

We are writing this letter to urge the Board of Supervisors to reconsider moving forward with the Draft General Plan EIR. The draft EIR has been accelerated to the point that too many issues and impacts have not been properly addressed or studied. These impacts and the corresponding mitigation measures will have severe impacts to land owners and especially those, like us in the agricultural industry and other productive economic segments.

I18-1

Our family has been involved in the agricultural industry for more than 100 years in Ventura County. We have owned numerous land holdings that remain in the family to this date. We have farmed throughout Ventura County and hope to continue to do so in the future.

The Draft EIR is deficient on many levels. CEQA requires that all mitigation measures must be technically and economically feasible. Numerous proposed mitigation measures are neither. We have in the past attempted to identify land and any owners that would be open to sell their development rights for land that was converting from agricultural to commercial use. Not only did we not find anyone that would do so, no one would even quote a price. The only positive response from numerous land owners were that you can buy my property for full market value and then you can do what you want. There is not a project that can be built by adding double land cost to the equation. This was very recently experienced based on proposed policies at LAFCo. These policies were eventually not enacted due to the inability to purchase development rights in an economical feasible manner. This was when LAFCo was contemplating an acre for acre ag preserve. The new policy that is proposed in the 2040 General Plan is requiring 2 acres for every 1 acre of land converted from ag to any other use. This will eliminate the ability to add any new required ag buildings or even farm worker housing. The Draft EIR must study these impacts, since they are not feasible.

I18-2

The Draft EIR also deals with water in a manner that is not properly studied. There is no analysis on increased water costs and diminishing availability of water. Without reasonable water costs and supply, there is no agricultural industry.

I18-3

The General Plan indicates that agriculture is a high priority in the County. However, new policies and requirements in the General Plan add additional mitigation measures that will make ag virtually impossible. These include new setbacks, limiting types of fumigants pesticides and fertilizers. The General Plan also requires the conversion of all farm equipment to be all electric. Again, not feasible. The costs to purchase new pumps, farm equipment and other existing fuel using equipment will increase operational costs to a point that the County crops will not be competitive in the open market. These new mitigation measures are not sufficiently studied and again are not economically feasible.

I18-4

The Draft EIR is extremely difficult to read and understand. The background reports are lacking in depth of what has been studied other than numerous general statements and very poor mapping. Detailed studies must be added to sufficiently identify impacts and the related mitigation measures for both direct and indirect impacts on the agricultural industry. It is our understanding that reports and studies need to be timely prepared. However numerous studies are older than 5 years. Not timely.

I18-5

After numerous devastating wildfires over the last few years, which significantly impacted ag, the General Plan continues to lay out limiting mitigation measures for fire prevention. The Wildlife corridor eliminates any ag operation or fire prevention in the proposed corridor areas. This is also a major concern not studied in the Draft EIR.

I18-6

The Draft EIR for the 2040 General plan does not provide adequate analysis for the expansion of permanent bike paths and pedestrian walking trails throughout the County. These impacts are very severe due to constant conflicts from trail users and ag operations. Spraying, dust, odors from ag operations, along with impacts created by the trail users. These are usually theft, vandalism, litter and pet waste. The proposed mitigation measures require additional setbacks from these trails which renders additional land unusable for ag operations.

I18-7

In addition to the above comments on the agricultural aspects and related land use concerns of the DEIR, the undersigned is also a mineral owner directly interested in the impacts on oil and gas production of the DEIR and related General Plan 2040 proposed provisions. In these documents there is a total failure to address the economic impacts of the various policies proposed in violation of the requirements for this process, including but not limited to the loss of royalty income to a large group of County residents. I join in the detailed comments on the various deficiencies and concerns identified in the DEIR as described in the concurrent submissions on behalf of Aera Energy and other operators delivered this week to the County.

I18-8

Please look at the long-term consequences of these General Plan policies and mitigation measures. We formally request additional studies and a revised Draft EIR that will properly look at these and many more issues. The DEIR must be corrected with details of the revisions. Then it can be recirculated.

I18-9

Sincerely,

Beverly Gutierrez

This comment letter repeats many of the same comments provided in Letter I4. The responses below provide cross references to the portions of Letter I4 where responses to the same comments have already been provided.

- I18-1 Refer to response to comment I4-1 regarding the adequacy of the draft EIR.
- I18-2 Refer to Master Response MR-5 regarding the feasibility of Mitigation Measure AG-2.
- I18-3 Refer to response to comment I4-3 regarding water availability and cost.
- I18-4 Refer to response to comment I4-4 regarding economic feasibility of General Plan policies that could affect agricultural operations.
- I18-5 Refer to response to comment I4-5 regarding the commenter's request for detailed studies and Master Response MR-6 for discussion of how the County appropriately uses the Background Report to describe the existing environmental setting in the draft EIR.
- I18-6 Refer to response to comment I4-6 regarding wildfires, fire prevention, and the County's Habitat Connectivity and Wildlife Corridor ordinances.
- I18-7 Refer to response to comment I4-7 regarding potential incompatibilities with adjacent bicycle and pedestrian paths.
- I18-8 The commenter refers to letters submitted by Aera Energy. See responses to Letters O5 and O6.
- I18-9 Refer to response to comment I4-9 regarding adequacy of the draft EIR and Master Response MR-7, which explains in detail why recirculation of the draft EIR is not required.

FEB 28 2020

Letter 119

23 February 2020

MAR 02 2020 11:15

RMA Planning Division
General Plan Update
800 Victoria Ave, L# 1740
Ventura, CA 93009-1740

Dear Ms. Susan Curtis;

I am writing to you for the purpose of commenting on the EIR for 2040 which was recently released in the fall of 2019. A County's General Plan is one of the most important documents that a County produces. This document is flawed in so many ways which is due to the reality, EIR's take 12-18 months to complete and this one was finished in 6 weeks!! I have selected just a few issues, however, I want to state this entire EIR has failed to achieve its primary purpose, in sooooo many ways.

I19-1

BACKGROUND REPORTS (BR)

BR's are the basis of data used for analysis of impacts. The EIR refers throughout to the the BR as the source of data and technical information used in the analysis of impacts.

The EIR states that the BR contains substantive information used to conduct impact analysis. However, the BR actually only contains general, incomplete and often incorrect or generalized information that cannot be applied to the impact analysis. The BR fails to provide adequate technical information to be utilized as the County claims.

The maps provided in the EIR and the Background Report are of such low resolution and detail that they do not provide the reader with the information necessary to evaluate or determine impacts or even to determine which parcels or areas may lack sufficient site exposure for solar installations to be effective or feasible. Much of the data in the BR is outdated.

I19-2

EXAMPLES:

1. Map 9-7 is of such poor quality and resolution that it is impossible to read the words. A map of such poor resolution and quality does not meet the CEQA standard of providing adequate information so the reader can evaluate the County's analysis of impacts.
2. All the tables in the Ag Chapter contain outdated information- the most recent data cited is from 2015.

Page Two

County fails to address the true impact on agriculture (lack of processing facilities and operations decreases economic sustainability of local ag.)

In the BR, the County admits that while "Current trend is for locally grown" products, there are very limited opportunities for this in Ventura County due to the lack of processing facilities.

Processing operations are restricted because of County policies and regulations. The EIR did not analyze the impact of lack of processing facilities on agriculture. The County did not propose any mitigation measures to reduce this impact.

I19-3

PROPOSE MITIGATION MEASURE:

Allow for the construction and operation of agricultural processing facilities. The mitigation measure will reduce the impact of conversion of ag lands to non-ag uses by improving long term economic-sustainability for agriculture.

COUNTY FAILS TO ANALYZE & REDUCE THE IMPACTS OF "ACTUAL" ISSUES.

Actual issues impacting agriculture in Ventura County that contribute to the conversion of ag land:

1. Water
2. Economics (extremely expensive are to do ag)
3. Lack of farmworker supply and housing
4. Increased regulatory burden from increasing compatibility issues from urban/ag interface

I19-4

County analyzed **NONE** of these issues and proposed no mitigation to address any of these issues.

Thank you Susan for your time.

 Bruce Holley
 Local Businessman
 Oxnard, CA

| | |
|------------------------------|--------------------------------------------------|
| <p>Letter I19</p> | <p>Bruce Holley February 23, 2020</p> |
|------------------------------|--------------------------------------------------|

- I19-1 This comment regarding the adequacy of the draft EIR is noted. However, no specific issues related to the content, analysis, conclusions, or overall adequacy of the draft EIR are raised in this comment. Therefore, no further response is provided.
- I19-2 The comment states that the 2040 General Plan Update Background Report contains incomplete and incorrect generalized information such that the reader cannot evaluate impacts or determine which parcels or areas may lack sufficient site exposure for solar installations to be effective or feasible. Refer to Master Response MR-6 for a discussion of the accuracy and timeliness of the information provided in the Background Report. Note that the EIR provides a programmatic evaluation of the 2040 General Plan and is not intended to support parcel-level analysis. For example, Figure 9-7 shows agricultural areas and watersheds for the entire county with sufficient clarity to illustrate the spatial relationship between the resources. The data characterizing agricultural land use in the County provides a reasonable representation of conditions to inform an analysis of potential effects. The commenter’s reference to solar installations does not appear to be related to the adequacy of the draft EIR. Also refer to response to comment I10-2.
- I19-3 The comment suggests that the draft EIR should consider expanding the potential for the agricultural processing facilities through modification of the zoning ordinance as mitigation in the draft EIR. Refer to response to comment O32-24 regarding this suggestion.
- I19-4 The comment states that the draft EIR does not analyze impacts related to water, economics, farmworker housing, and compatibility issues from urban/agriculture interface. Refer to response to comment O32-15 for a discussion of where these issues are addressed in the EIR—with the exception of economic impacts, which are not required to be treated as significant effects on the environment (State CEQA Guidelines, § 15131). Mitigation measures are provided for significant impacts, as required by the California Environmental Quality Act. The comment does not provide specific issues related to the content, analysis, conclusions, or overall adequacy of the draft EIR. Therefore, no further response is provided.

Comments on Draft 2040 County General Plan and DEIR

**Letter
120**

**Bruce Smith, AICP
3457 San Pablo St.
Ventura, CA 93003
February 24, 2020**

The following are my comments based on my cursory review of the Draft 2040 General Plan and DEIR:

DRAFT 2040 COUNTY GENERAL PLAN:

Land Use and Community Character Element:

LU-3.3 Range of Uses in the Existing Community Designation (pg. 2-12):

This policy states in part: ...*"The County shall allow the appropriate zoning, population densities, and building intensities based on the adopted Area Plan or, where no Area Plan exists, by the applicable Existing Community Map contained in Appendix A. Because of the degree of specificity on the Existing Community Maps, the County shall require a General Plan amendment for any zone change within an Existing Community."* (Emphasis added)

It appears that the zoning maps and population density and building intensity tables for Existing Communities of the current General plan have not been included in Appendix A of the Draft General Plan. As such, the requirement for a General Plan amendment for any zone change within an Existing Community would be without legal basis, since there would be nothing to amend in the Draft General Plan. Although it could be argued that a zone change that is inconsistent with Table 2-1 of the proposed General Plan would require a General Plan Amendment, such zone changes could be potentially inconsistent with the Guidelines for Orderly Development (retain land uses and development at pre-established levels) and could cause potential impacts that have not been discussed in the DEIR.

Having no building intensity standards for Existing Communities would be inconsistent with the requirements of existing California General Plan law since these areas would have no building intensity standards (i.e., maximum lot coverage). (See comments regarding Table 2-2).

I20-1

Table 2-1 General Plan Land Use Designations and Zoning Compatibility Matrix
(pg. 2-19):

As I stated in my May 2019 comments on the Preliminary Draft, the RA (Rural Agriculture) zone is not compatible with the Agricultural designation and should be eliminated therefrom. The RA zone predates the adoption of the Agricultural designation of the current General Plan, is listed under the heading of “Rural Residential Zones” in the Non-Coastal Zoning Ordinance, and allows many land uses that are incompatible with the purpose of the Agricultural designation. For example, the RA zone allows:

- Assembly Uses
- Intermediate and Residential Care of 7 or More Persons
- Cemeteries and Accessory Crematories, Columbaria and Mausoleums
- Cultural Heritage Sites with Historic Repository
- Colleges and universities
- Schools, elementary and secondary (boarding and nonboarding)
- Correctional Institutions
- Libraries
- Mobilehome Parks
- Camps
- Campgrounds
- Golf Courses and/or Driving Ranges
- Recreational Vehicle Parks
- Retreats
- Recyclables Collection Centers

I20-2

Failure to eliminate the RA Zone from the Agricultural designation will potentially cause significant adverse impacts regarding the loss of agricultural soils/crops, is growth inducing, and is inconsistent with the purpose and intent of the SOAR Ordinance. The Draft EIR does not currently discuss or analyzed these impacts.

If for some reason the County seeks to allow the RA zone under the ECU-Agricultural designation (not subject to SOAR), then the purpose and intent should be clearly stated and any potential impacts discussed in the EIR.

Table 2-2 Land Use Designations and General Development Standards (Pg. 2-21)

As I stated in my May 2019 comments on the Preliminary Draft, this table contains no maximum lot coverage standards for the urban Residential Designations and contains a footnote stating: “*Maximum lot coverage is per appropriate County Zoning classification.*” However, the Non-Coastal Zoning Ordinance states that the Maximum Percentage of Building Coverage standard for each zone is: “*As determined by the General Plan or Applicable Area Plan.*” With the exception of the Saticoy Area Plan, all

I20-3

Area Plans and Existing Communities not covered by an Area Plan currently contain maximum lot coverage standards. Moreover, this table fails to make reference to LU-10.3 Maximum Lot Coverage Nonconforming Lots (pg. 2-39). Therefore, this table needs to be corrected to make reference to maximum lot coverage standards contained in the Area Plans, Existing Community tables of the current countywide General Plan, and LU-10.3.

In addition, it appears that the zoning maps and population density and building intensity tables of each of the Existing Communities outside of an Area Plan of the current countywide General Plan have been eliminated in the proposed General Plan. This creates an inconsistency with State General Plan law since the Existing Community areas outside of an Area Plan would have no building intensity standards (see preceding comment regarding policy LU-3.3) and makes the Draft General Plan internally inconsistent. Therefore, these zoning maps and population density and building intensity tables should be added to either Appendix A, or an expanded Chapter 11 to address both Area Plans and Existing Communities.

ECU-Rural (ECU-R) (pg. 2-28), first paragraph is confusing and subject to misinterpretation, and should be modified to read:

I20-3
cont.

This designation applies within the boundaries of an Existing Community designated area and provides a physical transition between the outer edges of an Existing Community or Urban Area and nearby adjacent aAgricultural and eOpen eSpace designated areas and uses. ~~The ECU-Rural designation generally applies to the outer edges of Existing Community and Urban Areas and~~ around sensitive natural resources within the boundaries of an Existing Community designated area. Typical building types include large-lot single family homes in a rural setting.

PARKS & RECREATION LAND USE DESIGNATION (pg. 2-44) – *“This designation provides for parks and recreation facilities and associated recreation uses. The Parks and Recreation (PR) designation is only allowed in areas designated as Existing Community, Area Plans, or Areas of Interest under Policy LU-1.2.”* (Emphasis added)

This land use designation is apparently being created as a place saver for; 1) a future General Plan Amendment to actually designate specific properties with this designation and 2) a future Zoning Ordinance amendment to create a “REC” zone which would governing uses and development/operational standards.

Since the designation 1) only has a general description of allowed land uses (*parks and recreation facilities and associated recreation uses*), 2) the only development standard is *5% maximum lot coverage*, and 3) the designation is *allowed in areas designated Community, Area Plans, or Areas of Interest*, it is unclear how this designation is intended to be used. If the purpose is to change the land use designation of existing or planned parks and recreational facilities from Open Space, Agricultural, Rural, Existing Community and/or Urban designations to Parks and Recreation(PR), then that should be clearly stated. Moreover, the text of the Draft General Plan and Background Report should clearly state the current problem that the PR designation is intended to solve. In addition, it is unclear how the PR designation and the REC zoning would be consistent with the SOAR Ordinance on lands that are currently designated Open Space, Agricultural or Rural.

I20-3
cont.

If the unstated purpose of the PR designation is that it should only be applied to lands that are currently designated Existing Community or Urban, then the reference to Area Plans should be qualified by Unincorporated Urban Center of said Plans. In addition, since the reference to Areas of Interest would mean that most of the south half of the County would be eligible for re-designation from Agricultural, Open Space and Rural to PR, such re-designations would generally require a countywide vote under the provisions of the SOAR Ordinance. Unless this is clearly the Board's intent, the reference to Areas of Interest should be eliminated.

LU-12.1 Parks and Recreational Facilities (pg. 2-46).

"The County shall support the development of parks and recreation facilities within areas designated as Existing Community, Area Plans, or Areas of Interest."

My comments regarding PARKS & RECREATION LAND USE DESIGNATION above, also apply to this policy. In addition, this policy seems overly broad in that a proposed park and recreational facility may have significant adverse, un-mitigatable impacts such as the loss of agricultural soils or the loss of natural resources. This policy, as worded, may prevent the County from denying such a project. The DEIR does not discuss these potential impacts.

I20-4

Chapter 11 – Area Plans:

The last paragraph on page 11-1 states: *"Table 11-1 shows the compatibility between land use designations in the countywide General Plan and Area Plans. The solid squares indicate a directly compatible relationship between the two designations, and the empty square indicates limited compatibility because of a restriction from the development standards."*

I20-5

State law requires that a General Plan (including Area Plans) be internally consistent. Table 11-1 is replete with errors and needs to be comprehensively reviewed and corrected, especially in light of the zoning compatibility matrix of each Area Plan and Table 2-1 of the Draft countywide General Plan. As an example, the table incorrectly shows several Urban Residential designations of the Area Plans to be directly compatible with the Rural, ECU-Rural, Agricultural, ECU Agricultural, Open Space, and ECU-Open Space designations of the countywide General Plan. In addition, the table incorrectly shows Rural Residential Designations of the Area Plans to be directly compatible with the Agricultural, ECU-Agricultural, Open Space, and ECU-Open Space designations of the countywide General Plan. Additionally, the Open Space designations of the Area Plans are incorrectly shown as being directly compatible with the Agricultural and ECU-Agricultural designations of the countywide General Plan. Other inconsistencies exist within the table as well.

Neither the text of Chapter 11 nor Table 11-2 explains what is generally or precisely meant by “...empty square indicates limited compatibility because of a restriction from the development standards.” Without explanation, this phrase is meaningless.”

Unless Table 2-1 is corrected, the proposed General Plan will be internally inconsistent, exposing the County to a significant legal challenge in court.

I20-5
cont.

Appendices:

Appendix A - Area Plan and Existing Community Land Use Maps:

As I stated in my comments on Table 2-2, Appendix A should make reference to maximum lot coverage standards contained in the Area Plans, and include the maximum lot coverage standards of each of the Existing Communities in the current countywide General Plan.

General Comment regarding maps: Because of the scale of many of the maps, the Existing Community boundaries and land use designations within the Existing Community areas are unreadable and cannot be checked for accuracy. In addition, many of the land use designation labels on the maps are misplaced or unclear as to what parcels they apply to.

Figure A-2: General Plan Land Use Diagram - Lake Sherwood/Hidden Valley Area Plan: This map shows land use designations of some of the Existing Community areas that are within the Thousand Oaks Area Plan, which is confusing.

Figure A-8: General Plan Land Use Diagram - Thousand Oaks Area Plan: This map shows land use designations of some of the Existing Community areas that are within the Lake Sherwood/Hidden Valley Area Plan, which is confusing. In addition, the labels for land use designations within the Camarillo Area of Interest are unnecessary.

Figure A-21: General Plan Land Use Diagram - North Simi Valley: It is unclear what parcels the ECU-Open Space designation applies to since it is in an area that is outside of an Existing Community.

Figure A-23: General Plan Land Use Diagram - Santa Susana: The boundaries of the Existing Community along the north and northwest are confusing.

I20-5
cont.

DRAFT ENVIRONMENTAL IMPACT REPORT:

6.5.2 Alternative 2: Existing Community and Urban Area Designations Alternative (pg. 6-15):

Third paragraph states in part that *“Very Low Density or Low Density Residential lands outside of the Existing Community area designation (boundary) and Urban area designation (boundary) would remain the same as under the 2040 General Plan.”* (emphasis added). This is incorrect since the Very Low Density and Low Density Residential designations are only consistent with the Existing Community and Urban area designations, and are inconsistent with Rural, Agricultural and Open Space designations. Therefore, this sentence should be removed.

Pg. 6-16, Second paragraph, first sentence:

This sentence states: *“In addition, this alternative would employ policy incentives and disincentives to focus future population, housing, and employment growth within the Urban and Existing Community area designations.”* The feasibility and effectiveness of these incentives and disincentives is highly questionable, especially the transfer of development rights from Rural, Agricultural and Open Space designated lands.

Pg. 6-16, Fourth paragraph, first sentence:

“Overall population growth, housing, and employment projections for this alternative would be the same as under the 2040 General Plan.” This sentence is confusing in light of the next sentence of the paragraph that states that this alternative: *“... would result in substantially higher rates of population and job growth within these area designations relative to the 2040 General Plan.”* Therefore, the first sentence should be deleted.

I20-6

Comparison of Significant Environmental Effects (pg. 6-16)

First sentence states: *“This alternative would focus new development (e.g., more housing units, increase commercial square footage) anticipated to result from population growth that is forecast to occur over the life of the 2040 General Plan within a smaller disturbance footprint.”* (emphasis added). This statement is illogical since the Draft 2040 General Plan’s Very Low Density and Low Density Residential designated areas would be changed to more intense land use designations, which would result in greater disturbances to the existing physical and planned environment.

I20-7

Many of the other positive effects of this alternative seem to be based on the expectation of transfer of development rights from Rural, Agricultural and Open Space designated lands; however, there is no quantification of impacts and the benefits are based on an incentive that is highly speculative.

6.5.3 Alternative 3: Dense Cores Alternative

This alternative suffers from the same deficiencies as the preceding alternative: there is no quantification of impacts and the benefits are based on an incentive that is highly speculative.

I20-8

| | |
|-------------------|-----------------------------------------------|
| Letter I20 | Bruce Smith, AICP February 24, 2020 |
|-------------------|-----------------------------------------------|

I20-1

The comment asserts that any zone change under the 2040 General Plan could be inconsistent with the Guidelines for Orderly Development and could result in impacts not discussed in the draft EIR. Further, the comment asserts that lack of building intensity standards for Existing Communities would be inconsistent with the requirements of existing California General Plan law. The 2040 General Plan land use diagram establishes land use designations for the unincorporated county, including portions of the county within the Existing Community area designation. These land use designations do not change the land use zoning or building intensities on any properties compared to existing conditions; the designations were established based on the underlying zoning, thereby creating consistency. Any subsequent zoning amendment applications would also require update to the 2040 General Plan to maintain this consistency.

Future zoning amendments would be subject to review by the County. Potential for inconsistency with the Guidelines for Orderly development would be evaluated at the time the proponent applies for the zone change. The draft EIR has assumed that future development would be consistent with established regulations; the County has no basis upon which to speculate about future zoning amendments that could be inconsistent with the Guidelines for Orderly Development. Any such applications would undergo project-specific evaluation at the time the request is made.

Every location in the unincorporated county has a General Plan land use designation that includes an intensity maximum, as expressed by building footprint coverage. Population densities were intentionally omitted from the 2040 General Plan and are not required under State law. Refer to Master Response MR-2 for further discussion of the development potential (maximum density, intensity, and lot coverage) established by the land use designations in the 2040 General Plan.

I20-2

The comment states that the 2040 General Plan, Land Use and Community Character Element, Table 2-1, General Plan Land Use Designations and Zoning Compatibility Matrix (page 2-19), incorrectly identifies the Rural Agriculture zone as a compatible land use with the Agricultural land use designation. Planning Division staff have reviewed the existing General Plan Figure 3.2a, Zoning Compatibility Matrix, Non-Coastal Zones (page 73), and determined that identifying the Rural Agriculture zone as a new compatible land use with the Agricultural land use designation in Table 2-1 of the 2040 General Plan was recommended to the Board of Supervisors in error. The Planning Division will recommend that the Board of Supervisors correct this error in Table 2-1 during the adoption hearings for the final 2040 General Plan.

The comment also states that Table 2-1 indicates that the Rural Agriculture zone is a compatible land use with the proposed Existing Community-Agricultural (ECU-Agricultural) land use designation and asserts that the potential impacts of this compatibility should be analyzed in the draft EIR. By way of background, the draft EIR Section 4.11, "Land Use and Planning," indicates that the current Existing Community and Urban designations were retained as new area designations in the 2040 General Plan (page 4.11-9). Additionally, the Existing Community designation identifies existing urban residential, commercial, or industrial enclaves located outside Urban-designated areas. Furthermore, the County originally established the Existing Community designation to recognize existing unincorporated areas that have been developed with urban building intensities and urban land uses; to contain these enclaves within specific areas to prevent further expansion; and to limit the building intensity and land use to previously established levels to minimize incompatible land uses in these areas. The 2040 General Plan proposes to refine the Existing Community and Urban land use designations, as they currently exist in the current General Plan, by establishing new land use designations that provide more detailed information on the types of land uses (e.g., commercial, industrial, residential) that would be allowable within areas currently designated as Existing Community and Urban (Table 4.11-1). The draft EIR explains that these refined land use designations would result in future development that is consistent with the land uses, densities, and parcel sizes of Existing Communities based on current zoning (page 4.11-19).

The comment asserts that the potential impacts of deeming the Rural Agriculture zone compatible with the proposed Existing Community-Agricultural (ECU-Agricultural) General Plan designation should be analyzed in the draft EIR, and that such compatibility is "inconsistent with the purpose and intent of the [Save Open Space and Agricultural Resources (SOAR)] ordinance." The compatibility

of this zone classification and land use designation remains unchanged from the existing General Plan, Figure 3.2a, Zoning Compatibility Matrix, Non-Coastal Zones (page 73), which identifies the Rural Agriculture zone as a compatible with the Existing Community land use designation. Because the existing General Plan designation of all land that would be subject to the proposed ECU-Agricultural land use designation is Existing Community, none of the land is subject to the SOAR initiative measure which only applies to land designated Agricultural, Open Space, and Rural. Therefore, SOAR is not implicated and no additional analysis in the draft EIR is required to identify potential impacts of the compatibility of the Rural Agriculture zone and the Existing Community-Agricultural (ECU-Agricultural) land use designation. The remainder of the comment addresses implementation of the 2040 General Plan and is not related to the adequacy of the draft EIR. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopted a final 2040 General Plan.

- I20-3 The comment addresses the draft 2040 General Plan and is not related to the adequacy of the draft EIR. Therefore, no response is required. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan. Also refer to Master Response MR-2 describing the Parks and Recreation designation of the 2040 General Plan.
- I20-4 The comment cites Policy LU-12.1 in the 2040 General Plan, through which the County would “support the development of parks and recreation facilities within areas designated as Existing Community, Area Plans, or Areas of Interest” and asserts that this policy could result in a loss of agricultural and natural resources because it “may prevent the County from denying such a project.” First, Existing Community, Area Plans, and Areas of Interest are the portions of the county that are envisioned to accommodate the majority of the anticipated population growth over the 20-year planning horizon. These are the areas where populations that would use park facilities are located. They are not generally areas that support high-quality agricultural land or natural resources. Second, there is no reason that the County cannot both implement Policy LU-12.1 encouraging development of parks to serve existing communities and implement policies in the 2040 General Plan that protect agricultural and natural resources. Therefore, the commenter’s concern that Policy LU-12.1 would result in environmental impacts that are not evaluated in the draft EIR is speculative given the regulatory environment and the policies in the 2040 General Plan.

By analyzing the entire 2040 General Plan on a programmatic level, the draft EIR addresses the direct and indirect impacts of Policy LU-12.1. The comment does not raise a new or substantially more severe significant impact that was not already included in the draft EIR. No changes to the draft EIR have been made in response to this comment. Also refer to Master Response MR-2 describing the Parks and Recreation designation of the 2040 General Plan.

- I20-5 The comment provides suggested edits to the 2040 General Plan. Refer to response to comment O33-9 for discussion of the internal consistency of the 2040 General Plan and Area Plans. However, this comment is acknowledged for

the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan. No further response is required.

I20-6

The comment makes several statements regarding the description of Alternative 2 in Chapter 6, “Alternatives,” of the draft EIR. In response to this comment, the third paragraph under in Section 6.5.2, “Alternative 2: Existing Community and Urban Area Designations Alternative,” on page 6-15 of the draft EIR is revised to read:

However, the land use diagram of this alternative would be different from the 2040 General Plan in the following ways. ~~Very Low Density or Low Density Residential lands outside of the Existing Community area designation (boundary) and Urban area designation (boundary) would remain the same as under the 2040 General Plan.~~ Very Low Density or Low Density Residential lands located within the Existing Community area designation (boundary) and Urban area designation (boundary) would be designated as Medium-Density Residential or Residential High-Density.

As noted by the commenter, Alternative 2 would accommodate the same projected population, housing, and employment increases in the unincorporated county as the 2040 General Plan. As indicated on page 6-16 of the draft EIR, these changes in the land use diagram would necessitate “changes in the zoning designations and minimum parcel sizes (suffices in the Zoning Compatibility Matrix) as well as updates to the development standards to ensure increases in lot coverages, reduced setbacks and parking requirements, increased building heights to a maximum of 45 or 50 feet to accommodate a minimum of 3-story development (such as podium parking with two-stories residential above) in order to allow the county to accommodate the same amount of forecasted growth as the 2040 General Plan within more compact areas.” In the draft EIR the County describes potentially feasible policies and programs that incentivize this development pattern would support implementation of this alternative. The commenter’s concern about the effectiveness of these programs is noted and no further response to this issue is required.

No edits have been made to the language in the fourth paragraph on page 6-16 of the draft EIR, which is excerpted below. Both of the following statements are correct.

Overall population growth, housing, and employment projections for this alternative would be the same as under the 2040 General Plan. The lands within the Existing Community area designation (boundary) and Urban area designation (boundary) would become highly urbanized communities featuring high density and intensity development that create substantial additional opportunities to accommodate new housing units and commercial, office, and mixed-use land uses, which in turn would result in substantially higher rates of population and job growth within these area designations relative to the 2040 General Plan.

I20-7 The comment questions a statement within the description of Alternative 2 that forecast growth would occur within a smaller disturbance footprint than development the 2040 General Plan. However, this statement is accurate. As explained in the draft EIR (page 6-16), this alternative would employ policy incentives and disincentives to focus future population, housing, and employment growth within the Urban and Existing Community area designations. As described in the response to comment I20-6, the draft EIR describes the following potentially feasible policies and programs that could implement this alternative:

The types of policies and programs that would be created or revised to focus development within these areas would include changing development impact fees, parking standards, and permitting timelines. County investments in new or upgraded public infrastructure and other public expenditures would be prioritized within Urban and Existing Community area designations and limited elsewhere. This alternative could also include use of a transfer of development rights programs in which land owners outside of Urban and Existing Community area designations would be compensated for redirecting their development rights to land within these areas (page 6-16).

Alternative 2 includes more than just a transfer of development rights program. The comment also does not explain why transfer of development rights programs are “highly speculative.” This alternative is a potentially feasible development alternative that would avoid or substantially lessen one or more of the significant environmental effects identified in the draft EIR. The California Environmental Quality Act (CEQA) does not require that alternatives analysis include quantification of impacts. The evaluation of Alternative 2 meets the CEQA standard for level of detail and permits a comparison between alternatives. A determination of feasibility ultimately rests with the decision-making body of the lead agency.

I20-8 The draft EIR provides an appropriately supported and reasoned assessment of potentially feasible alternatives. CEQA does not require that alternatives analysis include quantification of impacts. As indicated in response to comment I20-7, above, for Alternative 2, the draft EIR describes the potentially feasible policies and programs that could implement Alternative 3, including the same types of policies and programs described for Alternative 2 plus specified revisions to the land use diagram to further accommodate growth within targeted areas of the county. Alternative 3 includes more than just a transfer of development rights program. The comment also does not explain why transfer of development rights programs are “highly speculative.” The analysis of alternatives is comparative and is not required to provide an equal level of detail in the draft EIR as the evaluation of the 2040 General Plan.

Comments on COS-7.2 setback requirements for oil and gas wells, **DEIR for GPU 2040**

From: Carol Holly, 10508 Sulphur Mountain Road, Ojai, CA 93023

Proposed General Plan 2040 Policy:

- **COS-7.2: Oil Well Distance Criteria.** The County shall require new discretionary oil wells to be located a minimum of 1,500 feet from residential dwellings and 2,500 from any school. (RDR) [Source: New Policy]

The DEIR suggests a mitigation measure to the above policy to decrease the setback from schools (and to include day care centers) from 2500' to 1500'. The reasoning in the DEIR for this decrease in setback is to allow a potential operator in the future who perhaps wanted to drill an oil well without directional drilling to place the well on the drill pad anywhere they want. The DEIR stretches common sense with this argument. If the future operator can drill horizontally 1500' as stated in the DEIR, why not 2500'? There is a difference in the cost of drilling, but the risk to the health and safety of young children far outweighs the small economic cost to an operator or two.

I21-1

I was an elementary school principal in Ojai Unified School District for 22 years. In my role, among other things, I was responsible for ensuring the health and safety of children assigned to my school. Many young children suffer from asthma and skin allergies. All children love to run and play at recess. It is critical that those sensitive children are protected from unwanted and unnecessary exposure to air toxins that may cause serious complications leading to poor school attendance and miserable days of recovery time.

In my last assignment before retiring, I was principal at a school with three classrooms of special needs children, some of whom were medically fragile and who suffered from life-threatening childhood illnesses. This latter group of children were often highly sensitive to changes in their environment and the reactions they suffered were sometimes immediate and very serious. I remember asking one mother of such a child, "when would you like me to call 911?" Her response was, "any time you want to." As chilling as that sounds, it was real.

I21-2

Air toxins are dangerous to anyone in close proximity to the source of the emissions, but they are especially dangerous to young children. Children who are medically fragile may find them intolerable.

Bad Accidents Happen

In 2006, oil well #36 in the Ojai Oil Field began spewing a mixture of brine water and oil at the rate of 210 gallons per minute (5 barrels) after a 3.1 magnitude earthquake on the San Cayetano Fault (see attached DOGGR report). Summit School at that time had a population of approximately 80 K-6 grade students. The school is cited about 1000' from well #36 (see attached map). The well continued to spew a toxic mix of brine water and unknown other

chemicals used in the capping process onto the land for three months. The well casing break was very difficult to get under control. Finally, after accruing a cost of 4 million dollars, the flow was stopped. During the entire time the well was being worked on by teams of international well control experts no one at the school was notified of the disaster unfolding on the hillside upwind from the school. Children continued to play on the playground, teachers taught physical education, parents with babies dropped off and picked up their students. **No one knew.** Where was the Ventura County Environmental Health Department? Where was DOGGR? Where was the fire department whose station is just a few hundred feet east of Summit School? Were any tests done on air quality near the school?

After the well was capped and the drill rigs and heavy equipment all cleared out, a parent of children at the school was told of the disaster by a worker from the oilfield. The story spread and we were collectively horrified. There was never any follow-up study or even a quick check-in to see how the children of Summit School were doing. No one knows if the school attendance went down, or if there are students with lasting health issues caused by breathing toxic chemicals for three months. No one knows because no one asked.

If staff and the industry assert in response to this comment that there is no evidence that anyone was sick or hurt by the break in well #36, be aware. How can there be evidence when 1) no one knew of the emergency in real time, 2) no studies were ever done to look for possible effects of the spill to human health at the school and 3) the air quality at the school was never tested?

A setback distance of 2,500', roughly 1/3 of a mile, is about all we can do to protect the health of young children at a school near active or idled oil and gas activities.

I can assure you that no one with a medically fragile child would ever rent or buy a house 1500' from an active oil well if they could possibly avoid it, why would they have to send their child to a school 1500' from such a well?

Please reject the mitigation measure and retain the 2500' setback from schools and day care centers.

Thank you,

Carol Holly,

Retired Elementary School Principal, Ojai Unified School District,

MS Educational Administration

I21-2
cont.

|-------------------|-----------------------------------------|
| Letter I21 | Carol Holly February 27, 2020 |
|-------------------|-----------------------------------------|

I21-1 Refer to Master Response MR-4, Section MR-4.H “Buffers (Setback)” and Section MR-4.I “Directional Drilling,” regarding the findings and conclusions related to buffers (setbacks) and directional drilling in oil and gas operations.

I21-2 The description of the commenting individual’s role and experiences as a principal in the Ojai Unified School District and the 2006 incident at oil well #36 in the Ojai Oil Field are noted. Based on these experiences and the effects of air quality impairment on sensitive receptors, the commenter expresses support for setback requirements between oil wells and schools. Refer to response to comment I21-1, above, regarding the effects of implementing General Plan Policy COS-7.2 (Oil Well Distance Criteria) related to health and safety.

The comment also references attachments to the main body of the letter that documents details about the 2006 release from well #36. The County has reviewed the attachments and determined that they do not contain comment on the content or conclusions of the draft EIR, nor do they raise any significant environmental issues for which a response is required. All comment letters submitted to the County on the draft EIR are provided with complete attachments in Attachment 1 to this final EIR.

Finally, the comment requests that the County “reject the mitigation measure and retain the 2500’ setback from schools.” As proposed in the 2040 General Plan, Policy COS-7.2 would require new discretionary oil wells to be located a minimum of 2,500 from any school. Based on the literature review and balancing the potential to hamper access to oil and gas reserves identified in Section 4.12, “Minerals and Petroleum Resources,” Mitigation Measure PR-1 would reduce the setback for schools to 1,500 feet. This comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan. Refer also to Master Response MR-4, Section MR-4.H, “Buffers (Setbacks),” for additional discussion of Policy COS-7.2, setback requirements, and Mitigation Measure PR-1.

February 24, 2020

Ventura County Board of Supervisors
Attn: RMA Planning Division
General Plan Update
800 Victoria Avenue L#1740
Ventura, California 93009-1740

Dear Board of Supervisors and Staff:

We are writing this letter to urge the Board of Supervisors to reconsider moving forward with the Draft General Plan EIR. The draft EIR has been accelerated to the point that too many issues and impacts have not been properly addressed or studied. These impacts and the corresponding mitigation measures will have severe impacts to land owners and especially those, like us in the agricultural industry and other productive economic segments.

I22-1

Our family has been involved in the agricultural industry for more than 100 years in Ventura County. We have owned numerous land holdings that remain in the family to this date. We have farmed throughout Ventura County and hope to continue to do so in the future.

The Draft EIR is deficient on many levels. CEQA requires that all mitigation measures must be technically and economically feasible. Numerous proposed mitigation measures are neither. We have in the past attempted to identify land and any owners that would be open to sell their development rights for land that was converting from agricultural to commercial use. Not only did we not find anyone that would do so, no one would even quote a price. The only positive response from numerous land owners were that you can buy my property for full market value and then you can do what you want. There is not a project that can be built by adding double land cost to the equation. This was very recently experienced based on proposed policies at LAFCo. These policies were eventually not enacted due to the inability to purchase development rights in an economical feasible manner. This was when LAFCo was contemplating an acre for acre ag preserve. The new policy that is proposed in the 2040 General Plan is requiring 2 acres for every 1 acre of land converted from ag to any other use. This will eliminate the ability to add any new required ag buildings or even farm worker housing. The Draft EIR must study these impacts, since they are not feasible.

I22-2

The Draft EIR also deals with water in a manner that is not properly studied. There is no analysis on increased water costs and diminishing availability of water. Without reasonable water costs and supply, there is no agricultural industry.

I22-3

The General Plan indicates that agriculture is a high priority in the County. However, new policies and requirements in the General Plan add additional mitigation measures that will make ag virtually impossible. These include new setbacks, limiting types of fumigants pesticides and fertilizers. The General Plan also requires the conversion of all farm equipment to be all electric. Again, not feasible. The costs to purchase new pumps, farm equipment and other existing fuel using equipment will increase operational costs to a point that the County crops will not be competitive in the open market. These new mitigation measures are not sufficiently studied and again are not economically feasible.

I22-4

The Draft EIR is extremely difficult to read and understand. The background reports are lacking in depth of what has been studied other than numerous general statements and very poor mapping. Detailed studies must be added to sufficiently identify impacts and the related mitigation measures for both direct and indirect impacts on the agricultural industry. It is our understanding that reports and studies need to be timely prepared. However numerous studies are older than 5 years. Not timely.

I22-5

After numerous devastating wildfires over the last few years, which significantly impacted ag, the General Plan continues to lay out limiting mitigation measures for fire prevention. The Wildlife corridor eliminates any ag operation or fire prevention in the proposed corridor areas. This is also a major concern not studied in the Draft EIR.

I22-6

The Draft EIR for the 2040 General plan does not provide adequate analysis for the expansion of permanent bike paths and pedestrian walking trails throughout the County. These impacts are very severe due to constant conflicts from trail users and ag operations. Spraying, dust, odors from ag operations, along with impacts created by the trail users. These are usually theft, vandalism, litter and pet waste. The proposed mitigation measures require additional setbacks from these trails which renders additional land unusable for ag operations.

I22-7

In addition to the above comments on the agricultural aspects and related land use concerns of the DEIR, the undersigned is also a mineral owner directly interested in the impacts on oil and gas production of the DEIR and related General Plan 2040 proposed provisions. In these documents there is a total failure to address the economic impacts of the various policies proposed in violation of the requirements for this process, including but not limited to the loss of royalty income to a large group of County residents. I join in the detailed comments on the various deficiencies and concerns identified in the DEIR as described in the concurrent submissions on behalf of Aera Energy and other operators delivered this week to the County.

I22-8

Please look at the long-term consequences of these General Plan policies and mitigation measures. We formally request additional studies and a revised Draft EIR that will properly look at these and many more issues. The DEIR must be corrected with details of the revisions. Then it can be recirculated.

I22-9

Sincerely,

Carolyn Diacos

This comment letter repeats many of the same comments provided in Letter I4. The responses below provide cross references to the portions of Letter I4 where responses to the same comments have already been provided.

- I22-1 Refer to response to comment I4-1 regarding the adequacy of the draft EIR.
- I22-2 Refer to Master Response MR-5 regarding the feasibility of Mitigation Measure AG-2.
- I22-3 Refer to response to comment I4-3 regarding water availability and cost.
- I22-4 Refer to response to comment I4-4 regarding economic feasibility of General Plan policies that could affect agricultural operations.
- I22-5 Refer to Master Response MR-6 for discussion of how the County appropriately uses the Background Report to describe the existing environmental setting in the draft EIR.
- I22-6 Refer to response to comment I4-6 regarding wildfires, fire prevention, and the County’s Habitat Connectivity and Wildlife Corridor ordinances.
- I22-7 Refer to response to comment I4-7 regarding potential incompatibilities with adjacent bicycle and pedestrian paths.
- I22-8 The commenter refers to letters submitted by Aera Energy. See responses to Letters O5 and O6.
- I22-9 Refer to response to comment I4-9 regarding adequacy of the draft EIR and Master Response MR-7, which explains in detail why recirculation of the draft EIR is not required.

Letter
I23

County of Ventura Draft Programmatic Environmental Impact Report for the Draft 2040
General Plan Update

Dear Ms. Curtis,

The County of Ventura (County) is in a unique position to be updating the County's primary planning document through 2040 as the impacts of climate change are becoming more severe. The Draft Environmental Impact Report (DEIR) fails to recognize the true impacts of climate change already occurring. The County is already experiencing a 2.6°C increase in average temperature from historical records. We are soon to re-enter drought conditions following the driest February on record. We are still recovering from two of the state's largest wildfires in modern history. We must act now, and we must act boldly.

I23-1

The DEIR fails to provide enough emissions reductions to meet, or meaningfully contribute to, the California state mandated climate goals. The DEIR fails to include a Climate Action Plan with measurable targets and goals to ensure County stakeholders are informed about progress, achievements and accurate analysis of shortcomings. Language used in the proposed 2040 General Plan update such as "encourage" or "support" rather than "require" or "mandate" is insufficient and meaningless to meet acknowledged greenhouse gas reduction targets.

The DEIR is based on a wholly inadequate inventory of county emissions. The inventory was conducted from top down rather than bottom up and fails to include, or even consider, a significant portion of present emissions. Studies published recently indicate significant under-assessment of greenhouse gases, especially methane, from current fossil fuel extraction and production sources that must be included in the DEIR analysis.

I23-2

Because the County is one of the leading producers of fossil fuels in the state, and therefore in the nation, including fossil fuel facilities NASA documents as greenhouse gas "super emitters," the County must act now, and act boldly. Approval of the proposed DEIR would be a failure of the County's moral and fiduciary responsibility.

I23-3

Therefore, to act responsibly, the County must:

- 1) Declare a climate emergency and direct all County government offices to incorporate climate change mitigation, to the extent feasible, in all activities,

- 2) Create a Climate Action Plan 2020-2040 with measurable targets and outcomes as a separate document from the General Plan update,
- 3) Set clear climate action goals and mandate enforceable climate policies based on the declaration of a climate emergency and Climate Action Plan 2020-2040, and
- 4) As part of the Climate Action Plan 2020-2040, set five-year interval targets beginning with 2025 to immediately begin the reduction of the County's contribution to the climate emergency.
 - a. Initial five-year (2025) emergency climate goals:
 - i. Begin the elimination of fossil fuel extraction and production within the County by immediately prohibiting operation of fossil fuel facilities within one-mile buffer zones of schools, public parks, mobile home parks, medical facilities, or any residential zones,
 - ii. Wind down discretionary oil and gas production by 10% per year to zero production in the County by 2030 starting with fossil fuel facilities within above one-mile buffer zones,
 - iii. Prohibit flaring and venting from any fossil fuel infrastructure before 2025,
 - iv. Implement a policy to coordinate with the California Department of Transportation (Caltrans) and the Ventura County Transportation Commission (VCTC) to cease all freeway, highway and road infrastructure expansion projects by 2025,
 - v. Implement a policy to coordinate with Caltrans and VCTC to use the existing 101 Freeway, Highway 126, and Highway 23/118 corridors to build light rail for inter-city and inter-county commuting by 2040,
 - vi. Implement a policy to expand existing rail infrastructure for multi-track capacity by 2040,
 - vii. Implement a policy requiring all public transportation (buses, shuttles, and all County vehicles) to be fully electric vehicles by 2030,
 - viii. Implement a County policy to prioritize walking and bicycling by connecting communities outside incorporated city limits with adequate walkways, bike lanes, and buffers from vehicle traffic,
 - ix. Implement a policy to coordinate with contracted refuse companies to divert all pre- and post-consumer food waste into the "green waste" stream for composting all County-derived food waste by 2025,

I23-3
cont.

I23-4

- x. Implement an agricultural policy requiring a transition to 100% regenerative farming including carbon sequestration and soil nutrient management plans by 2030,
- xi. Transition all small gas engines used in agriculture to electric models or diesel engines running on biodiesel produced from as locally-sourced waste vegetable oil as possible by 2030,
- xii. Implement a policy to transition all small, non-farm gas engines (i.e. blowers, mowers, trimmers, etc.) to electric models by 2025,
- xiii. Implement policies to facilitate distributed renewable energy generation and storage,
- xiv. Direct the County’s Resource Management Agency to study the potential to repurpose existing gas infrastructure as conduit for undergrounding electrical and communication lines by 2025,
- xv. Direct the County’s Chief Financial Officer to study the potential of public banking to finance County divestment from fossil fuels and investment in sustainable energy systems by 2025, and
- xvi. Implement a policy to include existing fossil fuel industry workers in the County’s responsible transition to clean, renewable energy infrastructure.

I23-4
cont.

Whatever price tag you want to envision for these proposals, it pales in comparison to the pending costs of sea level rise, soil degradation and crop failure, increased asthma and other heat-exacerbated medical conditions, and the shortsighted failures of free market economics and laissez faire County governance to deal with climate change. To delay action, to delay investment, will only cause greater harm and increased costs for us all.

I23-5

Respectfully,

Chad Christensen
Ventura, CA

| Letter I23 | Chad Christensen February 25, 2020 |
|-------------------|----------------------------------------------|

I23-1 The comment states that the draft EIR does not recognize the true impacts of climate change already occurring or provide enough emissions reductions to meet the State’s mandated climate goals. Chapter 12 of the Background Report is incorporated into Section 4.8, “Greenhouse Gas Emissions,” of the draft EIR, which summarizes anticipated effects of climate change on Ventura County and provides a recent inventory of the county’s greenhouse gas (GHG) emissions. Where feasible, the draft EIR estimates the anticipated emissions reductions from certain measures (displayed in Table 4.8-1) using Intergovernmental Panel on Climate Change’s Global Warming Potential values from the most recent Fifth Assessment Report. The 2040 General Plan does include measurable targets for GHG reductions for 2030, 2040, and 2050 that are aligned with the State’s legislative GHG reduction targets and other reduction goals (page 4.8-6, draft EIR).

The comment also states that language used in the 2040 General Plan policies is insufficient to result in meaningful reductions. In preparing the GHG analysis provided in the draft EIR, the County considered, and included references to, the proposed 2040 General Plan policies and implementation programs most applicable to the analysis. As explained in the methodology subsection in Section 4.8, "Greenhouse Gas Emissions," (page 4.8-7), the analyses evaluate whether the GHG reduction benefits of these policies and programs are supported by substantial evidence. Substantial evidence leading to estimates of GHG emissions resulting from implementation of the 2040 General Plan include both qualitative and quantitative assessments, consistent with Section 15064.4(a) of the State CEQA Guidelines. The draft EIR includes a detailed quantitative and qualitative analysis of the 118 policies and 45 implementation programs included in the 2040 General Plan to reduce GHG emissions in the county (pages 4.8-37 to 4.8-45).

Table 4.8-5, as revised in the final EIR, summarizes the policies and programs that would have quantifiable GHG reductions by 2030 (page 4.8-39). Implementation of the quantified policies and programs in Table 4.8-5 would collectively provide reductions of 168,065 metric tons of carbon dioxide equivalent (MTCO_{2e}) by 2030, an approximate 11 percent reduction from forecast 2030 levels and 30 percent of the reductions needed to meet a target of 1,138,708 MTCO_{2e} for consistency with emissions targets identified in Policy COS-10.2 (41 percent below 2015 levels by 2030). An additional 242,748 MTCO_{2e} of reductions would be needed to close the gap with the 2030 target (page 4.8-40). For additional discussion refer to Master Response MR-1; Attachment 2 to the final EIR, which provides revisions the GHG calculations of draft EIR Appendix D; and final EIR Chapter 3, "Revisions to the draft EIR."

Other policies and programs of the 2040 General Plan would also result in GHG reductions but specific amounts cannot be determined at this time as described on pages 4.8-39. Qualitative analysis of the GHG reduction benefits of 43 programs included in the 2040 General Plan to reduce GHG emissions is provided in Table 4.8-6 (pages 4.8-40 to 4.8-43).

The draft EIR also includes seven feasible mitigation measures that address the potentially significant GHG emissions impacts of the 2040 General Plan (draft EIR pages 4.8-45 to 4.8-47). Thus, the draft EIR correctly identifies and considers 2040 General Plan policies and programs in the GHG emissions analysis conducted in the draft EIR and correctly includes feasible and enforceable mitigation measures in the draft EIR analysis of GHG emissions.

The draft EIR concludes, in its post-mitigation significance conclusion for Impact 4.8-1 (Generate GHG Emissions, Either Directly or Indirectly, That May Have a Significant Impact on the Environment), that the 2040 General Plan policies and recommended mitigation measures would not be sufficient to reduce GHG emissions to the established 2030 and 2040 reduction target because the policies, while supportive of future GHG reductions, do not contain enough specificity for their numeric contribution to the established 2030 and 2040 targets to be quantified. The draft EIR explains that:

No additional feasible mitigation has been identified at this time beyond the mitigation measures identified above and the policies and implementation programs of the 2040 General Plan. Under the 2040 General Plan future GHG emissions in the county would be on a downward trajectory compatible with State plans, policies, and regulations that would also result in GHG reductions in the county (page 4.8-52).

In Impact 4.8-2 (Conflict with an Applicable Plan, Policy, or Regulation for the Purpose of Reducing the Emissions of GHGs) beginning on page 4.8-49), the draft EIR explains that the 2040 General Plan includes several implementation programs with a quantifiable effect on future GHG emissions, and a substantial number of additional programs and policies in every GHG emission sector that would result in further GHG emissions, although their effect on GHG emissions cannot be quantified at this program level of analysis. The 2040 General Plan policies and programs complement the main area of local government influence over GHG emissions, including renewable energy and energy efficiency, land use decisions, and local transportation infrastructure and policy. The available information that can be quantified demonstrates that future emissions in the county would be on a downward trajectory through 2050. Qualitative evidence shows that the many policies and programs that cannot be quantified at this time would lead to further GHG reductions and additional progress toward State GHG reduction targets. However, for these reasons and those described in Impact 4.8-1, the County cannot meaningfully quantify the effect of all its 2040 General Plan policies and programs on future GHG emissions, and therefore, cannot conclude, at this program level of analysis, that future GHG emissions in the unincorporated county under the 2040 General Plan would be sufficiently reduced to meet the State's 2030 or post-2030 targets.

Also refer to Master Response MR-1 for additional discussion of how the 2040 General Plan, its policies and programs, and draft EIR mitigation measures address GHG emissions.

I23-2

The comment states that the GHG inventory conducted for the County does not include a significant portion of present emissions from current fossil fuel extraction and production and states that unspecified recent studies indicate significant under-assessment of methane emissions. The commenter does not provide the study; therefore, the County cannot adequately address the science or findings of this reference. The GHG inventory prepared to characterize baseline emissions in the county is summarized in Table 4.8-1 of the draft EIR. This inventory provides estimates for stationary source emissions, which cover oil and gas extraction activity within the county. The commenter is correct that fugitive methane emissions have been reportedly undercounted by certain studies; this inventory was conducted using the most current science and reporting available. Refer to Master Response MR-1 for additional discussion of fugitive methane emissions and how stationary sources were included in the GHG inventory.

I23-3

The comment requests that the County declare a climate emergency, prepare a Climate Action Plan for 2020-2040 that is separate from the 2040 General Plan, and set clear climate action goals and mandate enforceable policies. Refer to Master Response MR-1 for discussion of the draft EIR's detailed quantitative and

qualitative analysis of the 118 policies and 45 implementation programs included in the 2040 General Plan to reduce GHG emissions in the county (draft EIR pages 4.8-37 to 4.8-45), and seven feasible mitigation measures that would address the significant GHG emissions impacts of the 2040 General Plan and further reduce GHG emissions in the county (draft EIR pages 4.8-45 to 4.8-47).

The 2040 General Plan sets GHG reduction targets at 10-year intervals that were developed in consideration of statewide GHG reduction targets and other reduction goals. Because the 2040 General Plan encompasses policies and targets that would similarly be contained in a standalone Climate Action Plan, the 2040 General Plan can be used in the same way to reduce countywide emissions.

Regarding the concept that “declaration of climate emergency” should be the basis for the County’s climate goals and policies, note that local emergency declarations are made by the governing body or a designated official and are part of a relatively short-term response effort (see, e.g., Gov. Code, §§ 8550 et seq. [California Emergency Services Act]). Because an emergency declaration is a quasi-legislative act authorizing the short-term exercise of extraordinary governmental powers, it would occur separately from the 2040 General Plan policies, which would guide County actions through 2040.

The comment is not related to the adequacy of the draft EIR. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.

I23-4

The comment directs the County to set 5-year interval reduction goals and lists strategies to reduce emissions. Implementation Program AA in the Conservation and Open Space Element of the 2040 General Plan would require updates to the GHG emissions inventory to track GHG reduction performance at 5-year intervals. In addition, many of the policy suggestions in the comment have been considered in development of the 2040 General Plan.

These suggestions are noted and are generally congruent with the types of policies and programs included in the 2040 General Plan and analyzed in the draft EIR. The 2040 General Plan includes policies and programs to facilitate alternative transportation modes including public transit (Policies HAZ-10.6 and HAZ-10.8); policies that would reduce food waste (Policy PFS-5.4); policies that encourage sustainable farming (AG-5.1 through AG-5.3), including Policy AG-5.2 that would support the transition from fossil-fuel-powered equipment to electric- or renewable-powered equipment and Program AG-L to sequester carbon through changes in farming practices; as well as policies to increase use of renewable energy (Policies COS-8.1 through COS-8.11). Refer to Master Response MR-4, Section MR-4.J, “Potential to Stop Issuing Permits for New Wells (Phase Out Oil and Gas Operations),” regarding the suggestion that the County prohibit petroleum extraction. Because this comment is not related to the adequacy of the draft EIR, no further response is required. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.

I23-5 The statement comparing the costs of the strategies suggested in comment I23-4 to the costs of several anticipated climate change impacts is noted. This comment is a concluding statement and does not raise a significant environmental issue for which a response is required.

Subject: 2040 General Plan Draft EIR Comment

| |
|------------------------------|
| <p>Letter I24</p> |
|------------------------------|

The County did not conduct complete analysis on impacts of creating a new source of glare for motorists.

The General Plan contains policies that require installation of solar panels and the creation of "reflective" roof tops.

Policy PFS-2.2: Sustainable Community Facility Design. The County shall encourage the incorporation of sustainable design features in community facilities to reduce energy demand and environmental impacts, such as reflective roofing, permeable pavement, and incorporation of shade trees.

Implementation Program U: Solar Canopies in Non-Residential Projects. The County shall amend the County's Coastal and Non-Coastal Zoning Ordinances to require parking lots for new non-residential construction projects, with floor area of greater than 50,000 square feet, to include solar canopies.

Yet these policies were not analyzed for impact even though they will both create new sources of glare.

Even with Mitigation Measure AES-1 (requiring that materials that reduce glare be used), how do you have a "reflective" roof and use "reduced glare" materials? By the very definition of "reflective", glare will be produced.

Also, has the County evaluated whether "non-glare" solar panels are technologically or economically feasible?

I24-1

| | |
|------------------------------|---------------------------------------------------|
| <p>Letter I24</p> | <p>Chris Raymond February 26, 2020</p> |
|------------------------------|---------------------------------------------------|

I24-1 The comment asserts that the draft EIR does not include a complete analysis related to glare impacts by stating that Policy PFS-2.2 and Implementation Program U would result in new sources of glare that were not evaluated. Policy PFS-2.2 encourages incorporation of design features that promote sustainability in new development, and Implementation Program U in the Conservation and Open Space Element would require solar canopies on certain non-residential developments.

Impact 4.1-3 (Create a New Source of Disability Glare or Discomfort Glare for Motorists Traveling along Any Road of the County Regional Road Network) analyzes the glare impacts of the 2040 General Plan on motorists. The analysis describes the policies of the 2040 General Plan and provisions of the Non-Coastal Zoning Ordinance and Coastal Zoning Ordinance that would reduce potential glare impacts, and concludes that while these policies and provisions

would generally reduce glare impacts, there would be still be limited circumstances in which future development would include reflective materials such as metal or glass and be visible from one or more Regional Road Network (RRN) roadways such that discomfort or disability glare for motorists traveling along an RRN roadway could occur (page 4.1-27).

The draft EIR identifies Mitigation Measure AES-1 for this potentially significant impact. This measure would establish an implementation program through which applicants for future discretionary development projects that include use of reflective surfaces which the County determines would potentially be visible to motorists traveling along the County RRN would be required to submit a detailed site plan and list of project materials to the County for review and approval. If the County determines that the project would include materials that would produce disability or discomfort glare for motorists, the County will either require the use of alternative materials or require that the applicant submit a study demonstrating that the project would not introduce a source of substantial glare. Through this process, it is expected that sustainable design features encouraged in Policy PFS-2.2 that conflict with the requirements of Mitigation Measure AES-1 would be eliminated or revised through design of the project because the requirement of Mitigation Measure AES-1 to evaluate and address glare generated along the County RRN would supersede the County's encouragement of building elements where they are found to generate such impacts at the project-level. Design could be modified by, for example, relocating a parking lot required to orient solar canopies to avoid glare impacts to a regional roadway. The technological and economic feasibility of sustainable design features encouraged in the 2040 General Plan would be determined at the project level for individual development applications.

Comment On:

climate Action Plan

Your Comment:

I am a 30 year resident of Ojai. I am currently a board member of Ojai Trees a nonprofit tree planting organization. I am alarmed at the current climate change rate and fully endorse CFROG additions to the plan. Climate change is caused by fossil fuel production and consumption. The CAP addresses the consumption side by merely encouraging, but not requiring, electric fuel vehicles and clean power for homes and businesses. But Ventura County is the third largest oil and gas producing county in California. As such, we must do our part to reduce oil production through thoughtful, rigorous policy to phase it out. This is not addressed.

I27-1

CAUTION: If this email looks suspicious, DO NOT click. Forward to Spam.Manager@ventura.org

Susan Curtis,

Dear Ventura County Board of Supervisors and Planning Department,

Climate issues are something I feel worried about. Ventura County is warming faster than any county in the nation. Our ocean is acidifying faster. Drought and floods have hit us worse, and we can expect more extreme weather. I want strong climate policy and a goal to be carbon neutral by 2045.

I28-1

My family and community are counting on you to make a strong plan that helps us mitigate climate impacts. With tipping points accelerating, we cannot go halfway! We want courageous leadership to set goals we can hang our hopes and efforts on.

First, it is necessary that all greenhouse gas emissions be counted based on the most current science.

I28-2

I want policies like a sunset plan for oil and gas production, decarbonization of transportation and buildings, zero waste, incentives for regenerative agriculture and water management, and effective benchmarks for reducing emissions from tailpipes.

I28-3

I want an EIR that covers major climate impacts and a systematic plan that will assure carbon neutrality no later than 2045.

Thank you—

Christopher Tull

- I28-2 Refer to response to comment I3-2 regarding the use of current climate change science in the draft EIR analysis.
- I28-3 The comment calls for certain GHG reducing policies. Refer to response to comment I3-3 for a discussion of these suggestions.

Letter
I29

Ventura County Board of Supervisors ,

206 people have signed a petition on Action Network telling you to Petition to VC Supervisors and Planners about VC2040 Draft General Plan and EIR.

I29-1

Here is the petition they signed:

With worsening climate change impacts, we reiterate and amplify the concerns the people expressed in January of last year about “climate change and GHGs, and the effects of continued oil and gas extraction including secondary effects related to climate change, air quality, water quality, water supply, traffic, noise, odors, aesthetics, and hazards.”

Our county is warming faster than any other in the nation, our ocean is becoming more hostile to marine life, our last drought was the most intense and lasted longest, and our history of costly floods will be dwarfed when future atmospheric rivers pour over our valleys. Our house is on fire. We need a thorough plan and environmental impacts analysis based on the latest science.

Ventura County’s plan matters. Our larger cities are making climate action plans and look for your example of leadership. The environmental impact from what we do to mitigate climate impacts at the global scale is profoundly influential in trying to stop runaway climate change. This is explained in a new report Insights from the California Energy Policy Simulator about the role of the State of California in the world. Ventura County as a local government hit hardest by climate impacts must step up and meet serious goals. “Insights about California’s climate policies are at the forefront of global efforts to battle climate change. The state’s leadership and success so far have helped maintain momentum despite political headwinds. If California faltered, global efforts to reduce GHG emissions would be dealt a major setback. Meanwhile, the severe risks from runaway global warming are becoming more tangible as the state suffers from wildfires supercharged by climate change.”

I29-2

A. Four Overall Comments:

We are grateful for the expertise at the law firm of Shute, Mihaly and Wineberger retained by CFROG regarding CEQA. We have appreciated their past comments. We join them in continuing to request the following:

1. Count ALL GHGs that result from activity in our county: Count all burning of oil and gas originating in our county and count all fugitive methane from wells in our county and from methane entering our county that was not counted at the jurisdiction of origin. Do the math on the GHG footprint for heavy exports. We want to mitigate our fair share of all climate impacts from activities within Ventura County. We have to know what they are. Worrying about double counting is not acceptable. Just worry that you haven’t counted every cause of climate impacts that we are morally and legally responsible to mitigate with a comprehensive inventory and a systematic plan.

I29-3

2. Use the latest science to calculate GWP of methane: The global warming potential of GWP is nearly 40 percent greater than what you are using. The International Panel on Climate Change states that over a 20 year period, methane has a GWP of 84 compared to carbon dioxide (up from their previous estimate of 72). The US EPA estimates it at 87 and recent scientific experts put the estimate at 96. We must know the true environmental impact of methane emissions. A complete and scientifically valid GHG inventory is required for a CEQA-compliant Climate Action Plan.

I29-4

3. Use the emissions reduction goal from Governor Brown’s Executive Order B-18-55 “to achieve carbon neutrality as soon as possible, and no later than 2045, and achieve and maintain net negative emissions thereafter. This goal is in addition to the existing statewide targets of reducing greenhouse gas emissions.” It is an inadequate compromise, but not as much as the SB 32 goal of 80% below 1990 levels by 2050. City of LA plans to stay within a net zero carbon budget between now and 2045. The proposed GHG reductions in the VC2040 Draft of 41 percent below 2015 levels by 2030, 61 percent by 2040, and 80 percent by 2050 are not ambitious enough for us to do our part to mitigate the climate chaos happening faster than scientists have predicted.

I29-5

4. Policies and programs must meet the goal: It does not take an in-depth analysis to see that this plan will not achieve the 2030 goal of 40% reduction in GHGs below 1990 levels. A new report Insights from the California Energy Policy Simulator shows that the State of California will fall short of that goal by at least 15 and as much as 45 MMT CO₂e. We have and continue to advocate for a goal aligned with Governor Brown’s Executive Order to achieve carbon neutrality as soon as possible and no later than 2045.

I29-6

B. Some Comments about Impacts and Mitigation

The environmental impacts that concern us are those resulting from governments not making and carrying out plans to mitigate climate change. Your draft analysis does not include most of them. Table B in the Executive Summary is not even half finished. Some of the more serious impacts are missing from the draft analysis. Here are a few of our concerns:

I29-7

1. Aesthetics, Scenic Resources and Light Pollution and Agriculture and Forest Resources: Mitigation programs are needed to protect our resources from degradation from significant climate impacts. The loss of soil in particular is associated with the downfall of civilizations.

2. Air Quality: The emissions impacts from exceeding criteria pollutant thresholds and also greenhouse gases seem significant and can be mitigated.

I29-8

3. Biological Resources: The new implementation program is a good start to “update the Initial Study Assessment Guidelines, Biological Resources Assessment report criteria and evaluate discretionary development that could potentially impact sensitive biological resources”. Two kinds of impacts are missing. 1) Climate Change. A major mitigation is the restoration of wetlands which should be at a 2:1 or greater ratio. Stormwater management is another mitigation that reverses the loss of vegetation from drought and floods and supports the restoration of all of the indigenous biology that makes an ecosystem function to maintain the small water cycles. 2) Toxic Pesticide and Herbicide Use and Drift. This must be part of the agenda of a Program for Protection of Sensitive Biological Resources to promulgate the mitigations provided by Integrated Pest Management. Pest management policy must align with the recommendations of the California Department of Pesticide Regulation Roadmap for Integrated Pest Management some of which have climate mitigation co-benefits.

I29-9

4. Energy: We want a workshop to learn how it is deemed less than significant to allow wasteful, inefficient, or unnecessary consumption of energy resources.

I29-10

5. Greenhouse Gas Emissions: The climate change impacts are so dire that the mitigations need to be benchmarked to be achieved before it is too late to reverse runaway climate chaos. At minimum we demand a systematic plan for decarbonization of county facilities and electrification of the transportation system.

I29-11

6. Hazards, Hazardous Materials, and Wildfire: The impacts of toxic explosions, leaks, and spills and the drift of regulated materials and the ignorance of the public about toxic impacts must be addressed where feasible through mitigations that regulate the use and transport of hazardous materials. We have recommended feasible mitigations for people being exposed to the risk of wildfires that have not been accepted by decision-makers.

I29-12

7. Hydrology and Water Quality: Impacts from climate change and poor land management have led to grave threats to water supply and water quality. These are highly significant—ground water overdraft, overuse and degradation of water quality, erosion, flooding, and siltation. (Impact 4.10-12) The failure to restore small water cycles to keep stormwater in the uplands and maintain forest health is one of the most serious impacts being mitigated in many places through a paradigm shift about stormwater management. Mitigation is essential—water is life. It requires an integrated water management plan that involves every sector working on every mitigation of which we are aware.

I29-13

8. Land Use and Planning We want an analysis of incompatible land uses and new development with negative health implications. Closing wells near sensitive sites is a mitigation. Environmental Justice is not examined in the draft EIR.

I29-14

9. Mineral and Petroleum Resources: We want an analysis of the impact of the scenario in which wells have been put on hold and the operator cannot close the wells for lack of funds. We have no choice. The wells must be closed properly. Fields must be restored to functioning ecosystems to help mitigate climate change impacts. We need insurance as well as bigger bonds.

I29-15

10. Traffic and Transportation: Tailpipe emissions is an extremely significant environmental impact. The mitigation aimed for in the CTM-C: Vehicle Miles Traveled (VMT) Reduction Program needs assurances of effectiveness via a clear description of what “conditions warrant providing additional mitigations and programs”? This is far too vague to be a mitigation for this significant impact. We have no alternative but to reliably cut GHGs in the transportation sector.

I29-16

I29-17

| | |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------|
| <p>11. Utilities: Failure to develop wholesale and commercial scale renewable energy generation and microgrids is a significant environmental impact because it has forced us to have to get our electricity from fossil fuels via transmission lines that spark wildfires. Community microgrids are a feasible mitigation.</p> | <p>I 29-18</p> |
| <p>12. Waste Management: Failure to properly manage waste has a highly significant environmental impact, especially when it produces methane super-emitter landfills that is driving climate change, but also the failure to reuse and recycle consumer goods and the materials and equipment discarded by commercial enterprises. We need a more comprehensive approach for mitigation of these impacts.</p> | <p>I 29-18</p> |
| <p>C. The following policy recommendations for the Draft Plan could help the Plan achieve the GHG reduction goals to mitigate climate change impacts and help the EIR be more relevant to the climate crisis.</p> | <p>I 29-19</p> |
| <p>Land Use and Community Character: We endorse the comments submitted by Bruce Smith to more firmly assure preservation of agricultural land and open space. We point out the lack of analysis of Environmental Justice policy issues.</p> | <p>I 29-20</p> |
| <p>Circulation, Transportation, and Mobility:</p> | |
| <p>1. No overriding considerations should allow a project to NOT reduce VMT unless all of the vehicles have zero emissions that will use the proposed project.</p> | <p>I 29-21</p> |
| <p>2. CTM 3-9 to widen SR 118 has a significant environmental impact.</p> | <p>I 29-22</p> |
| <p>3. Benchmarks to reduce VMT need to be more clear and the plan needs a review with public input every two years until 2028 and then no longer than every five years.</p> | <p>I 29-23</p> |
| <p>4. Parking programs should be included in ways that reduce single-occupancy car trips.</p> | <p>I 29-24</p> |
| <p>Public Facilities, Services, and Infrastructure:</p> | |
| <p>1. Enroll residents in a program to reduce CO2 emissions in their neighborhoods. Ex: Cool Block or Transition Streets.</p> | |
| <p>2. PFS 2.1 must be revised to say include rather than encourage 'Sustainable Plans and Operations' in order to be considered a mitigation of climate change impacts from greenhouse gas emissions.</p> | <p>I 29-25</p> |
| <p>3. Policy PFS 7.1 should be revised to delete the need for access to gas. The environmental impact from use of natural gas requires carbonizing buildings beginning with no gas connections to new residences . It is therefore contradictory to ensure access to gas.</p> | |
| <p>4. Local renewable energy generation must be part of the mitigation plan for reducing transmission facility fire hazard risk. This is not the same as "Smart Grid Technology". You need experts who know the cutting edge of this field to help write coherent policy on this topic.</p> | <p>I 29-26</p> |
| <p>5. Zero Waste The County shall achieve zero waste (via a suite of policies to reduce, reuse, and recycle) with no organic waste going to landfills by 2023</p> | |
| <p>6. Zero Waste Policy for Meetings and Events Design and implement a zero waste policy for meetings and events sponsored or permitted by the County to minimize waste and rescue surplus edible food</p> | |
| <p>7. Compostable Take-Out Foodware Require that take-out foodware be made with material compostable in solid waste processing facilities within 60 days</p> | <p>I 29-27</p> |
| <p>8. Reduce Solid Waste by Phasing Out Single-Use Plastic Evaluate how to best reduce solid waste generation per capita by at least 15% by 2030 including phasing out single-use plastics including but not limited to plastic straws, plastic utensils, plastic take-out containers, and expanded polystyrene</p> | |
| <p>9. Ban Expanded Polystyrene</p> | |

Conservation and Open Space:

1. Reduce oil and gas production by 40% by 2025 via higher monitoring standards and 2500 ft buffer zones near sensitive sites; reduce production to zero by no later than 2040.
2. Phase-Out of Oil and Gas Production The County shall prohibit new drilling and shall regulate existing wells to assure steady closing of wells beginning near residential and commercial areas.
3. Maintain Policy COS-7.8 as recommended by the Board of Supervisors, so that all newly permitted discretionary oil wells are required to collect gases and use or remove them for sale or proper disposal instead of flaring or venting. Flaring should be allowed only in cases of emergency or for testing purposes.
4. Maintain Policy COS-7.7 as recommended by the Board of Supervisors, so that all newly permitted discretionary oil wells are required to convey oil and produced water via pipelines instead of trucking.
5. Detect and curb methane emissions from "super-emitter" sites as identified by NASA.
6. Tax oil and gas production, and related uncaptured methane to raise the needed revenues to fund urgent climate programs to replace high-emission vehicles with a priority on trucking and freight companies, fishing businesses, general contractors and K-12 schools.
7. Require a fully accountable performance bond for all new wells to cover cost of closure Cite LAT article (maybe put on website and link to it).
8. Establish an insurance fund that oil and gas producers contribute to that will cover accidents and closing wells if the producer goes bankrupt.
9. Ban gas-fueled lawn and garden equipment. (Ex: City of Ojai)
10. Accelerate capture of legacy HFCs Enlist the public and private to find and destroy existing stocks of HFC's (refrigerant gases with extremely high Global Warming Potential).
11. Develop and adopt building codes based on best practices for use of low embodied carbon concrete and set targets for use of low GHG concrete alternatives. Ex: Bay Area Air Quality Management District and King Co, WA.
12. Encourage climate-safe and climate-resilient development through zoning reform and removal of limits on height, density, and minimum parking requirements to enable and promote walkability and a mix of uses for homes and businesses, parks and transit.
13. Create a master local clean energy siting and funding plan for wholesale distributed solar energy plus storage in commercial scale projects producing energy needs by 2030.
14. Provide energy efficiency benchmarking and rebates for low-income housing and renters as well as low-interest loans for small businesses to reduce energy use; assist owners of existing buildings to switch from natural gas to electricity.
15. Prepare sustainable building, siting, landscaping and passive heating and cooling practice guidelines, with a priority on low-income housing, that reduce consumption of non-renewable resources and that include climate and fire-safety in pre-approved plans.
16. Energy Efficiency to Reduce Electricity Use Use Energy Efficiency to Deliver 15% of Projected Needs for electricity in the county by 2023; and 30% by 2030.
17. Efficiency Building Standards for Retrofits Prioritize energy and water efficiency building standards and work to retrofit existing buildings.
18. Decarbonize County Buildings Develop a county building electrification plan eliminating natural gas use in County-owned facilities.
19. Decarbonize All Building Types Develop an electrification plan with goals for GHG emission reductions through renewable energy that evaluates and prioritizes programs for local solar, energy storage and demand response (DR) that disconnects all buildings from gas service by 2050. Include incentives for deep retrofits of inefficient buildings.

I29-28

I29-29

Agriculture:

1. Integrated Pest Management where toxic pesticides are a last resort. Create a program that promotes the principles (systems approach, building trust, and effective communication) and pursues the recommendations of the Roadmap for Integrated Pest Management from the University of California and CA Department of Pesticide Regulation. Environmental impacts from toxic pesticides are not described in the Background Report. The Roadmap to an Organic California Policy Report by CCOF Foundation offers information for mitigations and climate action. A workshop is needed.
2. Inorganic Nitrogen Based Fertilizers Set benchmarks for reducing use of inorganic N fertilizer and encourage optimized use of organic and inorganic fertilizer for greatest efficiency in closed nutrient cycles, monitor for nutrient runoff from fields and encourage the use of cover crops and green manure crops to reduce or avoid nitrous oxide (N₂O) emissions and nutrient runoff.
3. Diversified Cropping Systems Encourage farmers to include 1 – 5% of beneficial insect attracting plants in a planted crop, and other methods, such as crop rotation, perennial mowed cover crop in orchards, and integrating multiple species or varieties to enhance the biological and economic stability by spreading economic risk and buffering against pest invasions and extreme weather events, and increase carbon sequestration.
4. Reward Regenerative Farmers with Digestate and Compost from Food Waste Research feasibility of a program for composting food waste for use by farmers and landscapers who use regenerative practices that sequester certified amounts of CO₂.

I29-30

Water Resources:

1. At least 30,000 acre-feet per year must come from storm water capture by 2035
2. All rainfall must be retained onsite in soil and reservoirs.
3. Slow It. Spread It. Sink It! The County shall enforce Best Management Practices (BMP) and Low Impact Development (LID) for new developments.
4. Recycle all wastewater for beneficial reuse by 2035.
5. Reduce potable water use per capita by 22% by 2025 and 25% by 2035: Offer incentives for water conservation features, including drought tolerant landscaping, permeable materials in standard parkway design guidelines, street trees, infiltration, greywater, and water-saving plumbing.
6. Close oil and gas wells and injection wells near aquifers as a top priority.
7. Create a Master Plan to develop the full potential of integrated water management to infiltrate the ground and recharge aquifers; support reforestation and restoration of watershed ecosystems; conserve and protect groundwater resources, and clean up creeks, streams, and estuaries.
8. Support Santa Clara River Loop Trail and Ventura River Trail Development

I29-31

Economic Vitality:

1. Agricultural Diversification should include reference to regenerative practices to create biodiversity with opportunities for community members to visit farms.
2. Small Business Promotion. Support approval of caretaker residential space on business property to reduce VMT and more financial strength for small businesses.
3. Green Economy. Prioritize youth and immigrants for workforce development in industries that promote and enhance environmental sustainability, including GHG reductions, climate adaptation, resiliency and local renewable energy generation, storage and distribution, including solar power, wind power, wave energy, regenerative organic farming and value-added agriculture-related activities, and other appropriate renewable sources.
4. Maritime Economy. Facilitate a sustainable maritime economy using restorative aquaculture techniques that restore ocean health and biodiversity while reviving pre-human fisheries abundance. For example, restore sand-bottom kelp forests and increase kelp forests with flexible floating fishing reefs where the seafloor is otherwise too deep for kelp.

I29-32

5. Promote Fire-Resistant Infill and Revitalization. Encourage infill development that serves as firebreak rather than as additional fuel for wildfires.

6. Create a Collaborative Structure for Innovation for a Resilient Future. The structure should be able to make decisions and create a way forward for zoning, building and materials and environmental health to allow options for a resilient future, include government officials, innovators and public as described in submissions from Sustainable Living Research Initiative.

7. Parking Infrastructure. Develop parking policies to reduce single occupancy trips associated with employees and business activity to reduce Vehicle Miles Traveled.

8. Master Plan for Distributed Energy Resources and Community Microgrids. Prepare a map of siting options for renewable energy generation and storage facilities and coordinate the identification of financing options for renewable energy resource development, including solar, wind, wave, storage and community microgrids both in front of and behind the meter.

In summary, with the accelerating tipping points, we cannot go half-way in our vision. We need extraordinary courage to set goals we can hang our hopes and efforts on. We want completeness and clarity so we can see how the emissions reduction plan adds up. We want respect for climate science to tell us the truth. We want more ambition. A 2016 decision of the state legislature in SB32 is just not good enough as a goal. We want to see a systematic plan that will assure carbon neutrality no later than 2045.

You can view each petition signer and the comments they left you in the attached PDF.

Thank you,

Christopher Tull

|-----------------------|----------------------------------------------|
| Letter I29 | Christopher Tull February 27, 2020 |
|-----------------------|----------------------------------------------|

- I29-1 Refer to the response to comment O1-1. The comment introduces a petition to the Ventura County Board of Supervisors regarding the 2040 General Plan and draft EIR. This petition was also submitted by 350 Ventura County Climate Hub. See responses to Letter O1 for a discussion of the concerns raised in this petition. The 206 signatories are acknowledged for the record. Comment letters submitted to the County on the draft EIR are provided with complete attachments in Attachment 1 to this final EIR.
- I29-2 The comment reiterates general concerns from the petition about the effects of ongoing oil and gas extraction. These concerns are acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.
- The comment also summarizes the foreseeable environmental changes associated with anthropogenic climate change and emphasizes the need to conduct environmental impact analysis using the latest science. See response to comment I28-2 for a discussion of the methodology used to evaluate greenhouse gas (GHG) emissions for baseline conditions and future target years in the draft EIR. The comment summarizes more detailed comments provided elsewhere in the comment letter. See responses to comments I29-3 and I29-4, below.
- I29-3 Refer to response to comment O1-2 for a discussion of GHG emissions and the global warming potential of methane.
- I29-4 Refer to response to comment O1-3.
- I29-5 Refer to response to comment O1-4. The comment summarizes more detailed comments provided elsewhere in the comment letter. See responses to comments I29-6 through I29-18, below, regarding impacts and mitigation measures.
- I29-6 Refer to response to comment O1-5.
- I29-7 Refer to response to comment O1-6 for a discussion of programs to protect scenic resources and agriculture and forest resources from degradation due to significant climate impacts.
- I29-8 Refer to response to comment O1-7 regarding criteria air pollutant emissions.
- I29-9 The comment asserts the new implementation program does not include impacts as a result of climate change and should include mitigation regarding the restoration of wetlands and stormwater management. Refer to response to comment O1-8, which explains that EIRs are not required to include an analysis of impacts that are a result of climate change.

- I29-10 Refer to response to comment O1-9 for an explanation of why the draft EIR correctly omits analysis of the impacts of pesticide and herbicide use on biological resources.
- I29-11 Refer to response to comment O1-10 for a discussion of the energy consumption analysis in the draft EIR.
- I29-12 Refer to response to comment O1-11 regarding GHG mitigation.
- I29-13 Refer to response to comment O1-12 for a discussion of the evaluation of potential hazards included in the draft EIR.
- I29-14 Refer to response to comment O1-13 regarding hydrology and water quality.
- I29-15 Refer to response to comment O1-14 regarding analysis of incompatible land uses and new development resulting in negative health implications.
- I29-16 The comment requests an analysis of a scenario in which wells have been put on hold and the operator cannot close the wells due to lack of funds. Additionally, the comment asserts wells must be properly closed to restore functioning ecosystems to mitigate climate change impacts and insurance is needed along with bigger bonds. Refer to response to comment O1-15 and Master Response MR-4, Section MR-4.J, “Potential to Stop Issuing Permits for New Wells (Phase Out Oil and Gas Operations),” regarding the findings and conclusions of the draft EIR related to phasing out the oil and gas industry.
- I29-17 Refer to response to comment O1-16 for a discussion GHG mitigation measures.
- I29-18 The comment asserts that the failure to develop wholesale and commercial scale renewable energy generation and microgrids is a significant environmental impact, for which community microgrids is a feasible mitigation. Refer to response to comment O1-17.
- I29-19 The comment states that the failure to properly manage waste has a significant environmental impact, especially when it produces methane which is driving climate change. Refer to response to comment O1-18.
- I29-20 The comment summarizes more detailed comments provided elsewhere in the comment letter. See responses to comments O1-20 through O1-32 regarding policy recommendations for the General Plan to achieve GHG reduction goals to mitigate climate change.
- I29-21 Refer to response to comment O1-20 regarding comments submitted by Bruce Smith. Also, see responses to Letter I20 from Bruce Smith..
- I29-22 Refer to response to comment O1-21 regarding overriding considerations and evaluation of vehicle miles traveled.
- I29-23 Refer to response to comment O1-22 regarding the assertion that 2040 General Plan Policy CTM 3-9 has a significant environmental impact.

- I29-24 The comment is related to vehicle miles of travel benchmarks and public review. Refer to response to comment O1-23.
- I29-25 The comment suggests additional topics that could be considered in the 2040 General Plan and is not related to the adequacy of the draft EIR. Refer to response to comment O1-24.
- I29-26 The comment provides suggested edits to policies proposed and suggests additional topics that could be considered in the 2040 General Plan and is not related to the adequacy of the draft EIR. Refer to response to comment O1-25.
- I29-27 The comment asserts that local renewable energy generation must be part of the mitigation plan for reducing transmission facility fire hazard risk. Refer to response to comment O1-26.
- I29-28 The comment suggests additional topics that could be considered in the 2040 General Plan and is not related to the adequacy of the draft EIR. Refer to response to comment O1-27.
- I29-29 Refer to Master Response MR-4, Section MR-4.H “Buffers (Setback),” Section MR-4.J “Potential to Stop Issuing Permits for New Wells (Phase Out Oil and Gas Operations),” Section MR-4.F “Flaring,” and Section MR-4.G “Pipeline Requirements” regarding the findings and conclusions related to buffers (setbacks), phasing out the oil and gas industry, flaring, and pipelines in oil and gas operations. The remainder of the comment addresses implementation of the 2040 General Plan and is not related to the adequacy of the draft EIR. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopted a final 2040 General Plan.
- I29-30 The comment suggests additional policies to be included in the 2040 General Plan and is not related to the adequacy of the draft EIR. Refer to response to comment O1-29.
- I29-31 The comment suggests additional topics that could be considered in the 2040 General Plan and is not related to the adequacy of the draft EIR. Refer to response to comment O1-30.
- I29-32 The comment provides suggested actions that could benefit water resources, but fails to provide evidence linking benefits from these actions to impacts from implementation of the 2040 General Plan identified in the draft EIR. Refer to response to comment O1-31.
- I29-33 The comment suggests additional topics that could be considered in the 2040 General Plan and is not related to the adequacy of the draft EIR. Refer to response to comment O1-32.
- I29-34 Refer to response to comment O1-33.

| Letter I31 |
|-----------------------|

VC Planning,

You may have remembered a news story in the VC Star about my wife and I defending our Tierra Rejada home from the Easy Fire in 2019. My wife and I did this, alone, without assistance of the VC Fire Dept due to the fact that they were busy protecting the Reagan Library. We know firsthand the potential destruction of wildfires. But more importantly, we understand the role of vegetation buffers and wildfire fuel control. Part of the reason my wife and I were able to stand our ground and successfully defend our home from the flames was due to the fact that we had regularly cut and disposed of vegetation FARTHER than the 100-foot barrier required by the County or that will be permitted to be done with the aid of mechanized equipment. We have been told that we were "lucky". No, we were prepared, but our ability to continue that preparation will be severely hampered with these new regulations.

I31-1

In Part 4.9 of the EIR, the County talks about how increased fuel loads will increase risk of wildfires. But then the County fails to talk about Policies COS-3.2, COS-1.15, Implementation Program COS-H, and Implementation Program COS-C which will increase fuel load and vegetation.

Please revise the DEIR so that it accurately identifies and mitigates wildfire risks. Help me save my home from the next wildfire.

Best Regards

Chuck

Subject: We're in a Climate Emergency!

**Letter
I32**

CAUTION: If this email looks suspicious, DO NOT click. Forward to Spam.Manager@ventura.org

Susan Curtis,

Dear Ventura County Board of Supervisors and Planning Department,

Climate issues are something I am deeply about. Ventura County is warming faster than any county in the nation. Our ocean is acidifying faster. Drought and floods have hit us worse, and we can expect more extreme weather.

I32-1

My family and community are counting on you to assure analysis of the full scope of environmental impacts and mitigations in the Draft EIR.

First, it is necessary that all greenhouse gas emissions be counted based on the most current science.

I32-2

There are many ways to mitigate climate impacts, like a sunset plan for oil and gas production, decarbonization of transportation and buildings, zero waste, incentives for regenerative agriculture and water management and supporting HR763 The Energy Innovation and Carbon Dividend Act.

I32-3

We want an EIR that covers major climate impacts via a systematic plan.

Thank you—
Clint Fultz

 800 S. Victoria Ave., L #1740
 Ventura, CA 93009-1740

GeneralPlanUpdate@ventura.org

Dear Ms. Curtis:

I am writing to call your attention to significant flaws in the process, data, and conclusions of the Ventura County General Plan, Draft EIR, and supplemental documents.

My great grandfather, Mark McLoughlin (1843-1914), was a true Ventura County pioneer, purchasing his first 318 acres of undeveloped land in Ventura County in 1875. He was a hard-working visionary, revered by his community. With his son—my grandfather, James Patrick McLoughlin—he raised livestock and farmed the land, providing jobs and feeding the growing towns of Oxnard and Ventura.

I33-1

Our land, in a vitally important location on Olivas Park Drive across from the Ventura Marina, has been in the family, and part of the economic fabric of the community, for 100 years. And we want it to be part of the future of this community, with a flourishing economy, a thriving job market, and unsurpassed quality of life for its residents.

But the General Plan and DEIR do not describe a viable path for us as landowners going forward.

I will begin with some specific issues regarding language in the Coastal Area Plan, 4-82-83 and 4-94-95. Part of our land is located in the Central Coastal Zone, adjacent to the Ventura Marina, on Olivas Park Drive at Harbor Blvd. The only conclusion the Plan draws about our land is the statement that, “unlike the Preble area, services are not readily available to the Olivas lands.” This is false. Our property has access to all utilities, water, main roads, and the freeway. Indeed, easements on our property serve surrounding areas with utilities.

The Plan also claims that our property is “not included in the City’s sanitation district because of problems with water pressure.” This language is irrelevant and incorrect. There is no evidence that there are water pressure issues, and the sanitation district’s pipelines actually traverse our property.

I33-2

While we do not know the original source of these misstatements, such misrepresentations—now repeated in the Plan—threaten to diminish the value of our land in relation to the Preble property. And, of course, they undermine the goal and the value of the Plan itself.

The General Plan also speaks of the widening of Olivas Park Drive, our southern boundary. This would have a direct impact on our property. But the Plan does not address how this would happen or how it would affect our land.

Damaging misstatements about our property also appear in the DEIR. Contrary to the portrayal in the DEIR, our property has significant infrastructure in place, as well as prime accessibility to the highway and the harbor. In fact, with easy access to the marina and beach community, and with the railroad as part of our eastern boundary, our land is uniquely suited to be an important part of future economic development in the area. We are entitled to have all these matters corrected.

I33-3

I would also like to raise some additional concerns:

- 1. The General Plan and DEIR continue to ignore the 28% increase in the homeless population in our community. I 133-4
- 2. According to the General Plan, if we were to build an acre of low income / worker housing we would need to buy two replacement acres of same Ag land to be placed into perpetual agricultural preservation. This is unrealistic and infeasible, and certainly not in line with the State government’s housing policies. I 133-5
- 3. The EIR does not adequately address the enormous “indirect impacts” that will occur as a result of implementing the General Plan, calling them “less than significant.” I 133-6
- 4. The General Plan contains policies that will increase the costs of normal farming operations, making it difficult for farming to remain profitable. I 133-7
- 5. The Plan does not adequately evaluate the impacts of increased competition for water in our community. I 133-8

The EIR is a flawed document, full of errors, that does not disclose all impacts, direct and indirect, caused by the General Plan. It was obviously rushed—completed in six weeks. It is inaccurate and incomplete, and fails to provide members of the community with the information that they are legally entitled to. This EIR should be corrected and reconsidered, and a reasonable time period should be allowed for meaningful and thoughtful community input. I 133-9

Sincerely,
 Cynthia Thomas Dickson

Letter
I34

Ventura County Resource Management Agency, Planning Division
 Attn: Susan Curtis, Manager, General Plan Update Section
 800 South Victoria Avenue, L#1740
 Ventura, CA 93009-1740
 Re: Comments on Ventura County General Plan DEIR

Dear Ms. Curtis:

I represent and serve on the McLoughlin Family Committee, a group of family members that own approximately 300 acres of agricultural property off of Olivas Park Road in the County of Ventura, in proximity to the City of Ventura.

The McLoughlin family has farmed this land for generations. It remains our desire to continue this legacy. However, in the face of never-ending changes to the regulatory environment, we again find ourselves attempting to ascertain how new policies and programs as proposed in the draft 2040 General Plan will impact and challenge our ability to serve as stewards of this heritage.

I34-1

It had been our hope that the DEIR would provide some clarity and insight into how the new policies and programs within the revised General Plan would impact our farming operation. However, that is not the case. Simply said, we believe the General Plan Update and subsequent Environmental Impact Report fail to adequately analyze or study impacts on the farming industry.

With that said, we would like to specifically present the following:

- The Background report Table 6-26: Transportation Department Planned Capital Projects lists sections of roadways the County plans for expanded capacity or widening, along with the scope of those enhancements. It also covers in length the plan to add bike paths and bike lanes in accordance with existing County wayfarer plans. However, the DEIR never analyzes the loss of farmland resulting from these changes in infrastructure – it’s not even mentioned as a possibility in the DEIR.

I34-2

Olivas Park Road between Victoria and Harbor is listed as one of the areas planned for road widening, a stretch of roadway that borders the entire eastern portion of our farmland and property. While the impact on our farming operation and financial losses due to property loss are clearly quantifiable, the report fails to list or quantify these impacts.

- In Section 3-8, The DEIR states that because there will be no “substantive” change to the agricultural, open space, or rural designations, the General Plan Update (GPU) will be consistent with SOAR. However, no further details beyond this conclusory statement is provided. There is no way for the reader to come to his or her own conclusion on whether the GPU will result in inconsistencies with SOAR that might lead to physical environmental impacts. There is no description of the changes to the Agriculture, Open Space, and Rural policies to determine whether they are in fact non-substantive.

I34-3

Given the length and breath of the Draft General Plan update and CEQA analysis, we made an attempt to focus our initial review and subsequent comments to issues specific to agriculture and farming. However, it’s clear that the 2040 General Plan will impact the Ventura County local economy across sectors – all of which influence the ability to live and work in this region. The DEIR’s lack of analysis of those economic impacts, calls into question the legitimacy of both the draft General Plan update, and the CEQA analysis. As such, we respectfully request that the DEIR be recirculated in the hopes that further study will resolve these shortcomings.

I34-4

I appreciate your consideration.

Laura McAvoy

I, Daniel James Chambers, fully support the content of this letter.

Subject: 2040 General Plan Draft EIR Comment

Regarding the 2040 General Plan,

The County failed to analyze the impact of allowing alternative fuel production in an Industrial area.

The County must analyze any impact that creates hazards on public health and safety through the transport, use or disposal of HazMat and HazWaste.

The County failed to evaluate Policy CTM-6.4 (alternative fueling stations) and has failed to even mention Policy LU-11.X (alternative fuel production) or Implementation Program LU-Program X (County shall allow the production of alternative fuel). These policies were not analyzed for impacts - and yet the County claims, without having conducted a complete and thorough analysis, that the impact will be less than significant (pg. 4.9-12 and 4.9-14).

This analysis was grossly inadequate and needs to be corrected and the EIR needs to be recirculated.

Sincerely yours,
 Dario Grossberger

Ventura County Resource Management Agency, Planning Division

Attn: Susan Curtis, Manager, General Plan Update Section
 800 S. Victoria Ave., L #1740
 Ventura, CA 93009-1740

GeneralPlanUpdate@ventura.org

Dear Ms. Curtis:

I am writing to call your attention to significant flaws in the process, data, and conclusions of the Ventura County General Plan, Draft EIR, and supplemental documents.

My great grandfather, Mark McLoughlin (1843-1914), was a true Ventura County pioneer, purchasing his first 318 acres of undeveloped land in Ventura County in 1875. He was a hard-working visionary, revered by his community. With his son—my grandfather, James Patrick McLoughlin—he raised livestock and farmed the land, providing jobs and feeding the growing towns of Oxnard and Ventura.

I36-1

Our land, in a vitally important location on Olivas Park Drive across from the Ventura Marina, has been in the family, and part of the economic fabric of the community, for 100 years. And we want it to be part of the future of this community, with a flourishing economy, a thriving job market, and unsurpassed quality of life for its residents.

But the General Plan and DEIR do not describe a viable path for us as landowners going forward.

I will begin with some specific issues regarding language in the Coastal Area Plan, 4-82-83 and 4-94-95. Part of our land is located in the Central Coastal Zone, adjacent to the Ventura Marina, on Olivas Park Drive at Harbor Blvd. The only conclusion the Plan draws about our land is the statement that, “unlike the Preble area, services are not readily available to the Olivas lands.” This is false. Our property has access to all utilities, water, main roads, and the freeway. Indeed, easements on our property serve surrounding areas with utilities.

I36-2

The Plan also claims that our property is “not included in the City’s sanitation district because of problems with water pressure.” This language is irrelevant and incorrect. There is no evidence that there are water pressure issues, and the sanitation district’s pipelines actually traverse our property.

While we do not know the original source of these misstatements, such misrepresentations—now repeated in the Plan—threaten to diminish the value of our land in relation to the Preble property. And, of course, they undermine the goal and the value of the Plan itself.

The General Plan also speaks of the widening of Olivas Park Drive, our southern boundary. This would have a direct impact on our property. But the Plan does not address how this would happen or how it would affect our land.

Damaging misstatements about our property also appear in the DEIR. Contrary to the portrayal in the DEIR, our property has significant infrastructure in place, as well as prime accessibility to the highway and the harbor. In fact, with easy access to the marina and beach community, and with the railroad as part of our eastern boundary, our land is uniquely suited to be an important part of future economic development in the area. We are entitled to have all these matters corrected.

I36-3

I would also like to raise some additional concerns:

1. The General Plan and DEIR continue to ignore the 28% increase in the homeless population in our community.

I36-4

2. According to the General Plan, if we were to build an acre of low income / worker housing we would need to buy two replacement acres of same Ag land to be placed into perpetual agricultural preservation. This is unrealistic and infeasible, and certainly not in line with the State government's housing policies.

I36-5

3. The EIR does not adequately address the enormous "indirect impacts" that will occur as a result of implementing the General Plan, calling them "less than significant."

I36-6

4. The General Plan contains policies that will increase the costs of normal farming operations, making it difficult for farming to remain profitable.

I36-7

5. The Plan does not adequately evaluate the impacts of increased competition for water in our community.

I36-8

The EIR is a flawed document, full of errors, that does not disclose all impacts, direct and indirect, caused by the General Plan. It was obviously rushed—completed in six weeks. It is inaccurate and incomplete, and fails to provide members of the community with the information that they are legally entitled to. This EIR should be corrected and reconsidered, and a reasonable time period should be allowed for meaningful and thoughtful community input.

I36-9

Sincerely,
Dave Chambers

Re: Comments on Ventura County General Plan DEIR

Dear Ms. Curtis:

I represent and serve on the McLoughlin Family Committee, a group of family members that own approximately 300 acres of agricultural property off of Olivas Park Road in the County of Ventura, in proximity to the City of Ventura.

The McLoughlin family has farmed this land for generations. It remains our desire to continue this legacy. However, in the face of never-ending changes to the regulatory environment, we again find ourselves attempting to ascertain how new policies and programs as proposed in the draft 2040 General Plan will impact and challenge our ability to serve as stewards of this heritage.

I37-1

It had been our hope that the DEIR would provide some clarity and insight into how the new policies and programs within the revised General Plan would impact our farming operation. However, that is not the case. Simply said, we believe the General Plan Update and subsequent Environmental Impact Report fail to adequately analyze or study impacts on the farming industry.

With that said, we would like to specifically present the following:

- The Background report Table 6-26: Transportation Department Planned Capital Projects lists sections of roadways the County plans for expanded capacity or widening, along with the scope of those enhancements. It also covers in length the plan to add bike paths and bike lanes in accordance with existing County wayfarer plans. However, the DEIR never analyzes the loss of farmland resulting from these changes in infrastructure—it’s not even mentioned as a possibility in the DEIR.

I37-2

Olivas Park Road between Victoria and Harbor is listed as one of the areas planned for road widening, a stretch of roadway that borders the entire eastern portion of our farmland and property. While the impact on our farming operation and financial losses due to property loss are clearly quantifiable, the report fails to list or quantify these impacts.

- In Section 3-8, The DEIR states that because there will be no “substantive” change to the agricultural, open space, or rural designations, the General Plan Update (GPU) will be consistent with SOAR. However, no further details beyond this conclusory statement is provided. There is no way for the reader to come to his or her own conclusion on whether the GPU will result in inconsistencies with SOAR that might lead to physical environmental impacts. There is no description of the changes to the Agriculture, Open Space, and Rural policies to determine whether they are in fact non-substantive.

I37-3

Given the length and breath of the Draft General Plan update and CEQA analysis, we made an attempt to focus our initial review and subsequent comments to issues specific to agriculture and farming. However, it’s clear that the 2040 General Plan will impact the Ventura County local economy across sectors – all of which influence the ability to live and work in this region. The DEIR’s lack of analysis of those economic impacts, calls into question the legitimacy of both the draft General Plan update, and the CEQA analysis. As such, we respectfully request that the DEIR be recirculated in the hopes that further study will resolve these shortcomings.

I37-4

I appreciate your consideration.

To: Susan Curtis-

County failed to evaluate mitigation measure for feasibility- 500' set back for "sensitive receptors" from freeways and high traffic roads.

Mitigation Measure AQ-3 (Policy HAZ10-X) creates a minimum 500' set back for "sensitive receptors" from freeways and high traffic roads. Yet the County states in the Land Use section of the EIR that "the majority of the anticipated build out will be within the freeway corridors."

Has the County completed a "buildout study" to ensure that the establishment of this set back still leaves enough room for development to occur? Will this mitigation measure be economically feasible?

Ventura, CA 93003

Re: 2040 General Plan Environmental Impact Report (EIR)

Dear Mr. Hedrick and Honorable Members of APAC:

Thank you for the opportunity to provide comments following today’s presentation by Ventura County Planning staff on the 2040 General Plan EIR.

I39-1

There are several issues with the 2040 General Plan EIR that CoLAB believes will negatively impact the viability of local agriculture.

Proposed mitigation measure AG-2: The County proposes that any project that either directly or indirectly results in the loss of farmland must obtain and place into perpetual agricultural preservation twice the total of the farmland loss. This mitigation measure is infeasible. Contrary to statements made by County Planning staff today at the APAC meeting, the California Environmental Quality Act (CEQA) requires that all mitigation proposed in an EIR be feasible. CEQA Section 21061.1 defines feasible as “capable of being accomplished in a successful manner within a reasonable period of time,

” (*emphasis added*). All mitigation measures proposed in an EIR must be shown to reduce impacts and an infeasible mitigation measure, by definition, cannot and will not reduce impacts.

The EIR does not provide evidence of any of the following:

1. 1) Whether there is sufficient land available for purchase/conservation easement for each farmland category;
2. 2) The cost per acre to purchase each category of farmland;
3. 3) The anticipated cost of establishing a conservation easement for each category of farmland;
4. 4) The anticipated cost associated with managing each category of farmland under a conservation easement;
5. 5) The anticipated cost associated with monitoring these mitigation parcels scattered throughout the County and who will bear that cost;
6. 6) Any information that could constitute a “plan” for management of farmland in conservation easements;

I39-2

February 19, 2020

Page 2 of 4

7. 7) An analysis of direct and indirect impacts caused by this mitigation measure (including impacts associated with LU compatibility conflicts and increased urban-ag-interface);
8. 8) Whether the smallest possible mitigation acreage required will achieve the minimum to ensure viability of agriculture on the parcel; and
9. 9) Whether the proposed mitigation is in conflict with other ordinances and regulations, such as the County's Zoning Ordinance and the County's minimum lot sizes.

The County is already aware that this proposed mitigation measure is infeasible. On March 24, 2016, at a Local Agency Formation Commission (LAFCo) hearing, Supervisor Linda Parks attempted to establish an "Agricultural Mitigation Measure" through the LAFCo project approval process. The mitigation measure would have required the 1-to-1 purchase of local farmland (half of what is proposed in the 2040 General Plan EIR) to replace farmland that would be impacted by any proposed development. Ventura County Counsel, Michael Walker, informed both LAFCo and Supervisor Parks that the proposed mitigation measure did not meet the standard for economic feasibility, and, for that and other reasons, LAFCo could not adopt Supervisor Park's proposed mitigation measure. He referenced a 2015 legal decision, *City of Irvine v. County of Orange*, in which the Court stated, "the sheer astronomical expense of land supports the finding of the EIR that the purchase of an agricultural conservation easement is a non-starter."

I39-2
cont.

In addition to being infeasible, CoLAB does not believe that this mitigation measure will reduce impacts on agricultural land, as it does not address the actual issues that will impact farmland under the 2040 General Plan: lack of economic sustainability, the increasing regulatory demands on agriculture, increased competition for water resources, and increased compatibility conflicts from development.

Indirect Impacts

The EIR dismisses "indirect impacts" that will occur as a result of implementing the 2040 General Plan as "less than significant."

Page 4.2-13 of the EIR states "AG-2.3 maintains the Right-to-Farm Ordinance to protect agricultural land uses from conflicts with non-agricultural uses, as well as to help land purchasers and residents understand the potential for nuisance, (e.g., dust, noise, odors) that may occur as the natural result of living in or near agricultural areas...These sections of the code protect farmers engaged in agricultural activity from public nuisance claims...This protects the farming community, including Important Farmlands and farms less than 10 acres, from developments that would inhibit their ability to continue agricultural production."

Page 4.2-17 of the EIR states: "Residential growth in areas nearby agricultural lands has the potential to result in land use conflicts. Residential land uses are generally more sensitive and prone to conflict with adjacent agricultural land uses than commercial or industrial land uses. The placement of sensitive land uses, such as residences and schools, nearby classified farmland can negatively impact both uses due to conflict including odor nuisances and noise from agriculture machinery. The countywide Right-to-Farm Ordinance protects existing agricultural and farming operations from conflicts attributed to residential development...Therefore, the potential for conflicts would be minimal. This impact would be less than significant" (emphasis added).

I39-3

This is simply not true. Historic and recent County actions have shown that the County has and will continue to create new restrictions and ordinances that have a significant impact on existing agricultural and farming operations because of conflicts attributed to residential development. The recent interim urgency ordinance restricting hemp cultivation is one such example.

Ventura County Coalition of Labor, Agriculture and Business / 1672 Donlon Street, Ventura, CA 93003 / 805-633-2260 / info@colabvc.org

Page 3 of 4

Contrary to statements made today by Ventura County Planning staff, an EIR, whether it is labeled as “programmatic” or “project”, must analyze all reasonably foreseeable consequences of the action that is proposed. For the 2040 General Plan EIR, the action proposed is the implementation of all policies and programs within. Therefore, if the implementation of a policy in the 2040 General Plan will result in an impact, that impact must be analyzed. For example, the 2040 General Plan contains land use designation changes that will increase allowable housing density near agricultural land. It is reasonably foreseeable that more houses will create more compatibility conflicts with normal farming operations. The impact of these compatibility conflicts must be addressed in the EIR.

I39-4

In 2014, the California Court of Appeal stated in a ruling that “[T]he fact that this EIR is labeled a ‘project’ rather than a ‘program’ EIR matters little....Designating an EIR as a program EIR ... does not by itself decrease the level of analysis otherwise required in the EIR. All EIRs must cover the same general content. The level of specificity of an EIR is determined by the nature of the project and the “rule of reason,” rather than any semantic label accorded to the EIR.”

It is CoLAB’s opinion that indirect impacts from increasing urban-ag interface are SIGNIFICANT and cannot be dismissed in the EIR.

Direct and indirect impacts of increased costs

The 2040 General Plan has policies that will increase the costs of normal farming operations. CoLAB believes that the most effective way to minimize conversion of agricultural land to non-agricultural uses is to take active measures to allow farming to remain profitable. And even the County admits that reducing the cost of farming reduces conversion of agricultural land in their discussion of the Williamson Act in Chapter 4.2 of the EIR.

I39-5

But the County fails to analyze direct and indirect impacts of 2040 General Plan policies that will increase the cost of normal farming operations, such as:

- Policy AG-5.2: Electric- or Renewable-Powered Agricultural Equipment. The County shall encourage and support the transition to electric- or renewable-powered or lower emission agricultural equipment in place of fossil fuel-powered equipment when feasible.
- Policy AG-5.3: Electric- or Renewable-Powered Irrigation Pumps. The County shall encourage farmers to convert fossil fuel-powered irrigation pumps to systems powered by electric or renewable energy sources, such as solar power, and encourage electric utilities to eliminate or reduce standby charges.

Direct and indirect impacts of increased competition for water resources

The County fails to evaluate the impact of increased competition for water resources caused by development allowed in the 2040 General Plan on either the conversion of agricultural land or the loss of agricultural lands through the loss of topsoil.

I39-6

The EIR states on page 4.2-3 that “...a reduction in available water resources for irrigation” is an example of indirect impacts on agricultural land due to loss of topsoil from increased wind and water erosion. But the County fails to analyze or propose mitigation measures to address this significant impact.

Ventura County Coalition of Labor, Agriculture and Business / 1672 Donlon Street, Ventura, CA 93003 / 805-633-2260 / info@colabvc.org

Page 4 of 4

APAC is the expert charged with advising County decision-makers on agricultural issues in Ventura County. And the County should be seeking guidance from APAC about the actual issues that will impact farmland under the 2040 General Plan: lack of economic sustainability, the increasing regulatory demands on agriculture, increased competition for water resources, and increased compatibility conflicts from development.

CoLAB encourages APAC to provide guidance to the County on appropriate and effective mitigation measures to prevent the conversion of agricultural land to non-agricultural uses. These may include:

1. 1) Strengthen the Right-to-Farm ordinance to prevent nuisance complaints from being used to justify the creation or expansion of setbacks or regulatory restrictions on normal farming practices;
2. 2) Expand the Land Conservation Act Program to include Open Space zoned properties that are engaged in farming (including grazing); and
3. 3) Protect agricultural land from urban-ag interface encroachment and compatibility conflicts by establishing setbacks on NON-AE-zoned land that will restrict the construction of bike paths, public trails, and sensitive receptors within 2000' of any land zoned A/E.

I39-7

Thank you again for the opportunity to provide comments on this issue. We appreciate your consideration and leadership at this time.

Sincerely,

Louise Lampara Executive Director

Re: 2040 General Plan Environmental Impact Report (EIR)

Dear Mr. Hedrick and Honorable Members of APAC:

Thank you for the opportunity to provide comments following today's presentation by Ventura County Planning staff on the 2040 General Plan EIR.

There are several issues with the 2040 General Plan EIR that CoLAB believes will negatively impact the viability of local agriculture.

I40-1

Proposed mitigation measure AG-2: The County proposes that any project that either directly or indirectly results in the loss of farmland must obtain and place into perpetual agricultural preservation twice the total of the farmland loss. This mitigation measure is infeasible. Contrary to statements made by County Planning staff today at the APAC meeting, the California Environmental Quality Act (CEQA) requires that all mitigation proposed in an EIR be feasible. CEQA Section 21061.1 defines feasible as "capable of being accomplished in a successful manner within a reasonable period of time,

" *(emphasis added)*. All mitigation measures proposed in an EIR must be shown to reduce impacts and an infeasible mitigation measure, by definition, cannot and will not reduce impacts.

The EIR does not provide evidence of any of the following:

1. 1) Whether there is sufficient land available for purchase/conservation easement for each farmland category;
2. 2) The cost per acre to purchase each category of farmland;
3. 3) The anticipated cost of establishing a conservation easement for each category of farmland;
4. 4) The anticipated cost associated with managing each category of farmland under a conservation easement;
5. 5) The anticipated cost associated with monitoring these mitigation parcels scattered throughout the County and who will bear that cost;
6. 6) Any information that could constitute a "plan" for management of farmland in conservation easements;

I40-2

February 19, 2020

Page 2 of 4

7. 7) An analysis of direct and indirect impacts caused by this mitigation measure (including impacts associated with LU compatibility conflicts and increased urban-ag-interface);
8. 8) Whether the smallest possible mitigation acreage required will achieve the minimum to ensure viability of agriculture on the parcel; and
9. 9) Whether the proposed mitigation is in conflict with other ordinances and regulations, such as the County's Zoning Ordinance and the County's minimum lot sizes.

The County is already aware that this proposed mitigation measure is infeasible. On March 24, 2016, at a Local Agency Formation Commission (LAFCo) hearing, Supervisor Linda Parks attempted to establish an "Agricultural Mitigation Measure" through the LAFCo project approval process. The mitigation measure would have required the 1-to-1 purchase of local farmland (half of what is proposed in the 2040 General Plan EIR) to replace farmland that would be impacted by any proposed development. Ventura County Counsel, Michael Walker, informed both LAFCo and Supervisor

I40-2
cont.

Parks that the proposed mitigation measure did not meet the standard for economic feasibility, and, for that and other reasons, LAFCo could not adopt Supervisor Park's proposed mitigation measure. He referenced a 2015 legal decision, *City of Irvine v. County of Orange*, in which the Court stated, "the sheer astronomical expense of land supports the finding of the EIR that the purchase of an agricultural conservation easement is a non-starter."

In addition to being infeasible, CoLAB does not believe that this mitigation measure will reduce impacts on agricultural land, as it does not address the actual issues that will impact farmland under the 2040 General Plan: lack of economic sustainability, the increasing regulatory demands on agriculture, increased competition for water resources, and increased compatibility conflicts from development.

Indirect Impacts

The EIR dismisses "indirect impacts" that will occur as a result of implementing the 2040 General Plan as "less than significant."

Page 4.2-13 of the EIR states "AG-2.3 maintains the Right-to-Farm Ordinance to protect agricultural land uses from conflicts with non-agricultural uses, as well as to help land purchasers and residents understand the potential for nuisance, (e.g., dust, noise, odors) that may occur as the natural result of living in or near agricultural areas...These sections of the code protect farmers engaged in agricultural activity from public nuisance claims...This protects the farming community, including Important Farmlands and farms less than 10 acres, from developments that would inhibit their ability to continue agricultural production."

Page 4.2-17 of the EIR states: "Residential growth in areas nearby agricultural lands has the potential to result in land use conflicts. Residential land uses are generally more sensitive and prone to conflict with adjacent agricultural land uses than commercial or industrial land uses. The placement of sensitive land uses, such as residences and schools, nearby classified farmland can negatively impact both uses due to conflict including odor nuisances and noise from agriculture machinery. The countywide Right-to-Farm Ordinance protects existing agricultural and farming operations from conflicts attributed to residential development...Therefore, the potential for conflicts would be minimal. This impact would be less than significant" (*emphasis added*).

I40-3

This is simply not true. Historic and recent County actions have shown that the County has and will continue to create new restrictions and ordinances that have a significant impact on existing agricultural and farming operations because of conflicts attributed to residential development. The recent interim urgency ordinance restricting hemp cultivation is one such example.

Ventura County Coalition of Labor, Agriculture and Business / 1672 Donlon Street, Ventura, CA 93003 / 805-633-2260 / info@colabvc.org

Page 3 of 4

Contrary to statements made today by Ventura County Planning staff, an EIR, whether it is labeled as “programmatic” or “project”, must analyze all reasonably foreseeable consequences of the action that is proposed. For the 2040 General Plan EIR, the action proposed is the implementation of all policies and programs within. Therefore, if the implementation of a policy in the 2040 General Plan will result in an impact, that impact must be analyzed. For example, the 2040 General Plan contains land use designation changes that will increase allowable housing density near agricultural land. It is reasonably foreseeable that more houses will create more compatibility conflicts with normal farming operations. The impact of these compatibility conflicts must be addressed in the EIR.

I40-4

In 2014, the California Court of Appeal stated in a ruling that “[T]he fact that this EIR is labeled a ‘project’ rather than a ‘program’ EIR matters little....Designating an EIR as a program EIR ... does not by itself decrease the level of analysis otherwise required in the EIR. All EIRs must cover the same general content. The level of specificity of an EIR is determined by the nature of the project and the “rule of reason,” rather than any semantic label accorded to the EIR.”

It is CoLAB’s opinion that indirect impacts from increasing urban-ag interface are SIGNIFICANT and cannot be dismissed in the EIR.

Direct and indirect impacts of increased costs

The 2040 General Plan has policies that will increase the costs of normal farming operations. CoLAB believes that the most effective way to minimize conversion of agricultural land to non-agricultural uses is to take active measures to allow farming to remain profitable. And even the County admits that reducing the cost of farming reduces conversion of agricultural land in their discussion of the Williamson Act in Chapter 4.2 of the EIR. But the County fails to analyze direct and indirect impacts of 2040 General Plan policies that will increase the cost of normal farming operations, such as:

I40-5

- Policy AG-5.2: Electric- or Renewable-Powered Agricultural Equipment. The County shall encourage and support the transition to electric- or renewable-powered or lower emission agricultural equipment in place of fossil fuel-powered equipment when feasible.
- Policy AG-5.3: Electric- or Renewable-Powered Irrigation Pumps. The County shall encourage farmers to convert fossil fuel-powered irrigation pumps to systems powered by electric or renewable energy sources, such as solar power, and encourage electric utilities to eliminate or reduce standby charges.

Direct and indirect impacts of increased competition for water resources

The County fails to evaluate the impact of increased competition for water resources caused by development allowed in the 2040 General Plan on either the conversion of agricultural land or the loss of agricultural lands through the loss of topsoil.

I40-6

The EIR states on page 4.2-3 that “...a reduction in available water resources for irrigation” is an example of indirect impacts on agricultural land due to loss of topsoil from increased wind and water erosion. But the County fails to analyze or propose mitigation measures to address this significant impact.

Ventura County Coalition of Labor, Agriculture and Business / 1672 Donlon Street, Ventura, CA 93003 / 805-633-2260 / info@colabvc.org

Page 4 of 4

APAC is the expert charged with advising County decision-makers on agricultural issues in Ventura County. And the County should be seeking guidance from APAC about the actual issues that will impact farmland under the 2040 General Plan: lack of economic sustainability, the increasing regulatory demands on agriculture, increased competition for water resources, and increased compatibility conflicts from development.

CoLAB encourages APAC to provide guidance to the County on appropriate and effective mitigation measures to prevent the conversion of agricultural land to non-agricultural uses. These may include:

1. 1) Strengthen the Right-to-Farm ordinance to prevent nuisance complaints from being used to justify the creation or expansion of setbacks or regulatory restrictions on normal farming practices;
2. 2) Expand the Land Conservation Act Program to include Open Space zoned properties that are engaged in farming (including grazing); and
3. 3) Protect agricultural land from urban-ag interface encroachment and compatibility conflicts by establishing setbacks on NON-AE-zoned land that will restrict the construction of bike paths, public trails, and sensitive receptors within 2000' of any land zoned A/E.

I40-7

Thank you again for the opportunity to provide comments on this issue. We appreciate your consideration and leadership at this time.

Sincerely,
Louise Lampara Executive Director

VIA Email: GeneralPlanUpdate@ventura.org

Letter
I41

Dear Ms. Curtis,

The Ventura County General Plan Update Draft Environmental Impact Report (DEIR) fails to adequately address the impacts associated with the policies proposed by the draft General Plan. Specifically, this letter comments on DEIR Section 4.2 – Agriculture and Forestry Resources.

Section 15168 (b)(2) of the California Resources Code identifies one of the advantages of a Program EIR as ensuring “consideration of cumulative impacts that might be slighted in a case-by-case analysis.” The DEIR further clarifies: “The impact analysis provided in this section addresses the physical changes to the existing environment that could occur as a result of 2040 General Plan implementation.”

The methodology of the analysis (Section 4.2.2) addresses only future development and land-use conflicts. Implementation of the General Plan is much more complex. This approach treats agricultural resources as just another land use designation while ignoring the viability of what CEQA determined to be a critical and valuable part of our environment.

There are numerous deficiencies but for brevity I will review the first two scoring factors in the California LESA model: water availability and project size. Both are critical to the viability of sustainable agricultural production but the impacts of the proposed General Plan policies and DEIR mitigations are not properly analyzed or evaluated. The proposed policies and mitigations could result in the conversion of Farmland to non-agricultural uses or create physical changes that are not analyzed or meaningfully mitigated under the DEIR.

Water Availability. The DEIR passingly references the importance of water to agricultural sustainability but fails to quantify existing conditions or anticipated changes in availability for agricultural uses. The Background Report and Section 4-10 identify groundwater basins in overdraft including the Oxnard Plain Basin that provides more than half of all agricultural irrigation water in the county. The proposed GSP for the Oxnard Basin will require significant reductions in agricultural groundwater extraction over the next 20 years - possibly up to 50%. The head of the Fox Canyon GMA is advocating for the full reductions immediately.

It is not possible to irrigate the same amount of land with half the water. The reductions in available water for irrigation and increased costs will necessarily lead to the fallowing of thousands of acres of agricultural land during the General Plan’s 20-year time horizon.

I41-1

I41-2

Unplanted areas will be subject to increased erosion from wind and water forces. The proposed General Plan policies will play a significant role in the conversion of current Farmland to non-agricultural uses.

I41-2
cont.

The proposed mitigations of permanently restricting agricultural lands on a 2:1 basis is well established to be infeasible (see LAFCo analysis). Without water, the designated land could not be used for agricultural production. There is no analysis of any of the impacts from significant water supply reductions and the DEIR is inadequate.

Project Size. According to the DEIR, the county contains prime agricultural lands that "...are capable of supporting commercially viable agricultural operations on minimum 9-acre parcels. According to the most recent data from the USDA (2017), the majority of farms in the county are less than 50 acres and approximately half of the farms are less than 10 acres."

Despite this data, the General Plan sets a minimum lot size for Agriculture that is at least four times larger than half of the existing farms:

Policy LU-8.3: Minimal Parcel Size for the Agricultural Land Use Designation. The County shall ensure that the smallest minimum parcel size consistent with the Agricultural land use designation is 40 acres. The County may require larger minimum parcel sizes based on the zone classification.

For farms located in an Open Space land-use designation, the minimum lot size is 10 acres. These policies may make more than half of all farms nonconforming with the underlying General Plan. The probability that a nonconforming farm lot was created legally is extremely low. Over the extended life of the plan, the impacts on agricultural resources are potentially profound.

I41-3

LU 4-4 and Sec. 8113-8 of the Non-Coastal Zoning Ordinance, for example, prohibit the allowed uses on a nonconforming lot unless it is a legal lot. No building permits may be issued on an illegal lot. To correct most illegal lots requires a Conditional Certificate of Compliance and the conditions are not required to be feasible. Generally, consistency with the General Plan requires that the lot conform to the established minimum lot size. By setting the minimum lot size larger than most of the existing farms, the General Plan will require that illegal lot owners purchase adjacent land. If that land is not available or too expensive, the county may shut down the existing agricultural use and/or deny any new permits.

The General Plan sets minimum lot sizes larger than more than half of the County's farms and larger than what the County determined was necessary for commercial viability. There is no analysis of how many farms may be impacted by these policies or how they could result in the conversion to non-agricultural uses.

The conversion to non-agricultural uses under CEQA is not predicated on establishing an alternative land use designation. Any use or having no use that results in stopping the

I41-4

production of agriculture constitutes a conversion. The DEIR fails evaluate all potential impacts and must be rewritten and subsequently recirculated for review.

I41-4

| Letter I41 | David S Armstrong February 27, 2020 |
|-----------------------|-----------------------------------------------|

I41-1 The comment asserts that the draft EIR does not adequately address impacts associated with proposed 2040 General Plan policies, specifically related to agriculture and forestry resources, because the impact assessment methodology does not account for the complexity of the 2040 General Plan. The comment also introduces more detailed comments below as based on the California Agricultural Land Evaluation and Site Assessment (LESA) Model.

The LESA model is a point-based approach for rating the relative importance of agricultural land resources that was developed by the California Department of Conservation as an optional model to use in assessing impacts on agriculture and farmland. It is based upon specific, measurable features at the parcel scale and is most appropriately applied at the project level. Refer to response to comment I41-2 and I41-3, below, for detailed response.

The draft EIR analyzes, at a programmatic level, the physical changes that could occur upon implementation of the 2040 General Plan. Contrary to the commenter’s assertion, the analysis of potential agricultural impacts is not limited to evaluation of direct land use conflicts. As explained under the subheading “Methodology” on page 4.2-3:

The analysis considers whether future development under the 2040 General Plan could result in loss of agricultural resources or conversion of agricultural resources to non-agricultural uses by allowing for non-agricultural land uses to be located directly on existing designated farmland. It also considers whether the 2040 General Plan would result in indirect loss of agricultural resources by allowing for non-agricultural land uses adjacent to classified farmland. Examples of indirect losses of agricultural resources due to land use conflicts include: decreased solar access due to building heights from nonagricultural uses, dust exposure from construction or ongoing operations, and a reduction in available water resources for irrigation. Indirect loss of agricultural soils is due to increased wind and water erosion and direct loss of important soils is attributed to removal or permanent overcovering.

The discussion in the draft EIR under the subheading “Thresholds of Significance” explains the development of thresholds for the evaluation. As explained, the option to evaluate the 2040 General Plan based on the LESA model was not employed. Instead, thresholds were developed by combining the County of Ventura’s adopted Initial Study Assessment Guidelines, which include threshold criteria to assist in the evaluation of significant impacts for individual projects, and the sample questions provided in Appendix G of the California Environmental Quality Act (CEQA) Guidelines. This has resulted in an appropriately thorough and CEQA-compliant evaluation of the potential for implementation of the 2040 General Plan to result in conversion of agricultural land.

The comment suggests that the draft EIR does not provide an analysis or meaningful mitigation of policies and mitigation measures that could result in the conversion of farmland to non-agricultural uses or create physical changes, but provides no specific examples. The draft EIR discusses the potential for direct and indirect loss of Prime Farmland, Farmland of Statewide Importance, Unique Farmland, and Farmland of Local Importance under Impact 4.2-1 beginning on page 4.2-9. Any future development that causes the loss of Important Farmland that exceeds the County’s acreage thresholds would be considered significant. Potential for conflicts between Farmland and non-agricultural uses to result in conversion or loss of agricultural land is evaluated in Impact 4.2-2 beginning on page 4.2-17 of the draft EIR. As summarized on page 4.2-18, the 2040 General Plan includes policies and programs that limit potential for land use conflicts in addition to the County’s robust existing regulatory framework established to protect agricultural resources; therefore, potential for conflicts would be minimal.

I41-2

The comment states that the draft EIR does not quantify existing conditions or anticipated changes in water availability for agricultural uses. Refer to response to comment A13-11 for a discussion of available water resources for irrigation and indirect impacts to agricultural land. Also refer to response to comment O7-4 addressing the availability of water for the agricultural industry.

Specifically, the commenter cites the proposed groundwater sustainability plan for the Oxnard Basin and restrictions on water use purportedly proposed by Fox Canyon Groundwater Management Agency. These changes are being made by water purveyors in response to State legislation and are not part of the 2040 General Plan. A reduction in available water resources that causes conversion of farmland is not a potential impact of the project and is, therefore, appropriately excluded from the draft EIR impact discussion.

Although the comment states that the proposed 2040 General Plan policies will play a significant role in the conversion of farmland to non-agricultural uses, no specific areas of concern are identified. Refer to response to comment I41-1, above, regarding the draft EIR’s discussion of potential conversion of farmland to non-agriculture uses and Master Response MR-5 regarding the feasibility of Mitigation Measure AG-2.

I41-3

The comment states that the 2040 General Plan would create minimum lot size requirements for the Open Space and Agricultural land use designations, which it asserts would make more than half of farms in the county non-conforming with the

General Plan, and that as a result existing agricultural uses would be shut down or otherwise become non-agricultural uses. The comment further states that there is no analysis of the effect that policies establishing minimum parcel sizes could have on existing agricultural operations. Because these existing land uses would be considered non-conforming, the comment indicates that the 2040 General Plan could impair the ability for agricultural properties that do not meet the parcel size requirements to obtain building permits. The 2040 General Plan proposes no change in the minimum lot sizes of any land use designations. Therefore, the commenter's assertion that the 2040 General Plan would create new minimum lot size requirements is inaccurate. Furthermore, EIRs are not required to speculate about a project's environmental impacts (State CEQA Guidelines, § 15145). As an initial matter, the 2040 General Plan would not make or require any regulatory changes that would render any existing legal lot nonconforming as to minimum lot size. Moreover, no County land use approval is needed to engage in agricultural production regardless of the size of the parcel or its conformance to the applicable minimum lot size. In addition, there is no blanket prohibition on the issuance of building permits for structures proposed on legal lots that do not conform to the applicable minimum lot size. There is no evidence that existing agricultural uses would be "shut down" or that building permits would be denied if landowners do not purchase adjacent land to increase lot sizes to conform to the minimum lot size requirements of the 2040 General Plan. Discussion of potential indirect effects related to minimum lot sizes would be speculative and would not significantly change the analysis or conclusions of the draft EIR. No changes to the draft EIR have been made in response to this comment.

I41-4 The comment suggests that any outcome of the 2040 General Plan "that results in stopping the production of agriculture constitutes a conversion" pursuant to CEQA and asserts that the draft EIR fails to evaluate all potential impacts.

In fact, the evaluation of the effect of a project on agriculture under CEQA addresses conversion of Prime Farmland, Unique Farmland, or Farmland of Statewide Importance as defined by the United States Department of Agriculture (see Pub. Res. Code, § 21060.1 and Section II.a of Appendix G to the State CEQA Guidelines). Changes to the existing environment are also evaluated for their potential to result in conversion of Farmland to non-agricultural use (see Section II.e of Appendix G). Therefore, the analysis in the draft EIR appropriately addresses effects to land that meets the requirements of these designations; an evaluation of all land in agricultural production is not required. Further, CEQA does not define the term "conversion" for the purpose of this evaluation. See response to comment O5-29 for additional discussion of agricultural conversion.

As discussed in response to comments I41-2 and I41-3, above, there is no evidence that the policies and implementation programs proposed in the 2040 General Plan would result in changes to the existing environment that would cause conversion of farmland to non-agricultural use beyond those analyzed in the draft EIR. The potential for specific future projects to conflict with, or cause the conversion of, agricultural land would be evaluated at the project level. As discussed on page 4.2-17 of the draft EIR, the potential to result in the conversion of Farmland is considered a significant and unavoidable impact due

to the potential that future projects could result in direct or indirect loss of Important Farmlands because there are no actions or policies that the County could feasibly mandate to fully replace the loss of Important Farmland. Refer to Master Response MR-7, which explains in detail why recirculation of the draft EIR is not required.

REC'D FEB 27 2023

Re: Comments on Ventura County General Plan DEIR

Dear Ms. Curtis:

I am a part of the McLoughlin Family. We have been farming in Ventura County for approximately 150 years. We currently own 300 acres of agricultural property off of Olivas Park Road in the County of Ventura near the Ventura Marina on Harbor Rd, in proximity to the City of Ventura.

The McLoughlin family has farmed this land and other parcels for generations going back to 1863. It remains our desire to continue this legacy. However, in the face of never-ending changes to the regulatory environment, we again find ourselves attempting to ascertain how new policies and programs as proposed in the draft 2040 General Plan will impact and challenge our ability to serve as stewards of this heritage.

It had been our hope that the DEIR would provide some clarity and insight into how the new policies and programs within the revised General Plan would impact our farming operation. However, that is not the case. Simply said, we believe the General Plan Update and subsequent Environmental Impact Report fail to adequately analyze or study impacts on the farming industry.

With that said, we would like to specifically present the following:

- The Background report Table 6-26: Transportation Department Planned Capital Projects lists sections of roadways the County plans for expanded capacity or widening, along with the scope of those enhancements. It also covers in length the plan to add bike paths and bike lanes in accordance with existing County wayfarer plans. However, the DEIR never analyzes the loss of farmland resulting from these changes in infrastructure – it's not even mentioned as a possibility in the DEIR.

Olivas Park Road between Victoria and Harbor is listed as one of the areas planned for road widening, a stretch of roadway that borders the entire eastern portion of our farmland property. While the impact on our farming operation and financial losses due to property loss are clearly quantifiable, the report fails to list or quantify these impacts.

- In Section 3-8, The DEIR states that because there will be no "substantive" change to the agricultural, open space, or rural designations, the General Plan Update (GPU) will be consistent with SOAR. However, no further details beyond this conclusory statement is provided. There is no way for the reader to come to his or her own conclusion on whether the GPU will result in inconsistencies with SOAR that might lead to physical environmental impacts. There is no description of the changes to the Agriculture, Open Space, and Rural policies to determine whether they are in fact non-substantive.

I42-1

I42-2

I42-3

Given the length and breath of the Draft General Plan update and CEQA analysis, we made an attempt to focus our initial review and subsequent comments to issues specific to agriculture and farming. However, it's clear that the 2040 General Plan will impact the Ventura County local economy across sectors – all of which influence the ability to live and work in this region. The DEIR's lack of analysis of those economic impacts, calls into question the legitimacy of both the draft General Plan update, and the CEQA analysis. As such, we respectfully request that the DEIR be recirculated in the hopes that further study will resolve these shortcomings.

I42-4

I appreciate your consideration.

Your Comment:

I am very concerned that Ventura County is not taking drastic enough steps to protect our drinking water, and air quality from contamination from the oil industry. In a time of drought we should have a moratorium on fracking. Flaring is contaminating our air and it's avoidable and there are solutions. Sadly it's business as usual even though our air quality and water quality are continually suffering from the oil industry. We need forward thinking in our general plan to tackle climate change and really make a measurable difference. Please phase out fossil fuel production, maintain policy COS-7.8 and protect our finite water supply, and our air quality. Thank you. Dawn Kuznkowski

Re: General Plan Update Draft Environmental Impact Report Comments

Dear Ms. Curtis,

We are royalty owners who have lived in Ventura County for 71 years. We support continued local oil and natural gas production. Royalty and mineral rights owners have a legally vested interest in mineral rights. We have many concerns regarding the economic impact of the Draft Environmental Impact Report (DEIR).

Upon further review of the DEIR, we believe that the document has a bias against local oil and gas producers. COS-7.2 mandates a 2,500-foot setback for oil and gas wells in the unincorporated areas of the County. This arbitrary setback does little to safeguard public health and safety. It does however lead to an unavoidable shutdown of many existing oil operations. The DEIR itself states that, "There are no actions or policies that the County could feasibly mandate to fully reduce the impact that Policy COS 7.2 would have on hampering or precluding access to petroleum resources. This impact would remain significant and unavoidable". It is of concern to us that this new policy would leave the County vulnerable to millions of dollars in lawsuits if passed.

The DEIR neglects to accurately assess the financial impact of setbacks on the County. The DEIR cites Assembly Bill 345 to support the new setback policy. This is inappropriate given that AB 345 is stalled in the state legislature last year. The legislature's analysis of AB 345 estimated a loss of up to \$3.5 billion in revenue from reserves in the setback zone, and that the bill was so draconian that it would likely lead to lawsuits. It is not the policy Ventura County should be looking to model.

The City of Los Angeles Department of Public Works Office of Petroleum and Natural Gas Administration recently published a report that concluded: "The estimated potential cost to the City of establishing a setback distance on existing operations is \$724 million, which includes the minimum value of the current oil production, land value costs, well abandonment costs, environmental clean-up costs and five years of litigation expenses." Future operations subject to setback policies could be as high as \$97.6 billion in compensation for the future value of mineral rights owed from takings litigation.

I44-1

The DEIR does not consider minimum value of the current oil production, land value costs, well abandonment costs, environmental clean-up costs and five years of litigation expenses like the City of Los Angeles Department of Public Works Office of Petroleum and Natural Gas Administration report. The true cost of setbacks is missing from this DEIR.

Any effort to infringe upon legally vested rights is concerning. We believe local energy production contributes to a vibrant economy and provides an affordable reliable energy source for the state. Ventura County is lucky to have this natural resource. The DEIR should be revised and recirculated to accurately reflect oil and gas revenue as it pertains to mineral rights owners.

I44-1
cont.

Sincerely,

Dennis Reynolds

Dennis Reynolds
Royalty Owner

Camarillo CA 93011

| | |
|-----------------------|---------------------------------------------|
| Letter I44 | Dennis Reynolds February 25, 2020 |
|-----------------------|---------------------------------------------|

I44-1 The comment expresses concern about the economic impacts of the draft EIR and asserts that the draft EIR is biased against oil and gas producers. The comment apparently conflates the draft EIR with the 2040 General Plan. The 2040 General Plan is the genesis of Policy COS-7.2; the draft EIR evaluates the potential for the policies and programs proposed in the 2040 General Plan to hamper or preclude access to the resource (refer to Impact 4.12-3). As noted by the commenter, the draft EIR determines that the effect of the 2040 General Plan would be significant and unavoidable.

EIRs are not required to treat a project's economic or social effects as significant effects on the environment (CEQA Guidelines, § 15131). Social and economic effects need only be considered in an EIR where there is a clear link between those economic or social effects and physical environmental changes. Therefore, the commenter's concerns about the fairness and the financial implications of Policy COS-7.2 are appropriately excluded from discussion in the draft EIR. The economic issues raised in this comment would not result in any adverse physical changes to the environment not already addressed in the draft EIR. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.

For further discussion of the setback proposed in COS-7.2, as well as draft EIR Mitigation Measure PR-1, which would reduce the minimum setback for schools from 2,500 feet to 1,500 feet, refer to Master Response MR-4. Master Response MR-4 also provides further context regarding the County's authority to regulate oil and gas development (MR-4.A), antiquated permits and takings (MR-4.B), and the underlying motives of the proposed oil and gas policies (MR-4.C).

Regarding the comment that the draft EIR should be recirculated, refer to Master Response MR-7, which explains in detail why recirculation of the draft EIR is not required.

760-579-1437 271 S Ventura Rd #299 Port Hueneme

Comment On:
Draft Environmental Impact Report

Your Comment:

Don't allow expansion of the port in Port Hueneme. I live about 1/3 of a mile east of it & often I & thousands of others are downwind of it. It already has far too much air pollution. At least make them have all large vessels plug into the grid upon arrival before any expansion is seriously considered or have to install excellent air pollution equipment on their exhaust, such as scrubbers like those on one of the Wallenius Wilhelmsen auto carriers.

Even without any thought of port expansion, cleaning up the port's air pollution & the ships while in port needs to be much further the list of county air pollution priorities. Many schools are downwind of the port & almost always people are downwind of it.

Quite putting so many new residential units in highly air polluted areas near freeways. Bad for the residents till we have much cleaner fleets of vehicles.

Try hard to avoid more of the coast being lined with rip-rap & seawalls. Keep the shoreline way more natural than that. Discuss-sting when you go north of the city of Ventura. So much of the coast is rip-rap instead of natural beaches, dunes, wetlands, bluffs etc.

Regarding two things from Aug. 6, 2019 Board of Supervisor hearing, session I attended: one, Supervisor Parks idea on tree planting has a lot of good points though we must consider if more greenhouse gases will be produced than the trees make up for, by the transporting of water to water them & if water trucks will be used to water many of them. I've heard &/or read the Calif. Water Project is the largest user of electricity in the state & that's just one of the 3 large aqueduct systems that bring water to So. Calif. Water trucks should be electric, hydrogen or better, otherwise will also have air pollution from them. One fellows 90 seconds comment that day addressed problem if the trees degrade the natural ecosystems of the county. I agree that's a serious concern though Parks said we should use drought tolerant trees which will help narrow the choose to natives & a few others. That's good. We could concentrate on replacing native trees where they have been removed with natives. I think eucalyptus tend to drop stuff on the ground that prevent native plants from growing plus they blow over easy & aren't native & probably bad in fires.

2nd: I agree with all of supervisor Bennett's comments on climate change he mentioned on Aug. 6th. Not to downplay all the very important other considerations of the general plan, but I strongly feel that is the most important issue the county should address in the general plan.

Try to help insure we always have the Oxnard performing arts center

I45-1

I45-2

I45-3

| | |
|-----------------------|------------------------------------|
| Letter I45 | Derek McLaughlin No date |
|-----------------------|------------------------------------|

- I45-1 The comment raises concerns about current operation and expansion of the Port of Hueneme, locating residential units near freeways, and preservation of natural shorelines. The comment does not clearly address the draft 2040 General Plan and is not related to the adequacy of the draft EIR. Therefore, no response is required. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan. Note that the effects of the 2040 General Plan on air quality are addressed in the draft EIR in Section 4.3, "Air Quality." Specifically, Impact 4.3-5 (starting on page 4.3-20) analyzes the potential impacts to sensitive receptors from locating new residential development and other sensitive uses near high traffic volume freeways and roadways and other sources of toxic air contaminants. The draft EIR proposes Mitigation Measure AQ-3, which, as revised in the final EIR, would require that new sensitive receptors not be located within 1,000 feet of any freeway or roadway experiencing traffic volumes that exceed 50,000 vehicles per day, respectively, unless a site-specific Ventura County Air Pollution Control District-approved health risk assessment shows that associated levels of cancer risk at the sensitive receptors would not exceed 10 in 1 million. Refer to final EIR Chapter 3, "Revisions to the draft EIR," for the revisions to Mitigation Measure AQ-3.
- I45-2 The comment is related to implementation of Policy COS-1.15, proposed in the 2040 General Plan, through which the County would establish a goal to plant two million trees by 2040. The comment expresses concern about the greenhouse gas emissions associated with embedded energy of water that would be used to irrigate the trees and the potential for nonnative trees to degrade natural ecosystems.
- The draft EIR analyzes, at a programmatic level, the physical changes that could occur upon implementation of the 2040 General Plan; this includes planting trees pursuant to Policy COS-1.15 which states "The County shall establish and support a countywide target for the County, cities in Ventura County, agencies, organizations, businesses, and citizens to plant two million trees throughout the county by 2040." The commenter recommends that this policy should require native and drought tolerant trees. The effects of the 2040 General Plan on natural ecosystems, greenhouse gas emissions, and air quality, are addressed in the draft EIR in Section 4.4, "Biological Resources," Section 4.8, "Greenhouse Gas Emissions," and Section 4.3, "Air Quality," respectively. The location, species, and program for establishing the trees planted pursuant to Policy COS-1.15 have not been established. Furthermore, the policy encourages the planting of trees throughout Ventura County, regardless of jurisdictional boundaries and property owner (e.g. unincorporated versus city and private versus public entity) and provides broad flexibility in the species and type of trees planted to achieve this goal. For this reason, it is not possible to provide a detailed analysis of the

potential water demand and source of water to establish the trees. Additionally, because this policy encourages a wide range of opportunities to plant up to two million trees countywide, it does not limit the species and type of trees. An EIR is not required to speculate about environmental impacts. It is anticipated that implementation of this policy would not conflict with the County's programs related to water use efficiency, promotion of renewable energy, and preservation of natural communities. Also, the GHG projections included in the 2040 General Plan and draft EIR account for GHG emissions associated with the embedded energy of future water consumption, which includes water for irrigation.

This comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.

I45-3

The comment states that climate change is the most important topic addressed in the 2040 General Plan and requests that the County preserve the Oxnard Performing Arts Center. The comment addresses the draft 2040 General Plan and is not related to the adequacy of the draft EIR. Therefore, no response is required. Refer to Master Response MR-1 for a discussion of the Climate Action Plan that is incorporated into the 2040 General Plan. Climate change is also addressed in the draft EIR in Section 4.8, "Greenhouse Gas Emissions."

Subject: VC2040 General Plan Input Re Climate Change Mitigation

**Letter
I46**

Dear Ms. Susan Curtis,

As a member of the Ventura County Climate Hub, I have signed my name to the very thorough petition sent by the organization regarding the climate change mitigation- related components of the VC2040 Draft General Plan (and EIR). I also wanted to add a emphasize a few more points personally, covering some core areas regarding the urgent and vital climate change mitigation work we need to do, especially in the next decade.

I46-1

Community Collaboration

Establish a Citizen Advisory Committee, to work with the Board of Supervisors (and relevant County staff), to help both give input to climate change mitigation efforts, as well as advise the County on critical community resilience- building work.

Sustainable Transport

Since the transportation sector is a core contributor to carbon emissions, we need to follow the lead of model green cities (such as Portland, Oregon), and establish cycling/walking linkages throughout core routes in our cities. I live in Ventura, and believe people here are desperate for more sustainable and healthy transport options.

I46-2

Food Security

Please include edible, fire-mitigating, and indigenous trees in Supervisor Parks' 'two million trees' planting campaign.

Water Security

Please support community water resilience- building projects, such as one the Climate Hub is planning, called 'Transition Streets'

Thank you for your critical work,
Diana Kubilos

| <p>Letter I46</p> | <p>Diana Kubilos February 27, 2020</p> |
|------------------------------|---------------------------------------------------|

I46-1 The commenting individual’s participation in Ventura County Climate Hub is noted. This comment is introductory in nature and does not raise a significant environmental issue for which a response is required. Refer to the responses to Letter O1 for responses to the comments raised in the petition.

I46-2 The comment provides suggestions about the types of programs that could be included in the 2040 General Plan. These include a citizen advisory committee to provide input about the climate change and community resilience, support for trails and sustainable transport, refinement to Policy COS-1.15 to address food security through the types of trees that would be planted, and “Transition Streets.” As explained in draft EIR Table 4.8-6 (page 4.8-40) and in the text (page 4.8-44), the 2040 General Plan includes several programs that would reduce GHG emissions by reducing vehicle miles traveled and promoting trips by people walking and biking, and other options to driving alone (Programs CTM-A, and CTM-I to CTM-O). The 2040 General Plan also includes programs to reduce GHG emissions through water efficiency and conservation as explained on page 4.8-44. The 2040 General Plan also would include programs that reduce GHG emissions associated with the hauling and production of food including encouraging local consumption of locally produced food (page 4.8-33). The 2040 General Plan also includes Implementation Program COS-CC, which would establish a Climate Emergency Council to advise the Board of Supervisors on implementation of the climate action plan goals, policies, and programs of the 2040 General Plan.

The draft EIR includes Mitigation Measure GHG-4, in which the Climate Emergency Council would develop recommended subprograms to implement the 52 GHG reduction policies of the 2040 General Plan that do not have associated implementation programs (draft EIR Table 4.8-7, page 4.8-45). Refer to final EIR Chapter 3, “Revisions to the draft EIR,” for revisions to Mitigation Measure GHG-4.

The comment does not identify how these changes to the 2040 General Plan would address environmental effects found to be significant in the draft EIR. Therefore, no further response is required. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.

Ventura County Board of Supervisors
Attn: RMA Planning Division
General Plan Update
800 Victoria Avenue L#1740
Ventura, California 93009-1740

Dear Board of Supervisors and Staff:

We are writing this letter to urge the Board of Supervisors to reconsider moving forward with the Draft General Plan EIR. The draft EIR has been accelerated to the point that too many issues and impacts have not been properly addressed or studied. These impacts and the corresponding mitigation measures will have severe impacts to land owners and especially those, like us in the agricultural industry and other productive economic segments.

I47-1

Our family has been involved in the agricultural industry for more than 100 years in Ventura County. We have owned numerous land holdings that remain in the family to this date. We have farmed throughout Ventura County and hope to continue to do so in the future.

The Draft EIR is deficient on many levels. CEQA requires that all mitigation measures must be technically and economically feasible. Numerous proposed mitigation measures are neither. We have in the past attempted to identify land and any owners that would be open to sell their development rights for land that was converting from agricultural to commercial use. Not only did we not find anyone that would do so, no one would even quote a price. The only positive response from numerous land owners were that you can buy my property for full market value and then you can do what you want. There is not a project that can be built by adding double land cost to the equation. This was very recently experienced based on proposed policies at LAFCo. These policies were eventually not enacted due to the inability to purchase development rights in an economical feasible manner. This was when LAFCo was contemplating an acre for acre ag preserve. The new policy that is proposed in the 2040 General Plan is requiring 2 acres for every 1 acre of land converted from ag to any other use. This will eliminate the ability to add any new required ag buildings or even farm worker housing. The Draft EIR must study these impacts, since they are not feasible.

I47-2

The Draft EIR also deals with water in a manner that is not properly studied. There is no analysis on increased water costs and diminishing availability of water. Without reasonable water costs and supply, there is no agricultural industry.

I47-3

The General Plan indicates that agriculture is a high priority in the County. However, new policies and requirements in the General Plan add additional mitigation measures that will make ag virtually impossible. These include new setbacks, limiting types of fumigants pesticides and fertilizers. The General Plan also requires the conversion of all farm equipment to be all electric. Again, not feasible. The costs to purchase new pumps, farm equipment and other existing fuel using equipment will increase operational costs to a point that the County crops will not be competitive in the open market. These new mitigation measures are not sufficiently studied and again are not economically feasible.

I47-4

The Draft EIR is extremely difficult to read and understand. The background reports are lacking in depth of what has been studied other than numerous general statements and very poor mapping. Detailed studies must be added to sufficiently identify impacts and the related mitigation measures for both direct and indirect impacts on the agricultural industry. It is our understanding that reports and studies need to be timely prepared. However numerous studies are older than 5 years. Not timely.

I47-5

After numerous devastating wildfires over the last few years, which significantly impacted ag, the General Plan continues to lay out limiting mitigation measures for fire prevention. The Wildlife corridor eliminates any ag operation or fire prevention in the proposed corridor areas. This is also a major concern not studied in the Draft EIR.

I47-6

The Draft EIR for the 2040 General plan does not provide adequate analysis for the expansion of permanent bike paths and pedestrian walking trails throughout the County. These impacts are very severe due to constant conflicts from trail users and ag operations. Spraying, dust, odors from ag operations, along with impacts created by the trail users. These are usually theft, vandalism, litter and pet waste. The proposed mitigation measures require additional setbacks from these trails which renders additional land unusable for ag operations.

I47-7

In addition to the above comments on the agricultural aspects and related land use concerns of the DEIR, the undersigned is also a mineral owner directly interested in the impacts on oil and gas production of the DEIR and related General Plan 2040 proposed provisions. In these documents there is a total failure to address the economic impacts of the various policies proposed in violation of the requirements for this process, including but not limited to the loss of royalty income to a large group of County residents. I join in the detailed comments on the various deficiencies and concerns identified in the DEIR as described in the concurrent submissions on behalf of Aera Energy and other operators delivered this week to the County.

I47-8

Please look at the long-term consequences of these General Plan policies and mitigation measures. We formally request additional studies and a revised Draft EIR that will properly look at these and many more issues. The DEIR must be corrected with details of the revisions. Then it can be recirculated.

I47-9

Sincerely,

Diane Diedrich

Ventura County Board of Supervisors
Attn: RMA Planning Division
General Plan Update
800 Victoria Avenue L#1740
Ventura, California 93009-1740

Dear Board of Supervisors and Staff:

We are writing this letter to urge the Board of Supervisors to reconsider moving forward with the Draft General Plan EIR. The draft EIR has been accelerated to the point that too many issues and impacts have not been properly addressed or studied. These impacts and the corresponding mitigation measures will have severe impacts to land owners and especially those, like us in the agricultural industry and other productive economic segments.

I48-1

Our family has been involved in the agricultural industry for more than 100 years in Ventura County. We have owned numerous land holdings that remain in the family to this date. We have farmed throughout Ventura County and hope to continue to do so in the future.

The Draft EIR is deficient on many levels. CEQA requires that all mitigation measures must be technically and economically feasible. Numerous proposed mitigation measures are neither. We have in the past attempted to identify land and any owners that would be open to sell their development rights for land that was converting from agricultural to commercial use. Not only did we not find anyone that would do so, no one would even quote a price. The only positive response from numerous land owners were that you can buy my property for full market value and then you can do what you want. There is not a project that can be built by adding double land cost to the equation. This was very recently experienced based on proposed policies at LAFCo. These policies were eventually not enacted due to the inability to purchase development rights in an economical feasible manner. This was when LAFCo was contemplating an acre for acre ag preserve. The new policy that is proposed in the 2040 General Plan is requiring 2 acres for every 1 acre of land converted from ag to any other use. This will eliminate the ability to add any new required ag buildings or even farm worker housing. The Draft EIR must study these impacts, since they are not feasible.

I48-2

The Draft EIR also deals with water in a manner that is not properly studied. There is no analysis on increased water costs and diminishing availability of water. Without reasonable water costs and supply, there is no agricultural industry.

I48-3

The General Plan indicates that agriculture is a high priority in the County. However, new policies and requirements in the General Plan add additional mitigation measures that will make ag virtually impossible. These include new setbacks, limiting types of fumigants pesticides and fertilizers. The General Plan also requires the conversion of all farm equipment to be all electric. Again, not feasible. The costs to purchase new pumps, farm equipment and other existing fuel using equipment will increase operational costs to a point that the County crops will not be competitive in the open market. These new mitigation measures are not sufficiently studied and again are not economically feasible.

I48-4

The Draft EIR is extremely difficult to read and understand. The background reports are lacking in depth of what has been studied other than numerous general statements and very poor mapping. Detailed studies must be added to sufficiently identify impacts and the related mitigation measures for both direct and indirect impacts on the agricultural industry. It is our understanding that reports and studies need to be timely prepared. However numerous studies are older than 5 years. Not timely.

I48-5

After numerous devastating wildfires over the last few years, which significantly impacted ag, the General Plan continues to lay out limiting mitigation measures for fire prevention. The Wildlife corridor eliminates any ag operation or fire prevention in the proposed corridor areas. This is also a major concern not studied in the Draft EIR.

I48-6

The Draft EIR for the 2040 General plan does not provide adequate analysis for the expansion of permanent bike paths and pedestrian walking trails throughout the County. These impacts are very severe due to constant conflicts from trail users and ag operations. Spraying, dust, odors from ag operations, along with impacts created by the trail users. These are usually theft, vandalism, litter and pet waste. The proposed mitigation measures require additional setbacks from these trails which renders additional land unusable for ag operations.

I48-7

In addition to the above comments on the agricultural aspects and related land use concerns of the DEIR, the undersigned is also a mineral owner directly interested in the impacts on oil and gas production of the DEIR and related General Plan 2040 proposed provisions. In these documents there is a total failure to address the economic impacts of the various policies proposed in violation of the requirements for this process, including but not limited to the loss of royalty income to a large group of County residents. I join in the detailed comments on the various deficiencies and concerns identified in the DEIR as described in the concurrent submissions on behalf of Aera Energy and other operators delivered this week to the County.

I48-8

Please look at the long-term consequences of these General Plan policies and mitigation measures. We formally request additional studies and a revised Draft EIR that will properly look at these and many more issues. The DEIR must be corrected with details of the revisions. Then it can be recirculated.

I48-9

 Ventura, CA 93009-1740

Subject: Comments on the Draft Environmental Impact Report for the 2040 Ventura County General Plan Update (Planning Division Case Number PL17-0141)

Dear Ms. Curtis:

My name is Donald Price and I am an environmental engineer retired from the Ventura County Air Pollution Control District. Please accept the following comments regarding the Draft Environmental Impact Report (DEIR) for the 2040 Ventura County General Plan Update.

I49-1

- 1) The frequency of Greenhouse Gas (GHG) Strategy Implementation and Monitoring reports and GHG emission inventory updates have been extended beyond agreed limits.

DEIR, January 2020, 2040 General Plan Implementation Programs, Conservation and Open Space Element (COS), Page 4.8-27:

Implementation Program Z: Public Reporting on GHG Strategy Progress. The County shall prepare public reports on the results of GHG Strategy implementation and monitoring and present these reports to the Board of Supervisors. The first report shall be submitted to the Board of Supervisors two years after the approval of the General Plan, after which the Board of Supervisors will determine the appropriate reporting interval. The County shall also present a more detailed progress report to the Board of Supervisors, including results of the latest GHG inventory update, every five years.

I49-2

Implementation Program AA: GHG Inventory Updates. The County shall update the County's GHG emissions inventory at least every five years.

The above reflects a significant change in the schedule for preparation of GHG Strategy Implementation and Monitoring reports and GHG emission inventory updates based on the last known discussion of the subject by the Board of Supervisors on August 6, 2019.

Appendix B: Climate Change, May, 2019, Table B-9, Page B-17:

V - Public Reporting on GHG Strategy Progress

The County shall prepare public reports on the results of GHG Strategy implementation and monitoring and present these reports to the Board of Supervisors at least annually. The County shall also present a more detailed progress report to the Board of

February 25, 2020
Ms. Susan Curtis, VCRMA, Planning Division
Page 2 of 5

Supervisors, including results of the latest GHG inventory update, at least every five years. [Source: *New Program*]

As noted in Program V above, GHG Strategy Implementation and Monitoring reports were scheduled annually in the Preliminary Draft General Plan Update. GHG emission inventory updates were proposed every five years. However, on August 6, 2019, Supervisor Bennett made it clear that five years between GHG emission inventory updates is not acceptable.

August 6, 2019, Board of Supervisors, Supervisor Bennett, [interpretation added]:

“In another place in the plan, we are going to have an annual update; it already says we’re going to have an annual update. It’s just not a greenhouse gas emissions inventory update. We will have an update... We will have it annually...”

“At the same time, waiting 5 years [for a GHG emission inventory update] seems like a long time. One thought I had was, everybody’s going to want that first early check... At the 2 year mark, let’s have our first attempt; let’s see where we are. And then actually say it’s up to the Board to decide how often they want to do it after that. So, you don’t lock it in and say five years, and have everybody go ‘this Board’s just gonna ignore this’ because it’s every five years...”

“I think we’ve got to give everybody confidence that the first greenhouse gas emissions inventory [update] is going to happen fairly promptly, and you don’t set a five-year precedent.”

I agree with Supervisor Bennett; five years is too long to wait for a GHG emission inventory update. As I interpret his remarks, the first GHG inventory update should be done within two years of General Plan adoption, after which the Board will decide GHG inventory update frequency. At no time did the discussion involve the GHG annual implementation and monitoring report. I can find no further Board discussion or activity on this issue, so I do not know if the Board approved, modified or abandoned Supervisor Bennett’s proposal.

Nevertheless, I support GHG emission inventory updates every two years, as proposed by both Supervisor Bennett (for the initial report) and the Planning Commission.

2) The proposed Climate Action Plan (CAP) will never meet either the 2030 or 2040 GHG emission reduction targets.

As noted in Table 4.8-3 below, Ventura County GHG emission reduction targets have been calculated for the years 2020, 2030, 2040 and 2050. Also included are the GHG reductions needed to meet the targets, calculated from the baseline 2015 GHG emission levels for Ventura County. However, based on estimated emission reductions from “quantified” GHG reduction programs, neither the 2030 or 2040 targets will be met.

DEIR, January 2020, Page 4.8-40

I49-2
cont.

I49-3

February 25, 2020
 Ms. Susan Curtis, VCRMA, Planning Division
 Page 3 of 5

Implementation of the quantified policies and programs in Table 4.8-5 would collectively provide reductions of 151,903 MT CO₂e by 2030, an approximate 9 percent reduction from forecast 2030 levels and 30 percent of the reductions needed to meet a target of 1,113,972 MT CO₂e for consistency with emissions targets identified in Policy COS-10.2 (41 percent below 2015 levels by 2030). An additional 361,250 MT [metric tons per year] CO₂e of reductions would be needed to close the gap with the 2030 target.

The shortfall for 2040 is 644,032 MT CO₂e per year. See table from Appendix D below.

DEIR, January, 2020, Page 4.8-7

Greenhouse Gas Emissions

Table 4.8-3 2040 General Plan Target Reduction from 2015 Baseline Emissions Levels, 2020 to 2050

| | 2020 | 2030 | 2040 | 2050 |
|------------------------------------------------------------------------------------------|-----------|-----------|---------|-----------|
| Target Percentage Below 2015 Baseline GHG Emission Levels | 2.1% | 41.3% | 60.9% | 80.4% |
| GHG Emissions Target (MT CO ₂ e) | 1,856,620 | 1,113,972 | 742,648 | 371,324 |
| GHG Reductions Needed from Forecast GHG Emissions to Meet Targets (MT CO ₂ e) | -62,649 | 513,153 | 797,982 | 1,162,398 |

Notes: the negative number for GHG reductions in 2020 means that the forecast GHG emissions for 2020 will be below the 2020 target.

February 25, 2020
 Ms. Susan Curtis, VCRMA, Planning Division
 Page 4 of 5

“Quantified” GHG emission reductions are described in Table 4.8-5 (and the Appendix D table above). Table 4.8-6 lists CAP programs with “qualitative” GHG reduction benefits.

Table 4.8-6 provides an overview of 2040 General Plan programs that would result in additional GHG emissions reductions, and achieve additional progress toward meeting the 2030 GHG reduction target.

Forty-three (43) programs are listed in Table 4.8-6. Of these, I believe only twelve (12) may result in measurable GHG emission reductions. These are:

| Program | Description | Monitoring Procedure |
|-----------|-----------------------------------------------------|-------------------------------------------|
| AG-I/J | Transition farm water pumps from diesel to electric | Count new electric pumps |
| COS-M | Tax Oil and Gas facilities | Track oil and gas production |
| COS-P | Energy Reach Codes | Track projects. Track Title 24 compliance |
| COS-S | All electric new residential with solar | Track projects. Track Title 24 compliance |
| COS-T | Energy efficiency in county owned buildings | Track projects |
| HAZ-Q/W | Local zero carbon energy generation | Track projects |
| HAZ T/U/V | Energy efficiency in new construction | Track projects. Track Title 24 compliance |
| PFS-A | Energy efficiency in county owned buildings | Track projects |

I49-3
 cont.

In addition, Table 4.8-7 (Page 4.8-45) lists 52 GHG emission reduction policies with NO implementation program. Measurable emission reductions from these policies are unlikely.

DEIR, January 2020, Page 4.8-52

Additionally, longer term GHG reduction goals beyond 2030 established by State executive orders would necessitate additional or more stringent GHG reduction policies and programs beyond what is presented in the 2040 General Plan...Although the 2040 General Plan would not conflict with State GHG reduction targets and recommended local actions established in the 2017 Scoping Plan, and the 2040 General Plan would set future GHG emissions on a downward trajectory consistent with State reduction targets, it cannot be determined at this program level of analysis that future emissions within the county meet State 2030 and post-2030 targets for GHG reduction. Therefore, this impact would be **significant and unavoidable**.

This means that it is likely to be completely impossible for Ventura County to achieve its future GHG emission reduction goals with the proposed climate action plan. The cooperation of every agency in the county (local, state or federal) with a stake in energy efficiency, transportation, water use, and air pollution will be required to meet our GHG emission reduction goals.

February 25, 2020
 Ms. Susan Curtis, VCRMA, Planning Division
 Page 5 of 5

- 3) The prohibition on new natural gas infrastructure may be premature; it may be possible to distribute hydrogen for fuel cell electric vehicles through this delivery system

DEIR, January 2020, Page 4.8-46

Implementation Program HAZ-X: Prohibit Natural Gas Infrastructure in New Residential Development

To support the proposed reach codes under COS-S, the 2040 General Plan shall include a new program in the Hazards and Safety element that prohibits the installation of new natural gas infrastructure in new residential construction through amendments to the Ventura County Building Code. This program shall also be extended to include commercial building types such as offices, retail buildings, and hotels where the use of natural gas is not critical to business operations and contain appliances that can be feasibility substituted with electricity powered equivalents.

No one is more interested in closing down the fossil fuel industry and transitioning to 100 percent clean renewable energy than I am. However, in the future, blending hydrogen into natural gas pipeline networks (or distributing pure hydrogen through these networks) may be possible. This would enable fuel cell electric vehicle (FCEV) fueling at homes or businesses. Fuel cells produce only electricity and water and FCEVs may be an important transportation alternative in the future. Blending would eliminate the cost of building dedicated hydrogen pipelines for this purpose. There are issues with the process (like safety, material durability and integrity management, leakage, downstream extraction) that are likely to be overcome. Therefore, it may be premature to ban new natural gas pipeline infrastructure.

I49-4

For more information, see the following paper from the National Renewable Energy Laboratory:
 "Blending Hydrogen into Natural Gas Pipeline Networks: A Review of Key Issues"
 Authors: M. W. Melaina, O. Antonia, and M. Penev
 NREL/TP-5600-51995, March 2013

- 4) I appreciate that a climate action plan is included in the 2020 General Plan. However, it is unlikely that this plan will prevent serious sea level rise, increased heat, increased fire, and water shortages in Ventura County between now and 2100. The IPCC clearly warn that we have only a few years to make a transition away from fossil fuel use if we are to have any chance of avoiding devastating climate impacts. Transitioning to clean renewable energy is essential.

I49-5

Thank you for your consideration.

Signed,

Donald R. Price (drp@cefogg.com)

c: Clerk of the Board, clerkoftheboard@ventura.org
GeneralPlanUpdate@ventura.org

|-------------------|------------------------------------------|
| Letter I49 | Donald Price February 25, 2020 |
|-------------------|------------------------------------------|

I49-1 The description of the commenting individual’s role as an environmental engineer is noted. This comment is introductory in nature and does not raise a significant environmental issue for which a response is required.

I49-2 The comment states that the frequency of greenhouse gas (GHG) strategy implementation and monitoring reports and GHG emission inventory updates have been extended beyond agreed limits associated with Implementation Program Z and Implementation Program AA in the Conservation and Open Space Element of the 2040 General Plan. While these policies are included in Section 4.8, “Greenhouse Gas Emissions,” of the draft EIR, the comment addresses policies and implementation programs of the 2040 General Plan and is not related to the adequacy of the draft EIR.

Program Z and Program AA both support implementation and monitoring of the GHG reduction strategy (refer to Table 4.8-8 in the draft EIR). Program Z supports public participation by establishing a process for communication and public feedback on strategies. Program AA would require updates to the GHG emissions inventory to track GHG reduction performance at 5-year intervals. The comment provides no evidence that requiring update of the inventory at 2-year intervals would result in improved management and reduction of GHG emissions. There would be no change to the analysis or conclusions in the draft EIR. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.

I49-3 The comment addresses the GHG inventory prepared for baseline levels (2015) and future target years (2020, 2030, 2040, and 2050). The comment notes that the County may not achieve State targets and calls attention to the draft EIR’s significant and unavoidable conclusion for Impact 4.8-2 (Conflict with an Applicable Plan, Policy, or Regulation for the Purpose of Reducing the Emissions of GHGs). The draft EIR GHG analysis demonstrates that the 2040 General Plan would set future GHG emissions on a downward trajectory consistent with State reduction targets, provides detailed discussion of the 118 policies and 45 implementation programs of the 2040 General Plan that are supportive of future GHG reductions, and provides detailed discussion of why the County cannot determine at this time that future GHG emissions would align with State 2030 and post-2030 targets for GHG reduction. Refer to Master Response MR-1 for a discussion of these targets and additional details pertaining to the methodology used to estimate GHG emissions for these years.

I49-4 The comment suggests that the implementation of Mitigation Measure GHG-1 may be premature because it may be possible in the future to use natural gas pipelines to distribute hydrogen for fuel cell electric vehicles, if fuel cell electric vehicles become widely available, although, as the commenter acknowledges, there are several issues with the feasibility of such a proposal. Decarbonization

of future residential and commercial buildings through prohibition of natural gas infrastructure under Mitigation Measure GHG-1 is consistent with the trajectory of Part 6 of Title 24 of the California Building Code (California Energy Code). The draft EIR identifies Mitigation Measure GHG-1 to reduce the potentially significant GHG emissions impacts of the 2040 General Plan (Impact 4.8-1 and Impact 4.8-2). Refer to final EIR Chapter 3, "Revisions to the draft EIR," for revisions to Mitigation Measure GHG-4. No further response to this comment is required.

- I49-5 This comment expresses appreciation that climate change is addressed in the 2040 General Plan, and notes that the 2040 General Plan will not on its own prevent anticipated impacts of global climate change from affecting the county, and refers to the need for worldwide transition away from fossil fuel use to renewable energy to avoid climate change impacts. This comment does not address the adequacy of the draft EIR. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.

RMA Planning Division, General Plan Update
800 So. Victoria Ave., L#1740
Ventura, CA 93009-1740

According to a recent study of data by the Washington Post, with an average temperature increase of 2.6 degrees Celsius since preindustrial times, **Ventura ranks as the fastest-warming county in the Lower 48 states.** The effects of climate change have impacted Ventura County profoundly — from the wildfires which have raged out of control to coastal infrastructure now threatened by sea-level rise.

We need to do better ... faster! Years of committee meetings must translate into action now. **The Climate Action Plan (CAP) is seriously incomplete** and lacks the technical and scientific input needed for a meaningful CAP. We are calling for a sense of urgency and an "all-hands-on-deck" effort to get it right. The county should contract immediately with a team like those employed by the city and county of Los Angeles in order to produce a robust plan capable of meeting the greenhouse Gas (GHG) emission reduction goals. At the same time, we must strengthen individual policies in the General Plan.

I50-1

Climate change is caused by fossil fuel production and consumption. **Ventura County is the third largest oil and gas-producing county in California.** As such, we must do our part to reduce oil production through thoughtful, rigorous policy to phase out production.

This CAP will set the policies that will drive land use decisions and projects that affecting GHG emissions for the next 20 years. The planet depends on each county, municipality and country to do this right.

Climate Action Plan policies must result in measurable, enforceable reductions sufficient to meet California's climate goals. We've had enough of vague, inspirational slogans like "encouraging" or "supporting" green policies, but little to no actions on the ground.

A recent NASA study documents that several Ventura County facilities, including **oil and gas operations, are "super-emitters" of powerful climate pollutants.** Stationary source emissions, including those from oil and gas operations, make up approximately 26 percent of all emissions in California. The time for rubber-stamping oil and gas projects needs to end. We need to phase out these "super-emitters" fossil fuel operations in Ventura County. We have plenty of sun and wind to build energy grids upon, creating new green jobs.

I50-2

The Ojai Valley, where I live, is known for airflow patterns that lock in airborne pollutants during the day, trapped in the Valley. The 2040 General Plan must strongly defend the 5-pound air emissions limit for the Ojai Valley. And buffers between oil and gas facilities and residential and schools should be increased from 1,500 to 2,500'.

I50-3

I50-4

805-640-1133 Fax: 805-640-7899 Cell: 805-798-0158
dulanie@sbcglobal.net

Dulanie Ellis-La Barre
 206 So. Blanche St., Ojai, CA 93023

Flaring is another, frankly, insane practice in today's climate change crisis. It should be allowed only in case of emergencies or testing purposes. The new General Plan MUST **maintain Policy COS-7.8**, as recommended by the Board of Supervisors, so that wells are required to collect gases and use or remove them. The complaint about addressing this being "too costly" from the fossil fuel industry has always, and will always, be their excuse and failure to help right this self-caused crisis. **Frankly, Ventura County should immediately begin phasing out all fossil fuel development and production, given that we are the fastest warming county in the entire country!**

150-5

Fracking must be abandoned in Ventura County - If for no other reasons than FRACKING REQUIRES ENORMOUS USE OF WATER and contaminates aquifers. The droughts are only going to get worse, we cannot afford to destroy our water sources because of fracking - not to mention the role fracking plays in prompting earthquakes. We have enough to worry about without encouraging more earthquakes in Southern California.

150-6

Ventura County, for all its beauty and fertility of land and sea, has been in bed with the oil and gas industry, in the drilling and agricultural pesticides, for far too long and at great cost to our home environment and the future of life as we know it in Ventura County.

For example:

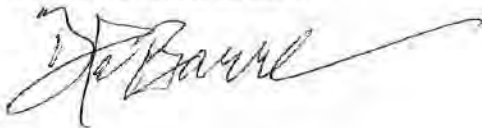

- A 2-day 'heat bomb' last year wiped out the avocado and citrus harvests in Ojai
- Rivers are drying up: Ventura has been over-drafting their water supply from the Ventura River at Foster Park for years and is blaming Ojai (who cut their water use by 40%)
- With sea level rise, we can expect saltwater intrusion (already a problem) to inundate the Oxnard Plain and devastate food production.
- Oxnard and Ventura coastal residential areas and harbors will be flooded.
- The Navy base is already trying to prepare for sea rise and impact to military abilities
- Wildfire storms will continue to devastate wild lands and our communities

150-7

Climate change is no longer theory. Our General Plan must be a robust response. We must implement rigorous, measurable, immediate steps in our General Plan if we are to the very real challenges we face.

With great expectation that you will respond favorably, we remain,
 Sincerely yours,

Dulanie & Douglas La Barre

805-640-1133 Fax: 805-640-7899 Cell: 805-798-0158

|-----------------------|---------------------------------------------------------|

- I50-1 For comments related to greenhouse gas (GHG) reduction planning concerns, refer to Master Response MR-1. For concerns regarding oil and gas, refer to Master Response MR-4.

- I50-2 The comment refers to some oil and gas operations in the county as “super-emitters.” Refer to Master Response MR-1 regarding oil and gas operations and how these activities are addressed in the GHG inventories prepared for the 2040 General Plan and draft EIR.

- I50-3 The comment requests that the 2040 General Plan “defend” the 5-pound air pollution limits for Ojai Valley. As discussed in the draft EIR and explained further in response to comment O20-14, the comment refers to a threshold of significance for daily reactive organic gas and nitrogen oxide emissions in the Ojai Valley which is referenced in the Ojai Valley Area Plan. This threshold, which applies to sources that are not permitted by the Ventura County Air Pollution Control District, was added to the Ventura County Air Pollution Control District’s Air Quality Assessment Guidelines in 1989 and the reference to this threshold was thereafter added to the Ojai Valley Area Plan in 1995. The 2040 General Plan would not change this threshold. The comment addresses the draft 2040 General Plan and is not related to the adequacy of the draft EIR. Therefore, no response is required. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.

- I50-4 Refer to Master Response MR-4, Section MR-4.H Buffers (Setback) regarding the findings and conclusions related to buffers (setbacks) in oil and gas operations.

- I50-5 Refer to Master Response MR-4, Section MR-4.F Flaring and Section MR-4.J Potential to Stop Issuing Permits for New Wells (Phase Out Oil and Gas Operations), regarding the findings and conclusions related to flaring and phasing out the oil and gas industry.

- I50-6 Refer to Master Response MR-4, Section MR-4.A, County’s Authority to Regulate Oil and Gas Development, regarding the County’s authority to prohibit specific activities such as hydraulic fracturing.

- I50-7 The climate change impacts summarized in the comment are noted. The comment addresses the draft 2040 General Plan and is not related to the adequacy of the draft EIR. Therefore, no response is required. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.

Subject: Comments on County General Plan/EIR

Letter
I51

Dear Ms. Curtis:

I am writing to call your attention to significant flaws in the process, data, and conclusions of the Ventura County General Plan, Draft EIR, and supplemental documents.

My great grandfather, Mark McLoughlin (1843-1914), was a true Ventura County pioneer, purchasing his first 318 acres of undeveloped land in Ventura County in 1875. He was a hard-working visionary, revered by his community. With his son—my grandfather, James Patrick McLoughlin—he raised livestock and farmed the land, providing jobs and feeding the growing towns of Oxnard and Ventura.

I51-1

Our land, in a vitally important location on Olivas Park Drive across from the Ventura Marina, has been in the family, and part of the economic fabric of the community, for 100 years. And we want it to be part of the future of this community, with a flourishing economy, a thriving job market, and unsurpassed quality of life for its residents.

But the General Plan and DEIR do not describe a viable path for us as landowners going forward.

I will begin with some specific issues regarding language in the Coastal Area Plan, 4-82-83 and 4-94-95. Part of our land is located in the Central Coastal Zone, adjacent to the Ventura Marina, on Olivas Park Drive at Harbor Blvd. The only conclusion the Plan draws about our land is the statement that, "unlike the Preble area, services are not readily available to the Olivas lands." This is false. Our property has access to all utilities, water, main roads, and the freeway. Indeed, easements on our property serve surrounding areas with utilities.

The Plan also claims that our property is "not included in the City's sanitation district because of problems with water pressure." This language is irrelevant and incorrect. There is no evidence that there are water pressure issues, and the sanitation district's pipelines actually traverse our property.

I51-2

While we do not know the original source of these misstatements, such misrepresentations—now repeated in the Plan—threaten to diminish the value of our land in relation to the Preble property. And, of course, they undermine the goal and the value of the Plan itself.

The General Plan also speaks of the widening of Olivas Park Drive, our southern boundary. This would have a direct impact on our property. But the Plan does not address how this would happen or how it would affect our land.

Damaging misstatements about our property also appear in the DEIR. Contrary to the portrayal in the DEIR, our property has significant infrastructure in place, as well as prime accessibility to the highway and the harbor. In fact, with easy access to the marina and beach community, and with the railroad as part of our eastern boundary, our land is uniquely suited to be an important part of future economic development in the area. We are entitled to have all these matters corrected.

I51-3

I would also like to raise some additional concerns:

1. The General Plan and DEIR continue to ignore the 28% increase in the homeless population in our community.

I51-4

- 2. According to the General Plan, if we were to build an acre of low income / worker housing we would need to buy two replacement acres of same Ag land to be placed into perpetual agricultural preservation. This is unrealistic and infeasible, and certainly not in line with the State government's housing policies. I 151-5
 - 3. The EIR does not adequately address the enormous "indirect impacts" that will occur as a result of implementing the General Plan, calling them "less than significant." I 151-6
 - 4. The General Plan contains policies that will increase the costs of normal farming operations, making it difficult for farming to remain profitable. I 151-7
 - 5. The Plan does not adequately evaluate the impacts of increased competition for water in our community. I 151-8
- The EIR is a flawed document, full of errors, that does not disclose all impacts, direct and indirect, caused by the General Plan. It was obviously rushed—completed in six weeks. It is inaccurate and incomplete, and fails to provide members of the community with the information that they are legally entitled to. This EIR should be corrected and reconsidered, and a reasonable time period should be allowed for meaningful and thoughtful community input. I 151-9

Sincerely,
Edward Chambers, MD

 Ventura, CA 93009-1740
GeneralPlanUpdate@ventura.org

Dear Ms. Curtis:

I am writing to call your attention to significant flaws in the process, data, and conclusions of the Ventura County General Plan, Draft EIR, and supplemental documents.

My wifes great grandfather, Mark McLoughlin (1843-1914), was a true Ventura County pioneer, purchasing his first 318 acres of undeveloped land in Ventura County in 1875. He was a hard-working visionary, revered by his community. With his son—my grandfather, James Patrick McLoughlin—he raised livestock and farmed the land, providing jobs and feeding the growing towns of Oxnard and Ventura.

I52-1

Our land, in a vitally important location on Olivas Park Drive across from the Ventura Marina, has been in the family, and part of the economic fabric of the community, for 100 years. And we want it to be part of the future of this community, with a flourishing economy, a thriving job market, and unsurpassed quality of life for its residents.

But the General Plan and DEIR do not describe a viable path for us as landowners going forward.

I will begin with some specific issues regarding language in the Coastal Area Plan, 4-82-83 and 4-94-95. Part of our land is located in the Central Coastal Zone, adjacent to the Ventura Marina, on Olivas Park Drive at Harbor Blvd. The only conclusion the Plan draws about our land is the statement that, “unlike the Preble area, services are not readily available to the Olivas lands.” This is false. Our property has access to all utilities, water, main roads, and the freeway. Indeed, easements on our property serve surrounding areas with utilities.

The Plan also claims that our property is “not included in the City’s sanitation district because of problems with water pressure.” This language is irrelevant and incorrect. There is no evidence that there are water pressure issues, and the sanitation district’s pipelines actually traverse our property.

I52-2

While we do not know the original source of these misstatements, such misrepresentations—now repeated in the Plan—threaten to diminish the value of our land in relation to the Preble property. And, of course, they undermine the goal and the value of the Plan itself.

The General Plan also speaks of the widening of Olivas Park Drive, our southern boundary. This would have a direct impact on our property. But the Plan does not address how this would happen or how it would affect our land.

Damaging misstatements about our property also appear In the DEIR. Contrary to the portrayal in the DEIR, our property has significant infrastructure in place, as well as prime accessibility to the highway and the harbor. In fact, with easy access to the marina and beach community, and with the railroad as part of our eastern boundary, our land is uniquely suited to be an important part of future economic development in the area. We are entitled to have all these matters corrected.

I52-3

I would also like to raise some additional concerns:

- 1. The General Plan and DEIR continue to ignore the 28% increase in the homeless population in our community. I52-4
- 2. According to the General Plan, if we were to build an acre of low income / worker housing we would need to buy two replacement acres of same Ag land to be placed into perpetual agricultural preservation. This is unrealistic and infeasible, and certainly not in line with the State government's housing policies. I52-5
- 3. The EIR does not adequately address the enormous "indirect impacts" that will occur as a result of implementing the General Plan, calling them "less than significant." I52-6
- 4. The General Plan contains policies that will increase the costs of normal farming operations, making it difficult for farming to remain profitable. I52-7
- 5. The Plan does not adequately evaluate the impacts of increased competition for water in our community. I52-8

The EIR is a flawed document, full of errors, that does not disclose all impacts, direct and indirect, caused by the General Plan. It was obviously rushed—completed in six weeks. It is inaccurate and incomplete, and fails to provide members of the community with the information that they are legally entitled to. This EIR should be corrected and reconsidered, and a reasonable time period should be allowed for meaningful and thoughtful community input. I52-9

Sincerely,
Edward Michael McMonigle

GeneralPlanUpdate@ventura.org

Dear Ms. Curtis:

I am writing to call your attention to significant flaws in the process, data, and conclusions of the Ventura County General Plan, Draft EIR, and supplemental documents.

My great grandfather, Mark McLoughlin (1843-1914), was a true Ventura County pioneer, purchasing his first 318 acres of undeveloped land in Ventura County in 1875. He was a hard-working visionary, revered by his community. With his son—my grandfather, James Patrick McLoughlin—he raised livestock and farmed the land, providing jobs and feeding the growing towns of Oxnard and Ventura.

Our land, in a vitally important location on Olivas Park Drive across from the Ventura Marina, has been in the family, and part of the economic fabric of the community, for 100 years. And we want it to be part of the future of this community, with a flourishing economy, a thriving jobmarket, and unsurpassed quality of life for its residents.

But the General Plan and DEIR do not describe a viable path for us as landowners going forward.

I will begin with some specific issues regarding language in the Coastal Area Plan, 4-82-83 and 4-94-95. Part of our land is located in the Central Coastal Zone, adjacent to the Ventura Marina, on Olivas Park Drive at Harbor Blvd. The only conclusion the Plan draws about our land is the statement that, “unlike the Preble area, services are not readily available to the Olivas lands.” This is false. Our property has access to all utilities, water, main roads, and the freeway. Indeed, easements on our property serve surrounding areas with utilities.

The Plan also claims that our property is “not included in the City’s sanitation district because of problems with water pressure.” This language is irrelevant and incorrect. There is no evidence that there are water pressure issues, and the sanitation district’s pipelines actually traverse our property.

I53-1

I53-2

The Plan also claims that our property is “not included in the City’s sanitation district because of problems with water pressure.” This language is irrelevant and incorrect. There is no evidence that there are water pressure issues, and the sanitation district’s pipelines actually traverse our property.

While we do not know the original source of these misstatements, such misrepresentations—now repeated in the Plan—threaten to diminish the value of our land in relation to the Preble property. And, of course, they undermine the goal and the value of the Plan itself.

I53-2
cont.

The General Plan also speaks of the widening of Olivas Park Drive, our southern boundary. This would have a direct impact on our property. But the Plan does not address how this would happen or how it would affect our land.

Damaging misstatements about our property also appear in the DEIR. Contrary to the portrayal in the DEIR, our property has significant infrastructure in place, as well as prime accessibility to the highway and the harbor. In fact, with easy access to the marina and beach community, and with the railroad as part of our eastern boundary, our land is uniquely suited to be an important part of future economic development in the area. We are entitled to have all these matters corrected.

I53-3

I would also like to raise some additional concerns:

1. The General Plan and DEIR continue to ignore the 28% increase in the homeless population in our community.
2. According to the General Plan, if we were to build an acre of low income / worker housing we would need to buy two replacement acres of same Ag land to be placed into perpetual agricultural preservation. This is unrealistic and infeasible, and certainly not in line with the State government’s housing policies.
3. The EIR does not adequately address the enormous “indirect impacts” that will occur as a result of implementing the General Plan, calling them “less than significant.”
4. The General Plan contains policies that will increase the costs of normal farming operations, making it difficult for farming to remain profitable.
5. The Plan does not adequately evaluate the impacts of increased competition for water in our community.

I53-4

I53-5

I53-6

I53-7

I53-8

The EIR is a flawed document, full of errors, that does not disclose all impacts, direct and indirect, caused by the General Plan. It was obviously rushed—completed in six weeks. It is inaccurate and incomplete, and fails to provide members of the community with the information that they are legally entitled to. This EIR should be corrected and reconsidered, and a reasonable time period should be allowed for meaningful and thoughtful community input.

I53-9

Sincerely,
Elizabeth Chambers Martinez and Family
Great Granddaughter of Mark McLoughlin

Agricultural Policy Advisory Committee (APAC) County of Ventura
800 S. Victoria Blvd.
Ventura, CA 93003

Re: 2040 General Plan Environmental Impact Report (EIR)

Dear Mr. Hedrick and Honorable Members of APAC:

Thank you for the opportunity to provide comments following today’s presentation by Ventura County Planning staff on the 2040 General Plan EIR.

I54-1

There are several issues with the 2040 General Plan EIR that CoLAB believes will negatively impact the viability of local agriculture.

Proposed mitigation measure AG-2: The County proposes that any project that either directly or indirectly results in the loss of farmland must obtain and place into perpetual agricultural preservation twice the total of the farmland loss. This mitigation measure is infeasible. Contrary to statements made by County Planning staff today at the APAC meeting, the California Environmental Quality Act (CEQA) requires that all mitigation proposed in an EIR be feasible. CEQA Section 21061.1 defines feasible as “capable of being accomplished in a successful manner within a reasonable period of time,

I54-2

” (*emphasis added*). All mitigation measures proposed in an EIR must be shown to reduce impacts and an infeasible mitigation measure, by definition, cannot and will not reduce impacts.

The EIR does not provide evidence of any of the following:

1. 1) Whether there is sufficient land available for purchase/conservation easement for each farmland category;
2. 2) The cost per acre to purchase each category of farmland;
3. 3) The anticipated cost of establishing a conservation easement for each category of farmland;
4. 4) The anticipated cost associated with managing each category of farmland under a conservation easement;
5. 5) The anticipated cost associated with monitoring these mitigation parcels scattered throughout the County and who will bear that cost;
6. 6) Any information that could constitute a “plan” for management of farmland in conservation easements;

Page 2 of 4

7. 7) An analysis of direct and indirect impacts caused by this mitigation measure (including impacts associated with LU compatibility conflicts and increased urban-ag-interface);
8. 8) Whether the smallest possible mitigation acreage required will achieve the minimum to ensure viability of agriculture on the parcel; and
9. 9) Whether the proposed mitigation is in conflict with other ordinances and regulations, such as the County's Zoning Ordinance and the County's minimum lot sizes.

The County is already aware that this proposed mitigation measure is infeasible. On March 24, 2016, at a Local Agency Formation Commission (LAFCo) hearing, Supervisor Linda Parks attempted to establish an "Agricultural Mitigation Measure" through the LAFCo project approval process. The mitigation measure would have required the 1-to-1 purchase of local farmland (half of what is proposed in the 2040 General Plan EIR) to replace farmland that would be impacted by any proposed development. Ventura County Counsel, Michael Walker, informed both LAFCo and Supervisor Parks that the proposed mitigation measure did not meet the standard for economic feasibility, and, for that and other reasons, LAFCo could not adopt Supervisor Park's proposed mitigation measure. He referenced a 2015 legal decision, *City of Irvine v. County of Orange*, in which the Court stated, "the sheer astronomical expense of land supports the finding of the EIR that the purchase of an agricultural conservation easement is a non-starter."

I54-2
cont.

In addition to being infeasible, CoLAB does not believe that this mitigation measure will reduce impacts on agricultural land, as it does not address the actual issues that will impact farmland under the 2040 General Plan: lack of economic sustainability, the increasing regulatory demands on agriculture, increased competition for water resources, and increased compatibility conflicts from development.

Indirect Impacts

The EIR dismisses "indirect impacts" that will occur as a result of implementing the 2040 General Plan as "less than significant."

Page 4.2-13 of the EIR states "AG-2.3 maintains the Right-to-Farm Ordinance to protect agricultural land uses from conflicts with non-agricultural uses, as well as to help land purchasers and residents understand the potential for nuisance, (e.g., dust, noise, odors) that may occur as the natural result of living in or near agricultural areas...These sections of the code protect farmers engaged in agricultural activity from public nuisance claims...This protects the farming community, including Important Farmlands and farms less than 10 acres, from developments that would inhibit their ability to continue agricultural production."

I54-3

Page 4.2-17 of the EIR states: "Residential growth in areas nearby agricultural lands has the potential to result in land use conflicts. Residential land uses are generally more sensitive and prone to conflict with adjacent agricultural land uses than commercial or industrial land uses. The placement of sensitive land uses, such as residences and schools, nearby classified farmland can negatively impact both uses due to conflict including odor nuisances and noise from agriculture machinery. The countywide Right-to-Farm Ordinance protects existing agricultural and farming operations from conflicts attributed to residential development...Therefore, the potential for conflicts would be minimal. This impact would be less than significant" (emphasis added).

This is simply not true. Historic and recent County actions have shown that the County has and will continue to create new restrictions and ordinances that have a significant impact on existing agricultural

Ventura County Coalition of Labor, Agriculture and Business / 1672 Donlon Street, Ventura, CA 93003 / 805-633-2260 / info@colabvc.org

Page 3 of 4

and farming operations because of conflicts attributed to residential development. The recent interim urgency ordinance restricting hemp cultivation is one such example.

Contrary to statements made today by Ventura County Planning staff, an EIR, whether it is labeled as “programmatic” or “project”, must analyze all reasonably foreseeable consequences of the action that is proposed. For the 2040 General Plan EIR, the action proposed is the implementation of all policies and programs within. Therefore, if the implementation of a policy in the 2040 General Plan will result in an impact, that impact must be analyzed. For example, the 2040 General Plan contains land use designation changes that will increase allowable housing density near agricultural land. It is reasonably foreseeable that more houses will create more compatibility conflicts with normal farming operations. The impact of these compatibility conflicts must be addressed in the EIR.

I54-3
cont.

In 2014, the California Court of Appeal stated in a ruling that “[T]he fact that this EIR is labeled a ‘project’ rather than a ‘program’ EIR matters little....Designating an EIR as a program EIR ... does not by itself decrease the level of analysis otherwise required in the EIR. All EIRs must cover the same general content. The level of specificity of an EIR is determined by the nature of the project and the “rule of reason,” rather than any semantic label accorded to the EIR.”

It is CoLAB’s opinion that indirect impacts from increasing urban-ag interface are SIGNIFICANT and cannot be dismissed in the EIR.

Direct and indirect impacts of increased costs

The 2040 General Plan has policies that will increase the costs of normal farming operations. CoLAB believes that the most effective way to minimize conversion of agricultural land to non-agricultural uses is to take active measures to allow farming to remain profitable. And even the County admits that reducing the cost of farming reduces conversion of agricultural land in their discussion of the Williamson Act in Chapter 4.2 of the EIR. But the County fails to analyze direct and indirect impacts of 2040 General Plan policies that will increase the cost of normal farming operations, such as:

I54-4

- Policy AG-5.2: Electric- or Renewable-Powered Agricultural Equipment. The County shall encourage and support the transition to electric- or renewable-powered or lower emission agricultural equipment in place of fossil fuel-powered equipment when feasible.
- Policy AG-5.3: Electric- or Renewable-Powered Irrigation Pumps. The County shall encourage farmers to convert fossil fuel-powered irrigation pumps to systems powered by electric or renewable energy sources, such as solar power, and encourage electric utilities to eliminate or reduce standby charges.

Direct and indirect impacts of increased competition for water resources

The County fails to evaluate the impact of increased competition for water resources caused by development allowed in the 2040 General Plan on either the conversion of agricultural land or the loss of agricultural lands through the loss of topsoil.

I54-5

The EIR states on page 4.2-3 that “...a reduction in available water resources for irrigation” is an example of indirect impacts on agricultural land due to loss of topsoil from increased wind and water erosion.

But the County fails to analyze or propose mitigation measures to address this significant impact.

Ventura County Coalition of Labor, Agriculture and Business / 1672 Donlon Street, Ventura, CA 93003 / 805-633-2260 / info@colabvc.org

Page 4 of 4

APAC is the expert charged with advising County decision-makers on agricultural issues in Ventura County. And the County should be seeking guidance from APAC about the actual issues that will impact farmland under the 2040 General Plan: lack of economic sustainability, the increasing regulatory demands on agriculture, increased competition for water resources, and increased compatibility conflicts from development.

CoLAB encourages APAC to provide guidance to the County on appropriate and effective mitigation measures to prevent the conversion of agricultural land to non-agricultural uses. These may include:

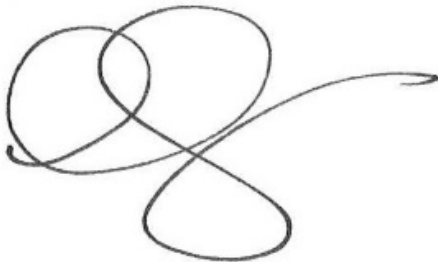

1. 1) Strengthen the Right-to-Farm ordinance to prevent nuisance complaints from being used to justify the creation or expansion of setbacks or regulatory restrictions on normal farming practices;
2. 2) Expand the Land Conservation Act Program to include Open Space zoned properties that are engaged in farming (including grazing); and
3. 3) Protect agricultural land from urban-ag interface encroachment and compatibility conflicts by establishing setbacks on NON-AE-zoned land that will restrict the construction of bike paths, public trails, and sensitive receptors within 2000' of any land zoned A/E.

I54-6

Thank you again for the opportunity to provide comments on this issue. We appreciate your consideration and leadership at this time.

Sincerely,

Louise Lampara Executive Director

Re: Comments on Ventura County General Plan DEIR

Dear Ms. Curtis:

I represent and serve on the McLoughlin Family Committee, a group of family members that own approximately 300 acres of agricultural property off of Olivas Park Road in the County of Ventura, in proximity to the City of Ventura.

The McLoughlin family has farmed this land for generations. It remains our desire to continue this legacy. However, in the face of never-ending changes to the regulatory environment, we again find ourselves attempting to ascertain how new policies and programs as proposed in the draft 2040 General Plan will impact and challenge our ability to serve as stewards of this heritage.

I55-1

It had been our hope that the DEIR would provide some clarity and insight into how the new policies and programs within the revised General Plan would impact our farming operation. However, that is not the case. Simply said, we believe the General Plan Update and subsequent Environmental Impact Report fail to adequately analyze or study impacts on the farming industry.

With that said, we would like to specifically present the following:

- The Background report Table 6-26: Transportation Department Planned Capital Projects lists sections of roadways the County plans for expanded capacity or widening, along with the scope of those enhancements. It also covers in length the plan to add bike paths and bike lanes in accordance with existing County wayfarer plans. However, the DEIR never analyzes the loss of farmland resulting from these changes in infrastructure – it’s not even mentioned as a possibility in the DEIR.

I55-2

Olivas Park Road between Victoria and Harbor is listed as one of the areas planned for road widening, a stretch of roadway that borders the entire eastern portion of our farmland and property. While the impact on our farming operation and financial losses due to property loss are clearly quantifiable, the report fails to list or quantify these impacts.

- In Section 3-8, The DEIR states that because there will be no “substantive” change to the agricultural, open space, or rural designations, the General Plan Update (GPU) will be consistent with SOAR. However, no further details beyond this conclusory statement is provided. There is no way for the reader to come to his or her own conclusion on whether the GPU will result in inconsistencies with SOAR that might lead to physical environmental impacts. There is no description of the changes to the Agriculture, Open Space, and Rural policies to determine whether they are in fact non-substantive.

I55-3

Given the length and breath of the Draft General Plan update and CEQA analysis, we made an attempt to focus our initial review and subsequent comments to issues specific to agriculture and farming. However, it’s clear that the 2040 General Plan will impact the Ventura County local economy across sectors – all of which influence the ability to live and work in this region. The DEIR’s lack of analysis of those economic impacts, calls into question the legitimacy of both the draft General Plan update, and the CEQA analysis. As such, we respectfully request that the DEIR be recirculated in the hopes that further study will resolve these shortcomings.

I55-4

I appreciate your consideration.

County of Ventura Draft Programmatic Environmental Impact Report for the draft 2040
General Plan Update

Dear Ms. Curtis,

The County of Ventura (County) is in a unique position to be updating the County's primary planning document through 2040 as the impacts of climate change are becoming more severe. The Draft Environmental Impact Report (DEIR) fails to recognize the true impacts of climate change already occurring. The County is already experiencing a 2°C increase in average temperature from historical records. We are soon to re-enter drought conditions following the driest February on record. We are still recovering from two of the state's largest wildfires in modern history. We must act now, and we must act boldly.

I56-1

The DEIR fails to provide enough emissions reduction to meet, or meaningfully contribute to, the California state mandated climate goals. The DEIR fails to include a Climate Action Plan with measurable targets and goals to ensure County stakeholders are informed about progress, achievements and accurate analysis of shortcomings. Language used in the [plan] such as "encourage" or "support" rather than "require" or "mandate" is insufficient and meaningless to meet acknowledged greenhouse gas reduction targets.

The DEIR is based on a wholly inadequate inventory of county emissions. The inventory was conducted from top down rather than bottom up and fails to include, or even consider, a significant portion of present emissions. Recent published studies indicate significant under-assessment of greenhouse gases, especially methane, from current fossil fuel extraction and production that must be included in the DEIR analysis.

I56-2

Because the County is one of the leading producers of fossil fuels in the state, and therefore in the nation, including fossil fuel facilities NASA documents as greenhouse gas “super emitters,” the County must act now, and act boldly. Approval of the proposed DEIR would be a failure of the County’s moral and fiduciary responsibility.

Therefore, to act responsibly, the County must:

- 1) Declare a climate emergency and direct all County government offices to incorporate climate change mitigation, to the extent feasible, in all activities,
- 2) Create a Climate Action Plan 2020-2040 with measurable targets and outcomes as a separate document from the General Plan update,
- 3) Set clear climate action goals and mandate enforceable climate policies based on the declaration of a climate emergency and Climate Action Plan 2020-2040, and
- 4) As part of the Climate Action Plan 2020-2040, set five-year interval targets beginning with 2025 to immediately begin the reduction of the County’s contribution to the climate emergency.

a. Initial five-year (2025) emergency climate goals:

- i. Begin the elimination of fossil fuel extraction and production with the County by immediately prohibiting operation of fossil fuel facilities within one-mile buffer zones of schools, public parks, mobile home parks, medical facilities, or any residential zones,
- ii. Wind down discretionary oil and gas production by 10% per year to zero production in the County by 2030 starting with fossil fuel facilities within above one-mile buffer zones,
- iii. Prohibit flaring and venting from any fossil fuel infrastructure before 2025,
- iv. Implement a policy to coordinate with the California Department of Transportation (Caltrans) and the Ventura County Transportation Commission (VCTC) to cease all freeway, highway and road infrastructure expansion projects by 2025,
- v. Implement a policy to coordinate with Caltrans and VCTC to use the existing 101 Freeway and Highway 126 corridors to build light rail for inter-city and inter-county commuting by 2040,
- vi. Implement a policy to expand existing rail infrastructure for multi-track capacity by 2040,
- vii. Implement a policy to coordinate with contracted refuse companies to divert all pre- and post-consumer food waste into the “green waste” stream for composting all County-derived food waste by 2025,
- viii. Implement an agricultural policy requiring a transition to 100% regenerative farming including carbon sequestration and soil nutrient management plans by 2030,
- ix. Transition all small gas engines used in agriculture to electric models or diesel engines running on biodiesel produced from as locally-sourced waste vegetable oil as possible by 2030,
- x. Implement a policy to transition all small, non-farm gas engines (i.e. blowers, mowers, trimmers, etc.) to electric models by 2025,
- xi. Implement a policy requiring all public transportation (buses, shuttles, and all County vehicles) to be fully electric vehicles by 2030,

I56-3

I56-4

- xii. Implement a County policy to prioritize walking and bicycling by connecting communities outside incorporated city limits with adequate sidewalks, bike lanes, and/or buffers from vehicle traffic,
- xiii. Implement policies to facilitate distributed renewable energy generation and storage,
- xiv. Study the potential to repurpose existing gas infrastructure as conduit for undergrounding electrical and communication lines,
- xv. Study the potential of public banking to finance County divestment from fossil fuels and investment in sustainable energy systems, and
- xvi. Implement a policy to work with existing fossil fuel industry workers to transition into clean energy jobs supporting clean energy infrastructure in the County.

I56-4
cont.

Whatever price tag you want to envision for these proposals, it pales in comparison to the pending costs of sea level rise, soil degradation and crop failure, increased asthma and other heat-exasperated medical conditions, and the shortsighted failures of free market economics and laissez faire County governance to deal with climate change. To delay action, to delay investment, will only cause greater harm and increased costs for us all.

I56-5

Respectfully,

Elizabeth Siboldi

County of Ventura Draft Programmatic Environmental Impact Report for the draft 2040
General Plan Update

Dear Ms. Curtis,

The County of Ventura (County) is in a unique position to be updating the County's primary planning document through 2040 as the impacts of climate change are becoming more severe. The Draft Environmental Impact Report (DEIR) fails to recognize the true impacts of climate change already occurring. The County is already experiencing a 2°C increase in average temperature from historical records. We are soon to re-enter drought conditions following the driest February on record. We are still recovering from two of the state's largest wildfires in modern history. We must act now, and we must act boldly.

The DEIR fails to provide enough emissions reduction to meet, or meaningfully contribute to, the California state mandated climate goals. The DEIR fails to include a Climate Action Plan with measurable targets and goals to ensure County stakeholders are informed about progress, achievements and accurate analysis of shortcomings. Language used in the [plan] such as "encourage" or "support" rather than "require" or "mandate" is insufficient and meaningless to meet acknowledged greenhouse gas reduction targets.

The DEIR is based on a wholly inadequate inventory of county emissions. The inventory was conducted from top down rather than bottom up and fails to include, or even consider, a significant portion of present emissions. Recent published studies indicate significant under-assessment of greenhouse gases, especially methane, from current fossil fuel extraction and production that must be included in the DEIR analysis.

Because the County is one of the leading producers of fossil fuels in the state, and therefore in the nation, including fossil fuel facilities NASA documents as greenhouse gas "super emitters," the County must act now, and act boldly. Approval of the proposed DEIR would be a failure of the County's moral and fiduciary responsibility.

Therefore, to act responsibly, the County must:

- 1) Declare a climate emergency and direct all County government offices to incorporate climate change mitigation, to the extent feasible, in all activities,

- 2) Create a Climate Action Plan 2020-2040 with measurable targets and outcomes as a separate document from the General Plan update,
- 3) Set clear climate action goals and mandate enforceable climate policies based on the declaration of a climate emergency and Climate Action Plan 2020-2040, and
- 4) As part of the Climate Action Plan 2020-2040, set five-year interval targets beginning with 2025 to immediately begin the reduction of the County's contribution to the climate emergency.
 - a. Initial five-year (2025) emergency climate goals:
 - i. Begin the elimination of fossil fuel extraction and production with the County by immediately prohibiting operation of fossil fuel facilities within one-mile buffer zones of schools, public parks, mobile home parks, medical facilities, or any residential zones,
 - ii. Wind down discretionary oil and gas production by 10% per year to zero production in the County by 2030 starting with fossil fuel facilities within above one-mile buffer zones,
 - iii. Prohibit flaring and venting from any fossil fuel infrastructure before 2025,

**Letter
I57**

To Whom It May Concern,

The effects of climate change are overwhelmingly evident in our county. The General Plan update does not provide high enough emissions reduction to meet the state-mandated goals. A stronger plan, with the help of technical and scientific input, needs to be included for the 2040 General Plan, including a strong defense of the five pound air emissions limit for the Ojai Valley.

I57-1

Thank you,
Emily
Ojai, CA

| | |
|-----------------------|------------------------------------------|
| Letter I57 | Emily Hirsch February 23, 2020 |
|-----------------------|------------------------------------------|

I57-1 The comment refers to the level of greenhouse gas emissions reductions provided by the 2040 General Plan relative to State goals. Refer to Master Response MR-1 for discussion of these topics. See also response to comment I50-3 regarding the Ventura County Air Pollution Control District’s recommended threshold of significance for reactive organic gas and nitrogen oxide emissions in Ojai Valley.

The comment addresses the 2040 General Plan and is not related to the adequacy of the draft EIR. Therefore, no response is required. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.

| <p>Letter 158</p> |
|-----------------------|

While I appreciate the inclusion of environmental justice as a cross-cutting issue that is addressed throughout the various sections of the Plan, I see opportunities in nearly every written goal/objective to make social justice, environmental justice, and inclusivity a stronger focus. I've only examined Section 10 due to personal time constraints, but would likely have many comments on other sections if there are public comment periods in the future.

Within Section 10 on Economic Vitality, I suggest the following edits:

- EV-1.2 should read "The County shall prioritize investment in infrastructure, services, safety net programs and other assets that are critical to future economic vitality, including public safety, healthcare, library services, water supply and quality, transportation, energy, and environmental resources. This investment shall improve equity in investment opportunities to designated disadvantaged communities, including designated Opportunity Zones under the federal Tax Cuts and Jobs Act of 2017. The focus of these efforts shall be to improve social equity and opportunity for all. (FB, SO) [Source: VCEVSP Policy A.3, E.1, modified]"
- EV-1.3 should read: "The County shall continue to work with cities and community organizations to implement, assess, and improve best practices, pursue funding to improve housing affordability, and implement programs that a) reduce the cost of housing in order to retain and attract employers, employees, and young graduates and professionals, b) improve the number of affordable housing units accessible to the most vulnerable/disadvantaged communities, and c) meaningfully address the underlying causes of unaffordable housing in Ventura County. (MPSP, IGC) [Source: VCEVSP Policy F.1, modified]"
- EV-1.4 should read: "The County shall promote socioeconomic inclusivity and business-friendliness in the regulatory and permitting environment throughout Ventura County through collaboration (especially with existing local organizations that serve vulnerable/disadvantaged groups), exchange of ideas and best practices, improvement in clarity and efficiency in the permitting process, taking advantage of opportunities for streamlining in the development process, promoting cooperative and nonprofit business models and supporting their growth in Ventura County, and improving consistency in policy and practice among cities and the County. (RDR, IGC) [Source: VCEVSP Policy F.3, modified]"
- EV-1.6 should read: "The County shall work with local chambers of commerce, countywide economic development organizations, and businesses to support the appropriate and socially inclusive expansion of the local economy that improves the standard of living for the most vulnerable/disadvantaged communities in Ventura County first and foremost and also leads to the creation of environmentally sustainable and cutting-edge jobs for long-term economic prosperity, particularly in Existing Communities and unincorporated Urban Areas where zoning allows. (MPSP, JP) [Source: New Policy]"
- EV-1.7 should read: "The County shall strive to attract industries based on existing and projected workforce demographics, educational attainment, skills, and commute patterns, and which provide opportunities to residents living in designated disadvantaged communities. The County shall equip designated disadvantaged communities with the educational attainment, skills, and commute patterns that allow them to be highly competitive in the industries that develop in Ventura County in the future. (MPSP, JP) [Source: New Policy]"
- EV-1.8 should read: "The County shall coordinate and work with cities in the county to enhance the efficiency of development of remaining vacant commercial and industrial sites and encourage infill and revitalization of underutilized sites so that nearby neighborhoods become more walkable, green, cohesive, and affordable. (MPSP, IGC) [Source: VCEVSP A5]"
- EV-1.9 should read: "The County shall facilitate the development of a range of commercial uses in urban areas and Existing Communities, where zoning allows, that not only fulfill the daily needs of residents and visitors but also make the communities more walkable, cohesive, affordable, and vibrant. (MPSP, JP) [Source: Existing GPP Goal 3.4.1.1, modified]"
- EV-1.10 should read: "The County shall strive to attract and retain high-quality, full-service, affordable, and culturally appropriate grocery stores and other healthy food purveyors to fill local

158-1

needs in Existing Communities and adjacent urban areas, particularly in underserved areas. (MPSP, JP) [Source: *New Policy*]

- EV-3.2 should read: “The County should promote and expand existing small business and women-owned business development programs by identifying partnerships between industry and educational organizations, and identifying potential mentoring, job training, networking, and professional development opportunities between these organizations and by supporting and promoting efforts of the Small Business Administration to provide technical assistance to small business owners and employees through classes and assistance in the areas of business management, marketing, and legal assistance. The County should allow entrepreneurs to use government property or facilities to test new products and services that are beneficial to the public good for micro enterprises of five employees or fewer to encourage economic and social opportunities in low-income areas. (IGC, JP) [Source: *New Policy*]
- EV-3.5 should read: “The County shall support local efforts to attract firms in key industries from outside the county that have a history of positive social, environmental, and economic charity. The County shall facilitate the entrepreneurial development of new firms and cooperative business models within the county as well as support the necessary training to develop entrepreneurship and innovation in the local workforce. (IGC, JP) [Source: *VCEVSP Strategy C, modified*]
- EV-4.2 should read: “The County shall support the development of industries and businesses that promote and enhance environmental sustainability, greenhouse gas reductions, decarbonization, climate change adaptation, resiliency, and renewable energy generation, storage, and transmission, including solar power, wind power, wave energy and other appropriate renewable sources. The County shall promote the efforts of existing businesses that meet green business criteria and encourage them to become more diverse and inclusive in their daily operations, organization, and local impact; provide job training in green building techniques and regenerative farming and trainings on starting social enterprises built on cooperative business models; and strive to build green technologies into and decarbonize existing government buildings and facilities. (MPSP, JP) [Source: *New Policy*]
- EV-4.3 should read: “The County shall encourage the development and expansion of businesses and business models (eg. cooperatives) that advance social equity, inclusivity and fairness, environmental quality, and economic sustainability, as well as capitalize on key industry strengths. Economic sustainability includes planning and preparation for disaster response and long-term resiliency of businesses and economic assets in the county. (JP) [Source: *New Policy*]

I58-1
cont.

Within the Climate Action Plan, I see opportunities to make Ventura County a stronger leader in both reducing our contribution to the climate crisis as well as addressing social/environmental injustice. One urgent need in the Climate Action Plan is to establish a framework for making the implementation (and success) of the Plan observable and measurable so that the public can hold polluters and public officials accountable if they fail to meet the goals established in the Plan – that framework should include some details on the specific indicators chosen to measure implementation/success of the Plan. I would suggest that the planners and decision-makers working on this update establish close contact with CFROG (Climate First: Replacing Oil and Gas) to set up an appropriate framework. The framework should also have a robust public outreach component where local stakeholders are invited into the assessment and monitoring of the Climate Action Plan on an iterative basis. The public outreach component of the monitoring protocol should center around the needs of Ventura County’s vulnerable, disadvantaged, and/or historically marginalized communities and meaningfully include their voices.

I58-2

| Letter I58 | Erik Fruth February 27, 2020 |
|-----------------------|----------------------------------------|

- I58-1 The comment provides suggested edits to policies proposed in the 2040 General Plan related to social justice, environmental justice, and inclusivity and is not related to the adequacy of the draft EIR. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.
- I58-2 The comment provides suggestions for the 2040 General Plan and is not related to the adequacy of the draft EIR. Specifically, the comment requests the inclusion of programs that provide a framework for implementation of the greenhouse gas-related policies and programs of the 2040 General Plan that is observable, measurable, and provides for public participation. Note that the programs in the 2040 General Plan would largely achieve these goals. See, for example, Programs Z, AA, BB, and CC of the Conservation and Open Space Element. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.

Letter
I59

CAUTION: If this email looks suspicious, DO NOT click. Forward to Spam.Manager@ventura.org

Susan Curtis,

Dear Ventura County Board of Supervisors and Planning Department,

Climate issues are something I feel worried about. Ventura County is warming faster than any county in the nation. Our ocean is acidifying faster. Drought and floods have hit us worse, and we can expect more extreme weather.

I59-1

My family and community are counting on you to assure analysis of the full scope of environmental impacts and mitigations in the Draft EIR.

First, it is necessary that all greenhouse gas emissions be counted based on the most current science.

I59-2

There are many ways to mitigate climate impacts, like a sunset plan for oil and gas production, decarbonization of transportation and buildings, zero waste, incentives for regenerative agriculture and water management, and reducing emissions from tailpipes.

I59-3

I want an EIR that covers major climate impacts via a systematic plan.

In addition, I feel the plan should restore the decisions of the Board of Supervisors to require that all new wells collect gases rather than flare or vent and also that gas-fueled lawn and garden equipment should be banned.

I59-4

Thank you—

Fiona Bremner

Subject: 2040 General Plan Draft EIR comment

Letter
I60

ATTN: Planning Division

Thank you for your time in preparing this document and for receiving my comments. My name is Fred J. Ferro and I have serious concerns about areas related to our local oil and gas industry. The DEIR contains false and ill-advised policies affecting the local oil and gas industry without proper evidence and analysis. I60-1

The policy COS-7.4 mandates the electrically powered equipment be used for oil and gas exploration and production. The DEIR makes this mandate of the oil and gas industry but does not apply this mandate to other industries. First of all, that is blatant in its disregard of an industry that provides thousands of high-paying jobs and provides tax revenues that support vital community services and local education. This mandate that is unfairly targeted to oil and gas should be further analyzed for economic impacts. I60-2

Furthermore, preventing a permitted land use such as extraction of energy resources would be a public taking. The DEIR needs to correct this failure to recognize and analyze the public taking as a result of these policies. I60-2

These policies must be corrected and further studied is this document is to be considered complete. Upon further analyzing these issues, the document will need to be recirculated instead of rushed through. Similarly, more recent available County Ag Commissioners data could and should have been used for discussion of the impacts of proposed changes affecting the local agricultural industry. I60-3
I60-4

Thank you for your time,

Fred J.Ferro

| Letter I60 | Fred J Ferro February 25, 2020 |
|-----------------------|------------------------------------------|

- I60-1 The description and concerns related to the oil and gas industry of the commenting individual are noted. This comment is introductory in nature and does not raise a significant environmental issue for which a response is required. See responses to comments I60-2 through I60-4, below, regarding policies addressed in the draft EIR that pertain to the oil and gas industry.
- I60-2 The comment addresses implementation of Policy COS-7.4 in the 2040 General Plan and is not related to the adequacy of the draft EIR. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.
- Further, the comment states that the economic impacts of implementing Policy COS-7.4 should be analyzed. However, EIRs are not required to treat a project's economic or social effects as significant effects on the environment (State CEQA Guidelines, § 15131). Social and economic effects need only be considered in an EIR where there is a clear link between those economic or social effects and physical environmental changes. The economic issues raised in this comment would not result in any adverse physical changes to the environment not already addressed in the draft EIR. Refer to Master Response MR-4, Section MR-4.B, "Antiquated Permits and Takings," regarding takings. This comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopted a final 2040 General Plan.
- I60-3 Regarding revisions to Policy COS-7.4, refer to response to comment I60-2, above. Also, refer to Master Response MR-7, which explains in detail why recirculation of the draft EIR is not required.
- I60-4 The comment states that recent available County Agricultural Commissioner data should have been used in discussing impacts that would affect the local agricultural industry. It is unclear which data from the County Agricultural Commissioner the commenter refers to. The data used for the impact analysis accurately represent existing physical conditions at the time of publication of the notice of preparation in January 2019 (refer to Section 4.2, "Agriculture and Forestry Resources," in the draft EIR). Nonetheless, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.

Letter
I61

February 27, 2020

Ventura County Board of Supervisors
Attn: Susan Curtis, Manager, General Plan Update Section
800 South Victoria Avenue, L#1740
Ventura, CA 93009-1740

I'm writing to you as a concerned resident of the County regarding the viability of the oil and gas industry in Ventura County.

I61-1

The 2040 General Plan Draft EIR fails to give proper analysis to oil and gas mineral resources.

Neither the EIR nor the Background report provide a complete and thorough description of the existing, current regulatory setting that oversees the management and production of mineral resources in the County and the State of California. The EIR and the Background Report only disclose federal and state agencies that regulate pipelines and flaring, which is not applicable to all mineral resources that must be analyzed in an EIR under CEQA guidelines. The EIR should be revised to include an overview and description of all potential regulations, regulatory bodies, and programs that regulate mineral resources in Ventura County.

I61-2

The EIR fails to actually analyze for direct and indirect impacts to mineral resource zones that will occur as a result of the 2040 General Plan. The County admits that Land Use Designation changes in the 2040 General Plan will result in changes to land uses OVER known and important mineral reserves. But neither the EIR nor the Background Report provide any information regarding estimated and anticipated "buildout" in terms of acreage, actual location, number of dwelling units, and development density and intensity. These incompatible land uses will significantly impact future mineral resource production and must be evaluated and mitigated for in the EIR.

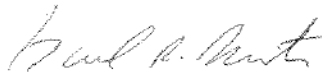

I61-3

The EIR never addresses indirect impacts to mineral resource development that will occur under the 2040 General Plan. As incompatible land uses (such as residential development) occur on or adjacent to mineral production and mineral reserves, compatibility conflicts will increase. Reasonably foreseeable indirect impacts include nuisance complaints, traffic conflicts, theft, vandalism and attempted trespass on mineral production sites. The EIR must analyze and evaluate these impacts on the ability to produce mineral resources in the County.

The Draft EIR is lacks critical analysis and must be corrected and recirculated to ensure a fair process for Ventura County residents.

I61-4

Thank you,

| | |
|-----------------------|-----------------------------------------------|
| Letter I61 | Gabriel R. Duarte February 27, 2020 |
|-----------------------|-----------------------------------------------|

- I61-1 The commenting individual's concerns related to the oil and gas industry and the draft EIR's analysis of oil and gas mineral resources are noted. This comment is introductory in nature and does not raise a significant environmental issue for which a response is required.
- I61-2 Refer to Master Response MR-6 for discussion of how the County appropriately uses the Background Report to describe the existing environmental setting in the draft EIR. The commenter indicates that the draft EIR and Background Report do not provide a complete description of the existing and current regulatory setting for production of mineral resources. The commenter does not specify the additional information regarding the regulatory setting applicable to analysis of impacts to mineral and petroleum resources that needs to be included in the EIR.
- The Background Report Section 8.4, "Mineral Resources," 8.5, "Energy Resources," and Section 10.2 "Legal and Regulatory Framework for Water Management (Class II Underground Injection Control Program)," provide relevant regulatory information necessary for understanding and evaluating the impacts of the 2040 General Plan on petroleum resources. Additionally, the draft EIR Mineral and Petroleum Resources Section 4.12.1, Background Report Setting Updates, includes additional information laws and regulations that pertain to petroleum development. This includes federal laws and regulations related to gas pipelines, state laws and regulations related to the California Pipeline Safety Act of 1981, Ventura County Air Pollution Control District (VCAPCD) Rule No. 71.1 – Crude Oil Production and Separation and Rule No. 54 – Sulfur Compounds, VCAPCD Primary (Non-Emergency) Flares, VCAPCD Emergency Flares, and VCAPCD Permitted Flare Variances, and Non-Coastal and Coastal Zoning Ordinances. In the response to this comment, and based on the April 9, 2020 comment letter from the California Geologic Energy Management Division (CalGEM) describing its current regulatory program, the regulatory framework section has been augmented. The enhance discussion of regulatory framework would not alter the findings or analysis in the EIR. The augments to the regulatory setting for Section 4.12 are provided in final EIR Chapter 3, "Revisions to the Draft EIR."
- I61-3 The commenter asserts that the draft EIR fails to analyze impacts to mineral resource zones that would occur as a result of implementation of the 2040 General Plan. The draft EIR Section 4.12.2 Environmental Impacts and Mitigation Measures (page 4.12-5) indicates that "To determine the potential for the 2040 General Plan to conflict with the extraction of mineral resources, the proposed land use diagram was compared to maps of aggregate resources maintained by the State (mineral resource zones mapped by the California Division of Mines and Geology [now known as the California Geological Survey]) and County (as Mineral Resource Protection [MRP] overlay zone) described in the Background Report. The potential for physical changes within identified mineral resource

zones (MRZs) was determined using geographic information system software. Specifically, the analysis focused on MRZ-2 lands, which are identified in the County’s NCZO with an MRP Overlay. Consistent with ISAG [Initial Study Assessment Guidelines] Section 3a, any land use proposed on or immediately adjacent to land zoned in the MRP Overlay designation or adjacent to a principal access road to a property with the boundaries of an existing conditional use permit for mineral (e.g., aggregate) resources extraction is considered to have the potential to hamper or preclude access to mineral resources.”

The draft concludes that with the implementation of policies proposed in the 2040 General Plan, the potential for development on or adjacent to mineral resources that are zoned, mapped, or permitted for extraction, which could hamper or preclude extraction of the resources, would be less than significant (4.12-10) for Impact 4.12-1: Result in Development on or Adjacent to Existing Mineral Resources Extraction Sites or Areas Where Mineral Resources Are Zoned, Mapped, or Permitted for Extraction, Which Could Hamper or Preclude Extraction of the Resources (4.12-9)). Additionally, the draft EIR concludes that future development would not be anticipated to result in the loss of a known mineral resource that would be of value to the region and the residents of the State and this impact would be less than significant (4.12-10) for Impact 4.12-2: Result in the Loss of Availability of a Known Mineral Resource That Would Be of Value to the Region and the Residents of the State (4.12-10).

Refer to response to comment O5-90 regarding the interplay between the land use designations in the 2040 General Plan and mineral resource zones and Master Response MR-2 for a detailed discussion of how buildout was analyzed in the draft EIR. Response to comment O9-8 provides a discussion of the potential for indirect impacts due to incompatible land uses.

I61-4

The comment states that the draft EIR does not include the analysis requested in the above comments. For the reasons described in response to comments I61-1 and I61-2, above, the draft EIR analysis is adequate. Also, refer to Master Response MR-7, which explains in detail why recirculation of the draft EIR is not required.

Letter
I63

February 25, 2020

Ventura County Board of Supervisors
Attn: RMA Planning Division
General Plan Update
800 Victoria Avenue L#1740
Ventura, California 93009-1740

Dear Board of Supervisors and Staff:

We are writing this letter to urge the Board of Supervisors to reconsider moving forward with the Draft General Plan EIR. The draft EIR has been accelerated to the point that too many issues and impacts have not been properly addressed or studied. These impacts and the corresponding mitigation measures will have severe impacts to land owners and especially those, like us in the agricultural industry and other productive economic segments.

I63-1

Our family has been involved in the agricultural industry for more than 100 years in Ventura County. We have owned numerous land holdings that remain in the family to this date. We have farmed throughout Ventura County and hope to continue to do so in the future.

The Draft EIR is deficient on many levels. CEQA requires that all mitigation measures must be technically and economically feasible. Numerous proposed mitigation measures are neither. We have in the past attempted to identify land and any owners that would be open to sell their development rights for land that was converting from agricultural to commercial use. Not only did we not find anyone that would do so, no one would even quote a price. The only positive response from numerous land owners were that you can buy my property for full market value and then you can do what you want. There is not a project that can be built by adding double land cost to the equation. This was very recently experienced based on proposed policies at LAFCo. These policies were eventually not enacted due to the inability to purchase development rights in an economical feasible manner. This was when LAFCo was contemplating an acre for acre ag preserve. The new policy that is proposed in the 2040 General Plan is requiring 2 acres for every 1 acre of land converted from ag to any other use. This will eliminate the ability to add any new required ag buildings or even farm worker housing. The Draft EIR must study these impacts, since they are not feasible.

I63-2

The Draft EIR also deals with water in a manner that is not properly studied. There is no analysis on increased water costs and diminishing availability of water. Without reasonable water costs and supply, there is no agricultural industry.

I63-3

The General Plan indicates that agriculture is a high priority in the County. However, new policies and requirements in the General Plan add additional mitigation measures that will make ag virtually

I63-4

impossible. These include new setbacks, limiting types of fumigants pesticides and fertilizers. The General Plan also requires the conversion of all farm equipment to be all electric. Again, not feasible. The costs to purchase new pumps, farm equipment and other existing fuel using equipment will increase operational costs to a point that the County crops will not be competitive in the open market. These new mitigation measures are not sufficiently studied and again are not economically feasible.

I63-4
cont.

The Draft EIR is extremely difficult to read and understand. The background reports are lacking in depth of what has been studied other than numerous general statements and very poor mapping. Detailed studies must be added to sufficiently identify impacts and the related mitigation measures for both direct and indirect impacts on the agricultural industry. It is our understanding that reports and studies need to be timely prepared. However numerous studies are older than 5 years. Not timely.

I63-5

After numerous devastating wildfires over the last few years, which significantly impacted ag, the General Plan continues to lay out limiting mitigation measures for fire prevention. The Wildlife corridor eliminates any ag operation or fire prevention in the proposed corridor areas. This is also a major concern not studied in the Draft EIR.

I63-6

The Draft EIR for the 2040 General plan does not provide adequate analysis for the expansion of permanent bike paths and pedestrian walking trails throughout the County. These impacts are very severe due to constant conflicts from trail users and ag operations. Spraying, dust, odors from ag operations, along with impacts created by the trail users. These are usually theft, vandalism, litter and pet waste. The proposed mitigation measures require additional setbacks from these trails which renders additional land unusable for ag operations.

I63-7

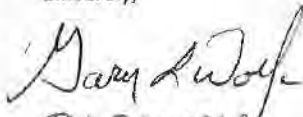

In addition to the above comments on the agricultural aspects and related land use concerns of the DEIR, the undersigned is also a mineral owner directly interested in the impacts on oil and gas production of the DEIR and related General Plan 2040 proposed provisions. In these documents there is a total failure to address the economic impacts of the various policies proposed in violation of the requirements for this process, including but not limited to the loss of royalty income to a large group of County residents. I join in the detailed comments on the various deficiencies and concerns identified in the DEIR as described in the concurrent submissions on behalf of Aera Energy and other operators delivered this week to the County.

I63-8

Please look at the long-term consequences of these General Plan policies and mitigation measures. We formally request additional studies and a revised Draft EIR that will properly look at these and many more issues. The DEIR must be corrected with details of the revisions. Then it can be recirculated.

I63-9

Sincerely,

P.O. Box 1268
Ventura, CA 93002

Subject: Ventura County general plan and climate change

Ms Curtis -

Others have written more thoroughly on this subject than I can, so I am just adding my voice. Ventura County should be a national leader to mitigate the effects of climate change, to stop or reverse climate change, to move us to long-term sustainable ways of life, to reverse the last century of "better living through chemistry". Ventura County has abundant natural resources and human resources to make these things happen.

thanks

Geoffrey Dann

I64-1 The comment addresses the 2040 General Plan and is not related to the adequacy of the draft EIR, therefore no further response is required. The comment also expresses concerns about climate change, which is addressed in the draft EIR in Section 4.8, "Greenhouse Gas Emissions." This comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.

February 24, 2020

Ventura County Board of Supervisors
Attn: RMA Planning Division
General Plan Update
800 Victoria Avenue L#1740
Ventura, California 93009-1740

Dear Board of Supervisors and Staff:

We are writing this letter to urge the Board of Supervisors to reconsider moving forward with the Draft General Plan EIR. The draft EIR has been accelerated to the point that too many issues and impacts have not been properly addressed or studied. These impacts and the corresponding mitigation measures will have severe impacts to land owners and especially those, like us in the agricultural industry and other productive economic segments.

I65-1

Our family has been involved in the agricultural industry for more than 100 years in Ventura County. We have owned numerous land holdings that remain in the family to this date. We have farmed throughout Ventura County and hope to continue to do so in the future.

The Draft EIR is deficient on many levels. CEQA requires that all mitigation measures must be technically and economically feasible. Numerous proposed mitigation measures are neither. We have in the past attempted to identify land and any owners that would be open to sell their development rights for land that was converting from agricultural to commercial use. Not only did we not find anyone that would do so, no one would even quote a price. The only positive response from numerous land owners were that you can buy my property for full market value and then you can do what you want. There is not a project that can be built by adding double land cost to the equation. This was very recently experienced based on proposed policies at LAFCo. These policies were eventually not enacted due to the inability to purchase development rights in an economical feasible manner. This was when LAFCo was contemplating an acre for acre ag preserve. The new policy that is proposed in the 2040 General Plan is requiring 2 acres for every 1 acre of land converted from ag to any other use. This will eliminate the ability to add any new required ag buildings or even farm worker housing. The Draft EIR must study these impacts, since they are not feasible.

I65-2

The Draft EIR also deals with water in a manner that is not properly studied. There is no analysis on increased water costs and diminishing availability of water. Without reasonable water costs and supply, there is no agricultural industry.

I65-3

The General Plan indicates that agriculture is a high priority in the County. However, new policies and requirements in the General Plan add additional mitigation measures that will make ag virtually impossible. These include new setbacks, limiting types of fumigants pesticides and fertilizers. The General Plan also requires the conversion of all farm equipment to be all electric. Again, not feasible. The costs to purchase new pumps, farm equipment and other existing fuel using equipment will increase operational costs to a point that the County crops will not be competitive in the open market. These new mitigation measures are not sufficiently studied and again are not economically feasible.

I
165-4
I

The Draft EIR is extremely difficult to read and understand. The background reports are lacking in depth of what has been studied other than numerous general statements and very poor mapping. Detailed studies must be added to sufficiently identify impacts and the related mitigation measures for both direct and indirect impacts on the agricultural industry. It is our understanding that reports and studies need to be timely prepared. However numerous studies are older than 5 years. Not timely.

I
165-5
I

After numerous devastating wildfires over the last few years, which significantly impacted ag, the General Plan continues to lay out limiting mitigation measures for fire prevention. The Wildlife corridor eliminates any ag operation or fire prevention in the proposed corridor areas. This is also a major concern not studied in the Draft EIR.

I
165-6
I

The Draft EIR for the 2040 General plan does not provide adequate analysis for the expansion of permanent bike paths and pedestrian walking trails throughout the County. These impacts are very severe due to constant conflicts from trail users and ag operations. Spraying, dust, odors from ag operations, along with impacts created by the trail users. These are usually theft, vandalism, litter and pet waste. The proposed mitigation measures require additional setbacks from these trails which renders additional land unusable for ag operations.

I
165-7
I

In addition to the above comments on the agricultural aspects and related land use concerns of the DEIR, the undersigned is also a mineral owner directly interested in the impacts on oil and gas production of the DEIR and related General Plan 2040 proposed provisions. In these documents there is a total failure to address the economic impacts of the various policies proposed in violation of the requirements for this process, including but not limited to the loss of royalty income to a large group of County residents. I join in the detailed comments on the various deficiencies and concerns identified in the DEIR as described in the concurrent submissions on behalf of Aera Energy and other operators delivered this week to the County.

I
165-8
I

Please look at the long-term consequences of these General Plan policies and mitigation measures. We formally request additional studies and a revised Draft EIR that will properly look at these and many more issues. The DEIR must be corrected with details of the revisions. Then it can be recirculated.

I
165-9
I

Sincerely,

George A. Graham

Ventura County Board of Supervisors
Attn: RMA Planning Division
General Plan Update
800 Victoria Avenue L#1740
Ventura, California 93009-1740

Dear Board of Supervisors and Staff:

We are writing this letter to urge the Board of Supervisors to reconsider moving forward with the Draft General Plan EIR. The draft EIR has been accelerated to the point that too many issues and impacts have not been properly addressed or studied. These impacts and the corresponding mitigation measures will have severe impacts to land owners and especially those, like us in the agricultural industry and other productive economic segments.

I66-1

Our family has been involved in the agricultural industry for more than 100 years in Ventura County. We have owned numerous land holdings that remain in the family to this date. We have farmed throughout Ventura County and hope to continue to do so in the future.

The Draft EIR is deficient on many levels. CEQA requires that all mitigation measures must be technically and economically feasible. Numerous proposed mitigation measures are neither. We have in the past attempted to identify land and any owners that would be open to sell their development rights for land that was converting from agricultural to commercial use. Not only did we not find anyone that would do so, no one would even quote a price. The only positive response from numerous land owners were that you can buy my property for full market value and then you can do what you want. There is not a project that can be built by adding double land cost to the equation. This was very recently experienced based on proposed policies at LAFCo. These policies were eventually not enacted due to the inability to purchase development rights in an economical feasible manner. This was when LAFCo was contemplating an acre for acre ag preserve. The new policy that is proposed in the 2040 General Plan is requiring 2 acres for every 1 acre of land converted from ag to any other use. This will eliminate the ability to add any new required ag buildings or even farm worker housing. The Draft EIR must study these impacts, since they are not feasible.

I66-2

The Draft EIR also deals with water in a manner that is not properly studied. There is no analysis on increased water costs and diminishing availability of water. Without reasonable water costs and supply, there is no agricultural industry.

I66-3

The General Plan indicates that agriculture is a high priority in the County. However, new policies and requirements in the General Plan add additional mitigation measures that will make ag virtually impossible. These include new setbacks, limiting types of fumigants pesticides and fertilizers. The General Plan also requires the conversion of all farm equipment to be all electric. Again, not feasible. The costs to purchase new pumps, farm equipment and other existing fuel using equipment will increase operational costs to a point that the County crops will not be competitive in the open market. These new mitigation measures are not sufficiently studied and again are not economically feasible.

I
166-4
I

The Draft EIR is extremely difficult to read and understand. The background reports are lacking in depth of what has been studied other than numerous general statements and very poor mapping. Detailed studies must be added to sufficiently identify impacts and the related mitigation measures for both direct and indirect impacts on the agricultural industry. It is our understanding that reports and studies need to be timely prepared. However numerous studies are older than 5 years. Not timely.

I
166-5
I

After numerous devastating wildfires over the last few years, which significantly impacted ag, the General Plan continues to lay out limiting mitigation measures for fire prevention. The Wildlife corridor eliminates any ag operation or fire prevention in the proposed corridor areas. This is also a major concern not studied in the Draft EIR.

I
166-6
I

The Draft EIR for the 2040 General plan does not provide adequate analysis for the expansion of permanent bike paths and pedestrian walking trails throughout the County. These impacts are very severe due to constant conflicts from trail users and ag operations. Spraying, dust, odors from ag operations, along with impacts created by the trail users. These are usually theft, vandalism, litter and pet waste. The proposed mitigation measures require additional setbacks from these trails which renders additional land unusable for ag operations.

I
166-7
I

In addition to the above comments on the agricultural aspects and related land use concerns of the DEIR, the undersigned is also a mineral owner directly interested in the impacts on oil and gas production of the DEIR and related General Plan 2040 proposed provisions. To: ClerkoftheBoard, ClerkoftheBoard <ClerkoftheBoard@ventura.org>
Cc: Curtis, Susan <Susan.Curtis@ventura.org>
Subject: VC2040 General Plan Comments

**Letter
I68**

To: Board of Supervisors
cc: Susan Curtis
From: Gordon Clint
4102 Greenwood Street
Newbury Park, CA 91320

I am signing on to this letter because I care about the deteriorating condition of my County and planet. We must approve a plan that will provide a just and sustainable future. Please strengthen the climate aspects of the 2040 General Plan consistent with the following concerns:

With worsening climate change impacts, we reiterate and amplify the concerns the people expressed in January of last year about “climate change and GHGs, and the effects of continued oil and gas extraction including secondary effects related to climate change, air quality, water quality, water supply, traffic, noise, odors, aesthetics, and hazards.”

Our county is warming faster than any other in the nation, our ocean is becoming more hostile to marine life, our last drought was the most intense and lasted longest, and our history of costly floods will be dwarfed when future atmospheric rivers pour over our valleys. Our house is on fire. We need a thorough plan and environmental impacts analysis based on the latest science.

Ventura County’s plan matters. Our larger cities are making climate action plans and look for your example of leadership. The environmental impact from what we do to mitigate climate impacts at the global scale is profoundly influential in trying to stop runaway climate change. This is explained in a new report Insights from the California Energy Policy Simulator about the role of the State of California in the world. Ventura County as a local government hit hardest by climate impacts must step up and meet serious goals. “Insights about California’s climate policies are at the forefront of global efforts to battle climate change. The state’s leadership and success so far have helped maintain momentum despite political headwinds. If California faltered, global efforts to reduce GHG emissions would be dealt a major setback. Meanwhile, the severe risks from runaway global warming are becoming more tangible as the state suffers from wildfires supercharged by climate change.”

I68-1

A. Four Overall Comments:

We are grateful for the expertise at the law firm of Shute, Mihaly and Wineberger retained by CFROG regarding CEQA. We have appreciated their past comments. We join them in continuing to request the following:

1. Count ALL GHGs that result from activity in our county: Count all burning of oil and gas originating in our county and count all fugitive methane from wells in our county and from methane entering our county that was not counted at the jurisdiction of origin. Do the math on the GHG footprint for heavy exports. We want to mitigate our fair share of all climate impacts from activities within Ventura County. We have to know what they are. Worrying about double counting is not acceptable. Just worry that you haven’t counted every cause of climate impacts that we are morally and legally responsible to mitigate with a comprehensive inventory and a systematic plan.

I68-2

2. Use the latest science to calculate GWP of methane: The global warming potential of GWP is nearly 40 percent greater than what you are using. The International Panel on Climate Change states that over a 20 year period, methane has a GWP of 84 compared to carbon dioxide (up from their previous estimate of 72). The US EPA estimates it at 87 and recent scientific experts put the estimate at 96. We must know the true environmental impact of methane emissions. A complete and scientifically valid GHG inventory is required for a CEQA-compliant Climate Action Plan.

3. Use the emissions reduction goal from Governor Brown’s Executive Order B-18-55 “to achieve carbon neutrality as soon as possible, and no later than 2045, and achieve and maintain net negative emissions thereafter. This goal is in addition to the existing statewide targets of reducing greenhouse gas emissions.” It is an inadequate compromise, but not as much as the SB 32 goal of 80% below 1990 levels by 2050. City of LA plans to stay within a net zero carbon budget between now and 2045. The proposed GHG reductions in the VC2040 Draft of 41 percent below 2015 levels by 2030, 61 percent by 2040, and 80 percent by 2050 are not ambitious enough for us to do our part to mitigate the climate chaos happening faster than scientists have predicted.

I68-3

4. Policies and programs must meet the goal: It does not take an in-depth analysis to see that this plan will not achieve the 2030 goal of 40% reduction in GHGs below 1990 levels. A new report Insights from the California Energy Policy Simulator shows that the State of California will fall short of that goal by at least 15 and as much as 45 MMT CO₂e. We have and continue to advocate for a goal aligned with Governor Brown’s Executive Order to achieve carbon neutrality as soon as possible and no later than 2045.

B. Some Comments about Impacts and Mitigation

The environmental impacts that concern us are those resulting from governments not making and carrying out plans to mitigate climate change. Your draft analysis does not include most of them. Table B in the Executive Summary is not even half finished. Some of the more serious impacts are missing from the draft analysis. Here are a few of our concerns:

I68-4

1. Aesthetics, Scenic Resources and Light Pollution and Agriculture and Forest Resources: Mitigation programs are needed to protect our resources from degradation from significant climate impacts. The loss of soil in particular is associated with the downfall of civilizations.

I68-5

2. Air Quality: The emissions impacts from exceeding criteria pollutant thresholds and also greenhouse gases seem significant and can be mitigated.

I68-6

3. Biological Resources: The new implementation program is a good start to “update the Initial Study Assessment Guidelines, Biological Resources Assessment report criteria and evaluate discretionary development that could potentially impact sensitive biological resources”. Two kinds of impacts are missing. 1) Climate Change. A major mitigation is the restoration of wetlands which should be at a 2:1 or greater ratio. Stormwater management is another mitigation that reverses the loss of vegetation from drought and floods and supports the restoration of all of the indigenous biology that makes an ecosystem function to maintain the small water cycles. 2) Toxic Pesticide and Herbicide Use and Drift. This must be part of the agenda of a Program for Protection of Sensitive Biological Resources to promulgate the mitigations provided by Integrated Pest Management. Pest management policy must align with the recommendations of the California Department of Pesticide Regulation Roadmap for Integrated Pest Management some of which have climate mitigation co-benefits.

I68-7

4. Energy: We want a workshop to learn how it is deemed less than significant to allow wasteful, inefficient, or unnecessary consumption of energy resources.

I68-9

5. Greenhouse Gas Emissions: The climate change impacts are so dire that the mitigations need to be benchmarked to be achieved before it is too late to reverse runaway climate chaos. At minimum we demand a systematic plan for decarbonization of county facilities and electrification of the transportation system.

I68-10

6. Hazards, Hazardous Materials, and Wildfire: The impacts of toxic explosions, leaks, and spills and the drift of regulated materials and the ignorance of the public about toxic impacts must be addressed where feasible through mitigations that regulate the use and transport of hazardous materials. We have recommended feasible mitigations for people being exposed to the risk of wildfires that have not been accepted by decision-makers.

I68-11

| | |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------|
| <p>7. Hydrology and Water Quality: Impacts from climate change and poor land management have led to grave threats to water supply and water quality. These are highly significant--ground water overdraft, overuse and degradation of water quality, erosion, flooding, and siltation. (Impact 4.10-12) The failure to restore small water cycles to keep stormwater in the uplands and maintain forest health is one of the most serious impacts being mitigated in many places through a paradigm shift about stormwater management. Mitigation is essential--water is life. It requires an integrated water management plan that involves every sector working on every mitigation of which we are aware.</p> | <p>I 68-12</p> |
| <p>8. Land Use and Planning We want an analysis of incompatible land uses and new development with negative health implications. Closing wells near sensitive sites is a mitigation. Environmental Justice is not examined in the draft EIR.</p> | <p>I 68-13</p> |
| <p>9. Mineral and Petroleum Resources: We want an analysis of the impact of the scenario in which wells have been put on hold and the operator cannot close the wells for lack of funds. We have no choice. The wells must be closed properly. Fields must be restored to functioning ecosystems to help mitigate climate change impacts. We need insurance as well as bigger bonds.</p> | <p>I 68-14</p> |
| <p>10. Traffic and Transportation: Tailpipe emissions is an extremely significant environmental impact. The mitigation aimed for in the CTM-C: Vehicle Miles Traveled (VMT) Reduction Program needs assurances of effectiveness via a clear description of what "conditions warrant providing additional mitigations and programs"? This is far too vague to be a mitigation for this significant impact. We have no alternative but to reliably cut GHGs in the transportation sector.</p> | <p>I 68-15</p> |
| <p>11. Utilities: Failure to develop wholesale and commercial scale renewable energy generation and microgrids is a significant environmental impact because it has forced us to have to get our electricity from fossil fuels via transmission lines that spark wildfires. Community microgrids are a feasible mitigation.</p> | <p>I 68-16</p> |
| <p>12. Waste Management: Failure to properly manage waste has a highly significant environmental impact, especially when it produces methane super-emitter landfills that is driving climate change, but also the failure to reuse and recycle consumer goods and the materials and equipment discarded by commercial enterprises. We need a more comprehensive approach for mitigation of these impacts.</p> | <p>I 68-17</p> |
| <p>C. The following policy recommendations for the Draft Plan could help the Plan achieve the GHG reduction goals to mitigate climate change impacts and help the EIR be more relevant to the climate crisis.</p> | <p>I 68-18</p> |
| <p>Land Use and Community Character: We endorse the comments submitted by Bruce Smith to more firmly assure preservation of agricultural land and open space. We point out the lack of analysis of Environmental Justice policy issues.</p> | <p>I 68-19</p> |
| <p>Circulation, Transportation, and Mobility:</p> | |
| <p>1. No overriding considerations should allow a project to NOT reduce VMT unless all of the vehicles have zero emissions that will use the proposed project.</p> | <p>I 68-20</p> |
| <p>2. CTM 3-9 to widen SR 118 has a significant environmental impact.</p> | <p>I 68-21</p> |
| <p>3. Benchmarks to reduce VMT need to be more clear and the plan needs a review with public input every two years until 2028 and then no longer than every five years.</p> | <p>I 68-22</p> |
| <p>4. Parking programs should be included in ways that reduce single-occupancy car trips.</p> | <p>I 68-23</p> |

Public Facilities, Services, and Infrastructure:

- | | |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------|
| <ol style="list-style-type: none"> 1. Enroll residents in a program to reduce CO2 emissions in their neighborhoods. Ex: Cool Block or Transition Streets. 2. PFS 2.1 must be revised to say include rather than encourage 'Sustainable Plans and Operations' in order to be considered a mitigation of climate change impacts from greenhouse gas emissions. 3. Policy PFS 7.1 should be revised to delete the need for access to gas. The environmental impact from use of natural gas requires carbonizing buildings beginning with no gas connections to new residences . It is therefore contradictory to ensure access to gas. 4. Local renewable energy generation must be part of the mitigation plan for reducing transmission facility fire hazard risk. This is not the same as "Smart Grid Technology". You need experts who know the cutting edge of this field to help write coherent policy on this topic. 5. Zero Waste The County shall achieve zero waste (via a suite of policies to reduce, reuse, and recycle) with no organic waste going to landfills by 2023 6. Zero Waste Policy for Meetings and Events Design and implement a zero waste policy for meetings and events sponsored or permitted by the County to minimize waste and rescue surplus edible food 7. Compostable Take-Out Foodware Require that take-out foodware be made with material compostable in solid waste processing facilities within 60 days 8. Reduce Solid Waste by Phasing Out Single-Use Plastic Evaluate how to best reduce solid waste generation per capita by at least 15% by 2030 including phasing out single-use plastics including but not limited to plastic straws, plastic utensils, plastic take-out containers, and expanded polystyrene 9. Ban Expanded Polystyrene | <p>I68-24</p> <p>I68-25</p> <p>I68-26</p> |
| <p>Conservation and Open Space:</p> <ol style="list-style-type: none"> 1. Reduce oil and gas production by 40% by 2025 via higher monitoring standards and 2500 ft buffer zones near sensitive sites; reduce production to zero by no later than 2040. 2. Phase-Out of Oil and Gas Production The County shall prohibit new drilling and shall regulate existing wells to assure steady closing of wells beginning near residential and commercial areas. 3. Maintain Policy COS-7.8 as recommended by the Board of Supervisors, so that all newly permitted discretionary oil wells are required to collect gases and use or remove them for sale or proper disposal instead of flaring or venting. Flaring should be allowed only in cases of emergency or for testing purposes. 4. Maintain Policy COS-7.7 as recommended by the Board of Supervisors, so that all newly permitted discretionary oil wells are required to convey oil and produced water via pipelines instead of trucking. 5. Detect and curb methane emissions from "super-emitter" sites as identified by NASA. 6. Tax oil and gas production, and related uncaptured methane to raise the needed revenues to fund urgent climate programs to replace high-emission vehicles with a priority on trucking and freight companies, fishing businesses, general contractors and K-12 schools. 7. Require a fully accountable performance bond for all new wells to cover cost of closure Cite LAT article (maybe put on website and link to it). 8. Establish an insurance fund that oil and gas producers contribute to that will cover accidents and closing wells if the producer goes bankrupt. | <p>I68-27</p> |

9. Ban gas-fueled lawn and garden equipment. (Ex: City of Ojai)
10. Accelerate capture of legacy HFCs Enlist the public and private to find and destroy existing stocks of HFC's (refrigerant gases with extremely high Global Warming Potential).
11. Develop and adopt building codes based on best practices for use of low embodied carbon concrete and set targets for use of low GHG concrete alternatives. Ex: Bay Area Air Quality Management District and King Co, WA.
12. Encourage climate-safe and climate-resilient development through zoning reform and removal of limits on height, density, and minimum parking requirements to enable and promote walkability and a mix of uses for homes and businesses, parks and transit.
13. Create a master local clean energy siting and funding plan for wholesale distributed solar energy plus storage in commercial scale projects producing energy needs by 2030.
14. Provide energy efficiency benchmarking and rebates for low-income housing and renters as well as low-interest loans for small businesses to reduce energy use; assist owners of existing buildings to switch from natural gas to electricity.
15. Prepare sustainable building, siting, landscaping and passive heating and cooling practice guidelines, with a priority on low-income housing, that reduce consumption of non-renewable resources and that include climate and fire-safety in pre-approved plans.
16. Energy Efficiency to Reduce Electricity Use Use Energy Efficiency to Deliver 15% of Projected Needs for electricity in the county by 2023; and 30% by 2030.
17. Efficiency Building Standards for Retrofits Prioritize energy and water efficiency building standards and work to retrofit existing buildings.
18. Decarbonize County Buildings Develop a county building electrification plan eliminating natural gas use in County-owned facilities.
19. Decarbonize All Building Types Develop an electrification plan with goals for GHG emission reductions through renewable energy that evaluates and prioritizes programs for local solar, energy storage and demand response (DR) that disconnects all buildings from gas service by 2050. Include incentives for deep retrofits of inefficient buildings.

I68-28

Agriculture:

1. Integrated Pest Management where toxic pesticides are a last resort. Create a program that promotes the principles (systems approach, building trust, and effective communication) and pursues the recommendations of the Roadmap for Integrated Pest Management from the University of California and CA Department of Pesticide Regulation. Environmental impacts from toxic pesticides are not described in the Background Report. The Roadmap to an Organic California Policy Report by CCOF Foundation offers information for mitigations and climate action. A workshop is needed.
2. Inorganic Nitrogen Based Fertilizers Set benchmarks for reducing use of inorganic N fertilizer and encourage optimized use of organic and inorganic fertilizer for greatest efficiency in closed nutrient cycles, monitor for nutrient runoff from fields and encourage the use of cover crops and green manure crops to reduce or avoid nitrous oxide (N2O) emissions and nutrient runoff.
3. Diversified Cropping Systems Encourage farmers to include 1 – 5% of beneficial insect attracting plants in a planted crop, and other methods, such as crop rotation, perennial mowed cover crop in orchards, and integrating multiple species or varieties to enhance the biological and economic stability by spreading economic risk and buffering against pest invasions and extreme weather events, and increase carbon sequestration.
4. Reward Regenerative Farmers with Digestate and Compost from Food Waste Research feasibility of a program for composting food waste for use by farmers and landscapers who use regenerative practices that sequester certified amounts of CO2.

I68-29

Water Resources:

1. At least 30,000 acre-feet per year must come from storm water capture by 2035
2. All rainfall must be retained onsite in soil and reservoirs.
3. Slow It. Spread It. Sink It! The County shall enforce Best Management Practices (BMP) and Low Impact Development (LID) for new developments.
4. Recycle all wastewater for beneficial reuse by 2035.
5. Reduce potable water use per capita by 22% by 2025 and 25% by 2035: Offer incentives for water conservation features, including drought tolerant landscaping, permeable materials in standard parkway design guidelines, street trees, infiltration, greywater, and water-saving plumbing.
6. Close oil and gas wells and injection wells near aquifers as a top priority.
7. Create a Master Plan to develop the full potential of integrated water management to infiltrate the ground and recharge aquifers; support reforestation and restoration of watershed ecosystems; conserve and protect groundwater resources, and clean up creeks, streams, and estuaries.
8. Support Santa Clara River Loop Trail and Ventura River Trail Development

I68-30

Economic Vitality:

1. Agricultural Diversification should include reference to regenerative practices to create biodiversity with opportunities for community members to visit farms.
2. Small Business Promotion. Support approval of caretaker residential space on business property to reduce VMT and more financial strength for small businesses.
3. Green Economy. Prioritize youth and immigrants for workforce development in industries that promote and enhance environmental sustainability, including GHG reductions, climate adaptation, resiliency and local renewable energy generation, storage and distribution, including solar power, wind power, wave energy, regenerative organic farming and value-added agriculture-related activities, and other appropriate renewable sources.
4. Maritime Economy. Facilitate a sustainable maritime economy using restorative aquaculture techniques that restore ocean health and biodiversity while reviving pre-human fisheries abundance. For example, restore sand-bottom kelp forests and increase kelp forests with flexible floating fishing reefs where the seafloor is otherwise too deep for kelp.
5. Promote Fire-Resistant Infill and Revitalization. Encourage infill development that serves as firebreak rather than as additional fuel for wildfires.
6. Create a Collaborative Structure for Innovation for a Resilient Future. The structure should be able to make decisions and create a way forward for zoning, building and materials and environmental health to allow options for a resilient future, include government officials, innovators and public as described in submissions from Sustainable Living Research Initiative.
7. Parking Infrastructure. Develop parking policies to reduce single occupancy trips associated with employees and business activity to reduce Vehicle Miles Traveled.
8. Master Plan for Distributed Energy Resources and Community Microgrids. Prepare a map of siting options for renewable energy generation and storage facilities and coordinate the identification of financing options for renewable energy resource development, including solar, wind, wave, storage and community microgrids both in front of and behind the meter.

I68-31

In summary, with the accelerating tipping points, we cannot go half-way in our vision. We need extraordinary courage to set goals we can hang our hopes and efforts on. We want completeness and clarity so we can see how the emissions reduction plan adds up. We want respect for climate science to tell us the truth. We want more ambition. A 2016 decision of the state legislature in SB32 is just not good enough as a goal. We want to see a systematic plan that will assure carbon neutrality no later than 2045.

I68-32

This comment letter repeats many of the same comments provided in Letter I29. The responses below provide cross references to the portions of Letter I29 where responses to the same comments have already been provided.

- I68-1 The concerns of the commenter regarding climate change and importance of the County's General Plan are noted. This comment is introductory in nature and does not raise a significant environmental issue for which a response is required.
- I68-2 Refer to response to comment I29-3 with respect to the treatment of methane and oil and gas extraction.
- I68-3 Refer to response to comment I29-4 with respect to statewide greenhouse gas (GHG) reduction goals.
- I68-4 The commenter's concerns related to climate change are noted. This comment is introductory in nature and does not raise a significant environmental issue for which a response is required.
- I68-5 Refer to response to comment I29-6 regarding mitigation for climate change impacts.
- I68-6 Refer to response to comment O1-7 regarding criteria air pollutant emissions.
- I68-7 Refer to response to comment I29-8 regarding impacts and mitigation related to climate change and stormwater management.
- I68-8 The comment addresses the draft 2040 General Plan and is not related to the adequacy of the draft EIR. Therefore, no response is required. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.
- I68-9 Refer to response to comment I29-10 regarding the evaluation of energy use in the draft EIR.
- I68-10 Refer to response to comment I29-11 for a discussion of decarbonization and electrification of the transportation system.
- I68-11 Refer to response to comment I29-12 regarding the use and transport of hazardous materials as well as feasible mitigation.
- I68-12 Refer to response to comment O1-13 regarding hydrology and water quality.
- I68-13 Refer to response to comment I29-14 regarding incompatible land uses, health risk, and environmental justice.
- I68-14 Refer to response to comment I29-15 regarding economic effects and climate changes effects.

- I68-15 Refer to response to comment I29-16 for discussion of 2040 General Plan Policy CTM-C.
- I68-16 Refer to response to comment I29-17 regarding California Environmental Quality Act requirements for the analysis of GHG effects.
- I68-17 Refer to response to comment I29-18 regarding renewable energy and microgrids.
- I68-18 Refer to response to comment I29-19 regarding regulations and policies related to solid waste and recycling.
- I68-19 Refer to response to comment I29-20 regarding comments submitted by Bruce Smith. Also, see responses to Letter I20 from Bruce Smith.
- I68-20 Refer to response to comment I29-21 regarding use of a statement of overriding considerations and evaluation of vehicle miles traveled.
- I68-21 See response to comment I29-22 regarding concerns about environmental impacts associated with modifications to State Route 118 proposed in the 2040 General Plan.
- I68-22 Refer to response to comment I29-23 regarding vehicle miles traveled benchmarks.
- I68-23 Refer to response to comment I29-24 regarding suggested topics to be considered in the 2040 General Plan.
- I68-24 Refer to response to comment I29-24 regarding suggested revisions to proposed 2040 General Plan policies.
- I68-25 Refer to response to comment I29-26 regarding proposed renewable energy policies in the 2040 General Plan.
- I68-26 Refer to response to comment I29-27 regarding suggested topics to be considered in the 2040 General Plan.
- I68-27 Refer to response to comment I29-28 regarding the commentary on the County's policies and procedures relative to the oil and gas industry.
- I68-28 Refer to response to comment I29-29 regarding suggested topics to be considered in the 2040 General Plan.
- I68-29 Refer to response to comment I29-30 regarding suggested topics to be considered in the 2040 General Plan.
- I68-30 Refer to response to comment I29-31 regarding water resources.
- I68-31 Refer to response to comment I29-32 regarding suggested topics to be considered in the 2040 General Plan.
- I68-32 The comment emphasizes the need for an adequate plan that sufficiently reduces GHG emissions. This comment is conclusory in nature and does not raise a significant environmental issue for which a response is required.

Ventura County Board of Supervisors
Attn: RMA Planning Division
General Plan Update
800 Victoria Avenue L#1740
Ventura, California 93009-1740

Dear Board of Supervisors and Staff:

We are writing this letter to urge the Board of Supervisors to reconsider moving forward with the Draft General Plan EIR. The draft EIR has been accelerated to the point that too many issues and impacts have not been properly addressed or studied. These impacts and the corresponding mitigation measures will have severe impacts to land owners and especially those, like us in the agricultural industry and other productive economic segments.

I69-1

Our family has been involved in the agricultural industry for more than 100 years in Ventura County. We have owned numerous land holdings that remain in the family to this date. We have farmed throughout Ventura County and hope to continue to do so in the future.

The Draft EIR is deficient on many levels. CEQA requires that all mitigation measures must be technically and economically feasible. Numerous proposed mitigation measures are neither. We have in the past attempted to identify land and any owners that would be open to sell their development rights for land that was converting from agricultural to commercial use. Not only did we not find anyone that would do so, no one would even quote a price. The only positive response from numerous land owners were that you can buy my property for full market value and then you can do what you want. There is not a project that can be built by adding double land cost to the equation. This was very recently experienced based on proposed policies at LAFCo. These policies were eventually not enacted due to the inability to purchase development rights in an economical feasible manner. This was when LAFCo was contemplating an acre for acre ag preserve. The new policy that is proposed in the 2040 General Plan is requiring 2 acres for every 1 acre of land converted from ag to any other use. This will eliminate the ability to add any new required ag buildings or even farm worker housing. The Draft EIR must study these impacts, since they are not feasible.

I69-2

The Draft EIR also deals with water in a manner that is not properly studied. There is no analysis on increased water costs and diminishing availability of water. Without reasonable water costs and supply, there is no agricultural industry.

I69-3

The General Plan indicates that agriculture is a high priority in the County. However, new policies and requirements in the General Plan add additional mitigation measures that will make ag virtually

I69-4

impossible. These include new setbacks, limiting types of fumigants pesticides and fertilizers. The General Plan also requires the conversion of all farm equipment to be all electric. Again, not feasible. The costs to purchase new pumps, farm equipment and other existing fuel using equipment will increase operational costs to a point that the County crops will not be competitive in the open market. These new mitigation measures are not sufficiently studied and again are not economically feasible.

I69-4
cont.

The Draft EIR is extremely difficult to read and understand. The background reports are lacking in depth of what has been studied other than numerous general statements and very poor mapping. Detailed studies must be added to sufficiently identify impacts and the related mitigation measures for both direct and indirect impacts on the agricultural industry. It is our understanding that reports and studies need to be timely prepared. However numerous studies are older than 5 years. Not timely.

I69-5

After numerous devastating wildfires over the last few years, which significantly impacted ag, the General Plan continues to lay out limiting mitigation measures for fire prevention. The Wildlife corridor eliminates any ag operation or fire prevention in the proposed corridor areas. This is also a major concern not studied in the Draft EIR.

I69-6

The Draft EIR for the 2040 General plan does not provide adequate analysis for the expansion of permanent bike paths and pedestrian walking trails throughout the County. These impacts are very severe due to constant conflicts from trail users and ag operations. Spraying, dust, odors from ag operations, along with impacts created by the trail users. These are usually theft, vandalism, litter and pet waste. The proposed mitigation measures require additional setbacks from these trails which renders additional land unusable for ag operations.

I69-7

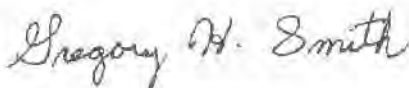

In addition to the above comments on the agricultural aspects and related land use concerns of the DEIR, the undersigned is also a mineral owner directly interested in the impacts on oil and gas production of the DEIR and related General Plan 2040 proposed provisions. In these documents there is a total failure to address the economic impacts of the various policies proposed in violation of the requirements for this process, including but not limited to the loss of royalty income to a large group of County residents. I join in the detailed comments on the various deficiencies and concerns identified in the DEIR as described in the concurrent submissions on behalf of Aera Energy and other operators delivered this week to the County.

I69-8

Please look at the long-term consequences of these General Plan policies and mitigation measures. We formally request additional studies and a revised Draft EIR that will properly look at these and many more issues. The DEIR must be corrected with details of the revisions. Then it can be recirculated.

I69-9

Sincerely,

P.O. Box 25010
Ventura, CA 93002

Ventura County Board of Supervisors:
Susan.Curtis@ventura.org

Re: 2040 General Plan Draft EIR Comment

I have some concerns about the 2040 General Plan Report (EIR) that has recently been released. With 700+ policies and implementation programs how can you say you have finished this plan in 6 weeks? 12-18 + months is, what I am understanding, what it takes to adequately complete all the analysis and their impacts.

As an 85 year old farmer, in this county since 1957, it appears that more and more you are not looking what is best for individuals nor long/short term solutions to many issues.

I70-1

As with a recent issue, a few people stood up talking about “their rights” and to heck with other’s rights. Maybe the initial decision, to approve the crop, was made in haste. As well as extending the ban to plant the crop to 10 ½ months. Why not go for another 45 days? You have just taken income from those that farm and taken the side of those who “yell” the loudest.

Wildfire Corridor is another issue – restrictions on brush removal leads to increased fuel load and increased wildfire risk. Did your decisions make things better or worse?

I70-2

Why would you require small development projects to purchase farmland to preserve in perpetuity? Where are small pieces of farmland available and who will manage these small ag preservation parcels. Again, as I see it, take away from those in agriculture to give to others who have not put in any dollars, sweat or tears in the land. Again, increasing regulatory demands on agriculture.

I70-3

How current was the background information that was used to understand and evaluate the County’s impact analysis. My understanding is that it was older than 2015.

I70-4

What does the analysis show on these indirect impacts that affect landowners? Such as: theft and vandalism, complaints by those who know nothing about agriculture, water competition, speeding cars in rural areas without regard for farm machinery, etc.

I70-5

There are many other areas that I feel were not considered and most certainly will continue to increase farming operational costs such as: converting ag equipment to electric, requiring all electric water pumps, water supply increases.

Sincerely,
H Elaine Cavaletto

cc: chris@rinconstrategies.com and llampara@colabvc.org

|-----------------------|------------------------------------------------|
| Letter I70 | H Elaine Cavaletto February 27, 2020 |
|-----------------------|------------------------------------------------|

- I70-1 The commenting individual's concerns regarding the EIR are noted. This comment is introductory in nature and does not raise a significant environmental issue for which a response is required.
- I70-2 The comment states that "wildlife corridor" is an issue and that restrictions on brush removal leads to increased fuel load and increased wildfire risk. The commenter's reference to restrictions on brush removal within wildfire corridors is unclear. This term is not used in the draft 2040 General Plan. Refer to response to comment I4-6 regarding the County's Habitat Connectivity and Wildlife Corridor ordinances, which are separate from the 2040 General Plan, and the draft EIR's analysis of wildfire impacts.
- I70-3 The commenter's references to purchasing farmland for agricultural preservation is unclear and increased regulatory demand are unclear. It is inferred that the commenter may be referring to Mitigation Measure AG-2. Refer to Master Response MR-5 for further discussion of the feasibility and applicability of Mitigation Measure AG-2.
- I70-4 Refer to Master Response MR-6 for discussion of how the County appropriately uses the Background Report to describe the existing environmental setting in the draft EIR.
- I70-5 The commenter expresses concerns such as theft, vandalism, and speeding cars as potential indirect impacts to landowners. State CEQA Guidelines, Section 15126.2(a) explains that "[a]n EIR shall identify and focus on the significant effects of the proposed project on the environment." Therefore, only the environmental impacts caused by adoption of the 2040 General Plan need to be addressed in the EIR. The draft EIR is not required to analyze the impacts of the project to landowners, only the environment. In addition, the 2040 General Plan requires that the County provide adequate law enforcement and emergency services to county residents (Policy PFS-11.1), and future development, in particular on the edges or outside of existing developed areas, to maintain adequate service ratios and other performance standards. See response to comment I2-5 for additional discussion.
- The comment expresses concern for indirect and direct impacts related to competition for water supplies for agriculture. Refer to response to comment A13-11 regarding water supplies.
- It is assumed that the commenter is referencing Policy AG-5.2 and AG-5.3 when referring to the conversion of "ag equipment to electric" and "requiring all water pumps." Refer to response to comment A13-10 regarding 2040 General Plan Policies AG-5.2 and AG-5.3.
- The commenter's reference to water supply increases are vague and no response can be provided.

Subject: Comments on new Draft Environmental Impact Report

Letter
I71

CAUTION: If this email looks suspicious, DO NOT click. Forward to
Spam.Manager@ventura.org

Ventura County must protect our quality of life with bold action on climate in its General Plan Update. This document sets the policies that drive all land-use decisions for the next 20 years, but the current draft is completely inadequate in addressing the climate crisis.

A recent report in the Washington Post confirmed that we are the fastest-warming county in the continental U.S.

We have seen the catastrophic effect of a warming world in the fierce winds that whipped the Thomas and Woolsey fires out of control and we will not forget the suffering it caused our families and neighbors.

Climate change is caused by fossil fuel production and consumption. We must do our part to reduce oil production through thoughtful, rigorous policy to phase it out.

Your written comments will let the Board of Supervisors know your concerns...if you don't write, they won't know.

Buffer Requirements – The proposed buffers for locating oil and gas facilities a safe distance from schools and homes are inadequate. Studies show adverse health impacts from oil and gas facilities at distances of at least half a mile.

Action Needed: Buffers should be increased from the currently proposed 1,500 feet to 2,500 feet.

Trucking vs. Pipeline – Currently, oil and produced water from local oil wells are mostly transported by truck. Trucking creates safety hazards on county roads, exposes residents to toxic diesel pollution, and causes substantial amounts of greenhouse gas emissions. Draft General Plan Policy COS-7.7 attempts to address this problem by requiring newly permitted oil wells to use pipelines instead of trucks to transport oil and produced water. However, the DEIR attempts to undermine Policy COS-7.7, concluding that the added costs of constructing pipeline connections make this policy infeasible and may lead to a loss of petroleum resources. The DEIR proposes to allow trucking if pipelines are deemed infeasible. This would create a loophole allowing oil companies to simply claim that the cost of a pipeline connection is too high.

Action Needed: Maintain Policy COS-7.7 as recommended by the Board of Supervisors, so that all newly permitted discretionary oil wells are required to convey oil and produced water via pipelines instead of trucking.

I71-1
I71-2
I71-3

Flaring – Draft General Plan Policy COS-7.8 requires gases from all new discretionary oil and gas wells to be collected and used, or removed for sale or proper disposal, instead of being flared or vented to the atmosphere. The policy would allow flaring only in cases of emergency or for testing purposes. This is important because venting and flaring release both toxic gases and powerful climate pollutants like methane to the atmosphere.

The DEIR tries to undermine this policy, too. It concludes that the added costs of treating the gas on site or constructing pipeline connections would make this requirement infeasible and may lead to a loss of petroleum resources. The DEIR instead would allow flaring if conveyance by pipeline is deemed infeasible, creating another loophole that could allow oil producers to simply claim that the cost is too high and continue with business as usual.

Action Needed: Maintain Policy COS-7.8 as recommended by the Board of Supervisors, so that all newly permitted discretionary oil wells are required to collect gases and use or remove them for sale or proper disposal instead of flaring or venting. Flaring should be allowed only in cases of emergency or for testing purposes.

I71-4

Climate Action Plan – The draft General Plan and the DEIR conclude that the county’s greenhouse gas emissions would have significant impacts. However, the Climate Action Plan proposed as part of the General Plan is inadequate and will not reduce emissions in a meaningful way. Most proposed Climate Action Plan policies are vague and aspirational, relying on noncommittal assurances that the county will “encourage” and “support” change rather than clearly require measurable reductions in climate pollution.

Climate Action Plan policies must result in measurable, enforceable reductions sufficient to meet California’s climate goals. This is important because the General Plan and related Climate Action Plan can be used to streamline approval of future development projects. The county may not carefully analyze the climate consequences of future projects — including discretionary oil and gas development — if those projects claim they’re consistent with the Climate Action Plan. If the Climate Action Plan consists mostly of vague, voluntary, or otherwise unenforceable policies, future projects could easily be found consistent and could evade proper environmental review.

Action Needed: Revise the Climate Action Plan and corresponding policies in the General Plan to achieve measurable, enforceable reductions in greenhouse gas emissions.

I71-5

Greenhouse Gas “Super-Emitters” – A recent NASA study documents that several Ventura County facilities, including oil and gas operations, are “super-emitters” of powerful climate pollutants. Stationary source emissions, including those from oil and gas operations, make up approximately 26 percent of all emissions in California. The General Plan must include strong policies to detect and curb emissions from these “super-emitters.”

Action Needed: The county should adopt the strongest possible measures to ensure that greenhouse gas emissions are curbed to protect air quality and to ensure a safe, sustainable future for all county residents.

Sincerely,

Harmony Eckberg

I71-6

| | |
|-----------------------|---------------------------------------------|
| Letter I71 | Harmony Echberg February 22, 2020 |
|-----------------------|---------------------------------------------|

- I71-1 The commenter’s concerns regarding climate change in Ventura County are noted. This comment is introductory in nature and does not raise a significant environmental issue for which a response is required.
- I71-2 Refer to Master Response MR-4, Section MR-4.H Buffers (Setback) regarding the findings and conclusions related to buffers (setbacks) in oil and gas operations.
- I71-3 Refer to Master Response MR-4, Section MR-4.G, “Pipeline Requirements,” regarding the findings and conclusions related to pipelines in oil and gas operations.
- I71-4 Refer to Master Response MR-4, Section MR-4.F, “Flaring,” regarding the findings and conclusions related to flaring in oil and gas operations.
- I71-5 The comment asserts that the greenhouse gas policies of the 2040 General Plan are not actionable. Refer to Master Response MR-1 for discussion of the draft EIR’s detailed quantitative and qualitative analysis of the 118 policies and 45 implementation programs included in the 2040 General Plan to reduce greenhouse gas (GHG) emissions in the county and the seven feasible mitigation measures included in the draft EIR to address the potentially significant GHG impacts of the 2040 General Plan and achieve additional GHG emissions reductions. Regarding streamlining approval of future development projects consistent with the 2040 General Plan, the draft EIR includes Mitigation Measure GHG-3, which would remove the CEQA streamlining provision proposed in Program COS-EE from the 2040 General Plan, and specify that the potential GHG emissions impacts of future, discretionary projects be reviewed in accordance with the most recent adopted version of the ISAGs at the time of project-level environmental review. For a full discussion of the potential for the 2040 General Plan to result in GHG emissions that contribute to climate change, refer to Section 4.8, “Greenhouse Gas Emissions,” in the draft EIR.
- I71-6 The comment recommends that the County adopt the strongest measures to ensure GHG emissions are curbed, particularly from oil and gas operations that are “super-emitters.” Refer to Master Response MR-1 regarding oil and gas operations and how these activities are addressed in the GHG inventory prepared for the 2040 General Plan and draft EIR.

February 27, 2020

Attn: RMA Planning Division
General Plan Update
800 Victoria Ave., L #1740
Ventura, CA 93009-1740
Susan.Curtis@ventura.org

Dear Planning Division:

In reviewing the 2040 General Plan Environmental Impact Report (EIR), I have some grave concerns that were not addressed and will affect many people in this county. I have listed some below for your review and response:

I72-1
I72-2
I72-3
I72-4
I72-5
I72-6

1. Wildfire risk – EIR states that "managing fuel through activities such as vegetation removal and controlled burns, the County and other agencies would be directly reducing the chance of wildfire as well as fuels that would feed wildfires. This statement does not take into regard that it is in *direct opposite* of County Policies COS-3.2, COS-1.15, Implementation Program COS-H, Implementation Program COS-C and the recent restrictions on brush removal in the Wildlife Corridor. All of these Policies and restrictions will increase wildfire risk and in order to comply with the EIR, must be removed or re-written.
2. CEQA requires that indirect impacts be analyzed: Specifically, the impact on agriculture from the buildout planned in the 2040 General Plan. As the population grows, there will be more interactions with farm land. Presently, in most cases, this leads to more costs for the farmer and can cause a negative effect on this industry in this county.
3. The EIR states that the policies in the 2040 General Plan will decrease water supply for irrigation, but the County has not evaluated this impact. Reducing water supply for irrigation, or even increasing cost to obtain water, will remove ag lands from production which will affect the County significantly.
4. The EIR also does not address the impact of the General Plan that will require ag to use all electric equipment and pumps. This is very expensive and will impact this industry considerably.
5. The General Plan does not seem to take into effect that agriculture is a major industry in the County and will affect the County's revenues if it does not analyze the negative effects that these new policies will have on this industry.

Respectfully submitted,

Heather Gilchrist-Wise

| | |
|-----------------------|----------------------------------------------------|
| Letter I72 | Heather Gilchrist-Wise February 27, 2020 |
|-----------------------|----------------------------------------------------|

- I72-1 The commenting individual’s concerns regarding the draft EIR are noted. This comment is introductory in nature and does not raise a significant environmental issue for which a response is required. Refer to responses to comments I72-1 through I72-6, below, for responses to the commenter’s specific concerns.

- I72-2 The comment states that the 2040 General Plan policies would increase wildfire risk and should, therefore, be removed or rewritten. See response to comment O32-30 for a discussion of the potential for 2040 General Plan policies and programs that encourage tree planting and preservation for a discussion of the potential to increase wildland fire hazard. Note that the County’s Habitat Connectivity and Wildlife Corridor ordinances, which were adopted in March of 2019 to provide protections for areas designated as important wildlife corridors within the non-coastal unincorporated area, are separate from the 2040 General Plan currently under review.

- I72-3 The comment states that the California Environmental Quality Act requires indirect impacts to be analyzed and provides an example of indirect agricultural impacts that the comment asserts were not analyzed in the draft EIR. Refer to response to comment I2-5 regarding the analysis of indirect impacts on agriculture resulting from buildout of the 2040 General Plan. Note that the County’s Habitat Connectivity and Wildlife Corridor ordinances, which were adopted in March of 2019 to provide protections for areas designated as important wildlife corridors within the non-coastal unincorporated area, are separate from the 2040 General Plan currently under review.

- I72-4 Refer to response to comment I4-3 regarding water availability and cost.

- I72-5 It is assumed that the commenter is referencing Policy AG-5.2 and AG-5.3. Refer to response to comment A13-9 regarding impacts related to urban-agriculture interface.

- I72-6 This comment expresses concerns about the 2040 General Plan and is not related to the adequacy of the draft EIR. Therefore, no response is required. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.

Ventura County Board of Supervisors
Attn: RMA Planning Division
General Plan Update
800 Victoria Avenue L#1740
Ventura, California 93009-1740

Dear Board of Supervisors and Staff:

We are writing this letter to urge the Board of Supervisors to reconsider moving forward with the Draft General Plan EIR. The draft EIR has been accelerated to the point that too many issues and impacts have not been properly addressed or studied. These impacts and the corresponding mitigation measures will have severe impacts to land owners and especially those, like us in the agricultural industry and other productive economic segments.

I73-1

Our family has been involved in the agricultural industry for more than 100 years in Ventura County. We have owned numerous land holdings that remain in the family to this date. We have farmed throughout Ventura County and hope to continue to do so in the future.

The Draft EIR is deficient on many levels. CEQA requires that all mitigation measures must be technically and economically feasible. Numerous proposed mitigation measures are neither. We have in the past attempted to identify land and any owners that would be open to sell their development rights for land that was converting from agricultural to commercial use. Not only did we not find anyone that would do so, no one would even quote a price. The only positive response from numerous land owners were that you can buy my property for full market value and then you can do what you want. There is not a project that can be built by adding double land cost to the equation. This was very recently experienced based on proposed policies at LAFCo. These policies were eventually not enacted due to the inability to purchase development rights in an economical feasible manner. This was when LAFCo was contemplating an acre for acre ag preserve. The new policy that is proposed in the 2040 General Plan is requiring 2 acres for every 1 acre of land converted from ag to any other use. This will eliminate the ability to add any new required ag buildings or even farm worker housing. The Draft EIR must study these impacts, since they are not feasible.

I73-2

The Draft EIR also deals with water in a manner that is not properly studied. There is no analysis on increased water costs and diminishing availability of water. Without reasonable water costs and supply, there is no agricultural industry.

I73-3

The General Plan indicates that agriculture is a high priority in the County. However, new policies and requirements in the General Plan add additional mitigation measures that will make ag virtually impossible. These include new setbacks, limiting types of fumigants pesticides and fertilizers. The General Plan also requires the conversion of all farm equipment to be all electric. Again, not feasible. The costs to purchase new pumps, farm equipment and other existing fuel using equipment will increase operational costs to a point that the County crops will not be competitive in the open market. These new mitigation measures are not sufficiently studied and again are not economically feasible.

I73-4

The Draft EIR is extremely difficult to read and understand. The background reports are lacking in depth of what has been studied other than numerous general statements and very poor mapping. Detailed studies must be added to sufficiently identify impacts and the related mitigation measures for both direct and indirect impacts on the agricultural industry. It is our understanding that reports and studies need to be timely prepared. However numerous studies are older than 5 years. Not timely.

I73-5

After numerous devastating wildfires over the last few years, which significantly impacted ag, the General Plan continues to lay out limiting mitigation measures for fire prevention. The Wildlife corridor eliminates any ag operation or fire prevention in the proposed corridor areas. This is also a major concern not studied in the Draft EIR.

I73-6

The Draft EIR for the 2040 General plan does not provide adequate analysis for the expansion of permanent bike paths and pedestrian walking trails throughout the County. These impacts are very severe due to constant conflicts from trail users and ag operations. Spraying, dust, odors from ag operations, along with impacts created by the trail users. These are usually theft, vandalism, litter and pet waste. The proposed mitigation measures require additional setbacks from these trails which renders additional land unusable for ag operations.

I73-7

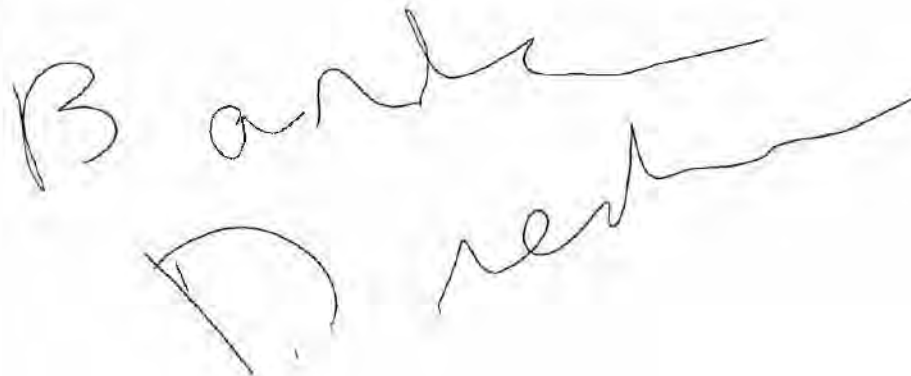

In addition to the above comments on the agricultural aspects and related land use concerns of the DEIR, the undersigned is also a mineral owner directly interested in the impacts on oil and gas production of the DEIR and related General Plan 2040 proposed provisions. In these documents there is a total failure to address the economic impacts of the various policies proposed in violation of the requirements for this process, including but not limited to the loss of royalty income to a large group of County residents. I join in the detailed comments on the various deficiencies and concerns identified in the DEIR as described in the concurrent submissions on behalf of Aera Energy and other operators delivered this week to the County.

I73-8

Please look at the long-term consequences of these General Plan policies and mitigation measures. We formally request additional studies and a revised Draft EIR that will properly look at these and many more issues. The DEIR must be corrected with details of the revisions. Then it can be recirculated.

I73-9

Sincerely,

Ventura County Resource Management Agency, Planning Division
ATTN Susan Curtis, Manager, General Plan Update Section
800 South Victoria Avenue, L #1740
Ventura, California 93009-1740

Regarding a Climate Action Plan for the draft 2040 General Plan Update

To Ms. Curtis and the General Planning Committee,

I am extremely alarmed by the lack of foresight the current draft of the 2040 General Plan update. Climate change is coming to Ventura. Specifically, our county has warmed more than any in the lower-48 states with an average increase of 2.6°C as of December 2019.* Maybe you are unaware of the science. If we do not drastically alter our course we can expect to witness the following effects by 2100:

- A conservative estimate of 1.8-3.6 feet and possibly up to 10 feet of sea level rise
- Larger, more frequent wildfires
- Water and food shortages from drought and crop failure
- Ocean acidification and increased oxygen-free 'dead zones' which will threaten the existence of all marine life as we know it
- Mass extinction of life on Earth, collapse of ecosystems.
- Increased disease
- Failure of economic markets
- Mass migration of "climate refugees"

I74-1

Get on the right side of history and prove in this General Plan that you value our children more than oil money. Now is the time to act. Those who came before us were not aware of the problem, and those who come after us will be unable to do anything about it. **Now is the only time.** Though there is reference to a Climate Action Plan in the General Plan, it has no teeth. It has no deadlines, it has no actionable goals, and it sits next to policies like this one:

"Through Policy COS-6.2, the County would maintain maps of mineral deposits identified by the State Geologist as having regional or statewide significance and any additional deposits as may be identified by the County . . . the purpose of this overlay zone is to safeguard future access to the resources, facilitate the long-term supply of mineral resources in the county, and notify landowners and the public of the presence of the resources."

[https://vcrma.org/vc2040.org/images/Draft_EIR - Jan. 2020/VCGPU-EIR_4.12_Minerals_Petroleum.pdf](https://vcrma.org/vc2040.org/images/Draft_EIR_-_Jan._2020/VCGPU-EIR_4.12_Minerals_Petroleum.pdf)

We really can't compromise here. This is about survival. Scientific fact: if we (humans) completely halt all new drilling for oil and just suck dry the reserves we're already tapped into, and burn just that, we will be sent over the threshold for catastrophic, feedback loop global warming. It will mean the end of civilization as we know it. This is not worth any amount of money. We must not permit any new extraction, and we must have a plan to draw down the extraction that is already occurring within Ventura County.

I am not writing this because I am an environmentalist, I am writing this because I demand that you protect the future of my children.

I74-1
cont.I

Respectfully,

James Brehm
553 North Ventura Ave, Apt E
Ventura, CA 93001
631-875-0514

*If you'd like any references for any of the facts in this letter, I will gladly supply upon request.

**Also, please let me know if there's anything else I can do to help make these changes happen besides sending this message. I am willing to put as much energy as necessary into this if it would help.

| Letter I74 | James Brehm February 26, 2020 |
|-----------------------|-----------------------------------------|

I74-1 This comment expresses concerns about the 2040 General Plan, specifically with how it addresses climate change. This comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.

The comment asserts that the policies of the 2040 General Plan are not actionable. Refer to Master Response MR-1 for discussion of the draft EIR’s detailed quantitative and qualitative analysis of the 118 policies and 45 implementation programs included in the 2040 General Plan to reduce greenhouse gas (GHG) emissions in the county and the seven feasible mitigation measures included in the draft EIR to address the potentially significant GHG impacts of the 2040 General Plan and achieve additional GHG emissions reductions.. For a full discussion of the potential for the 2040 General Plan to result in GHG emissions that contribute to climate change, refer to Section 4.8, “Greenhouse Gas Emissions,” in the draft EIR.

February 27, 2020

Dear Susan Curtis,

Our comments are about the Draft Environmental Impact Analysis of the Agriculture Element of the VC2040 General Plan. We have serious concerns about other chapters, especially Water Resources, but time does not permit us to develop comments.

Before commenting on the topics of food security, resilience, carbon sequestration, regenerative agriculture, inorganic nitrogen based fertilizer, compost, cover crops and low-and no-till, agricultural land conservation and preservation, and Integrated Pest Management, we preface by saying that everything in the General Plan must be seen through the lens of the global climate and ecological crisis and the need for leadership so that the people of Ventura County are confident that the community response meets some minimum standard of social and environmental justice. Climate change necessitates an examination of personal values and a shift of mindset about agriculture policy at the local level.

The VC2040 Environmental Impact Report reflects a great deal of this needed shift, but we see omissions in the coverage of existing conditions in the Background Report and in the scope and/or targeting of the goals, policy and programs. There are five programs added to the EIR that are not in the Draft Plan, so we refer to the EIR except where we have comments about the Goal statements in the Plan. The recommendation we hope you take most seriously is to create a separate Goal for Integrated Pest Management.

Planning that matches the climate crisis is vital. This is not clear enough in the Background Report. The most recent report of the Intergovernmental Panel on Climate Change (IPCC) states that the climate problem points first to what we do on the land. The USDA Economic Research Service reported on the impacts on prices of food, fiber and energy, and agricultural incomes, as well as the environment. “How farmers respond, or adapt—possibly mediated by policy and technology changes—will ultimately determine the impact of these altered growing conditions on production, natural resources, and food security” Report No ERR-266 “Climate Change and Agricultural Risk Management Into the 21st Century” projects an increase in the cost of the Federal Crop Insurance Program due to greater insured value and yield variability resulting from climate change.

I75-1

FOOD SECURITY

Lack of secure food system nationally affects local already extreme insecurity. The Union of Concerned Scientists reported in March 2019 that the already highly degraded industrial model of US agriculture—“a model that neglects soil, reduces diversity, and relies too heavily on fertilizers and pesticides”—makes US farms even more vulnerable to the impacts of climate change. Ventura County depends on the rest of the nation and other countries for 85% of its food supply. Our reliance on international markets and international trade leaves our local economy vulnerable to disruptions such as we must anticipate with the Covid-19 coronavirus.

We need to accelerate localizing our food supply as the focus for food security. It would help to delete the false narrative in Goal 8.4 that local farmers are feeding the local people. If there is no food coming or going, farms are not going to be a resource, which is ridiculous in a county that can grow such a diversity of crops throughout the year.

Goal AG-4.1 needs to include all agricultural products, not just fresh produce, and real incentives and marketing campaigns will be necessary including benchmarks for increased purchase of local products by institutions. Program B to encourage sales and Program C to identify opportunities to provide local food to county agencies are good, but they will need to be stronger. A more aggressive set of programs will be necessary to promote markets for local agricultural products to achieve the food security goal.

It is unacceptable to only “identify opportunities...to the extent feasible” to increase county procurement of local products. Feasibility is a matter of where the County decides to invest. Food security is such a priority goal that the county must invest increasingly year by year in local farmers to stimulate a market signal toward localizing our food supply.

Program F in the EIR is excellent to study and remove barriers to farm stands. The program must specifically aim to help Ventura County farmers sell their products in the county and be able to compete with farm stand operators selling products from the San Joaquin Valley, Mexico and elsewhere. Program G to study the “Farm to Front Door” business model ignores many other possible business models to connect producers and consumers and should be rewritten to be more general.

RESILIENCE

Resilience starts with farmers being informed about the climate modeling and adopting practices that increase biodiversity and enrich soil to hold carbon and water. Ventura County hired scientists to run climate models that show the changes in patterns of rainfall, drought, and extreme weather events and how that is connected to wildfires. The modeling is not found with enough detail in the VC2040 Background Report to help farmers and their advisers and representatives understand what’s ahead and why a shift in mindset about goals and effective policies and programs are needed that mitigate the climate impacts.

I75-2

The Agricultural Resilience goal has one policy AG-6. 2. The plan implies that resilience can be achieved only by crop selection. Neither the goal nor the policy covers the necessity to build soil and water-holding capacity and penetration, increase biodiversity and improve the watershed to hold storm water onsite. Program O in the EIR (Program N in the Draft Policy) refers to reduced tillage but the entire policy and program should be rewritten to assure development of the full scope of important resilience strategies.

INCREASING SOIL CARBON

Carbon sequestration is a moral imperative as well as the centerpiece of resilience. The draft policy to encourage and support carbon farming is not explicit enough about the contribution farmers can make by focused effort to increase soil carbon for climate mitigation.

The California Air Resources Board is working with agencies at local levels to develop measures as outlined in Scoping Plan update and governor's Executive Order B-30-15 to reduce GHG emissions toward net carbon sequestration by California's agricultural sector. The governor's 2030 targets for GHG emission reductions focus on the role played by farmland and soil in the carbon cycle. Research is being done regarding how much GHG is being emitted and how much can be sequestered by California's agricultural lands. The words "when feasible" should be deleted from Policy AG-5. 5 and Program L and replaced by a policy and program to develop meaningful incentives.

A serious flaw in the state Healthy Soils Program is the refusal to allow applications by farmers that have previously done practices on their farm to increase soil carbon. Farmers learn most from other farmers. Our early adopters should be supported to continue to do on-farm experimentation with multi-pronged and innovative practices that to increase their soil carbon and other benefits. The County should create a program complementary to the state program to support exemplary farmers to expand local experiences with carbon sequestration even though they are disqualified (because they are innovators) from the state Greenhouse Gas Reduction Fund programs.

I75-2
cont.

REGENERATIVE AGRICULTURE

Regenerative practices are essential for farmland preservation as well as resilience and food security, whether or not you use that term. The Planning Commission and the Board approved the addition of the word regenerative to the AG-5 goal 'Sustainable Farming and Ranching'. The term does not appear in the draft. Goals inherent in the word regenerative are not covered in the draft policy or programs—**to increase biodiversity and enrich soils to hold more carbon**. Increasing soil carbon and above-ground biomass may be implied by use of the term 'Carbon Farming' but these outcomes should be explicit.

In contrast with regenerative practices, what people understand about sustainable practices does not necessarily include increasing soil carbon and above-ground biomass. The USDA definition of sustainable agriculture: "Make the most efficient use of nonrenewable resources and on-farm resources and integrate, where appropriate, natural biological cycles and controls. Sustain the economic viability of farm operations. Enhance the quality of life for farmers and society as a whole." Organic farming used to require soil as the growing medium, but not any longer. Using the term "truly sustainable" as in the draft goal still does not assure the features of regenerative agriculture encompassing a robust response to climate change

by mitigating greenhouse gas emissions. Prohibiting the use of the word regenerative results in a loss of meaningful guidance for facing today's challenges. It can be made up for in Goal 5 by at least assuring in the policies and programs its key features of increasing biodiversity, enriching soils in ways that progressively increase soil carbon, increasing above-ground biomass, and improving watersheds.

Biodiversity here refers to everything from soil microbes to plant roots in the soil to above-ground cropping to include 1 to 5% planted for beneficial insect habitat, to include as many native plants as possible. Other practices to increase biodiversity are crop rotation, perennial mowed cover crop in orchards, agroforestry, silvopasture, and interplanting multiple species or varieties of crops. Not only does biodiversity enhance biological function, especially that of carbon sequestration and nutrient cycling, and improve resistance to all risks from diseases to floods, it also improves economic stability by spreading economic risk and buffering against pest invasions and extreme weather events.

I75-2
cont.

INORGANIC NITROGEN BASED FERTILIZERS

Inorganic nitrogen contributes to greenhouse gas emissions and is often unnecessary when regenerative practices are used. The energy used to manufacture and transport artificial N and phosphate fertilizers are major contributors to climate change. Research in pasture and cover crops show fertility is achievable with no nitrogen inputs, artificial or biological. The greater the biodiversity the greater the carbon sequestration, nitrogen fixation, and other nutrient cycling. There is misinformation being shared by trusted experts about the potential to increase soil carbon on Ventura County farms. Research shows that all nutrients, including phosphorus, calcium, and sulfur, as well as nitrogen, are available in soils and can be mobilized by growing the microbial diversity via the "liquid carbon pathway" fed by photosynthesis by a diversity of growing plants. Research and demonstration of this kind should be carried out, particularly in our orchards, vineyards, and other perennial crops.

It is unacceptable as proposed in Policy AG-5.1 to simply "encourage reduced fertilizer use and use of compost and enhanced efficiency fertilizers." This policy disregards the most cost-effective Best Management Practices to reduce inorganic nitrogen fertilizer use by cover cropping and crop rotation. The climate mitigation potential as well as the feasibility and the co-benefits associated with avoiding inorganic nitrogen suggest that AG-5.1 should be changed from 'shall encourage' to 'shall study, monitor and set benchmarks' for reducing use of inorganic nitrogen while encouraging the organic fertility approaches described on page 9-32 of the Background Report. Goals for reduction must show up in the GHG inventory. The inventory reflects no anticipated decrease in use of artificial nitrogen fertilizer for the next 20 years, one of many errors and omissions in the inventory.

I75-3

COVER CROPS AND LOW- AND NO-TILL

Cover cropping is a Best Management Practice for fertility that should be included in Program H in the EIR. Keeping soil covered prevents loss of soils to wind and water erosion. The benefits for food security, resilience and farmland conservation and preservation are so great that Program H should include incentives for cover cropping and crop rotation that builds soil nitrogen to avoid the need for inorganic nitrogen inputs, build soil carbon, hold water, and protect from erosion.

I75-4

A program for equipment sharing would help achieve adoption of low- and no-till farming. Farmers need the right size and adaptation of no-till seeders and transplanters for planting into cover crops, flammers and roller crimpers, flails and/or subsurface cutting equipment to be able to keep the ground covered, lay cover crops down, and enable planting and cultivation with minimum soil disturbance. The program should employ a fabricator to work with growers to modify or build the equipment needed to carry out low- and no-till farming.

COMPOST

Application of compost and compost tea or extract can kickstart increases in soil carbon. This is what is commonly promoted as 'carbon farming'. The County must maximize the availability and use of compost. The County must go beyond the incentives provided by the state Healthy Soils Program and incentivize effective use of compost teas and extracts as well as compost, because when composting is fully implemented there will not be enough compost to support Ventura County land management. There are proven benefits from inoculations with extracts and teas that have not met the state's accountability criteria for the Greenhouse Gas Reduction Fund grants.

The Background Report should include a description of the expanding expertise and experiences in the County to scale small-scale on-site composting, the application of extracts and brewing of custom blends of compost tea. The community organizing by the Center for Regenerative Agriculture in cooperation with Patagonia employees and Once Upon a Watershed is scalable. A plan for composting food waste should include studying the barriers and maximizing areawide and on-site composting for use by farmers and landscapers. We recommend fast-tracking project approvals and county investment in operations to compost food waste and municipal waste. Compost might be used as a reward for those who follow regenerative farm plans that increase soil carbon.

I75-4
cont.

AGRICULTURAL LAND PROTECTION AND PRESERVATION

Agricultural land protection and preservation depends on development of regenerative farming practices. Some "right-to-farm" issues are often moot when regenerative practices are employed. There may still be noise and odor impacts, but pesticides and dust need not be issues. Food safety issues can be managed. Practices that will best assure financially successful farms are not necessarily incompatible with urban areas or existing communities. It may be an economic advantage to develop compatibility with other land uses because, in the end, landowners have more good financial options when they care for their land using compatible regenerative practices. Otherwise, there is little chance that farmland could be dedicated to agricultural conservation easements. Farmland can only be worth conserving if the land manager increases the biodiversity, enriches the soil to hold carbon and improves the watershed. Furthermore, the most financially stable and potentially profitable farms will increasingly be connected to local markets and be patronized by a community that values their use of organic and/or regenerative practices.

As the most certain way to preserve agricultural land, the General Plan should create baselines and goals and targets for carbon sequestration that is an indicator of the value of farmland, with its co-benefits of preventing pest and disease, erosion and nutrient and water loss prevention, and increasing resilience to drought, flooding and resilience to temperature

extremes. If the “right-to-farm” implies that Prime and Important Farmland soil is laid bare, compacted and/or regularly tilled, and exposed to toxic inputs including herbicides, synthetic fertilizer causing it to be devoid of life and subject to erosion and crop failure under extreme weather conditions, then there is no land preservation policy able to save it from being abandoned or sold for development.

INTEGRATED PEST MANAGEMENT

Integrated Pest Management (IPM) policy must be the only pest management policy in the plan and it must be promoted as a system for all sectors, not just a set of practices for farmers. As the University of California definition states, IPM aims to prevent pests and diseases. This is achieved first by healthy plants ideally and then with selection of plants resistant to pests and diseases. Next, healthy plants are achieved by enhanced soil and resulting water holding capacity and fertility and cultural practices tailored to the site, the crop and the seasonal conditions, including habitat enhancement and biodiversity to support naturally occurring beneficial insects and pollinators. IPM is characterized by careful monitoring and avoiding toxic pesticides that disrupt the natural enemy complex that keeps pests below a level that creates economic damage.

IPM is often viewed as a substitution of a more toxic pesticide with a less toxic pesticide—a less disruptive silver bullet. This ignores the foremost feature of IPM which is that it is a system that aims to **prevent** pests and disease. The Agriculture Commission does not currently employ expertise in ecologically systems-based IPM in order to be able to have discussion with applicants about alternatives to pesticides. They have said that they do not see it as their role to advise applicants on alternatives. In our experience it does not appear that applicants are motivated to seriously consider alternatives to toxic pesticides. If the Ag Commission accepts without question whatever shows in the “Alternatives Considered” box on the application form and low risk alternatives are not considered, the process is of no benefit to the public.

One of the barriers to consideration of alternatives is that the most effective alternatives, such as biological control, require earlier lead times and more proactive and multi-pronged strategies than the use of pesticides. The best alternatives to pesticides require attention to soil building and crop plans that forecast insect movement in the farmscape, in other words systems thinking rather than the common replacement of an organic pesticide for higher risk pesticide.

The Background Report and the EIR omit reference to state legal requirements for the consideration of alternatives and cumulative effects before an applicant is approved to use a regulated pesticide. Pest Control Advisers who represent pesticide companies often do not understand or recommend IPM approaches to pest management. They have a conflict of interest, being paid a commission when they sell pesticides.

Pest Control Advisers who do not represent pesticide companies also are not materially incentivized to recommend many IPM practices because it usually requires more advanced agroecological knowledge and experience, and involves more frequent scouting, uncertainty, risk, and complex judgments about economic thresholds. Everything in the existing culture and incentives related to pest management advising and pesticide use applications favors the decision to use pesticides and conclude that there are no alternatives. There is no

I75-4
cont.

enforcement of the law over this decision-making process. These existing conditions highlight the need for the Agriculture Commission and the Cooperative Extension to somehow create learning opportunities about ecologically based Integrated Pest Management as a systems approach prioritizing pest and disease prevention.

Policy and programs are needed that lead the entire community of regulators, consultants, farmers and consumers along the Roadmap for Integrated Pest Management in the shift of mindset about pest management described on page 11 that flips the risks and incentives to favor the most effective alternatives that keep pests and disease below economic thresholds.

While developing protocols for guidance, discussion, and documentation of the consideration of alternatives within the definition of IPM, at the very minimum there must be a framework for analyzing cumulative effects of more than one aerial or vapor-borne pesticide and the effects from pesticides used in a non-attainment area for other air pollutants. There is at least one scientifically documented case study in the county of the failure to consider cumulative effects and other cases where studies are urgently needed as a result of the calendar spraying for Asian citrus psyllid.

The policy and programs relating IPM to the general public should also look deeper to support the shift in mindset described in the Roadmap to IPM. It is just scraping the surface “to provide information on IPM and agriculture produces and practices” as stated in Policy AG 3.3. IPM policies should be placed under a separate new goal with policies aligned with the state Roadmap for Integrated Pest Management recommendations. See at https://www.cdpr.ca.gov/docs/pestmgt/ipm_roadmap.pdf

Excerpting ideas from pages 16 and 17 of the Roadmap, for example:

- a. **Hire an IPM coordinator and revive the county’s IPM Committee** with county public participation to promoting IPM practices
- b. **Drive demand for IPM in the value chain** by coordinating efforts with key organizations to link IPM and regenerative and sustainable agriculture initiatives with retail brands and raise awareness among commodities and allied groups such as packers and shippers, retailers, and trade partners

I75-4
cont.

- c. **Participate in speeding up IPM innovation** through innovation hubs and on-farm research of ecologically based preventive strategies
- d. **Invest in trusted messengers** by collaborating with community-based organizations to facilitate field worker training on IPM and highlight ways they can be IPM leaders in the community as partners and storytellers, creating opportunities through environmental justice to address pest and pesticide issues for low-income households and neighborhoods, and expanding educational offerings in Spanish and Mixtec with culturally appropriate materials
- e. **Profit from frontline knowledge of field workers and municipal applicators** to improve early detection of pests, recommend lower risk approaches, and use safe practices in the workplace
- f. **Strengthen the public's capacity to understand** pests, pesticides and IPM by featuring IPM in training programs including STEM in schools, community colleges, 4-H, Master Gardeners, senior citizens' groups and others, teach consumers about pest prevention using IPM examples, promote positive public announcements with using IPM in core messages, and include identification of pesticide poisoning in continuing education of health professionals
- g. **Make practitioners more effective voices** for IPM by training frontline workers in agriculture, landscape and structural IPM
- h. **Leverage non-traditional resources** for IPM by working with Chumash and Mexican indigenous leaders to learn and expand the community's awareness about native wisdom that relates to IPM
- i. **Strengthen capacity of practitioners** to use more true IPM by supporting on-farm demonstrations and farmer-to-farmer field days and establishing training in non-agricultural settings e.g., restaurant and assisted-living workers, landscapers, etc.
- j. **Help redesign the retail IPM process** with programs to support retailers to educate consumers about responsible use of pesticides, limiting availability of high risk pesticides in the marketplace to trained and licensed professionals, and creating partnerships with local organizations such as Ocean Friendly Gardens to provide education and resources for consumers. An excellent example is the Our Water; Our World program.

I75-4

|-----------------------|-------------------------------------------------------------|
| Letter I75 | Jan Dietrick and Ron Whitehurst February 27, 2020 |
|-----------------------|-------------------------------------------------------------|

I75-1 The comments regarding the draft EIR analysis of the 2040 General Plan Agriculture Element and the need to include climate change in planning are noted. This comment is introductory in nature and does not raise a significant environmental issue for which a response is required.

Regarding the comment that the Background Report does not clearly convey the commenter's statement that "(p)lanning that matches the climate crisis is vital," the draft EIR references Chapter 12 of the Background Report, which provides an overview of climate change science, sources of greenhouse gas (GHG) emissions in the county, and the regulatory setting for GHG emissions (Section 12.1, starting at page 12-1) and describes the anticipated impacts of climate change in the county (Section 12.2, starting at page 12-19). Section 12.2 addresses the impacts of climate change on agriculture in the county, including from increased temperature, changes in precipitation patterns, and sea level rise. Also refer to Master Response MR-6 for discussion of how the County appropriately uses the Background Report to describe the existing environmental setting in the draft EIR, including discussion on the level of detail and scale of information.

Additionally, the comment states that five programs are added to the EIR, but are not in the draft 2040 General Plan. These five programs are not identified and no further specifics are provided in the comment. Thus, no further response can be provided.

Regarding the comment that the County should create a separate goal for Integrated Pest Management, this comment addresses the 2040 General Plan and is not related to the adequacy of the draft EIR. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.

I75-2 The comment addresses additional topics including food security, resilience strategies involving agriculture, carbon sequestration on agricultural lands, regenerative agricultural practices, and use of fertilizers that the commenter requests be addressed in the 2040 General Plan. As explained in the draft EIR, the 2040 General Plan includes eight implementation programs that would support reduced greenhouse gas (GHG) emissions from the agricultural uses in the county, including programs that reduce use of inorganic fertilizers, encourage farmers to adopt organic growing techniques, encourage the capture and storage of concentrated carbon in soils from farm waste and woody biomass; and improve soil health and reduce the need to apply inorganic fertilizers (pages 4.8-39 to 4.8-43). This comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.

- 175-3 The comment suggests that the language of Policy AG-5.1 be amended and that the GHG reduction benefits of the amended policy be represented in the GHG inventory. Contrary to the commenter’s assertion, the GHG inventory does assume reduced use of inorganic nitrogen fertilizer by 2030. Table 4.8-5 (page 4.8-39) of the draft EIR provides a numerical estimate of the anticipated GHG reductions association with Program AG-H: Nutrient Management Plans by 2030. Based on the analysis provided in Appendix D of the draft EIR, the County assumed that 25 percent of inorganic nitrogen fertilizer would be replaced by locally sourced organic waste resulting in 33,830 metric tons of carbon dioxide equivalent by 2030. The GHG inventory was conducted using the most current and available data, reasonable assumption predicated upon facts, and expert opinion supported by facts consistent with State CEQA Guidelines, Section 15384. This comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.
- 175-4 The comment requests that additional topics be addressed in the 2040 General Plan including cover cropping, crop rotation, low- and no-till farming, carbon farming, regenerative agricultural practices, and integrated pest management. Note that the 2040 General Plan includes implementation programs that encourage and facilitate carbon farming (Implementation Program AG-L) and provide subsidies for producing resilient crops (Implementation Program AG-O). Also refer to response to comment 175-2. This comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.
- Additionally, the comment states that the Background Report and EIR omit reference to state legal requirements for the consideration of alternatives and cumulative effects before an applicant is approved to use a regulated pesticide. It is not clear to what legal requirements the comment refers, and no specifics are provided in the comment. The draft EIR contains an analysis of alternatives to the project and cumulative effects of the project, as required by the California Environmental Quality Act (see Chapters 6, “Alternatives,” and 5, “Cumulative Impacts,” respectively). No further response to this comment can be provided.

February 25, 2020

Ventura County Board of Supervisors
Attn: RMA Planning Division
General Plan Update
800 Victoria Avenue L#1740
Ventura, California 93009-1740

Dear Board of Supervisors and Staff:

We are writing this letter to urge the Board of Supervisors to reconsider moving forward with the Draft General Plan EIR. The draft EIR has been accelerated to the point that too many issues and impacts have not been properly addressed or studied. These impacts and the corresponding mitigation measures will have severe impacts to land owners and especially those, like us in the agricultural industry and other productive economic segments.

I77-1

Our family has been involved in the agricultural industry for more than 100 years in Ventura County. We have owned numerous land holdings that remain in the family to this date. We have farmed throughout Ventura County and hope to continue to do so in the future.

The Draft EIR is deficient on many levels. CEQA requires that all mitigation measures must be technically and economically feasible. Numerous proposed mitigation measures are neither. We have in the past attempted to identify land and any owners that would be open to sell their development rights for land that was converting from agricultural to commercial use. Not only did we not find anyone that would do so, no one would even quote a price. The only positive response from numerous land owners were that you can buy my property for full market value and then you can do what you want. There is not a project that can be built by adding double land cost to the equation. This was very recently experienced based on proposed policies at LAFCo. These policies were eventually not enacted due to the inability to purchase development rights in an economical feasible manner. This was when LAFCo was contemplating an acre for acre ag preserve. The new policy that is proposed in the 2040 General Plan is requiring 2 acres for every 1 acre of land converted from ag to any other use. This will eliminate the ability to add any new required ag buildings or even farm worker housing. The Draft EIR must study these impacts, since they are not feasible.

I77-2

The Draft EIR also deals with water in a manner that is not properly studied. There is no analysis on increased water costs and diminishing availability of water. Without reasonable water costs and supply, there is no agricultural industry.

I77-3

The General Plan indicates that agriculture is a high priority in the County. However, new policies and requirements in the General Plan add additional mitigation measures that will make ag virtually

I77-4

impossible. These include new setbacks, limiting types of fumigants pesticides and fertilizers. The General Plan also requires the conversion of all farm equipment to be all electric. Again, not feasible. The costs to purchase new pumps, farm equipment and other existing fuel using equipment will increase operational costs to a point that the County crops will not be competitive in the open market. These new mitigation measures are not sufficiently studied and again are not economically feasible.

I77-4
cont

The Draft EIR is extremely difficult to read and understand. The background reports are lacking in depth of what has been studied other than numerous general statements and very poor mapping. Detailed studies must be added to sufficiently identify impacts and the related mitigation measures for both direct and indirect impacts on the agricultural industry. It is our understanding that reports and studies need to be timely prepared. However numerous studies are older than 5 years. Not timely.

I77-5

After numerous devastating wildfires over the last few years, which significantly impacted ag, the General Plan continues to lay out limiting mitigation measures for fire prevention. The Wildlife corridor eliminates any ag operation or fire prevention in the proposed corridor areas. This is also a major concern not studied in the Draft EIR.

I77-6

The Draft EIR for the 2040 General plan does not provide adequate analysis for the expansion of permanent bike paths and pedestrian walking trails throughout the County. These impacts are very severe due to constant conflicts from trail users and ag operations. Spraying, dust, odors from ag operations, along with impacts created by the trail users. These are usually theft, vandalism, litter and pet waste. The proposed mitigation measures require additional setbacks from these trails which renders additional land unusable for ag operations.

I77-7

In addition to the above comments on the agricultural aspects and related land use concerns of the DEIR, the undersigned is also a mineral owner directly interested in the impacts on oil and gas production of the DEIR and related General Plan 2040 proposed provisions. In these documents there is a total failure to address the economic impacts of the various policies proposed in violation of the requirements for this process, including but not limited to the loss of royalty income to a large group of County residents. I join in the detailed comments on the various deficiencies and concerns identified in the DEIR as described in the concurrent submissions on behalf of Aera Energy and other operators delivered this week to the County.

I77-8

Please look at the long-term consequences of these General Plan policies and mitigation measures. We formally request additional studies and a revised Draft EIR that will properly look at these and many more issues. The DEIR must be corrected with details of the revisions. Then it can be recirculated.

I77-9

Sincerely,

2960 Solimar Beach Drive
Ventura, CA 93001

This comment letter repeats many of the same comments provided in Letter I4. The responses below provide cross references to the portions of Letter I4 where responses to the same comments have already been provided.

- I77-1 Refer to response to comment I4-1 regarding the adequacy of the draft EIR.
- I77-2 Refer to Master Response MR-5 regarding the feasibility of Mitigation Measure AG-2.
- I77-3 Refer to response to comment I4-3 regarding water availability and cost.
- I77-4 Refer to response to comment I4-4 regarding economic feasibility of 2040 General Plan policies that could affect agricultural operations.
- I77-5 Refer to response to comment I4-5 regarding the commenter’s request for detailed studies and Master Response MR-6 for discussion of how the County appropriately uses the Background Report to describe the existing environmental setting in the draft EIR.
- I77-6 See response to comment O32-30 for a discussion of the potential for 2040 General Plan policies and programs that encourage tree planting and preservation for a discussion of the potential to increase wildland fire hazard.
- I77-7 Refer to response to comment I4-7 regarding potential incompatibilities with adjacent bicycle and pedestrian paths.
- I77-8 The commenter refers to letters submitted by Aera Energy. See responses to Letters O5 and O6.
- I77-9 Refer to response to comment I4-9 regarding adequacy of the draft EIR and Master Response MR-7, which explains in detail why recirculation of the draft EIR is not required.

Follow Up Flag: Follow up
Flag Status: Completed

Hello,

I would urge the County to include how the agency would establish a "preponderance of evidence that the resource is not archaeologically or culturally significant." How would this be done, by whom would it be done, and could any decisions be appealed?

The number of archaeological sites in Ventura County is decreasing at a rapid rate and the definition of archaeological significance should be revised, "that all Native American archaeological sites, should be considered significant since the prehistoric identity of the Indigenous groups is tied solely to archaeological evidence." Loss of any sites would irrevocably result in loss of significant portions of their culture.

|
I78-1
|

Thank you for your consideration.

| | |
|-----------------------|-----------------------------------------|
| Letter 178 | Jenn Foster February 27, 2020 |
|-----------------------|-----------------------------------------|

This comment letter repeats many of the same comments provided in Letter O30. The response below provides cross references to the portions of Letter O30 where responses to the same comments have already been provided.

I78-1 The comment inquires as to how the County would “establish a preponderance of evidence” that an archaeological or cultural resource is significant, asserts that archaeological sites in Ventura County are “decreasing at a rapid rate” and suggests a revised definition of “archaeological significance.” Refer to response to comment O30-1 for discussion of these issues.

Climate action plan

Your Comment:
we need a Climate Action Plan with measurable targets and outcomes!

The current draft General Plan won't help Ventura County meet its climate goals. The policies are not measurable or enforceable, and are not sufficient to drive the kind of change necessary to meet greenhouse gas reduction targets. The County needs to step up, and time is running out to address the climate crisis.

the draft environmental impact report.

Your Comment:

The buffers for locating oil and gas facilities a safe distance from schools and homes are inadequate. Studies show adverse health impacts from oil and gas facilities at distances of at least half a mile. Buffers should be increased from the current proposal of 1,500 feet to 2,500 feet.

None
Comment On:
Draft EIR

Your Comment:

The Climate Action Plan isn't good enough. Ventura County needs a Climate Action Plan with measurable targets and outcomes, as a separate document. Policies set in the GenPlan are not measurable or enforceable. Language used in the plan, such as policies that "encourage" and "support" action, are not sufficient to drive the kind of change necessary to meet greenhouse gas reduction targets. I am calling for a separate Climate Action Plan to fill the gaps in the draft General Plan: The county decided not to have a separate Climate element of the General Plan, and instead integrated climate-related policies into the other elements, such as "Land Use" and "Housing." Climate policies are included among these different sections, and compiled in Appendix B of the Plan. Climate was not the primary focus or concern, and these groups lacked the expertise to put forward adequate, science-backed climate policy to guide the next 20 years.

I85-1

Bigger Buffer Requirements
The current plan allows for oil and gas facilities to be located too close to schools and homes. The current draft plan sets a 1500 ft minimum between oil & gas facilities and homes and schools. This is completely inadequate. The negative health impacts of emissions can be seen as much as a mile away from facilities. We are demanding a minimum 2500 ft. (~half a mile) distance from schools and homes for new oil & gas projects.

I85-2

We must Stop Trucking Oil
All newly permitted oil wells should be required to transport oil & wastewater via pipelines, not trucks. Most of the oil and wastewater produced from drilling is transported by trucks. These trucks go through or near our neighborhoods carrying hazardous materials, emitting toxic air pollution, and contributing significantly to the addition of greenhouse gases. The current plan protects oil companies by giving them the loophole to default to additional trucking, instead of installing pipelines if oil companies claim the cost of pipeline connection is too high.

I85-3

The wasteful Flares must stop
I am calling for no new flares in Ventura County. Flares waste a finite natural resource that can be used for energy production. Venting and flaring release toxic gases and powerful climate pollutants like methane into the atmosphere. Under the proposed general plan oil companies would be allowed to continue venting and flaring without restrictions, if they claim the added cost of treating gas on-site or constructing pipeline connections is too high; this technicality lets oil companies carry on with business as usual. Instead, join us in insisting that flaring and venting in all new oil wells be prohibited, except in cases of emergency or testing purposes.

I85-4

Thank you

| Letter I85 | John Brooks February 10, 2020 |
|-----------------------|-----------------------------------------|

- I85-1 The comment suggests that a Climate Action Plan should be separate from the 2040 General Plan and should include stronger policy language. The policies and programs to reduce greenhouse gas emissions are not made less effective or enforceable by virtue of incorporation into the 2040 General Plan. Refer to Master Response MR-1 for further discussion.
- This comment expresses concerns about 2040 General Plan policies and programs to reduce GHG emissions and is not related to the adequacy of the draft EIR. Therefore, no further response is required. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.
- I85-2 Refer to Master Response MR-4, Section MR-4.H Buffers (Setback), regarding the findings and conclusions related to buffers (setbacks) in oil and gas operations.
- I85-3 Refer to Master Response MR-4, Section MR-4.G Pipeline Requirements, regarding the findings and conclusions related to pipelines in oil and gas operations.
- I85-4 Refer to Master Response MR-4, Section MR-4.F Flaring, regarding the findings and conclusions related to flaring in oil and gas operations.

Subject: One more thing

**Letter
I86**

This preface by Oxnard resident Steve Nash sums up the feelings of many that the EIR is not sufficient:
“The entire assumption of a General Plan and its supporting documentation is to have a forward-looking plan to deal with land use, potential significant impacts and their mitigation measures within a geographical area.

It is my belief, and the belief of many others, that climate disruption caused by greenhouse gas emissions is the primary concern that has to be addressed in this type of document. Any plan that attempts to provide a framework for mitigating significant impacts that does not place climate change at the very forefront of significant impacts is a deeply flawed document and doomed to fulfill its “raison d’etre” which, ultimately, is to secure a safe and prosperous future for the residents and the environment under its jurisdiction.”

Get busy formulating a real climate action plan!

John Brooks
Oak View

I86-1

| | |
|-----------------------|-----------------------------------------|
| Letter I86 | John Brooks February 17, 2020 |
|-----------------------|-----------------------------------------|

I86-1 The comment states that “climate disruption caused by greenhouse gas emissions is the primary concern that has to be addressed” in the 2040 General Plan, as well as the opinion that failing to do so would result in a “deeply flawed document.” The 2040 General Plan addresses climate change by integrating climate change policies and/or implementation programs into every element of the plan. Refer to Master Response MR-1 for additional discussion.

Letter
187

Dear Ventura County-

These comments written by Steve Nash and used with his permission are so wonderfully specific to the concerns that I have over the lack of concrete climate action that I am presenting them here as ideas I share.

187-1

Ventura County Resource Management Agency, Planning Division
 Attn: Susan Curtis, Manager, General Plan Update
 Section 800 S. Victoria Ave., L #1740
 Ventura, CA 93009-1740

The entire assumption of a General Plan and its supporting documentation is to have a forward-looking plan to deal with land use, potential significant impacts and their mitigation measures within a geographical area.

It is my belief, and the belief of many others, that climate disruption caused by greenhouse gas emissions is the primary concern that has to be addressed in this type of document. Any plan that attempts to provide a framework for mitigating significant impacts that does not place climate change at the very forefront of significant impacts is a deeply flawed document and is doomed to fulfill its "raison d'etre" which, ultimately, is to secure a safe and prosperous future for the residents and protect the physical environment under its jurisdiction.

The corrective action is to acknowledge the primacy of climate change and the devastating impacts that will be most severely felt in Ventura County. Climate change is caused by fossil fuel production and consumption. We must do our part to reduce oil production through thoughtful, rigorous policy to phase it out. All Goals and Policies incorporated within a General Plan must have annual quantifiable metrics and measurables that lead to a complete cessation of hydrocarbon extraction practices within the county and the elimination of hydrocarbon usage by a date certain.

Pg. 4.3-7, Policy PFS-2.5: County Employee Trip Reduction. The County shall encourage its employees to reduce the number and distance of single-occupancy vehicle work trips.

> What is the goal and how does the County plan on achieving it and in what time frame?

Pg. 4.3-8, Policy PFS-2.6: County Alternative Fuel Vehicle Purchases. The County shall review market-available technologies for alternative fuel vehicles and prioritize purchase of vehicles to reduce greenhouse gas emissions where economically feasible.

> What is the goal and how does the County plan on achieving it and in what time frame?

Pg. 4.3-8, Policy COS-8.1: Reduce Reliance on Fossil Fuels. The County shall promote the development and use of renewable energy sources (e.g., solar, thermal, wind, tidal, bioenergy) to reduce dependency on petroleum-based energy sources.

> What is the goal and how does the County plan on achieving it and in what time frame?

Pg. 4.3-8, Policy COS-8.6: Zero Net Energy and Zero Net Carbon Buildings. The County shall support the transition to zero net energy and zero net carbon buildings, including the electrification of new buildings.

> What is the goal and how does the County plan on achieving it and in what time frame?

Pg. 4.3-9, Policy HAZ-10.5: Air Pollution Impact Mitigation Measures for Discretionary Development. The County shall work with applicants for discretionary development projects to incorporate bike facilities, solar water heating, solar space heating, incorporation of electric appliances and equipment, and the use of zero and/or near zero emission vehicles and other measures to reduce air pollution impacts and reduce greenhouse gas emissions.

> What is the goal and how does the County plan on achieving it via metrics and measurables and in what time frame?

187-2

Pg. 4.3-10, Policy HAZ-10.7: Fuel Efficient County Vehicles. When purchasing new County vehicles, the County shall give strong preference to fuel efficient vehicles, include the use of zero emission vehicles when feasible.
 > What is the goal and how does the County plan on achieving it via metrics and measurables and in what time frame?

I87-2
cont.

Pg. 4.3-10, Policy AG-5.3: Electric- or Renewable-Powered Irrigation Pumps. The County shall encourage farmers to convert fossil fuel-powered irrigation pumps to systems powered by electric or renewable energy sources, such as solar power, and encourage electric utilities to eliminate or reduce stand-by charges.
 > What is the goal and how does the County plan on achieving it via metrics and measurables and in what time frame?

Pg. 4.6-6, For the purpose of this Draft EIR, implementation of the impact on energy resources would be significant if implementation of the 2040 General Plan would: Result in the wasteful, inefficient, or unnecessary consumption of energy resources during project construction or operation that would cause a potentially significant effect on the environment. Conflict with or obstruct a State or local plan for renewable energy or energy efficiency.
 > Include "Not meet a 100% renewable energy economy by 2045."

I87-3

Pg. 4.6-7, Policy LU-11.4: Sustainable Technologies. The County shall encourage discretionary development on commercial- and industrial- designated land to incorporate sustainable technologies, including energy- and water-efficient practices and low- or zero-carbon practices.
 > What is the goal and how does the County plan on achieving it via metrics and measurables and in what time frame?

Pg. 4.6-8, Policy CTM-2.12: Countywide Bicycle Lane and Trail System. The County shall coordinate with the cities in the county and Ventura County Transportation Commission (VCTC) to plan and implement a system of bicycle lanes and multi-use trails that link the cities, unincorporated communities, schools including colleges and universities, commercial/retail, employment centers, health care service facilities, public transportation, and other points of interest.
 > What is the goal and how does the County plan on achieving it via metrics and measurables and in what time frame?

Pg. 4.6-13, Policy PFS-7.6: Smart Grid Development. The County shall work with utility providers to implement smart grid technologies as part of new developments and infrastructure projects.
 > What is the goal and how does the County plan on achieving it via metrics and measurables and in what time frame? All large projects will incorporate a micro-grid with solar and battery storage technology.

I87-4

Pg. 4.6-13, Policy COS-7.7: Conveyance for Oil and Produced Water. The County shall require new discretionary oil wells to use pipelines to convey oil and produced water; oil and produced water shall not be trucked.
 > All produced water shall be treated on-site so as not unfairly burden disadvantaged and communities of color that have had to accept this toxic waste in the past.

Pg. 4.6-13, Policy COS-8.1: Reduce Reliance on Fossil Fuels. The County shall promote the development and use of renewable energy resources (e.g., solar, thermal, wind, tidal, bioenergy, hydroelectricity) to reduce dependency on petroleum-based energy sources.
 > What is the goal and how does the County plan on achieving it via metrics and measurables and in what time frame and by what date-certain?

Pg. 4.6-15, Implementation Program R: Performance-Based Building Code for Green Building. The County shall update the Building Code to establish performance-based standards that incentivize green building techniques.
 > What is the goal and how does the County plan on achieving it via metrics and measurables and in what time frame and by what date-certain?

Pg. 4.6-17, Policy WR-3.1: Non-Potable Water Use. The County shall encourage the use of nonpotable water, such as tertiary treated wastewater and household graywater, for industrial, agricultural, environmental, and landscaping needs consistent with appropriate regulations.

> Currently meaningless as written. What is the goal and how does the County plan on achieving it via metrics and measurables and in what time frame and by what date-certain?

I87-4
cont.

Pg. 4.8-1, Executive Order (EO) B-55-18, which calls for California to achieve carbon neutrality by 2045 and achieve and maintain net negative GHG emissions thereafter.

> To provide consistency with the time frame of the General Plan, Ventura County should be carbon neutral by 2040, if not sooner.

Pg. 4.8-11, For the purpose of this draft EIR, implementation of the 2040 General Plan would have a significant GHG emissions impact if it would: Generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment. Conflict with an applicable plan, policy, or regulation for the purpose of reducing the emissions of GHGs.

> If there is no actual program to measure GHG from all sources, nor scheduled, implementable reduction protocols that result in carbon neutrality by a date certain then this is meaningless. What is the goal and how does the County plan on achieving it via metrics and measurables and in what time frame and by what date-certain?

I87-5

Pg. 4.8-12, Implementation Program P: Annual General Plan Implementation Review. The County shall review the General Plan annually, focusing on the status and progress of program implementation. The County shall prepare a report to the Board of Supervisors summarizing the status of implementation programs and any recommendations for General Plan amendments.

> What are the metrics and measurables and in what time frame and by what date-certain will Program P be fully realized?

Pg. 4.8-22, Implementation Program K: Coordination on Large Onsite Wastewater Treatment Systems Repairs. The County shall coordinate with the Los Angeles Regional Water Quality Control Board to address compliance and repair issues for large onsite wastewater treatment systems (over 5,000 gallons) and package treatment systems.

> Wastewater infrastructure is a source of GHG emissions, especially methane. How will these emissions be measured and mitigated/reduced/eliminated?

Pg. 4.8-23, Policy COS-7.2: Oil Well Distance Criteria. The County shall require new discretionary oil wells to be located a minimum of 1,500 feet from residential dwellings and 2,500 from any school.

> Why the discrepancy? Make the distance a uniform 2,500 feet.

I87-6

Pg. 4.8-23, Policy COS-8.6: Zero Net Energy and Zero Net Carbon Buildings. The County shall support the transition to zero net energy and zero net carbon buildings, including electrification of new buildings.

> What is the goal and how does the County plan on achieving it via metrics and measurables and in what time frame and by what date-certain?

Pg. 4.8-24, Policy COS-10.2: Community Greenhouse Gas Emissions Reduction Target for 2030. The County shall achieve a community-wide GHG emissions reduction target of 41 percent below 2015 levels by 2030.

> What are the annual goals and how does the County plan on achieving it via metrics and measurables and in what time frame and by what date-certain?

Pg. 4.8-27, Implementation Program U: Solar Canopies in Non-Residential Projects. The County shall amend the County's Coastal and Non-Coastal Zoning Ordinances to require parking lots for new non-residential construction projects, with floor area of greater than 50,000 square feet, to include solar canopies.

> Eliminate the floor area requirement and go with a percentage such as 90% of the parking area shall have canopy solar.

Pg. 4.8-27/28, Implementation Program DD: Budget and Staffing Plan for CAP Implementation. The CEO shall, within six months from the adoption of the General Plan Update and Climate Action Plan, present to the Board of Supervisors a proposed budget and staffing plan Greenhouse Gas Emissions Ventura County 4.8-28 2040 General Plan Draft Environmental Impact Report (including qualified technical consultants) to implement the Climate Action Plan, and shall update the budget and staffing plan each year.

> Include a citizen advisory committee, also.

Pg. 4.8-32, Implementation Program Q: Standards for Solar Photovoltaic (PV) Carports in County Lots. The County shall establish standards for inclusion of solar PV carports in County-owned parking lots.

> Implement a 90% coverage by canopy solar by date certain.

Pg. 4.8-32, Include the following, "Work with the Clean Power Alliance to plan, permit and build all possible opportunities to implement the CPA's "Local Programs" mandate."

Pg. 4.8-33, Policy AG-5. 5: Carbon Farming Practices. The County shall encourage and support the efforts of resource conservation districts, farmers, and other stakeholders to expand carbon farming practices, such as reduced tilling, cover-cropping, composting, biochar, and other activities that both reduce GHG emissions and increase carbon sequestration and storage, when feasible.

> Include "regenerative farming".

Pg. 5-11, 5.2.8 Greenhouse Gas Emissions, Thus, the 2040 General Plan's incremental contribution to cumulatively significant climate change effects would be cumulatively considerable.

> Unacceptable conclusion.

The Los Angeles Sustainability Plan, aimed at meeting the goals of the Paris Climate Agreement, has clear and bold goals: "By eliminating fossil fuel production in the county, including drilling, production and refining, the county will protect its residents from harmful local pollution that inequitably burdens low-income communities and communities of color." We should demand no less from our DEIR/General Plan.

Action Needed: The county should adopt the strongest possible measures to ensure that greenhouse gas emissions are curbed to protect air quality and to ensure a safe, sustainable future for all county residents.

Therefore, in my opinion, this DEIR is inadequate, missing disclosure of plan impacts, lacking in meaningful and enforceable policies (e.g., substituting "shall" with "should"), incompletely quantified, and lacking mitigations for cumulative and incremental impacts.

Thank you for your time and consideration.

|-----------------------|-----------------------------------------|
| Letter I87 | John Brooks February 26, 2020 |
|-----------------------|-----------------------------------------|

I87-1 The comments written by Steve Nash (refer to Letter I197) and concerns over the lack of concrete climate action are noted. This comment is introductory in nature and does not raise a significant environmental issue for which a response is required.

I87-2 The comment expresses opinions about the importance of climate change and the need to cease oil and gas extraction. See response to I86-1, above, for a discussion of how climate planning is integrated into the 2040 General Plan. Refer to Master Response MR-1 for discussion of the draft EIR's detailed quantitative and qualitative analysis of the 118 policies and 45 implementation programs included in the 2040 General Plan to reduce greenhouse gas (GHG) emissions in the county and the seven feasible mitigation measures included in the draft EIR to address the potentially significant GHG impacts of the 2040 General Plan and achieve additional GHG emissions reductions. Refer to Master Response MR-4 for discussion of the suggestion that the 2040 General Plan require phaseout of petroleum extraction in the unincorporated county.

The comment also cites seven specific 2040 General Plan policies (as identified in Section 4.3, "Air Quality," of the draft EIR) and, for each one, asks about the County's goals, plans to achieve, and anticipated timeframe. These policies are considered qualitatively in the analysis of potential effects on air quality in Section 4.3 of the draft EIR. The impact analysis is not predicated on any assumptions of measurable reductions in air pollutants from these policies.

This comment on policies of the 2040 General Plan is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.

I87-3 The comment provides a suggested addition to the energy thresholds of significance in the draft EIR related to achieving a 100 percent renewable energy economy by 2045.

For the purpose of evaluating the potential environmental effects of implementing the 2040 General Plan, the thresholds of significance are based on the County's Initial Study Assessment Guidelines (ISAG), as well as the checklist presented in Appendix G of the State CEQA Guidelines; best available data; and the applicable regulatory standards of the County and federal and state agencies with jurisdiction over the resources at issue. As explained in Section 4.1, "Environmental Impact Analysis," (page 4-1) and described in detail for each resource analysis, "deviation from the ISAG thresholds, which were established by the County to evaluate the impacts of individual projects, was sometimes necessary to appropriately consider the programmatic nature of a general plan for the entire unincorporated area, and to incorporate the 2019 revisions to the Appendix G checklist."

The thresholds of significance used in the draft EIR to evaluate energy-related impacts are described on page 4.6-6. In Impact 4.6-1 (starting at page 4.6-18), the draft EIR analyzes whether implementation of the 2040 General Plan would result in the wasteful, inefficient, or unnecessary consumption of energy resources or conflict with or impede State or local plans for renewable energy or energy efficiency. On pages 4.8-21 and 4.8-22, the draft EIR provides analysis demonstrating the implementation of the 2040 General Plan would not conflict with or obstruct State plans for renewable energy and energy efficiency. Note that the State has not adopted any plans defining a 100 percent renewable energy economy or demonstrating how it would be achieved.

The suggested threshold would be consistent with Senate Bill (SB) 100, which is a Statewide renewable portfolio requirement implemented by state agencies including the California Public Utilities Commission, the California Energy Commission, and the California Air Resources Board. With full implementation of SB 100 by the end of 2045, zero-carbon sources would account for 100 percent of the electricity in the California grid. At least 60 percent will be provided through renewable energy resources such as wind and solar. The remaining 40 percent would be provided through a combination of renewable and zero-carbon sources, which are anticipated to include recognized methods like energy storage, as well as new technologies that are yet unknown. SB 100 is a statewide requirement that is imposed upon electricity providers. The draft EIR analysis demonstrates that 2040 General Plan implementation would not conflict with or impede SB 100 (page 4.8-22). No further response to this comment is required and no revisions have made to the draft EIR in response to this comment.

- 187-4 The comment cites specific 2040 General Plan policies (as identified in Section 4.8, “Greenhouse Gas Emissions,” of the draft EIR) and, for each one, asks about the County’s goals, plans to achieve, and anticipated timeframe. The comment addresses implementation of the 2040 General Plan and is not related to the adequacy of the draft EIR. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan. Also, refer to Master Response MR-1 for additional discussion of the 2040 General Plan, its policies and programs, and mitigation measures related to GHG emissions reductions.
- 187-5 The comment asserts that the County should be carbon neutral by 2040, to be consistent with Executive Order B-55-18, which calls for the State to achieve carbon neutrality by 2045 and net negative GHG emissions thereafter. The thresholds of significance used in the draft EIR to evaluate GHG-related impacts are described on pages 4.8-7 through 4.8-11, and the basis and methodology for establishing GHG reduction targets in the 2040 General Plan are described in Master Response MR-1.
- 187-6 The comment cites specific 2040 General Plan implementation programs and policies (as identified in Section 4.8, “Greenhouse Gas Emissions,” of the draft EIR) and, for each one, asks about the County’s goals, plans to achieve, and anticipated timeframe; for some policies, the commenter provides suggested revisions. The comment addresses implementation of the 2040 General Plan and

is not related to the adequacy of the draft EIR. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan. Also, refer to Master Response MR-1 for additional discussion of the 2040 General Plan, its policies and programs, and draft EIR mitigation measures related to GHG emissions reductions.

187-7

The comment states that the draft EIR's significance conclusion for climate change is unacceptable and requests that the County adopt stronger measures to reduce GHG emissions impacts. Refer to Master Response MR-1 for discussion of the draft EIR's detailed quantitative and qualitative analysis of the 118 policies and 45 implementation programs included in the 2040 General Plan to reduce GHG emissions in the county and the seven feasible mitigation measures included in the draft EIR to address the potentially significant GHG impacts of the 2040 General Plan and achieve additional GHG emissions reductions.

Planning Division
800 S. Victoria Ave
Ventura, CA 93009

Re: Comments on County General Plan and Climate Action Plan

Dear Ms. Curtis:

I appreciate the opportunity to review and comment on the County's General Plan and the integrated Climate Action Plan. It is a very significant undertaking and I wanted to recognize that staff has made great strides in incorporating the diversity of interests and often conflicting perspectives.

I have attached comments to this letter and divided them into comments specifically addressing a Policy/Program and an additional more generic set of comments, resources and research that I relied on as part of my evaluation or I was unsure which section or sections to include them in. Hopefully the additional context will assist in the refinement of the GP and CAP.

There is an overreliance on state legislation as a source of emissions reductions in the early years. Local efforts need to be more robust given the urgency of the issue and the potential that the IPPC targets are not substantive enough given the latest scientific analysis. Please see the CFROG letter from June 5, 2019 for a more comprehensive overview. To avoid redundancy, I am not replicating all the CFROG comments. However, I am including them as part of my comments by reference.

188-1

Sincerely,

John Brooks

Climate Change Resources & Comments

Specific comments on sections of the CAP

LU-11.4 Change Shall to Require

LU-16.5 Change Shall to Require

LU-18.5 – “encourage stakeholders” and “have opportunity to learn about” is a pretty low bar. Please upgrade to County shall conduct programs/outreach in their neighborhoods or community gatherings and include multi-lingual capabilities as needed to reach out to the Hispanic and Mixteco populations.

PFS-1.2 & 1.3 – The County should adopt a policy of considering the 100-year projections when evaluating infrastructure since these facilities have significant sunk costs and it is significantly cheaper to upgrade when planning a facility versus retrofitting an existing building.

PFS-2.3 State law requires commercial buildings to be zero net energy (ZNE) in 2030. The County should show leadership, by requiring all new buildings to be ZNE and existing buildings to be in substantial compliance if the County is leasing greater than 50% of the building space.

PFS-E – The County procurement policies should be updated to require all suppliers, vendors and consultants to disclose the sustainability of their operations. The County could award as little as one point to this category, however, the requirement to disclose will have a significant effect on the adoption of policies and procedures that are environmentally beneficial. The County could develop a one-page form checklist that they submit with their bids. Alternatively, large corporations can share their corporate sustainability or ISO certifications and smaller ones can show that they follow the [Ventura County Green Business](#) practices if they have already completed those more comprehensive processes.

COS-8.1 – include promotion of microgrids as both a carbon reduction and resiliency measure for PSPS events.

COS-8.9 - Change Shall to Require and have a list of recommended shade trees appropriate for that region and tolerant of parking lot conditions. This could assist with stormwater mitigation measures and help reduce financial impacts to the County from flow into the public ROW.

COS-H – Ensure that the goal is net additional trees beyond replacement of dead/dying trees or mitigation trees for a project. Recommend that preference be given for tree planting in EJ or low-income communities.

COS-M – In addition, oil companies should pay an extraction fee per barrel for an insurance mitigation fund to ensure that abandoned wells and sites owned by bankrupt companies do not become a burden to taxpayers.

COS-Z – These should be online with easily understandable charts or graphs enabling the public to understand the data and compare to the projected savings to determine if individual measures are being met.

I88-2

COS-CC I commend the recommendation to establish a Climate Emergency Council to advise the Board.

COS-DD – A critical component to assist in the development and implementation. An Office of Sustainability should be established within the CEO’s office and the primary staffperson in charge of this effort should be a direct report to the CEO recognizing both the critical and cross-cutting nature of this work and ensure the full cooperation of all County offices.

COS-EE - Measures should be incorporated to ensure that projects continue to implement requirements after the project if finished and occupancy is granted or face substantial penalties. For example, if they bypassed one or more measures, they could agree upfront to a penalty of 10x the carbon wasted with the funds going to assist in low-income areas of the county to weatherize or otherwise reduce their carbon footprint.

Haz-1.4 – The County should develop reach fire codes for the urban-wildland interface to minimize both property damage and the danger to emergency responders trying to protect structures in the new fire environment.

Haz-10.7 Change to read that the County will purchase ZEVs, unless they are not readily available in the vehicle class or purpose needed or the lifetime cost of the vehicle including purchase, fuel and maintenance exceeds 15% of the cost of a non-ZEV. The County needs to show leadership and these vehicles are a very public way to showcase the transition to the low-carbon economy.

HAZ-11.6 What provisions will be made to identify and transport those without transportation and the elderly or disabled who cannot afford or do not have access to AC to cooling centers? Will the cooling centers be open 24/7? One of the problems is that the nights are heating up faster than the days so residents may need to stay overnight. Will animals be allowed in these facilities?

I88-2
cont.

PSPS/Wind Events

PSPS outages – need to be prepared for 3-7 days of electricity outages. These are not considered emergencies by the Red Cross, so they will not staff shelters. If a substantial part of the county is without power, we will need cooling shelters (with power) which can be a mix of day use only and overnight shelters. The centers will need to have robust electrical charging stations to run oxygen tanks and other medical equipment. Medicines may need to be refrigerated and monitored. Have the shelters been retrofitted with generators or are they wired correctly for three-phase generators? Where will generators be located to quickly deploy especially if routes like the 101 freeway are closed?

A power outage may do the following:

- Disrupt communications, water, and transportation
- Close retail businesses, grocery stores, gas stations, ATMs, banks, and other services
- Cause food spoilage and water contamination
- Prevent use of medical devices and operations or medical/senior center facilities

From [Ready LA County](#)

A spike in generator purchases and rentals by people unfamiliar with their safe operation is likely and may result in carbon monoxide poisoning.

7.13 Wildfire – The County should adopt reach codes for fire.

Although Santa Anas have decreased in in frequency and severity of extreme wind events, the Santa Ana window or primary season is moving to Nov-Jan. This could result in more fires in this period, particularly in dry years¹.

7.13 P – Should also include infrastructure at risk that the County does not control but relies on.

7.13 Does not include anything related to the more intense rains and flooding expected from less frequent, but more intense storms.

In addition, wildfire has profound effects on storm runoff, erosion, and sedimentation in the complex terrain within Ventura County. For several years following a fire, runoff rates can more than double due to fire-driven changes in soil properties that render it water-repellant and reduce infiltration rates (USGS 2005; USGS 2019). Short-duration, high-intensity precipitation under these conditions increases surface runoff that can cause movement of ash, burned vegetation, soil, rocks, and other debris. This material is scoured from steep channels and moved downslope where it may impact communities or infrastructure below as a debris flow.

9.8 G – The County should adopt a policy to establish parcel-based water budgets to prepare for the implementation of the state water efficiency mandates “Making Water Conservation a Way of Life”. This will ensure that parcels that use more than their fair share are targeted for outreach and punitive measures as necessary to comply with the state law.

10 Economic Vitality

EV-4.2 Economic Development Opportunity

California and Ventura County are well-positioned to be leaders in the development and deployment of greenhouse gas (GHG) reduction solutions that will assist in the transition to a low-carbon economy. Because of California’s size and early adoption of significant environmental controls, Cap & Trade, AB 32, and mandatory organics recycling, the state is already a key player in finding sustainable solutions that include cleaner emission vehicles, energy efficient appliances, and green chemistry requirements. These are also the types of jobs and opportunities we need to develop locally to provide opportunities for our youth and to sustain our region.

The aerospace sector was a huge boost to the Southern California region in the 70s. The Bay area has developed the Silicon Valley, and North Carolina has the Research Triangle. What were the key components that enabled these areas to develop into such well-known powerhouses? How can we leverage the transition to a green economy and position Ventura County as a regional Green Innovation Hub?

Next 10 in November 2014, published the *Regional Clean Economy Series* of five reports highlighting five sectors of the state that are forming and nurturing regional clean economy sectors focused on the “core clean economy.” Next 10 is an independent, nonpartisan organization that focuses on the environment, the economy, and the quality of life for all Californians.

¹ Ventura_Climatechange_Review_Oakley.pdf slide 28

I88-2
cont.

They define the core clean economy as, *“businesses that provide the cutting-edge products and services that allow the entire economy to transition away from fossil fuels and use natural resources more efficiently.”*

The regions and core clean economy focus for their reports include:

1. Los Angeles and Orange – advanced transportation
2. Sacramento – electric vehicles, building energy efficiency and solar, waste-to-energy
3. San Diego and Imperial – smart grid and biorenewables
4. San Francisco Bay Area – advanced transportation, energy storage, building energy efficiency
5. San Joaquin Valley – water-agriculture, renewable energy

I88-2
cont.

General Comments

Requested Policy – Each County department should prepare a Climate Action Plan that evaluates their footprint, mitigation measures, risks to their clientele and mitigation or outreach measures that they will adopt. A substantial portion of this may be done by centralized staff. However, the department staff need to understand the issues and incorporate mitigation measures into their routine activities. This could be the Public Works department, the County Health Department. Climate changes will impact their day-to-day operations and they need to start recognizing, planning for and accommodating those changes.

Economic Related issues

Requested Policy - The Pacific Coast Highway in the Malibu region and the 101 between Ventura and Santa Barbara are both vulnerable. Short-term shutdowns would be disruptive. However, if the corridor was closed for multiple months this would significantly impact traffic and may result in substantial economic impacts. Critical infrastructure should be evaluated regardless of ownership and mitigation plans prepared as warranted.

Article related to Ventura County

[Fires, floods and free parking: California’s unending fight against climate change](#) – Scott Wilson, Washington Post December 5, 2019

Since 1895, the average temperature in Santa Barbara County has warmed by 4.1 degrees Fahrenheit, according to The Post’s analysis. Neighboring Ventura County has heated up even more rapidly. With an average temperature increase of 4.7 degrees Fahrenheit since preindustrial times, Ventura County ranks as the fastest-warming county in the Lower 48 states. [Some climate scientists believe that there is an error in the Post’s projections].

I88-2
cont.

Public Health

Climate change has been called “the biggest global health threat of the 21st century” (Castello et al. 2009). In the LA region, the health impacts of climate change are far-reaching, including direct and indirect impacts related to extreme heat, poor air quality, wildfires, infectious diseases, floods and mudslides, mental health concerns, and increasing disparities caused by disproportionate impacts to vulnerable populations. (NOTE: LA Region includes Ventura County in the analysis) ...

The number of extreme heat days in southern California is expected to increase considerably by the middle of the century as a result of climate change (pp. 11–12). Extreme heat is one of the most significant health impacts of climate change and already causes more deaths each year in the United States than floods, storms, and lightning combined (Berko et al. 2014). Exposure to extreme heat can cause direct heat-related illness (heat cramps, heat exhaustion, and heat stroke) and death, and can also exacerbate certain existing medical conditions. Heat waves are associated with increases in the number of people seeking emergency medical care for a variety of health conditions, though the magnitude of this effect depends on many factors, including geographic location, demographics, and availability of adaptive strategies such as air conditioning. During California’s 2006 heat wave, there were 16,166

excess emergency department visits and 1,182 excess hospitalizations across the state, with increases in visits for kidney related diseases, diabetes, and cardiovascular disease (Knowlton et al. 2009)².

While all residents are affected to some extent by extreme heat, certain populations are more vulnerable to severe impacts. These include (a) low-income communities and communities of color, which often experience a greater urban heat island effect due to a lack of trees and other vegetation, and which have lower access to air conditioning (Reid et al. 2009a); (b) older adults, young children, people with chronic medical conditions, and people taking certain medications, who are physiologically vulnerable to the effects of heat (Kenny et al. 2010; Reid et al. 2009a; Tsuzuki-Hayakawa, Tochiara, and Ohnaka 1995); and (c) outdoor workers (Bethel and Harger 2014), people experiencing homelessness (Harlan et al. 2013), and others who spend a significant amount of time outside and are more exposed to extreme heat. Unlike cities that have consistently experienced extreme heat in the past, the housing stock in LA is not designed for extreme heat. Approximately 51% of households in the LA-Long Beach area have central air conditioning (American Housing Survey 2015). While California code requires that landlords provide adequate heating facilities in homes, air conditioning is not a requirement. Moreover, the LA region's affordable housing crisis may prevent many renters from being able to move to air-conditioned homes where they would be less impacted by heat. Access to air-conditioned spaces may be additionally limited by factors such as mobility, vehicle ownership, perceptions of neighborhood safety, and distance to transit. These factors can prevent vulnerable populations from implementing adaptive and health protective strategies, such as getting to cooling centers or other air-conditioned locations.³

Do we know the percentage of our houses without AC? Although many resident's dependent on social security or other limited income may not turn on the AC even if they have it in their homes due to financial concerns it would be a starting point.

Climate change may impact mental health through various pathways, including but by no means limited to (a) increases in the frequency and severity of extreme weather events; (b) increasing economic instability; and (c) uncertainty about the future of the planet. Extreme weather events such as fires and floods can have acute mental health impacts. Clear links exist between extreme weather events and anxiety and depression (Kar and Bastia 2006), post-traumatic stress disorder (Neria, Nandi, and Galea 2008; Kar and Bastia 2006), and suicide (Krug et al. 1999).⁴

Public transit infrastructure - Transit design can mitigate human exposure to extreme heat (p. 44). Exposure to extreme heat can result in heat-related illnesses such as heat cramps, heat stroke, and heat exhaustion, and can also exacerbate pre-existing conditions. Further, extreme heat may discourage transit use altogether. Environmental exposure results from access and waiting. Transit users from areas with low residential density, limited high capacity roadways, and irregular street networks not located along direct paths between major activity centers, are likely to experience prolonged access and/or waiting times (Fraser and Chester 2017a)... The placement of transit stops impacts how long passengers are exposed to the environment, and, coupled with walking, may leave them at risk for negative heat-

³ Fourth Climate Change Assessment – LA Region pg 22

⁴ Fourth Climate Change Assessment – LA Region pg 24

related outcomes. Walking times can vary significantly by age and physical condition. They can increase by up to 30% for the slowest age group (Bohannon and Williams Andrews 2011).⁵

Human health effects of extreme heat

Climate change poses a threat to public health. Heat causes more reported deaths per year on average in the United States than any other weather hazard (NOAA, 2017). In addition to the long-recognized health impacts of extreme heat, hospital admissions and emergency room visits, deaths and other adverse health outcomes have been associated with the warm season in California.

In 2006, dramatic increases in many heat-related illnesses and deaths were reported in California following a record-breaking heat wave. During the summer months, large urbanized areas can experience higher temperatures compared to nonurban outlying regions. “Urban heat islands” create health risks both because of the increased temperatures and because of the enhanced formation of air pollutants. Warming temperatures can amplify the transmission of mosquito-borne diseases (such as West Nile Virus) and make conditions more hospitable for invasive species that may transmit diseases.

While difficult to track using indicators, climate change can impact human well-being in many ways, including injuries and fatalities from extreme events, and respiratory stress from poor air quality (Mellilo et al., 2014).⁶

Mental Health

People’s anxiety and distress about the implications of climate change are undermining mental health and well-being, according to a new federal report reviewing existing research on the topic. Issued by the U.S. Global Change Research Program, the report is the first time the federally mandated group has published an assessment solely focused on climate change and health.

The report is notable for another reason, too: It contains a chapter devoted to mental health and well-being, a significant step forward for an assessment of this type, says lead author Daniel Dodgen, PhD, a clinical psychologist at the U.S. Department of Health and Human Services, Office of the Assistant Secretary for Preparedness and Response. “I think people realize that if you’re going to talk about health, you have to talk about mental health,” he says.

The report also found that:

Exposure to climate- and weather-related natural disasters can result in mental health consequences such as anxiety, depression and post-traumatic stress disorder. A significant proportion of people affected by those events develop chronic psychological dysfunction.

⁵ Fourth Climate Change Assessment – LA Region pg 50

⁶ Indicators of Climate Change in California pg 161

I88-2
cont.

Some people are at higher risk for mental health consequences from weather-related disasters. Among them are children, pregnant and postpartum women, people with pre-existing mental illness, people who are economically disadvantaged, those who are homeless and first responders to the disaster.

Representations of climate change in the media and popular culture can also influence a person's stress response and mental well-being.

Climate change is threatening mental health -- American Psychological Association

1. Target populations of Concern
2. Outside workers (including County staff)
3. Children
4. Medically fragile, asthmatics, etc.
5. Pregnant women

Pregnancy effects According to research published in Nature Climate Change, birth rates were 5% higher on days when the temperature exceeded 90 degrees Fahrenheit. And, perhaps more concerning, births on those days occurred up to two weeks earlier — and 6.1 days earlier on average — than they would have otherwise.

“That’s enough to take somebody from what’s considered to be a pretty healthy pregnancy into a ‘we are somewhat worried’ pregnancy,” said Alan Barreca, a UCLA professor of environment and human health and lead author of the study.... Early delivery could cause long-term harm to the affected infants. Previous research has shown that early deliveries are linked to cognitive differences later in childhood, though it’s unclear whether this applies to heat-related early deliveries specifically. Another study found a direct link between mothers experiencing extreme heat during their third trimester of pregnancy and reduced income for their offspring once they reach adulthood. That might be due in part to earlier deliveries, too.

I88-2
cont.

Air Quality - Hotter future temperatures (Section 2.2) will act to increase surface ozone concentrations both due to chemistry producing more ozone and higher rates of biogenic emissions, while increases of water vapor also influence chemistry by increasing ozone production in already polluted areas (Steiner et al. 2006). It’s been estimated that ozone could increase up to 5-10 parts per billion (ppb) by 2050 in LA (Jacobson 2008; Pfister et al. 2014), and the number of days with ozone over 90 ppb could increase between 22-33 days (Abdullah Mahmud et al. 2008).⁷

Water

Drought

Anticipate a 64% decrease in snowpack by end of century⁸

By virtue of its Mediterranean climate and location along the periphery of the Pacific subtropical high, California experiences warm and dry summers with wet winters. During the wet winter months, which in Southern California typically begin in November and terminate in March, the bulk of precipitation arrives in a few, large storms (Dettinger et al. 2011; Oakley et al. 2018b). Should these storms not arrive due to

⁷ Fourth Climate Change Assessment – LA Region pg 20

⁸ Ventura_Climatechange_Review_Oakley.pdf slide 20

the presence of a persistent blocking ridge of high pressure in the North Pacific Ocean, precipitation deficits will be large (Cook et al. 2018). These deficits will be superimposed with climatologically high evaporative demands and may be exacerbated by above-normal winter season temperatures. Such dry years occur commonly in California, and multi-year periods of severe drought are not uncommon. However, evidence from various locations in California and throughout the southwestern United States indicates that extreme droughts lasting decades to several centuries have occurred numerous times since the end of the last ice age (e.g., Stine 1994; Benson et al. 2002; Woodhouse et al. 2010; Dingemans et al. 2014). The most recent extreme and persistent droughts occurred during the Medieval period, approximately 800-1000 years ago, with locally warm and dry conditions inferred from paleoproxy evidence provided by sedimentary cores taken from Zaca Lake in the San Rafael Mountains of Santa Barbara County (Dingemans et al. 2014). These droughts indicate that such extreme periods of aridity can occur under natural conditions (i.e., independent of human-driven changes in greenhouse gas concentrations) implying consideration of extended drought is prudent to sustainable water resource management, especially if projected warming increases drought risk Hatchett et al. 2015). Modeling studies of the Central Sierra Nevada have shown these droughts to be of comparable precipitation deficits to the most recent California Statewide drought that began in winter 2012 and ended in January of 2017 (Hatchett et al. 2015). The severity of the recent drought was exacerbated by anomalously warm temperatures driving a surplus in atmospheric evaporative demand and reducing the fraction of precipitation falling as snow in mountain regions (Williams et al. 2015b; Hatchett et al. 2017). The duration and severity of the recent drought varied statewide, with Ventura County being one of the first regions to go into drought conditions and one of the last to emerge (U.S. Drought Monitor 2019).⁹

Rain

4.2 Implications of Changes in Precipitation

- The number of dry days increases in the spring and fall (Fig. 4.6); however, there is little change projected in precipitation totals for these seasons (Fig. 4.2), implying some intensification of precipitation in these seasons, although these increases grow with time (Appendix A). Prolonged dry periods are associated with wildfire activity (e.g., Nauslar et al. 2018). With more dry days there may be potential for a longer wildfire season due to additional opportunities for persistence of dry conditions.
- Groundwater recharge is projected to decrease in the Southwest in a warming climate (Niraula et al. 2017) and may in part be related to increasing rainfall intensities (Dettinger and Earman 2007). Precipitation intensification at the seasonal to sub-daily timescales may have implications for the methods by which groundwater recharge occurs or how surface water is conveyed, captured, and stored.
- Roughly half of models project more frequent days exceeding historic 85th percentile daily precipitation totals (Fig. 4.7), resulting in more days with storm water management concerns if these outcomes are realized.
- Intensification of sub-daily precipitation (Figs. 4.8-16) raises concerns for increased flash flooding (Modrick and Georgakakos 2015), landslides, and debris flows (e.g., Oakley et al. 2018a) in a warming climate. In addition to the potential for increased threats to life and property, this may have impacts on infrastructure design and water resource management.

⁹ Ventura Climate 2019_Bookmarked.pdf pg 51-52

I88-2
cont.

- *Potential for storms with similar atmospheric characteristics to historic events to produce greater event total precipitation due to warming and ability for greater amounts of water vapor to be present in the atmosphere (Figs. 4.17-18; Prein et al. 2017).*

- *With uncertainty in annual precipitation changes, potential for increasing dry days, and increased temperatures (Section 3) and evapotranspiration (Section 5), diversified water supply portfolios will likely allow for more resilient water management (Sterle et al. 2019).¹⁰*

Atmospheric rivers (Ars) show a 20-50% increase in frequency of ARs along west coast and studies suggest fewer, but stronger and longer duration ARs in SoCal.¹¹ ARs can transport ten times the volume of the Mississippi River in water vapor and release a significant amount of the water when they rise over the coastal mountains.

Moreover, the peak season of atmospheric rivers may also lengthen, which could extend the flood-hazard season in California. The current generation of GCMs project a nearly 40% increase in precipitation during atmospheric river events over southern California by the late-21st century under RCP8.5. The number of atmospheric river events is also projected to increase in the future, possibly around a doubling of days by the end of the century (Warner et al. 2015; Hagos et al. 2016; Gao et al. 201512).

Short-duration, high intensity rainfall

Because of their ability to trigger flash floods and mass movements, short duration, high intensity precipitation events pose a major threat to life and property in Ventura County.¹³

Floods 1.5-2x more likely to exceed top 0.05% of historic hourly precipitation¹⁴.

If these rains occur after a significant fire then widespread flooding, mud flows and/or slope failure could result.

Evaporative Demand

Evapotranspiration represents the fluxes, or transfer, of moisture from open water and soil moisture (evaporation), and plant transpiration of water to the atmosphere under ambient conditions....

Historically, positive changes in ETO have been associated with increased water demand (Hobbins and Huntington 2017), increased wildfire activity (Abatzoglou and Williams 2016), and ecosystem impacts (Schwinning and Sala 2004). Thus, with projected ETO increases, the following impacts may be anticipated:

- *All seven models project county-wide increases in annual ETO, with minimum increases of at least 2 in. and maximum increases of approximately 6.5 in, which may impact water demand for crops (Hall et al. 2018), ecosystems, and municipal water use.*

I88-2
cont.

¹⁰ VenturaClimate2019_Bookmarked.pdf pg 31

¹¹ Ventura_Climatechange_Review_Oakley.pdf slide 19

¹² Fourth Climate Change Assessment – LA Region pg 14

¹³ VenturaClimate2019_Bookmarked.pdf pg 6

¹⁴ Ventura_Climate_Projections_Hatchett.pdf slide 35

- *The greater thirst of the atmosphere will deplete soil and plant moisture leading to faster rates of fuel moisture decline and longer periods of dry vegetation. This will increase the susceptibility of landscapes to wildfire and drought, as there is the potential for vegetation to dry more quickly and for longer periods of time.*
- *Reductions in soil moisture associated with increased ETO may reduce runoff production in some areas. The greatest increases in ETO (and thus reductions in soil moisture) are projected to occur in inland elevated terrain.¹⁵*

Although the greatest changes in absolute ETO occur during summer (Fig. 5.2c), percentage-wise, the largest increases (between 4–8%) are observed during fall in terms of spatial extent and magnitude (Fig. 5.3d). This will add stress to vegetation, decrease fuel moisture, and increase fire risk. Dry conditions extending into the late fall and early winter have a greater chance to coincide with Santa Ana winds. These conditions can lead to destructive wildfires such as the December 2017 Thomas Fire (Nauslar et al. 2018) and the November 2018 Woolsey Fire. Spring and summer show similar magnitudes of change and are consistent in the locations of change, though the core regions of greatest percentage increases shift westward from the Santa Clara River watershed (Fig. 5.3b) to the Ventura River watershed (Fig. 5.3c) during summer¹⁶.

Beyond Los Angeles: Imported Water Availability

The LA region is intimately connected to other Western U.S. watersheds. Water supply agencies rely on imported water for a majority of regional water supply (Gold et al 2015; Porse et al. 2017). Three main water sources supply metropolitan LA water agencies: the California Aqueduct as part of the State Water Project, the Colorado River Aqueduct that supplies southern California's allocation of Colorado River water, and the LA Aqueduct that imports water from the Owens Valley. Imported sources comprise a majority of water demands. For instance, in LA County, imported sources meet 55-60% of annual urban water demands, with the remaining amount supplied by groundwater (35-40%) and recycled water for nonpotable uses such as irrigation. From 2000-2010, these water agencies received an annual average of 810,000 acre-ft from MWD's imported sources, through in recent years averaging closer to 700,000 acre-ft. The entire American Southwest is expected to see increased drought and reduced availability of future water for agriculture and growth (MacDonald 2010). Such large-scale changes across a broad geography, which includes California, will pose unique risks for each of the massive infrastructure systems that import water to LA.

A substantial portion of Ventura County's water comes from the State Water Project through MWD.

The State Water Project of California brings water from the northern and western Sierra Nevada mountains south through the Sacramento-San Joaquin Delta to urban and agricultural users in southern California. Historically, the State Water Project contributed the majority of water supply to MWD's sources (53% from 1976-2010). Numerous studies have documented the likely shifts in precipitation regimes that will result from climate change in California, including reductions in snowpack, advances in the timing of runoff leading to reduced seasonal capture and storage capacity, and hotter coastal and

I88-2
cont.

¹⁵ VenturaClimate2019_Bookmarked.pdf pg 45-46

¹⁶ VenturaClimate2019_Bookmarked.pdf pg 48

inland temperatures increasing demand (Andersen et al. 2007; Brekke et al. 2004; N. L. Miller, Bashford, and Strem 2003; Tanaka et al. 2006; Vicuna and Dracup 2007; Dracup and Vicuna 2005). Additionally, the system of reservoirs will face increasing operational risks in managing more extreme rainfall events and preventing floods (Brekke et al. 2009). Applying such projections in planning can be challenging, given long-term uncertainties and sunk costs in current infrastructure (Groves, Yates, and Tebald 2008). Given these long-term likelihoods, the reliability of water deliveries from northern California will likely stir significant continued political debate and uncertainties, especially regarding future management alternatives for critical habitat and conveyance areas of the California Delta (Madani and Lund 2010).⁴⁷

CASE STUDY | MANAGING FOR SCARCITY TO WEATHER THE DROUGHT
Caryn Mandelbaum

The Inland Empire Utilities Agency (IEUA) water and energy optimization is a great example of climate resiliency in one of the hottest areas of southern California. The IEUA's service area covers 242 square miles where Riverside and San Bernardino Counties meet and where summer temperatures soar to over 110°F (43°C). The IEUA distributes imported and regionally-produced water and provides industrial/municipal wastewater collection and treatment services to more than 830,000 people throughout its nine member agencies.

How, you might ask, did they manage to have surplus water during the state's worst-ever drought? The short answer is they had been managing for scarcity for the past 20 years. Leadership had the foresight to establish a grant writing department that matched every dollar spent with grants for efficiency projects. They invested nearly \$500 million in developing regional water supplies, including state-of-the-art recycled water and groundwater recharge facilities, water use efficiency programs, and infrastructure improvements that avoided leaks.

They also developed close ties with their customers through public affairs staff and communications campaigns. This allowed the water agencies to enforce water budgets for each ratepayer. The budget provided a specific monthly allowance of water, depending on the number of occupants and outdoor footprint. The outdoor space was measured aeriaily to the square foot. They learned about how their consumption patterns measured up to prior use and that of their neighbors. When customers exceeded their budget, they were penalized and provided with tools for conservation. Armed with information and tools, ratepayers were able to better control their water consumption.

Remarkably, while the IEUA developed surplus water during California's historic drought, they were also becoming one of the most energy-efficient utilities in the state. In 2010, the agency installed the world's largest fuel cell system powered by renewable biogas and reduced energy consumption by nearly 25% upgrading operations. In 2017, they launched an advanced energy storage system designed by Tesla that integrates solar, wind, biogas, and grid resources to optimize renewable generation, reduce demand, and lower energy costs. Together with dynamically controlling consumption, IEUA is on track to go gridless by 2020 with almost no capital investment by the Agency.

188-2
cont.

⁴⁷ Fourth Climate Change Assessment – LA Region pg 62-63

Earthquake/levee collapse threats to water supply

"The problem becomes almost intractable," he continued. "Keep in mind, one failure took \$100 million to fix, and now we're looking at scores of failures, so the water managers for the state are petrified of this. They are not sure they can ever get this system up and running, or at the very least, it's going to take multiple years. So this is pretty serious."

"The [State Water Project](#) is essential, both from the volume standpoint as it provides a lot of our water, and from a water quality perspective, as the water quality is quite good from it. As currently configured, the levees are highly vulnerable, not necessarily for San Andreas events but for the local events directly beneath. The repair time is uncertain; it's almost certainly very long. They don't even know how long it would take, and I think by any measure, it is not resilient, and this is the problem."

<https://mavensnotebook.com/2018/01/03/earthquake-resilience-southern-californias-water-distribution-systems/>

Making Water Conservation a California Way of Life

"Making Water Conservation a California Way of Life" (Governor's Executive Order B-37-16) replaces and increases water conservation requirements. AB 1668 (Friedman, 2018) and SB 606 (Hertzberg, 2018) implement various provisions of the Governor's Executive Order including the establishment of long-term urban water use efficiency standards, an indoor water budget of 55 gpcd which decrease over time, and outdoor allocations based on irrigated or irrigable landscaped area.

Based on industry recommendations the state set a provisional standard for indoor water use of 55 gallons per person, per day. This standard was based on a report produced by the Water Research Foundation. To ensure that this standard is reasonable the state will be funding a research study to determine an appropriate budget.

Also, the state is developing an outdoor water usage standard based on irrigated area and other factors like local climate conditions.

Based on these standards, all water districts will be given a maximum water budget for their agency. The budgets are being developed currently, with a draft budget expected January 2021, and the final budget at the end of 2021. While the state is developing the standards, we will be developing the tools and processes necessary to track and stay within the budget.

Proposals also include a requirement for each agency to develop a five-year drought plan, including conservation strategies necessary to achieve conservation levels that range from ten percent up to, and beyond, fifty percent reduction in water usage.

Each agency must document the steps to be taken in the event of a water conservation reduction of:

- 10%
- 20%
- 30%
- 40%
- 50%
- Beyond 50%

I88-2

How climate change could threaten our water supply

Published 11:00 a.m. PT July 8, 2017 |

Gov. Jerry Brown announces that California will host a global climate summit.

SACRAMENTO - When it comes to California and climate change, the predictions are staggering: coastal airports besieged by floodwaters, entire beaches disappearing as sea levels rise.

Another disturbing scenario is brewing inland, in the sleepy backwaters of the Sacramento-San Joaquin Delta. It's a threat to the Delta's ecosystem that could swallow up a significant portion of California's water supply.

Scientists from government and academia say rising sea levels caused by climate change will bring more saltwater into the Delta, the hub of California's water-delivery network. As a result, millions of gallons of fresh water will have to be flushed through the Delta, and out into the ocean, to keep salinity from inundating the massive pumping stations near Tracy. That will leave less water available for San Joaquin Valley farmers and the 19 million Southern Californians and Bay Area residents who depend on Delta water — eventually as much as 475,000 acre-feet of water each year, enough to fill Folsom Lake halfway, according to one study by the Public Policy Institute of California.

"With rising sea levels, with climate change, that creates additional pressure coming in from the ocean," said Michael Anderson, the state's climatologist, in a recent interview. "Sea level rise is going to become more of an influence."

It figures to become a pocketbook issue for practically any Californian who drinks water that runs through the Delta. A 2010 study by scientists from the University of California, Davis said rising seas, coupled with the inundation of some islands in the western Delta, will translate into higher costs for purifying water for human use. The additional cost could go as high as \$1 billion a year, "making the Delta less desirable as a conventional water source," the study said.

That cost doesn't include the \$17.1 billion Gov. Jerry Brown proposes to spend on the Delta tunnels, his controversial plan for reshaping the estuary's plumbing system.

Brown's administration is heralding the threat from climate change as one of the reasons for building the tunnels, which would increase water bills for urban Southern Californians and San Joaquin Valley farmers. An environmental impact statement released by state and federal officials in December said the tunnels are needed to prevent a significant cutback in water deliveries from the Delta.

Without the tunnels, the ability to pump water south "will be reduced under future climate and sea level rise conditions," state and federal officials wrote. "Delta exports would be reduced by as much as 25 percent by the end of the century."

Complicating the issue, climate scientists also agree a warmer climate will mean more rain and less snow. The Sierra snowpack serves as a giant reservoir that naturally releases water long after the rainy season ends. If more of California's precipitation falls as rain instead of snow, much of that water will flow to the ocean in winter and spring, while it's still raining. That will leave less water available in summer to satisfy human needs and to offset salinity in the Delta.

I88-2
cont.

Saltwater is already a problem at the Contra Costa Water District, which serves 500,000 residents in eastern and central Contra Costa County. Its location near the spot where water becomes brackish in the Delta puts Contra Costa on the front lines of the battle against salinity from the ocean. One of its four main intake pipes at the western edge of the Delta is precariously close to the point where water becomes too salty to drink without substantial treatment.

The agency has invested millions on intake pipes that are further and further away from the ocean. In 1997 it opened an intake along the Old River closer to the heart of the Delta. In 2010 it spent \$80 million building another intake a few miles east of the Old River facility. It considered building a desalination plant a few years ago, but the project, estimated to cost \$175 million, has been tabled.

Contra Costa's main weapon against salinity is Los Vaqueros Reservoir, a 19-year-old man-made lake. Though it's in the southwest Delta, it feeds off a pipeline from a San Joaquin River tributary from the east. Its purpose is to hold 160,000 acre-feet of fresh water that Contra Costa uses to dilute the supply that washes in from the Pacific.

"Things can get very salty for prolonged periods of time," said Maureen Martin, the agency's senior water resources specialist, during a recent tour of Los Vaqueros.

Contra Costa has spent nearly \$560 million on Los Vaqueros, and it isn't done yet. Working with 11 other Bay Area agencies, it's developing a plan to expand Los Vaqueros' capacity by two-thirds, an \$800 million project.

Martin said her agency doesn't consider sea-level rise "an imminent threat to Delta water quality." But the scientific projections are influencing Contra Costa's long-term planning on Los Vaqueros and other facilities.

Climate change "would probably cause the Delta to become saltier," she said. If climatologists are correct, the just-ended drought gave Delta residents a taste of things to come. In 2015, when the drought was at its worst and relatively little fresh water was trickling through the estuary, state officials worried about a surge of saltwater gushing in. The Department of Water Resources built a temporary rock barrier on the West False River, near the heart of the Delta, to hold back the salty ocean water.

The price was \$37 million, including the expense of removing the 150,000 tons of rocks when the rainy season started. State officials declared it a successful investment. The barrier helped the state avoid releasing 90,000 acre-feet of water from upstream reservoirs to flush out the salinity.

Over the long haul, state officials believe keeping the salt at bay will be crucial to the viability of the State Water Project and the federal government's Central Valley Project, the delivery networks that move much of Northern California's water through the Delta to the water agencies of Southern California and the San Joaquin Valley.

It's a task that could become increasingly difficult as sea levels rise. Not only will higher waters bring a generally higher volume of salt into the estuary, they will put more stress on the 1,100 miles of levees protecting Delta farms and homes. A levee breach could inundate the SWP and CVP pumping stations with saltwater, forcing them to shut down and reduce operations.

It represents one of the state's arguments for the tunnels project: By diverting a portion of the Sacramento River's flow at Courtland, at the northern fringe of the Delta, and piping it directly to the

I88-2
cont.

Tracy pumps, the state and federal water projects can sidestep much of the saltwater and keep pumping water more reliably.

“The location of the north Delta diversion facility is further inland, making it less vulnerable to salinity intrusion,” officials wrote in the environmental report last December.

Tunnels opponents aren’t swayed by that argument.

They don’t dispute that rising seas will bring more salt to the Delta. But they say the tunnels would actually worsen the problem and make Delta water dangerously salty for farming and drinking water needs. By pulling some of the fresh water out of the Sacramento at the upstream location, opponents fear it will increase the salt concentration in the remaining water flowing through the Delta. In that respect, they’re insulted that the threat from global warming is being used to justify the project.

“Whatever the truth might be about the extent or arrival of (climate) changes, the theory is being used as one more arrow shot at us,” said John Herrick, attorney for the South Delta Water Agency.

“There isn’t a shadow of a doubt in our minds that once they’re able to take water from up north, they’d doom us,” he added.

To: Curtis, Susan <Susan.Curtis@ventura.org>
Subject: 2040 General Plan Draft EIR Comment

Letter
189

Dear Ms. Curtis:

I am writing to call your attention to significant flaws in the process, data, and conclusions of the Ventura County General Plan, Draft EIR, and supplemental documents.

My great grandfather, Mark McLoughlin (1843-1914), was a true Ventura County pioneer, purchasing his first 318 acres of undeveloped land in Ventura County in 1875. He was a hard-working visionary, revered by his community. With his son—my grandfather, James Patrick McLoughlin—he raised livestock and farmed the land, providing jobs and feeding the growing towns of Oxnard and Ventura.

189-1

Our land, in a vitally important location on Olivas Park Drive across from the Ventura Marina, has been in the family, and part of the economic fabric of the community, for 100 years. And we want it to be part of the future of this community, with a flourishing economy, a thriving job market, and unsurpassed quality of life for its residents.

But the General Plan and DEIR do not describe a viable path for us as landowners going forward.

I will begin with some specific issues regarding language in the Coastal Area Plan, 4-82-83 and 4-94-95. Part of our land is located in the Central Coastal Zone, adjacent to the Ventura Marina, on Olivas Park Drive at Harbor Blvd. The only conclusion the Plan draws about our land is the statement that, “unlike the Preble area, services are not readily available to the Olivas lands.” This is false. Our property has access to all utilities, water, main roads, and the freeway. Indeed, easements on our property serve surrounding areas with utilities.

The Plan also claims that our property is “not included in the City’s sanitation district because of problems with water pressure.” This language is irrelevant and incorrect. There is no evidence that there are water pressure issues, and the sanitation district’s pipelines actually traverse our property.

189-2

While we do not know the original source of these misstatements, such misrepresentations—now repeated in the Plan—threaten to diminish the value of our land in relation to the Preble property. And, of course, they undermine the goal and the value of the Plan itself.

The General Plan also speaks of the widening of Olivas Park Drive, our southern boundary. This would have a direct impact on our property. But the Plan does not address how this would happen or how it would affect our land.

Damaging misstatements about our property also appear in the DEIR. Contrary to the portrayal in the DEIR, our property has significant infrastructure in place, as well as prime accessibility to the highway and the harbor. In fact, with easy access to the marina and beach community, and with the railroad as part of our eastern boundary, our land is uniquely suited to be an important part of future economic development in the area. We are entitled to have all these matters corrected.

189-3

I would also like to raise some additional concerns:

1. The General Plan and DEIR continue to ignore the 28% increase in the homeless population in our community.

189-4

2. According to the General Plan, if we were to build an acre of low income / worker housing we would need to buy two replacement acres of same Ag land to be placed into perpetual agricultural preservation. This is unrealistic and infeasible, and certainly not in line with the State government's housing policies. I 189-5

3. The EIR does not adequately address the enormous "indirect impacts" that will occur as a result of implementing the General Plan, calling them "less than significant." I 189-6

4. The General Plan contains policies that will increase the costs of normal farming operations, making it difficult for farming to remain profitable. I 189-7

5. The Plan does not adequately evaluate the impacts of increased competition for water in our community. I 189-8

The EIR is a flawed document, full of errors, that does not disclose all impacts, direct and indirect, caused by the General Plan. It was obviously rushed—completed in six weeks. It is inaccurate and incomplete, and fails to provide members of the community with the information that they are legally entitled to. This EIR should be corrected and reconsidered, and a reasonable time period should be allowed for meaningful and thoughtful community input. I 189-9

Sincerely,
John Chambers

Comment On:
The responsibility of the Board decision to support the constituents not commerce.

Your Comment:
Sunday, February 16, 2020
Re: Draft General Plan and DEIR
Ventura County Board of Supervisors:

I am urging you to take meaningful action on the above documents coming before you that are schedule to have the public comments close this 27th. I90-1

Your physical and mental health and the health of your constituents as well as others in California, and indeed our global family are at stake when you make your decisions. Meaningful, measurable enforceable reductions to meet California’s climate goals are necessary.

California’s perspective, guidelines and procedures are antiquated as are our County’s own. It is necessary for you as individuals and as a Board, to take serious and bold measures to reel in the oil industry. Oil has had its day and stockholders have benefitted nicely. Ventura County and its citizens have benefitted from the oil industry, also. But the County, State, and Nation have suffered the health and climate consequences of lax regulation. Even if technology finds a “clean burn” solution - the end of oil can be expected. I90-2

The Los Angeles Sustainability Plan, aimed at meeting the goals of the Paris Climate Agreement, has clear and bold goals: “By eliminating fossil fuel production in the county, including drilling, production and refining, the county will protect its residents from harmful local pollution that inequitably burdens low-income communities and communities of color.” And this comes from the second largest oil-producing county in California. We need a similar goal for Ventura County. I90-3

I realize there are challenges you all face in this threading the needle legal world. It falls to you to do so for the sake of those with lives on the line in a polluted world. We will all ultimately benefit from measurable, enforceable reductions sufficient to meet California’s climate goals. It is clear to me, and I suspect to you in your personal quiet times of contemplation, that in the final analysis, there is an overriding benefit to the population of this county for the adoption of the strongest possible measures to insure that greenhouse gas emission are curbed to protect air quality and to ensure a safe, sustainable future for all county residents.

All the best.
John

Follow Up Flag: Follow up
Flag Status: Flagged

I would urge the County to include how the agency would establish a "preponderance of evidence that the resource is not archaeologically or culturally significant." See below. How would this be done and could it be appealed?

The number of archaeological sites in Ventura County is decreasing at a rapid rate and the definition of archaeological significance should be revised, "that all Native American archaeological sites, should be considered significant since the prehistoric identity of the Indigenous groups is tied solely to archaeological evidence." Loss of any sites would irrevocably result in loss of significant portions of their culture.

I91-1

Thank you for your consideration.

John M. Foster, RPA
 President, Greenwood and Associates

For the purpose of this draft EIR, implementation of the 2040 General Plan would have a significant impact on cultural, tribal cultural, or paleontological resources if it would:

Demolish or materially alter in an adverse manner those physical characteristics of an archaeological resource that account for its inclusion in a local register of historical resources pursuant to Section 5020.1(k) requirements of Section 5024.1(g) of the PRC, unless the public agency reviewing the effects of the project establishes by a preponderance of evidence that the resource is not archaeologically or culturally significant. Demolish or materially alter in an adverse manner those physical characteristics of an archaeological resource that convey its archaeological significance and that justify its eligibility for inclusion in the California Register of Historical Resources as determined by a lead agency for purposes of CEQA. Demolish or materially alter in an adverse manner those physical characteristics of an historical resource that convey its historical significance and that justify its inclusion in, or eligibility for, inclusion in the California Register of Historical Resources. Demolish or materially alter in an adverse manner those physical characteristics that account for its inclusion in a local register of historical resources pursuant to Section 5020.1(k) of the PRC or its identification in a historical resources survey meeting the requirements of Section 5024.1(g) of the PRC, unless the public agency reviewing the effects of the project establishes by a preponderance of evidence that the resource is not historically or culturally significant. Cultural, Tribal Cultural, and Paleontological Resources Ventura County 4.5-6 2040 General Plan Draft Environmental Impact Report Demolish or materially alter in an adverse manner those physical characteristics of a historical resource that convey its historical significance and that justify its eligibility for inclusion in the California Register of Historical Resources as determined by a lead agency for purposes of CEQA. Demolish or materially alter in an adverse manner those physical characteristics of a historical resource that convey its historical significance and that justify its eligibility for inclusion in the California Register of Historical Resources as determined by a lead agency for purposes of CEQA. Cause a substantial adverse change in the significance of a tribal cultural resource as defined in PRC Section 21074. Result in the disturbance of human remains, including those interred outside of formal cemeteries. Result in grading and excavation of fossiliferous rock (identified as "Moderate to High" or "High" on Table D.2 of the ISAG) or increase access opportunities and unauthorized collection of fossil materials from valuable sites.

|-----------------------|-------------------------------------------|

This comment letter repeats a comment provided in Letter O30. The response below provides cross references to the portions of Letter O30 where responses to the same comments have already been provided.

I91-1 The comment inquires as to how the County would “establish a preponderance of evidence” that an archaeological or cultural resource is significant, asserts that archaeological sites in Ventura County are “decreasing at a rapid rate” and suggests a revised definition of “archaeological significance.” Refer to response to comment O30-1 for discussion of these issues.

Susan Curtis,

**Letter
I92**

The EIR admits that increased fuel loads directly impacts wildfire risk. The County writes in the EIR that "managing fuel through activities such as vegetation removal and controlled burns, the County and other agencies would be directly reducing the chance of wildfire as well as fuels that would feed wildfires..."

However, the County failed to analyze the impacts of policies COS-3.2, COS-1.15, Implementation Program COS-H and Implementation Program COS-C and others which increase fuel load and vegetation that "feed wildfires."

The County has not conducted a full and complete analysis on the General Plan policies that will increase wildfire risk. Furthermore, they have failed to offer any mitigation to reduce this risk.

This needs to be addressed, revised and recirculated.

I92-1

I92-2

Thank you for your time

Sincerely John Vanoni
Vanoni AG. Construction Inc.

| | |
|-----------------------|-------------------------------|
| Letter I92 | John Vanoni No date |
|-----------------------|-------------------------------|

- I92-1 The comment states that the draft EIR does not analyze the impacts of 2040 General Plan policies that would increase fuel load and vegetation, thus increasing wildfire fire risk. See response to comment O32-30 for a discussion of the potential for 2040 General Plan policies and programs that encourage tree planting and preservation for a discussion of the potential to increase wildland fire hazard.
- I92-2 For the reasons explained in response to comment O32-30, the draft EIR analysis of potential wildfire impacts is adequate and no revisions are warranted. Also, refer to Master Response MR-7 which explains in detail why recirculation of the draft EIR is not required.

To: Curtis, Susan <Susan.Curtis@ventura.org>
Subject: 2040 General Plan Draft EIR Comment

Letter
193

Dear Ms. Curtis:

CEQA guidelines require the Lead Agency to require FEASIBLE mitigation measures to lessen or avoid significant effects on the environment. The agency does not have unlimited authority to impose mitigation measures.

Per CEQA guidelines: Mitigation measures must be feasible. Feasibility analysis must include evidence and data that the additional costs or lost profitability are not sufficiently severe as to render "it impractical to proceed with the project." The Courts have determined that if the costs of the mitigation or alternative are so great that a reasonably prudent person would not proceed with the project, this mitigation measure is deemed unfeasible.

I93-1

Example:

Proposed Mitigation Measure AG-2 (Implementation Program AG-X): The County has failed to disclose and analyze the following:

- 1) Whether there is sufficient land available for purchase/conservation easement for each farmland category;
- 2) The cost per acre to purchase each category of farmland;
- 3) The anticipated cost of establishing a conservation easement for each category of farmland;
- 4) The anticipated cost associated with managing each category of farmland under a conservation easement;
- 5) The anticipated cost associated with monitoring these mitigation parcels scattered throughout the County and who will bear that cost;
- 6) any information that could constitute a "plan" for management of farmland in conservation easements;
- 7) An analysis of direct and indirect impacts caused by this mitigation measure (including impacts associated with LU compatibility conflicts and increased urban-ag-interface);
- 8) Whether the smallest possible mitigation acreage required will achieve the minimum to ensure viability of agriculture on the parcel;
- 9) An analysis of potential conflicts with existing ordinances and statutes (such as the Non-Coastal Zoning Ordinance) to ensure that the smallest possible required mitigation acreage required does not conflict with the County's minimum lot sizes.

I93-2

Respectfully,
Joseph Lampara

| | |
|-----------------------|--------------------------------------------|
| Letter I93 | Joseph Lampara February 26, 2020 |
|-----------------------|--------------------------------------------|

- I93-1 The commenter’s understanding of the feasibility requirements for mitigation are noted. The California Environmental Quality Act requires that an EIR “describe feasible measures which could minimize significant adverse impacts” (State CEQA Guidelines, § 15126.4(a)(1)). It is the obligation of the decision-making body of the lead agency that chooses to approve a project for which an EIR has been certified to determine if there are considerations that make the mitigation identified in the EIR infeasible. These factors can include economic feasibility.
- I93-2 Refer to Master Response MR-5 regarding the feasibility of Mitigation Measure AG-2.

Letter
I94

Dear Board of Supervisors and Staff:

We are writing this letter to urge the Board of Supervisors to reconsider moving forward with the Draft General Plan EIR. The draft EIR has been accelerated to the point that too many issues and impacts have not been properly addressed or studied. These impacts and the corresponding mitigation measures will have severe impacts to land owners and especially those, like us in the agricultural industry and other productive economic segments.

I94-1

Our family has been involved in the agricultural industry for more than 100 years in Ventura County. We have owned numerous land holdings that remain in the family to this date. We have farmed throughout Ventura County and hope to continue to do so in the future.

The Draft EIR is deficient on many levels. CEQA requires that all mitigation measures must be technically and economically feasible. Numerous proposed mitigation measures are neither. We have in the past attempted to identify land and any owners that would be open to sell their development rights for land that was converting from agricultural to commercial use. Not only did we not find anyone that would do so, no one would even quote a price. The only positive response from numerous land owners were that you can buy my property for full market value and then you can do what you want. There is not a project that can be built by adding double land cost to the equation. This was

I94-2

very recently experienced based on proposed policies at LAFCo. These policies were eventually not enacted due to the inability to purchase development rights in an economical feasible manner. This was when LAFCo was contemplating an acre for acre ag preserve. The new policy that is proposed in the 2040 General Plan is requiring 2 acres for every 1 acre of land converted from ag to any other use. This will eliminate the ability to add any new required ag buildings or even farm worker housing. The Draft EIR must study these impacts, since they are not feasible.

I94-2
cont.

The Draft EIR also deals with water in a manner that is not properly studied. There is no analysis on increased water costs and diminishing availability of water. Without reasonable water costs and supply, there is no agricultural industry.

I94-3

The General Plan indicates that agriculture is a high priority in the County. However, new policies and requirements in the General Plan add additional mitigation measures that will make ag virtually impossible. These include new setbacks, limiting types of fumigants pesticides and fertilizers. The General Plan also requires the conversion of all farm equipment to be all electric. Again, not feasible. The costs to purchase new pumps, farm equipment and other existing fuel using equipment will increase operational costs to a point that the County crops will not be competitive in the open market. These new mitigation measures are not sufficiently studied and again are not economically feasible.

I94-4

The Draft EIR is extremely difficult to read and understand. The background reports are lacking in depth of what has been studied other than numerous general statements and very poor mapping. Detailed studies must be added to sufficiently identify impacts and the related mitigation measures for both direct and indirect impacts on the agricultural industry. It is our understanding that reports and studies need to be timely prepared. However numerous studies are older than 5 years. Not timely.

I94-5

After numerous devastating wildfires over the last few years, which significantly impacted ag, the General Plan continues to lay out limiting mitigation

I94-6

measures for fire prevention. The Wildlife corridor eliminates any ag operation or fire prevention in the proposed corridor areas. This is also a major concern not studied in the Draft EIR.

I94-6
cont.

The Draft EIR for the 2040 General plan does not provide adequate analysis for the expansion of permanent bike paths and pedestrian walking trails throughout the County. These impacts are very severe due to constant conflicts from trail users and ag operations. Spraying, dust, odors from ag operations, along with impacts created by the trail users. These are usually theft, vandalism, litter and pet waste. The proposed mitigation measures require additional setbacks from these trails which renders additional land unusable for ag operations.

I94-7

In addition to the above comments on the agricultural aspects and related land use concerns of the DEIR, the undersigned is also a mineral owner directly interested in the impacts on oil and gas production of the DEIR and related General Plan 2040 proposed provisions. In these documents there is a total failure to address the economic impacts of the various policies proposed in violation of the requirements for this process, including but not limited to the loss of royalty income to a large group of County residents. I join in the detailed comments on the various deficiencies and concerns identified in the DEIR as described in the concurrent submissions on behalf of Aera Energy and other operators delivered this week to the County.

I94-8

Please look at the long-term consequences of these General Plan policies and mitigation measures. We formally request additional studies and a revised Draft EIR that will properly look at these and many more issues. The DEIR must be corrected with details of the revisions. Then it can be recirculated.

I94-9

Sincerely,

| | |

Sent: Wednesday, February 26, 2020 1:17 PM
To: General Plan Update
Subject: Comments on General Plan Update

| |
|-----------------------|
| Letter I95 |
|-----------------------|

I am a resident of Upper Ojai, unincorporated Ventura County, at 12048 Sulphur Mountain Road, Ojai CA 93023. Please add this material to the public comments on the VC2040 General Plan Update:

I95-1

Setting policy to deal with climate change in Ventura County requires expert scientific and technical input so that the Climate Action Plan (CAP) is meaningful and can achieve significant greenhouse gas emission reduction goals. VC should contract with an experienced consulting team as Los Angeles City and County have done in order to improve emissions reduction efforts here and meet state climate goals.

I95-2

Ventura’s General Plan Update should include the goal of eliminating fossil fuel production in the County, including drilling, production and refining, in order to reduce pollution. Phasing out production should include policy measures, strict enforcement of regulations, and the closing of loopholes that, for example, would allow trucking of oil and produced water if oil companies claim pipeline construction costs are too high. Maintain Policy COS-7.7 and Policy COS-7.8 as recommended by the VC Board of Supervisors.

I95-3

Climate Action Plan policies must be able to produce measurable and enforceable emission reductions instead of asking for voluntary actions from the County’s oil and gas operators. Revise this plan to ensure that greenhouse gas emissions and groundwater pollution will be curbed, starting immediately. In particular, maintain and defend the five-pound air emissions limit for the Ojai Valley, and force projects subject to CEQA review to fully evaluate TOTAL air emissions and require strict mitigation of local air quality impacts.

I95-4

In conclusion, it is critical that Ventura County adopt climate policies for the future based on expert study and experience; provide for strong and rigorous evaluation of potential adverse impacts in all projects, and enforce regulations without allowing loopholes. We longtime property owners and our families, the future generations of our population, deserve no less.

| | |
|-----------------------|----------------------------------------|
| Letter I95 | June Behar February 26, 2020 |
|-----------------------|----------------------------------------|

- I95-1 This comment is introductory in nature and does not raise a significant environmental issue for which a response is required.

- I95-2 This comment expresses an opinion about the Climate Action Plan that was prepared for the 2040 General Plan and is not related to the adequacy of the draft EIR. Therefore, no response is required. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan. Refer to Master Response MR-1 for a discussion of the scientific and technical basis of the climate planning in the 2040 General Plan, as well as the extraneous factors that limit reasonably feasible emissions reductions.

- I95-3 Refer to Master Response MR-4, Section MR-4.J Potential to Stop Issuing Permits for New Wells (Phase Out Oil and Gas Operations), Section MR-4.G Pipeline Requirements, and Section MR-4.F Flaring regarding the findings and conclusions related to phasing out the oil and gas industry, pipelines, and flaring

in oil and gas operations. The remainder of this comment addresses implementation of the 2040 General Plan and is not related to the adequacy of the draft EIR. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopted a final 2040 General Plan.

I95-4

The comment requests measurable, enforceable Climate Action Plan policies, maintenance of the air emissions threshold of significance for the Ojai Valley, and evaluation and mitigation of the total air emissions of discretionary projects subject to the California Environmental Quality Act (CEQA). The comment also includes reference to enforcing policies without allowing loopholes.

Refer to Master Response MR-1 for discussion of the draft EIR's detailed quantitative and qualitative analysis of the 118 policies and 45 implementation programs included in the 2040 General Plan to reduce greenhouse gas (GHG) emissions in the county and the seven feasible mitigation measures included in the draft EIR to address the potentially significant GHG impacts of the 2040 General Plan and achieve additional GHG emissions reductions.

As discussed in the draft EIR and explained further in response to comment O20-14, the comment refers to a threshold of significance for daily reactive organic gases and oxides of nitrogen emissions in the Ojai Valley which is referenced in the Ojai Valley Area Plan. This threshold, which applies to sources that are not permitted by the Ventura County Air Pollution Control District (VCAPCD), was added to VCAPCD's Air Quality Assessment Guidelines in 1989 and the reference to this threshold was thereafter added to the Ojai Valley Area Plan in 1995. The 2040 General Plan would not change this threshold.

Similarly, the 2040 General Plan would not affect the methodology for calculation of impacts to air quality at the project level. As explained in Section 4.3, "Air Quality," of the draft EIR (page 4.3-5), the County's Initial Study Assessment Guidelines state that the Air Quality Assessment Guidelines published by the VCAPCD should be used for determining thresholds of significance for air quality impacts. VCAPCD's guidance recommends the sample air quality checklist questions contained in Appendix G Section III(a-d) of the State CEQA Guidelines, with additional guidelines specific to Ventura County. Also refer to the response to comment O20-15 for discussion regarding the types of air emissions sources addressed by VCAPCD guidance and thresholds.

This comment expresses an opinion about the 2040 General Plan that is not related to the adequacy of the draft EIR. Therefore, no response is required. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.

Ventura County Board of Supervisors
Attn: RMA Planning Division
General Plan Update
800 Victoria Avenue L#1740
Ventura, California 93009-1740

Dear Board of Supervisors and Staff:

We are writing this letter to urge the Board of Supervisors to reconsider moving forward with the Draft General Plan EIR. The draft EIR has been accelerated to the point that too many issues and impacts have not been properly addressed or studied. These impacts and the corresponding mitigation measures will have severe impacts to land owners and especially those, like us in the agricultural industry and other productive economic segments.

I96-1

Our family has been involved in the agricultural industry for more than 100 years in Ventura County. We have owned numerous land holdings that remain in the family to this date. We have farmed throughout Ventura County and hope to continue to do so in the future.

The Draft EIR is deficient on many levels. CEQA requires that all mitigation measures must be technically and economically feasible. Numerous proposed mitigation measures are neither. We have in the past attempted to identify land and any owners that would be open to sell their development rights for land that was converting from agricultural to commercial use. Not only did we not find anyone that would do so, no one would even quote a price. The only positive response from numerous land owners were that you can buy my property for full market value and then you can do what you want. There is not a project that can be built by adding double land cost to the equation. This was very recently experienced based on proposed policies at LAFCo. These policies were eventually not enacted due to the inability to purchase development rights in an economical feasible manner. This was when LAFCo was contemplating an acre for acre ag preserve. The new policy that is proposed in the 2040 General Plan is requiring 2 acres for every 1 acre of land converted from ag to any other use. This will eliminate the ability to add any new required ag buildings or even farm worker housing. The Draft EIR must study these impacts, since they are not feasible.

I96-2

The Draft EIR also deals with water in a manner that is not properly studied. There is no analysis on increased water costs and diminishing availability of water. Without reasonable water costs and supply, there is no agricultural industry.

I96-3

The General Plan indicates that agriculture is a high priority in the County. However, new policies and requirements in the General Plan add additional mitigation measures that will make ag virtually impossible. These include new setbacks, limiting types of fumigants pesticides and fertilizers. The General Plan also requires the conversion of all farm equipment to be all electric. Again, not feasible. The costs to purchase new pumps, farm equipment and other existing fuel using equipment will increase operational costs to a point that the County crops will not be competitive in the open market. These new mitigation measures are not sufficiently studied and again are not economically feasible.

196-4

The Draft EIR is extremely difficult to read and understand. The background reports are lacking in depth of what has been studied other than numerous general statements and very poor mapping. Detailed studies must be added to sufficiently identify impacts and the related mitigation measures for both direct and indirect impacts on the agricultural industry. It is our understanding that reports and studies need to be timely prepared. However numerous studies are older than 5 years. Not timely.

196-5

After numerous devastating wildfires over the last few years, which significantly impacted ag, the General Plan continues to lay out limiting mitigation measures for fire prevention. The Wildlife corridor eliminates any ag operation or fire prevention in the proposed corridor areas. This is also a major concern not studied in the Draft EIR.

196-6

The Draft EIR for the 2040 General plan does not provide adequate analysis for the expansion of permanent bike paths and pedestrian walking trails throughout the County. These impacts are very severe due to constant conflicts from trail users and ag operations. Spraying, dust, odors from ag operations, along with impacts created by the trail users. These are usually theft, vandalism, litter and pet waste. The proposed mitigation measures require additional setbacks from these trails which renders additional land unusable for ag operations.

196-7

In addition to the above comments on the agricultural aspects and related land use concerns of the DEIR, the undersigned is also a mineral owner directly interested in the impacts on oil and gas production of the DEIR and related General Plan 2040 proposed provisions. In these documents there is a total failure to address the economic impacts of the various policies proposed in violation of the requirements for this process, including but not limited to the loss of royalty income to a large group of County residents. I join in the detailed comments on the various deficiencies and concerns identified in the DEIR as described in the concurrent submissions on behalf of Aera Energy and other operators delivered this week to the County.

196-8

Please look at the long-term consequences of these General Plan policies and mitigation measures. We formally request additional studies and a revised Draft EIR that will properly look at these and many more issues. The DEIR must be corrected with details of the revisions. Then it can be recirculated.

196-9

Sincerely,

Jurgen Gramckow

**Letter
I97**

Hi,

I am a citizen that is deeply concerned about the impact of climate change on our county. I have noticed we have many oil wells in our county. I think our action plan should be aggressive like the LA plan and the Paris agreement. We need to have a goal of eliminating fossil fuel production in the county, including drilling, production and refining.

I
I97-1

Also I agree with the following policies:

1.Maintain Policy COS-7.7 as recommended by the Board of Supervisors, so that all newly permitted discretionary oil wells are required to convey oil and produced water via pipelines instead of trucking.

I
I97-2

2.Flaring should be allowed only in cases of emergency or for testing purposes.

I
I97-3

3.Revise the Climate Action Plan and corresponding policies in the General Plan to achieve measurable, enforceable reductions in greenhouse gas emissions.

I
I97-4

Thank you,

Karen Lindberg and John Tarascio, Newbury Park residents
1207 Knollwood Drive,
Newbury Park, CA 91320

|-----------------------|--------------------------------------------------------------|

- I97-1 Refer to Master Response MR-4, Section MR-4.J Potential to Stop Issuing Permits for New Wells (Phase Out Oil and Gas Operations), regarding the findings and conclusions related to phasing out oil and gas operations. The remainder of the comment addresses implementation of the 2040 General Plan and is not related to the adequacy of the draft EIR. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.
- I97-2 Refer to Master Response MR-4, Section MR-4.G, “Pipeline Requirements,” regarding the findings and conclusions related to the conveyance of oil and produced water via pipelines instead of trucking. The remainder of the comment addresses implementation of the 2040 General Plan and is not related to the adequacy of the draft EIR. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.
- I97-3 Refer to Master Response MR-4, Section MR-4.F, “Flaring,” regarding the findings and conclusions related to flaring in oil and gas operations. The remainder of the comment addresses implementation of the 2040 General Plan and is not related to the adequacy of the draft EIR. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.
- I97-4 The comment states that the 2040 General Plan should be revised to achieve measurable, enforceable reductions in greenhouse gas emissions. Refer to Master Response MR-1 regarding the development of the 2040 General Plan policies and programs. No specific issues related to the content, analysis, conclusions, or overall adequacy of the draft EIR are raised in this comment. Therefore, no further response is provided.

Comment On:
All of it
Your Comment:

I feel we should set policy driven by reducing climate change and the draft update does not provide enough emissions reduction.

We can and should do better.

The CAP addresses the consumption side by encouraging electric fuel vehicles and clean power for homes and businesses. It does not address the production side at all. Ventura County is the third largest oil and gas producing county in California. As such, we must do our part to reduce oil production through thoughtful, rigorous policy to phase out production.

This CAP will set the policies that will drive land use decisions and projects that affecting GHG emissions for the next 20 years. The planet depends on each county, municipality and country to do this right.

We need an expert team that will produce a plan that will meet the greenhouse gas emission reduction goals.

The General Plan needs to reduce emissions that harm people and the planet.

The Los Angeles Sustainability Plan, aimed at meeting the goals of the Paris Climate Agreement, has clear and bold goals: "By eliminating fossil fuel production in the county, including drilling, production and refining, the county will protect its residents from harmful local pollution that inequitably burdens low-income communities and communities of color." And this comes from the second largest oil-producing county in California. We need a similar goal for Ventura County. Another goal from the LA Plan: "Collaborate with DOGGR and unincorporated communities and affected cities to develop a sunset strategy for all oil and gas operations that prioritizes disadvantaged communities." Ventura County needs to do the same.

Climate change is caused by fossil fuel production and consumption.

I98-1
I98-2
I98-3

| | |
|-----------------------|-----------------------------------------|
| Letter I98 | Karen Socher February 1, 2020 |
|-----------------------|-----------------------------------------|

- I98-1 The comment asserts that the policies in the 2040 General Plan do not achieve enough emissions reductions and suggests that it inappropriately excludes policies related to production of non-renewable resources. Refer to Master Response MR-1 for discussion of the draft EIR’s detailed quantitative and qualitative analysis of the 118 policies and 45 implementation programs included in the 2040 General Plan to reduce greenhouse gas (GHG) emissions in the county and the seven feasible mitigation measures included in the draft EIR to address the potentially significant GHG impacts of the 2040 General Plan and achieve additional GHG emissions reductions. No specific issues related to the content, analysis, conclusions, or overall adequacy of the draft EIR are raised in this comment. Therefore, no further response is provided.
- I98-2 The comment suggests that phasing out the production of oil and gas in the unincorporated county is an appropriate policy for inclusion in the 2040 General Plan. This industry is a source of projected GHG emissions and eliminating extraction activities would be expected to have a favorable reduction in emissions. Refer to Master Response MR-4 for response to the comment requesting inclusion of a General Plan policy to phase out oil and gas production in the county.
- I98-3 The comment notes that the Los Angeles Sustainability Plan includes a goal to develop a sunset strategy for oil and gas extraction and suggests that the County consider a similar strategy. Refer to response to comment I98-2, above. This comment also expresses an opinion about the 2040 General Plan and is not related to the adequacy of the draft EIR. Therefore, no response is required. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.

Subject: Climate change has environmental impacts!

CAUTION: If this email looks suspicious, DO NOT click. Forward to Spam.Manager@ventura.org

Susan Curtis,

Dear Ventura County Board of Supervisors and Planning Department,

Climate issues are something I feel worried about. Ventura County is warming faster than any county in the nation. Our ocean is acidifying faster. Drought and floods have hit us worse, and we can expect more extreme weather.

I
I99-1

My family and community are counting on you to assure analysis of the full scope of environmental impacts and mitigations in the Draft EIR.

First, it is necessary that all greenhouse gas emissions be counted based on the most current science.

I
I99-2

There are many ways to mitigate climate impacts, like a sunset plan for oil and gas production, decarbonization of transportation and buildings, zero waste, incentives for regenerative agriculture and water management, and reducing emissions from tailpipes.

I
I99-3

I want an EIR that covers major climate impacts via a systematic plan.

Thank you for listening to the people and doing what's right for the health of your constituents, the ones you represent.

I
I99-4

Remember this: we ALL live downstream.

Thank you—

Comment On:
New Draft Environmental Impact Report
Your Comment:

According to a recent study of data by the Washington Post Ventura County ranks as the fastest-warming county in the Lower 48 states.

It is critical that Ventura County gets its climate policies RIGHT in the General Plan Update. The draft plan as currently written fails to meet requirements for streamlined CEQA review.

Please take the following actions:

- 1. Buffers should be increased from the currently 1,500 feet to 2,500 feet I I100-2
- 2. Maintain Policy COS-7.7 as recommended by the Board of Supervisors, so that all newly permitted discretionary oil wells are required to convey oil and produced water via pipelines instead of trucking I I100-3
- 3. Maintain Policy COS-7.8 as recommended by the Board of Supervisors, so that all newly permitted discretionary oil wells are required to collect gases and use or remove them for sale or proper disposal instead of flaring or venting. Flaring should be allowed only in cases of emergency or for testing purposes. I I100-4
- 4. Revise the Climate Action Plan and corresponding policies in the General Plan to achieve measurable, enforceable reductions in greenhouse gas emissions I I100-5
- 5. The county should adopt the strongest possible measures to ensure that greenhouse gas emissions are curbed to protect air quality and to ensure a safe, sustainable future for all county residents

Thank you for your time and attention to this most important issue.
 Katharine Simmons

| | |
|------------------------------|-------------------------------------------------|
| Letter I100 | Katharine S Simmons February 27, 2020 |
|------------------------------|-------------------------------------------------|

I100-1 The comment states that, as written, the 2040 General Plan does not meet requirements for streamlining and tiering subsequent California Environmental Quality Act (CEQA) review of project-level greenhouse gas emissions pursuant to State CEQA Guidelines Section 15183.5. This is accurate and reflected in the draft EIR. There is no requirement that the 2040 General Plan meet CEQA requirements for streamlined review. Page 4.8-46 of the draft EIR recommends Mitigation Measure GHG-3, which would remove the CEQA streamlining provision proposed in Implementation Program COS-EE from the 2040 General Plan and specify that the potential greenhouse gas (GHG) emissions impacts of future, discretionary projects be reviewed in accordance with the most recent adopted version of the ISAG at the time of project-level environmental review.

Mitigation Measure GHG-3 could result in additional GHG emission reductions if improved technologies, design features, or the like that are infeasible or unavailable today become available and are included in future development or required as part of future project-level reviews. To the extent this were to occur, this mitigation measure would improve progress toward meeting the 2030 and post-2030 GHG reduction targets. However, it would be speculative to determine at this time whether and how Mitigation Measure GHG-3 would affect future GHG emissions in the county. Because climate change impacts would remain significant and unavoidable following mitigation, the County has determined that CEQA streamlining pursuant to State CEQA Guidelines, Section 15183.5 for GHG emissions was not an appropriate 2040 General Plan program.

- I100-2 Refer to Master Response MR-4, Section MR-4.H, “Buffers (Setbacks),” regarding the findings and conclusions related to buffer (setback) distance.

- I100-3 Refer to Master Response MR-4, Section MR-4.G, “Pipeline Requirements,” regarding the findings and conclusions related to the conveyance of oil and produced water. The remainder of the comment addresses implementation of the 2040 General Plan and is not related to the adequacy of the draft EIR. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.

- I100-4 Refer to Master Response MR-4, Section MR-4.F, “Flaring,” regarding the findings and conclusions related to flaring in oil and gas operations. The remainder of the comment addresses implementation of the 2040 General Plan and is not related to the adequacy of the draft EIR. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.

- I100-5 The comment states that the 2040 General Plan should be revised to achieve measurable, enforceable reductions in GHG emissions. The 2040 General Plan includes measurable targets for GHG emission reductions for 2030, 2040, and 2050 that are aligned with the State’s legislative GHG reduction targets and other reduction goals (see page 4.8-6 of the draft EIR). Refer to Master Response MR-1 for additional detail. This comment expresses disapproval of the 2040 General Plan and is not related to the adequacy of the draft EIR. This comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.

Also, the comment states that the County should adopt “the strongest possible measures to ensure that greenhouse gas emissions are curbed.” Refer to Master Response MR-1 for additional detail regarding the development of the GHG inventory, policies, and programs of the 2040 General Plan.

Ventura County Board of Supervisors
Attn: RMA Planning Division
General Plan Update
800 Victoria Avenue L#1740
Ventura, California 93009-1740

Letter
I101

Dear Board of Supervisors and Staff:

We are writing this letter to urge the Board of Supervisors to reconsider moving forward with the Draft General Plan EIR. The draft EIR has been accelerated to the point that too many issues and impacts have not been properly addressed or studied. These impacts and the corresponding mitigation measures will have severe impacts to land owners and especially those, like us in the agricultural industry and other productive economic segments.

I101-1

Our family has been involved in the agricultural industry for more than 100 years in Ventura County. We have owned numerous land holdings that remain in the family to this date. We have farmed throughout Ventura County and hope to continue to do so in the future.

The Draft EIR is deficient on many levels. CEQA requires that all mitigation measures must be technically and economically feasible. Numerous proposed mitigation measures are neither. We have in the past attempted to identify land and any owners that would be open to sell their development rights for land that was converting from agricultural to commercial use. Not only did we not find anyone that would do so, no one would even quote a price. The only positive response from numerous land owners were that you can buy my property for full market value and then you can do what you want. There is not a project that can be built by adding double land cost to the equation. This was very recently experienced based on proposed policies at LAFCo. These policies were eventually not enacted due to the inability to purchase development rights in an economical feasible manner. This was when LAFCo was contemplating an acre for acre ag preserve. The new policy that is proposed in the 2040 General Plan is requiring 2 acres for every 1 acre of land converted from ag to any other use. This will eliminate the ability to add any new required ag buildings or even farm worker housing. The Draft EIR must study these impacts, since they are not feasible.

I101-2

The Draft EIR also deals with water in a manner that is not properly studied. There is no analysis on increased water costs and diminishing availability of water. Without reasonable water costs and supply, there is no agricultural industry.

I101-3

The General Plan indicates that agriculture is a high priority in the County. However, new policies and requirements in the General Plan add additional mitigation measures that will make ag virtually

I101-4

impossible. These include new setbacks, limiting types of fumigants pesticides and fertilizers. The General Plan also requires the conversion of all farm equipment to be all electric. Again, not feasible. The costs to purchase new pumps, farm equipment and other existing fuel using equipment will increase operational costs to a point that the County crops will not be competitive in the open market. These new mitigation measures are not sufficiently studied and again are not economically feasible.

I101-4
cont.

The Draft EIR is extremely difficult to read and understand. The background reports are lacking in depth of what has been studied other than numerous general statements and very poor mapping. Detailed studies must be added to sufficiently identify impacts and the related mitigation measures for both direct and indirect impacts on the agricultural industry. It is our understanding that reports and studies need to be timely prepared. However numerous studies are older than 5 years. Not timely.

I101-5

After numerous devastating wildfires over the last few years, which significantly impacted ag, the General Plan continues to lay out limiting mitigation measures for fire prevention. The Wildlife corridor eliminates any ag operation or fire prevention in the proposed corridor areas. This is also a major concern not studied in the Draft EIR.

I101-6

The Draft EIR for the 2040 General plan does not provide adequate analysis for the expansion of permanent bike paths and pedestrian walking trails throughout the County. These impacts are very severe due to constant conflicts from trail users and ag operations. Spraying, dust, odors from ag operations, along with impacts created by the trail users. These are usually theft, vandalism, litter and pet waste. The proposed mitigation measures require additional setbacks from these trails which renders additional land unusable for ag operations.

I101-7

In addition to the above comments on the agricultural aspects and related land use concerns of the DEIR, the undersigned is also a mineral owner directly interested in the impacts on oil and gas production of the DEIR and related General Plan 2040 proposed provisions. In these documents there is a total failure to address the economic impacts of the various policies proposed in violation of the requirements for this process, including but not limited to the loss of royalty income to a large group of County residents. I join in the detailed comments on the various deficiencies and concerns identified in the DEIR as described in the concurrent submissions on behalf of Aera Energy and other operators delivered this week to the County.

I101-8

Please look at the long-term consequences of these General Plan policies and mitigation measures. We formally request additional studies and a revised Draft EIR that will properly look at these and many more issues. The DEIR must be corrected with details of the revisions. Then it can be recirculated.

I101-9

I102

Re: County of Ventura 2040 General Plan Update and DEIR

Dear Susan,

I am writing to express my support of comments on the 2040 General Plan Update and DEIR submitted by Dr. Steven Colomé and also those comments submitted by Climate First: Replacing Oil & Gas (CFROG). As I recall, when the County conducted an early outreach effort on the General Plan Update, results came back showing a very high level of residents' concern about climate change. Since then, we've had extraordinary and damaging wildfires including the Thomas Fire and the Woolsey Fire; we've also had the County's commissioned report on sea level rise finding the County is highly susceptible both to the impending sea level rise as well as storm surge flooding. Yet, the County still cannot bring itself to adequately address and meet greenhouse gas (GHG) reduction goals of the State or even the County's own stated General Plan goals.

I102

Ventura County oil and gas production is one of the highest in the state. So, this sector – oil and gas development, including existing operations – is where we must plan and execute a huge reduction of GHG emissions over the next 20 years. The problems with the baseline inventory of GHG emissions, emission forecasting, lack of effective, meaningful policies, inadequate mitigations, and failure to produce an effective CAP (Climate Action Plan) are laid out in the comments from Dr. Colomé and CFROG.

The County is failing to take hold of the power of a General Plan and use it - to implement necessary and important change – to reduce our GHG emissions. In particular, the County must incorporate mitigation measures to: 1) prohibit all new oil well drilling, 2) prohibit all flaring, and 3) phase out all non-conforming/antiquated facilities and operations through amortization.

I102-2

Please remember and embrace the residents' concern about climate change at the outset of the General Plan process and show leadership in this time of climate crises. You must act in the best interests of Ventura County residents.

I102-3

Sincerely,
Kathryn Lottes

Susan Curtis,

Dear Ventura County Board of Supervisors and Planning Department,

Thank you for your care in ushering our community into a more resilient future. It must take great effort some days in this time of such rapid change where in your profession maybe you are facing issues your predecessors never had to consider. As a young adult in this world, I can relate. My peers and I are used to frequent climate anxiety dreams, pollution in our lungs, each other to show up, adjust our plans, and figure out how to be a resilient community. It takes attention but we see the capacity that you and we have to create a more thriving plan together.

I1103-1

As an ecologist and environmental educator I have seen first hand how the climate crisis is effecting our ecosystems, homes, neighbors, and youths. We are counting on you to assure analysis of the full scope of environmental impacts and mitigations in the Draft EIR.

First, it is necessary that all greenhouse gas emissions be counted based on the most current science.

I1103-2

Additionally, there are many ways to mitigate climate impacts, like a sunset plan for oil and gas production, decarbonization of transportation and buildings, zero waste, incentives for regenerative agriculture and water management, and reducing emissions from tailpipes.

I1103-3

I want an EIR that covers major climate impacts via a systematic plan.

cont.

The Draft EIR is extremely difficult to read and understand. The background reports are lacking in depth of what has been studied other than numerous general statements and very poor mapping. Detailed studies must be added to sufficiently identify impacts and the related mitigation measures for both direct and indirect impacts on the agricultural industry. It is our understanding that reports and studies need to be timely prepared. However numerous studies are older than 5 years. Not timely.

I104-5

After numerous devastating wildfires over the last few years, which significantly impacted ag, the General Plan continues to lay out limiting mitigation measures for fire prevention. The Wildlife corridor eliminates any ag operation or fire prevention in the proposed corridor areas. This is also a major concern not studied in the Draft EIR.

I104-6

The Draft EIR for the 2040 General plan does not provide adequate analysis for the expansion of permanent bike paths and pedestrian walking trails throughout the County. These impacts are very severe due to constant conflicts from trail users and ag operations. Spraying, dust, odors from ag operations, along with impacts created by the trail users. These are usually theft, vandalism, litter and pet waste. The proposed mitigation measures require additional setbacks from these trails which renders additional land unusable for ag operations.

I104-7

In addition to the above comments on the agricultural aspects and related land use concerns of the DEIR, the undersigned is also a mineral owner directly interested in the impacts on oil and gas production of the DEIR and related General Plan 2040 proposed provisions. In these documents there is a total failure to address the economic impacts of the various policies proposed in violation of the requirements for this process, including but not limited to the loss of royalty income to a large group of County residents. I join in the detailed comments on the various deficiencies and concerns identified in the DEIR as described in the concurrent submissions on behalf of Aera Energy and other operators delivered this week to the County.

I104-8

Please look at the long-term consequences of these General Plan policies and mitigation measures. We formally request additional studies and a revised Draft EIR that will properly look at these and many more issues. The DEIR must be corrected with details of the revisions. Then it can be recirculated.

I104-9

Sincerely,

| | |

Letter
I105

Re: Comments on Ventura County General Plan DEIR

Dear Ms. Curtis:

I represent and serve on the McLoughlin Family Committee, a group of family members that own approximately 300 acres of agricultural property off of Olivas Park Road in the County of Ventura, in proximity to the City of Ventura.

The McLoughlin family has farmed this land for generations. It remains our desire to continue this legacy. However, in the face of never-ending changes to the regulatory environment, we again find ourselves attempting to ascertain how new policies and programs as proposed in the draft 2040 General Plan will impact and challenge our ability to serve as stewards of this heritage.

I105-1

It had been our hope that the DEIR would provide some clarity and insight into how the new policies and programs within the revised General Plan would impact our farming operation. However, that is not the case. Simply said, we believe the General Plan Update and subsequent Environmental Impact Report fail to adequately analyze or study impacts on the farming industry.

With that said, we would like to specifically present the following:

- The Background report Table 6-26: Transportation Department Planned Capital Projects lists sections of roadways the County plans for expanded capacity or widening, along with the scope of those enhancements. It also covers in length the plan to add bike paths and bike lanes in accordance with existing County wayfarer plans. However, the DEIR never analyzes the loss of farmland resulting from these changes in infrastructure – it’s not even mentioned as a possibility in the DEIR. Olivas Park Road between Victoria and Harbor is listed as one of the areas planned for road widening, a stretch of roadway that borders the entire eastern portion of our farmland and property. While the impact on our farming operation and financial losses due to property loss are clearly quantifiable, the report fails to list or quantify these impacts.

I105-2

- In Section 3-8, The DEIR states that because there will be no “substantive” change to the agricultural, open space, or rural designations, the General Plan Update (GPU) will be consistent with SOAR. However, no further details beyond this conclusory statement is provided. There is no way for the reader to come to his or her own conclusion on whether the GPU will result in inconsistencies with SOAR that might lead to physical environmental impacts. There is no description of the changes to the Agriculture, Open Space, and Rural policies to determine whether they are in fact non-substantive.

I105-3

Given the length and breath of the Draft General Plan update and CEQA analysis, we made an attempt to focus our initial review and subsequent comments to issues specific to agriculture and farming. However, it’s clear that the 2040 General Plan will impact the Ventura County local economy across sectors – all of which influence the ability to live and work in this region. The DEIR’s lack of analysis of those economic impacts, calls into question the legitimacy of both the draft General Plan update, and the CEQA analysis. As such, we respectfully request that the DEIR be recirculated in the hopes that further study will resolve these shortcomings.

I105-4

I appreciate your consideration.

I106

February 24, 2020

Ventura County Board of Supervisors
Attn: RMA Planning Division
General Plan Update
800 Victoria Avenue L#1740
Ventura, California 93009-1740

Dear Board of Supervisors and Staff:

We are writing this letter to urge the Board of Supervisors to reconsider moving forward with the Draft General Plan EIR. The draft EIR has been accelerated to the point that too many issues and impacts have not been properly addressed or studied. These impacts and the corresponding mitigation measures will have severe impacts to land owners and especially those, like us in the agricultural industry and other productive economic segments.

I106-1

Our family has been involved in the agricultural industry for more than 100 years in Ventura County. We have owned numerous land holdings that remain in the family to this date. We have farmed throughout Ventura County and hope to continue to do so in the future.

The Draft EIR is deficient on many levels. CEQA requires that all mitigation measures must be technically and economically feasible. Numerous proposed mitigation measures are neither. We have in the past attempted to identify land and any owners that would be open to sell their development rights for land that was converting from agricultural to commercial use. Not only did we not find anyone that would do so, no one would even quote a price. The only positive response from numerous land owners were that you can buy my property for full market value and then you can do what you want. There is not a project that can be built by adding double land cost to the equation. This was very recently experienced based on proposed policies at LAFCo. These policies were eventually not enacted due to the inability to purchase development rights in an economical feasible manner. This was when LAFCo was contemplating an acre for acre ag preserve. The new policy that is proposed in the 2040 General Plan is requiring 2 acres for every 1 acre of land converted from ag to any other use. This will eliminate the ability to add any new required ag buildings or even farm worker housing. The Draft EIR must study these impacts, since they are not feasible.

I106-2

The Draft EIR also deals with water in a manner that is not properly studied. There is no analysis on increased water costs and diminishing availability of water. Without reasonable water costs and supply, there is no agricultural industry.

I106-3

The General Plan indicates that agriculture is a high priority in the County. However, new policies and requirements in the General Plan add additional mitigation measures that will make ag virtually impossible. These include new setbacks, limiting types of fumigants pesticides and fertilizers. The General Plan also requires the conversion of all farm equipment to be all electric. Again, not feasible. The costs to purchase new pumps, farm equipment and other existing fuel using equipment will increase operational costs to a point that the County crops will not be competitive in the open market. These new mitigation measures are not sufficiently studied and again are not economically feasible.

I1106-4

The Draft EIR is extremely difficult to read and understand. The background reports are lacking in depth of what has been studied other than numerous general statements and very poor mapping. Detailed studies must be added to sufficiently identify impacts and the related mitigation measures for both direct and indirect impacts on the agricultural industry. It is our understanding that reports and studies need to be timely prepared. However numerous studies are older than 5 years. Not timely.

I1106-5

After numerous devastating wildfires over the last few years, which significantly impacted ag, the General Plan continues to lay out limiting mitigation measures for fire prevention. The Wildlife corridor eliminates any ag operation or fire prevention in the proposed corridor areas. This is also a major concern not studied in the Draft EIR.

I1106-6

The Draft EIR for the 2040 General plan does not provide adequate analysis for the expansion of permanent bike paths and pedestrian walking trails throughout the County. These impacts are very severe due to constant conflicts from trail users and ag operations. Spraying, dust, odors from ag operations, along with impacts created by the trail users. These are usually theft, vandalism, litter and pet waste. The proposed mitigation measures require additional setbacks from these trails which renders additional land unusable for ag operations.

I1106-7

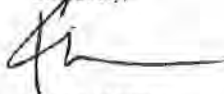

In addition to the above comments on the agricultural aspects and related land use concerns of the DEIR, the undersigned is also a mineral owner directly interested in the impacts on oil and gas production of the DEIR and related General Plan 2040 proposed provisions. In these documents there is a total failure to address the economic impacts of the various policies proposed in violation of the requirements for this process, including but not limited to the loss of royalty income to a large group of County residents. I join in the detailed comments on the various deficiencies and concerns identified in the DEIR as described in the concurrent submissions on behalf of Aera Energy and other operators delivered this week to the County.

I1106-8

Please look at the long-term consequences of these General Plan policies and mitigation measures. We formally request additional studies and a revised Draft EIR that will properly look at these and many more issues. The DEIR must be corrected with details of the revisions. Then it can be recirculated.

I1106-9

Sincerely,

Kevin McAtee

Subject: General Plan and EIR

| |
|------------------------|
| Letter I108 |
|------------------------|

Dear Ms. Curtis,

I am writing to express my concerns about the current draft of the General Plan and the Environmental Impact Report. The plan has some laudable goals, but they are aspirational and unenforceable.

I I108-1

We should have a sunset plan for oil and gas production. Oil should be transported by pipeline instead of trucks. Flaring should be prohibited, except for testing purposes.

I I108-2

We need to invest in green buildings, green jobs, and renewable energy. The time for business as usual is over. Our county is the fastest warming county in the lower forty-eight states. We need a strong general plan that addresses the climate crisis we face.

I I108-3

Thank you,
 Kristen Kessler
 Ventura

| | |
|------------------------|---------------------------------------------|
| Letter I108 | Kristen Kessler February 26, 2020 |
|------------------------|---------------------------------------------|

I108-1 This comment regarding the adequacy of the 2040 General Plan and draft EIR is noted. However, no specific issues related to the content, analysis, conclusions, or overall adequacy of the draft EIR are raised in this comment. Therefore, no further response is provided.

I108-2 Refer to Master Response MR-4, Sections MR-4.J Potential to Stop Issuing Permits for New Wells (Phase Out Oil and Gas Operations), MR-4.G Pipeline Requirements, MR-4.F Flaring, and MR-4.A County’s Authority to Regulate Oil and Gas Development, regarding the findings and conclusions related to phasing out oil and gas production, conveyance of oil and produced water from oil and gas operations, flaring in oil and gas operations, and the County’s authority to regulate oil and gas development.

I108-3 This comment expresses an opinion about the 2040 General Plan and is not related to the adequacy of the draft EIR. This comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.

Note that the 2040 General Plan, as proposed, includes policies and programs that promote green building practices (e.g., Policy COS-8.7 and Program R, Policy Haz-11.7) and renewable energy (e.g., Policies COS-8.1, COS-8.4, COS-8.5, COS-8.8, AG-5.2, AG-5.3, EV-4.4). Also, refer to Master Response MR-1 for additional information pertaining to the development of the greenhouse gas inventory, policies, and programs of the 2040 General Plan.

| Letter I109 |
|------------------------------|

To: Susan Curtis-

County failed to evaluate mitigation measure for feasibility- 500' set back for "sensitive receptors" from freeways and high traffic roads.

Mitigation Measure AQ-3 (Policy HAZ10-X) creates a minimum 500' set back for "sensitive receptors" from freeways and high traffic roads. Yet the County states in the Land Use section of the EIR that "the majority of the anticipated build out will be within the freeway corridors."

Has the County completed a "buildout study" to ensure that the establishment of this set back still leaves enough room for development to occur? Will this mitigation measure be economically feasible?

I109-1

Susan Curtis,

Dear Ventura County Board of Supervisors and Planning Department,

Climate change is THE existential threat, not just to the United States, but to the human race. Every level of government must take this into account and do what is necessary to stop the emission of carbon dioxide and methane. And to encourage the use of energy sources like solar, wind, and nuclear power. Specifically, it will be difficult, if not impossible, to reach a zero carbon economy without using nuclear power in a transition phase. There are modern nuclear powerplant designs that are much safer than coal and oil fired power plants. Government should encourage their deployment.

Letter
I111

February 25, 2020

Ventura County Board of Supervisors
Attn: Susan Curtis, Manager, General Plan Update Section
800 South Victoria Avenue, L#1740
Ventura, CA 93009-1740

I'm writing to you as a resident of the County concerned about the viability of the oil and gas industry in Ventura County.

I111-1

The 2040 General Plan Draft EIR fails to give proper analysis to oil and gas mineral resources.

Neither the EIR nor the Background report provide a complete and thorough description of the existing, current regulatory setting that oversees the management and production of mineral resources in the County and the State of California. The EIR and the Background Report only disclose federal and state agencies that regulate pipelines and flaring, which is not applicable to all mineral resources that must be analyzed in an EIR under CEQA guidelines. The EIR should be revised to include an overview and description of all potential regulations, regulatory bodies, and programs that regulate mineral resources in Ventura County.

I111-2

The EIR fails to actually analyze for direct and indirect impacts to mineral resource zones that will occur as a result of the 2040 General Plan. The County admits that Land Use Designation changes in the 2040 General Plan will result in changes to land uses OVER known and important mineral reserves. But neither the EIR nor the Background Report provide any information regarding estimated and anticipated "buildout" in terms of acreage, actual location, number of dwelling units, and development density and intensity. These incompatible land uses will significantly impact future mineral resource production and must be evaluated and mitigated for in the EIR.

I111-3

The EIR never addresses indirect impacts to mineral resource development that will occur under the 2040 General Plan. As incompatible land uses (such as residential development) occur on or adjacent to mineral production and mineral reserves, compatibility conflicts will increase. Reasonably foreseeable indirect impacts include nuisance complaints, traffic conflicts, theft, vandalism and attempted trespass on mineral production sites. The EIR must analyze and evaluate these impacts on the ability to produce mineral resources in the County.

The Draft EIR is lacks critical analysis and must be corrected and recirculated to ensure a fair process for Ventura County residents.

I111-4

Thank you,

| | |
|------------------------|---------------------------------------------|
| Letter I111 | Laura K. McAvoy February 25, 2020 |
|------------------------|---------------------------------------------|

This comment letter repeats many of the same comments provided in Letter I61. The responses below provide cross references to the portions of Letter I61 where responses to the same comments have already been provided.

- I111-1 Refer to response to comment I61-1 regarding concerns related to the oil and gas industry and the draft EIR’s analysis of oil and gas mineral resources.
- I111-2 Refer to Master Response MR-6 for discussion of how the County appropriately uses the Background Report to describe the existing environmental setting in the draft EIR. The commenter indicates that the draft EIR and Background Report do not provide a complete description of the existing and current regulatory setting for production of mineral resources. The Background Report Section 8.4, “Mineral Resources,” 8.5, “Energy Resources,” and Section 10.2 “Legal and Regulatory Framework for Water Management (Class II Underground Injection Control Program),” provide relevant regulatory information necessary for understanding and evaluating the impacts of the 2040 General Plan on petroleum resources. Additionally, the draft EIR Mineral and Petroleum Resources Section 4.12.1, Background Report Setting Updates, includes additional information laws and regulations that pertain to petroleum development. This includes federal laws and regulations related to gas pipelines, state laws and regulations related to the California Pipeline Safety Act of 1981, Ventura County Air Pollution Control District (VCAPCD) Rule No. 71.1 – Crude Oil Production and Separation and Rule No. 54 – Sulfur Compounds, VCAPCD Primary (Non-Emergency) Flares, VCAPCD Emergency Flares, and VCAPCD Permitted Flare Variances, and Non-Coastal and Coastal Zoning Ordinances.
- In the response to this comment, and based on the April 9, 2020 comment letter from the California Geologic Energy Management Division (CalGEM) describing its current regulatory program, the regulatory framework section has been augmented. The enhanced discussion of regulatory framework would not alter the findings or analysis in the EIR. These augments to the regulatory setting for Section 4.12 are provided in final EIR Chapter 3, “Revisions to the Draft EIR.”
- I111-3 Refer to response to comment O5-90 regarding the interplay between the land use designations in the 2040 General Plan and mineral resource zones and Master Response MR-2 for a detailed discussion of how buildout was analyzed in the draft EIR. Response to comment O9-8 provides a discussion of the potential for indirect impacts due to incompatible land uses.
- I111-4 Refer to response to comment I61-4 and Master Response MR-7, which explains in detail why recirculation of the draft EIR is not required.

Re: Comments on VC 2040, GPU DEIR

2-27-2020

**Letter
I113**

- Program H: County Tree Planting Program. The County shall plant at least one thousand trees annually on County property.

Comment: Priority should be given to planting appropriate native tree species, for their habitat value. County Administration and Court site at Victoria provides opportunity to create public awareness and education through the planting of native trees (and other native plants) with explanatory signage.

I113-1

- Policy-- Countywide Tree Planting: The County shall establish and support a countywide target for the County, cities in Ventura County, agencies, organizations and citizens to plant two million trees throughout the county by 2040.

Comment: County should encourage the planting of appropriate native trees.

- Air Quality Impacts:

Comment: Need for best management practices for dust control and/or mitigation along the dirt shoulders of some agricultural fields; particularly when such dust contains remnants of chemicals from fertilizers, herbicides, pesticides.

I113-2

- Water Quality impacts:

Comment: Need for best management practices and/or mitigation to control rain and or run-off, to prevent dirt from agricultural fields and/or shoulders of roadways, from washing into culverts/barrancas/streams/rivers/coastal waters/ocean, particularly when such dust contains remnants of chemicals from fertilizers, herbicides, pesticides.

I113-3

Leslie Purcell

lesliepurcell@gmail.com

| | |
|------------------------|--------------------------------------------|
| Letter I113 | Leslie Purcell February 27, 2020 |
|------------------------|--------------------------------------------|

- I113-1 The comment addresses the draft 2040 General Plan (specifically, programs and policies regarding tree planting) and is not related to the adequacy of the draft EIR. Additionally, the comment suggests additional topics that could be considered in the 2040 General Plan and is not related to the adequacy of the draft EIR. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.
- I113-2 The comment generally suggests best management practices for dust control along the dirt shoulders of agricultural fields and is not related to the adequacy of the draft EIR. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan. Section 4.3, “Air Quality,” in the draft EIR includes multiple policies and programs to reduce air quality impacts, including Mitigation Measure AQ-2b, which would establish fugitive dust best management practices for new discretionary development. Fugitive dust generated by existing agricultural fields is not an environmental effect of the 2040 General Plan.
- I113-3 The comment suggests best management practices to control runoff from agricultural fields and roadway shoulders but does not provide evidence linking benefits from these actions to impacts from implementation of the 2040 General Plan identified in the draft EIR. Section 4.10, “Hydrology and Water Quality,” in the draft EIR does not identify any significant environmental impacts. The draft EIR analyzes water quality impacts to surface water in Impact 4.10-8 and impacts to stormwater quality in Impact 4.10-9. These impact analysis discussions describe the role of existing regulations and permits in addressing the quantity of quality of stormwater and non-stormwater runoff associated with future development under the 2040 General Plan. Runoff from existing agricultural fields and roadways is not an environmental effect of the 2040 General Plan. For this reason, no further response is provided. Agricultural land use, including existing regulation of pesticide applications and erosion of agricultural soils, is discussed in Section 4.2, “Agriculture and Forestry Resources,” of the draft EIR.

I think both are involved in overseeing environmental issues.

Your Comment:

Please look to the continued work of CFROG and follow their recommendations concerning the environment and management of oil and gas extraction. We need to stop encouraging the fossil fuel industry to exploit the area for profit while endangering local, national and worldwide concerns.

| |
|------------------------|
| Letter I115 |
|------------------------|

The DEIR does not account for or include reliable information about some of the key challenges facing Ventura County, primarily housing. The Ventura County regional economy is struggling. According to the Ventura County Civic Alliance 2019 State of the Region Report, the region continues to struggle with "anemic" economic growth. The report's author, Tony Biasotti, told reporters that "the fact remains that Ventura County's economy is either in recession or very close to recession the last few years." According to the Center for Economic Research and Forecasting at California Lutheran University, Ventura County's economic output shrank in 2016 and 2017 when adjusted for inflation. The region's economic output was projected to contract again in 2018.

I115-1

The DEIR fails to recognize or address the serious affordability crisis Ventura County residents face. According to Census Bureau data and Ventura County Star reporting, more than 35,000 people left the region between 2013 and 2017, citing affordability concerns.

These issues need to be addressed when considering our options to create plans for our future. As it is now, this document fails to properly and accurately address these issues and should therefore be corrected to include this information for recirculation.

I115-2

Thank you,
 Lisa, Eklund

| Letter I115 | Lisa Eklund February 25, 2020 |
|------------------------|-----------------------------------------|

- I115-1 The comment states that the draft EIR does not recognize or address the affordability crisis residents face and the County's struggling economy. However, EIRs are not required to treat a project's economic or social effects as significant effects on the environment (State CEQA Guidelines, § 15131). Social and economic effects need only be considered in an EIR where there is a clear link between those economic or social effects and physical environmental changes. The economic issues raised in this comment would not result in any adverse physical changes to the environment not already addressed in the draft EIR.

- I115-2 As described in response to comment I115-1, above, the draft EIR properly excludes discussion of economic issues. Regarding the comment that the draft EIR should be corrected and recirculated, refer to Master Response MR-7, which explains in detail why recirculation of the draft EIR is not required.

I would like to offer the following comments:

Mitigation Measure AG-2: New Implementation Program AG-X: Establish an Agricultural Conservation Easement: This Mitigation Measure is unfeasible and unnecessary and unforeseen consequences of implementing this mitigation measure have not been identified. There are many existing programs and policies in Ventura County that prohibits the conversion of agricultural land for urban development. SOAR, the LCA Contract program, the Initial Study Assessment Guidelines and Guidelines for Orderly Development are all programs that protect against the loss of agricultural land in Ventura County. To add a policy that would require the purchasing of offsite farmland on a 2:1 ratio (acres preserved : acres converted) through the establishment of an offsite agricultural conservation easement for all discretionary development over a certain size is unfeasible and unnecessary.

I am currently involved in a farmworker housing project that would be subject to this mitigation measure policy. In order to develop 360 units of much needed farmworker housing in the County, we are impacting just over 18 acres of prime farmland. We will be processing an EIR because of the significant loss of ag soils as identified in the County’s Initial Study Assessment Guidelines and will be requesting that the Board of Supervisors adopts overriding considerations due to the dire need for farmworker housing in Ventura County. If mitigation measure AG-2 was in effect, this project would not be moving forward due to the extreme financial burden it would place on the non-profit housing developer of this project. I cannot imagine any farmworker housing complex project being able to absorb the financial burden associated with mitigation measure AG-2.

The other issue I have with this mitigation measure is that it is applicable to all land use designations in the County with an important farmland inventory classification. There could be land in the County located in an urban area but is currently farmed and is therefore classified as important farmland inventory. Therefore it could be designated Urban and zoned for some type of urban development, but because it has not developed yet, that property owner will be burdened with this mitigation measure.

In short, I urge the Board of Supervisors to not adopt mitigation measure AG-X. It will lead to impacts on important development needed to keep agriculture viable in Ventura County such as Farmworker Housing Complexes and Preliminary Packing Facilities.

Sincerely,

Lisa Woodburn, Planning Manager

Letter
I117

Dear Board of Supervisors and Staff:

We are writing this letter to urge the Board of Supervisors to reconsider moving forward with the Draft General Plan EIR. The draft EIR has been accelerated to the point that too many issues and impacts have not been properly addressed or studied. These impacts and the corresponding mitigation measures will have severe impacts to land owners and especially those, like us in the agricultural industry and other productive economic segments.

I117-1

Our family has been involved in the agricultural industry for more than 100 years in Ventura County. We have owned numerous land holdings that remain in the family to this date. We have farmed throughout Ventura County and hope to continue to do so in the future.

The Draft EIR is deficient on many levels. CEQA requires that all mitigation measures must be technically and economically feasible. Numerous proposed mitigation measures are neither. We have in the past attempted to identify land and any owners that would be open to sell their development rights for land that was converting from agricultural to commercial use. Not only did we not find anyone that would do so, no one would even quote a price. The only positive response from numerous land owners were that you can buy my property for full market value

I117-2

and then you can do what you want. There is not a project that can be built by adding double land cost to the equation. This was very recently experienced based on proposed policies at LAFCo.

These policies were eventually not enacted due to the inability to purchase development rights in an economical feasible manner. This was when LAFCo was contemplating an acre for acre ag preserve. The new policy that is proposed in the 2040 General Plan is requiring 2 acres for every 1 acre of land converted from ag to any other use. This will eliminate the ability to add any new required ag buildings or even farm worker housing. The Draft EIR must study these impacts, since they are not feasible.

1117-2
cont.

The Draft EIR also deals with water in a manner that is not properly studied. There is no analysis on increased water costs and diminishing availability of water. Without reasonable water costs and supply, there is no agricultural industry.

1117-3

The General Plan indicates that agriculture is a high priority in the County. However, new policies and requirements in the General Plan add additional mitigation measures that will make ag virtually impossible. These include new setbacks, limiting types of fumigants pesticides and fertilizers. The General Plan also requires the conversion of all farm equipment to be all electric. Again, not feasible. The costs to purchase new pumps, farm equipment and other existing fuel using equipment will increase operational costs to a point that the County crops will not be competitive in the open market. These new mitigation measures are not sufficiently studied and again are not economically feasible.

1117-4

The Draft EIR is extremely difficult to read and understand. The background reports are lacking in depth of what has been studied other than numerous general statements and very poor mapping. Detailed studies must be added to sufficiently identify impacts and the related mitigation measures for both direct and indirect impacts on the agricultural industry. It is our understanding that reports and studies need to be timely prepared. However numerous studies are older than 5 years. Not timely.

1117-5

After numerous devastating wildfires over the last few years, which significantly impacted ag, the General Plan continues to lay out limiting mitigation measures for fire prevention. The Wildlife corridor eliminates any ag operation or fire prevention in the proposed corridor areas. This is also a major concern not studied in the Draft EIR.

I117-6

The Draft EIR for the 2040 General plan does not provide adequate analysis for the expansion of permanent bike paths and pedestrian walking trails throughout the County. These impacts are very severe due to constant conflicts from trail users and ag operations. Spraying, dust, odors from ag operations, along with impacts created by the trail users. These are usually theft, vandalism, litter and pet waste. The proposed mitigation measures require additional setbacks from these trails which renders additional land unusable for ag operations.

I117-7

In addition to the above comments on the agricultural aspects and related land use concerns of the DEIR, the undersigned is also a mineral owner directly interested in the impacts on oil and gas production of the DEIR and related General Plan 2040 proposed provisions. In these documents there is a total failure to address the economic impacts of the various policies proposed in violation of the requirements for this process, including but not limited to the loss of royalty income to a large group of County residents. I join in the detailed comments on the various deficiencies and concerns identified in the DEIR as described in the concurrent submissions on behalf of Aera Energy and other operators delivered this week to the County.

I117-8

Please look at the long-term consequences of these General Plan policies and mitigation measures. We formally request additional studies and a revised Draft EIR that will properly look at these and many more issues. The DEIR must be corrected with details of the revisions. Then it can be recirculated.

I117-9

Sincerely,

| | |

Re: Comments on Ventura County General Plan DEIR

Dear Ms. Curtis:

I am a part of the McLoughlin Family. We have been farming in Ventura County for approximately 150 years. We currently own 300 acres of agricultural property off of Olivas Park Road in the County of Ventura near the Ventura Marina on Harbor Rd, in proximity to the City of Ventura.

I118-1

The McLoughlin family has farmed this land and other parcels for generations going back to 1863. It remains our desire to continue this legacy. However, in the face of never-ending changes to the regulatory environment, we again find ourselves attempting to ascertain how new policies and programs as proposed in the draft 2040 General Plan will impact and challenge our ability to serve as stewards of this heritage.

It had been our hope that the DEIR would provide some clarity and insight into how the new policies and programs within the revised General Plan would impact our farming operation. However, that is not the case. Simply said, we believe the General Plan Update and subsequent Environmental Impact Report fail to adequately analyze or study impacts on the farming industry.

With that said, we would like to specifically present the following:

- The Background report Table 6-26: Transportation Department Planned Capital Projects lists sections of roadways the County plans for expanded capacity or widening, along with the scope of those enhancements. It also covers in length the plan to add bike paths and bike lanes in accordance with existing County wayfarer plans. However, the DEIR never analyzes the loss of farmland resulting from these changes in infrastructure – it's not even mentioned as a possibility in the DEIR.

I118-2

Olivas Park Road between Victoria and Harbor is listed as one of the areas planned for widening, a stretch of roadway that borders the entire eastern portion of our farmland property. While the impact on our farming operation and financial losses due to property are clearly quantifiable, the report fails to list or quantify these impacts.

- In Section 3-8, The DEIR states that because there will be no "substantive" change to the agricultural, open space, or rural designations, the General Plan Update (GPU) will be consistent with SOAR. However, no further details beyond this conclusory statement is provided. There is no way for the reader to come to his or her own conclusion on whether the GPU will result in inconsistencies with SOAR that might lead to physical environmental impacts. There is no description of the changes to the Agriculture, Open Space, and Rural policies to determine whether they are in fact non-substantive.

I118-3

{202897.1}

Given the length and breadth of the Draft General Plan update and CEQA analysis, we made an attempt to focus our initial review and subsequent comments to issues specific to agriculture and farming. However, it's clear that the 2040 General Plan will impact the Ventura County local economy across sectors – all of which influence the ability to live and work in this region. The DEIR's lack of analysis of those economic impacts, calls into question the legitimacy of both the draft General Plan update, and the CEQA analysis. As such, we respectfully request that the DEIR be recirculated in the hopes that further study will resolve these shortcomings.

I118-4

I appreciate your consideration.

Letter
I119

Ventura County Resource Management Agency, Planning Division
Attn: Susan Curtis, Manager, General Plan Update Section
800 S. Victoria Ave., L #1740
Ventura, CA 93009-1740
GeneralPlanUpdate@ventura.org

Dear Ms. Curtis:

I am writing to call your attention to significant flaws in the process, data, and conclusions of the Ventura County General Plan, Draft EIR, and supplemental documents.

My great grandfather, Mark McLoughlin (1843-1914), was a true Ventura County pioneer, purchasing his first 318 acres of undeveloped land in Ventura County in 1875. He was a hard-working visionary, revered by his community. With his son—my grandfather, James Patrick McLoughlin—he raised livestock and farmed the land, providing jobs and feeding the growing towns of Oxnard and Ventura.

I119-1

Our land, in a vitally important location on Olivas Park Drive across from the Ventura Marina, has been in the family, and part of the economic fabric of the community, for 100 years. And we want it to be part of the future of this community, with a flourishing economy, a thriving job market, and unsurpassed quality of life for its residents.

But the General Plan and DEIR do not describe a viable path for us as landowners going forward.

I will begin with some specific issues regarding language in the Coastal Area Plan, 4-82-83 and 4-94-95. Part of our land is located in the Central Coastal Zone, adjacent to the Ventura Marina, on Olivas Park Drive at Harbor Blvd. The only conclusion the Plan draws about our land is the statement that, "unlike the Preble area, services are not readily available to the Olivas lands." This is false. Our property has access to all utilities, water, main roads, and the freeway. Indeed, easements on our property serve surrounding areas with utilities.

The Plan also claims that our property is "not included in the City's sanitation district because of problems with water pressure." This language is irrelevant and incorrect. There is no evidence that there are water pressure issues, and the sanitation district's pipelines actually traverse our property.

I119-2

While we do not know the original source of these misstatements, such misrepresentations—now repeated in the Plan—threaten to diminish the value of our land in relation to the Preble property. And, of course, they undermine the goal and the value of the Plan itself.

The General Plan also speaks of the widening of Olivas Park Drive, our southern boundary. This would have a direct impact on our property. But the Plan does not address how this would happen or how it would affect our land.

Damaging misstatements about our property also appear in the DEIR. Contrary to the portrayal in the DEIR, our property has significant infrastructure in place, as well as prime accessibility to the highway and the harbor. In fact, with easy access to the marina and beach community, and with the railroad as part of our eastern boundary, our land is uniquely suited to be an important part of future economic development in the area. We are entitled to have all these matters corrected.

I119-3

I would also like to raise some additional concerns:

1. The General Plan and DEIR continue to ignore the 28% increase in the homeless population in our community.

I119-4

2. According to the General Plan, if we were to build an acre of low income / worker housing we would need to buy two replacement acres of same Ag land to be placed into perpetual agricultural preservation. This is unrealistic and infeasible, and certainly not in line with the State government's housing policies.

I119-5

- 3. The EIR does not adequately address the enormous “indirect impacts” that will occur as a result of implementing the General Plan, calling them “less than significant.” I119-6
 - 4. The General Plan contains policies that will increase the costs of normal farming operations, making it difficult for farming to remain profitable. I119-7
 - 5. The Plan does not adequately evaluate the impacts of increased competition for water in our community. I119-8
- The EIR is a flawed document, full of errors, that does not disclose all impacts, direct and indirect, caused by the General Plan. It was obviously rushed—completed in six weeks. It is inaccurate and incomplete, and fails to provide members of the community with the information that they are legally entitled to. This EIR should be corrected and reconsidered, and a reasonable time period should be allowed for meaningful and thoughtful community input. I119-9

Sincerely,

Margaret Chambers McMonigle

Letter
I120

Sanger Hedrick, Chair
Agricultural Policy Advisory Committee (APAC) County of Ventura
800 S. Victoria Blvd.
Ventura, CA 93003

Re: 2040 General Plan Environmental Impact Report (EIR)

Dear Mr. Hedrick and Honorable Members of APAC:

Thank you for the opportunity to provide comments following today’s presentation by Ventura County Planning staff on the 2040 General Plan EIR.

There are several issues with the 2040 General Plan EIR that CoLAB believes will negatively impact the viability of local agriculture.

I120-1

Proposed mitigation measure AG-2: The County proposes that any project that either directly or indirectly results in the loss of farmland must obtain and place into perpetual agricultural preservation twice the total of the farmland loss. This mitigation measure is infeasible. Contrary to statements made by County Planning staff today at the APAC meeting, the California Environmental Quality Act (CEQA) requires that all mitigation proposed in an EIR be feasible. CEQA Section 21061.1 defines feasible as “capable of being accomplished in a successful manner within a reasonable period of time,

” (*emphasis added*). All mitigation measures proposed in an EIR must be shown to reduce impacts and an infeasible mitigation measure, by definition, cannot and will not reduce impacts.

The EIR does not provide evidence of any of the following:

1. 1) Whether there is sufficient land available for purchase/conservation easement for each farmland category;
2. 2) The cost per acre to purchase each category of farmland;
3. 3) The anticipated cost of establishing a conservation easement for each category of farmland;
4. 4) The anticipated cost associated with managing each category of farmland under a conservation easement;
5. 5) The anticipated cost associated with monitoring these mitigation parcels scattered throughout the County and who will bear that cost;
6. 6) Any information that could constitute a “plan” for management of farmland in conservation easements;

I120-2

February 19, 2020

Ventura County Coalition of Labor, Agriculture and Business / 1672 Donlon Street, Ventura, CA 93003 / 805-633-2260 / info@colabvc.org

Page 2 of 4

7. 7) An analysis of direct and indirect impacts caused by this mitigation measure (including impacts associated with LU compatibility conflicts and increased urban-ag-interface);
8. 8) Whether the smallest possible mitigation acreage required will achieve the minimum to ensure viability of agriculture on the parcel; and

9. 9) Whether the proposed mitigation is in conflict with other ordinances and regulations, such as the County’s Zoning Ordinance and the County’s minimum lot sizes.

The County is already aware that this proposed mitigation measure is infeasible. On March 24, 2016, at a Local Agency Formation Commission (LAFCo) hearing, Supervisor Linda Parks attempted to establish an “Agricultural Mitigation Measure” through the LAFCo project approval process. The mitigation measure would have required the 1-to-1 purchase of local farmland (half of what is proposed in the 2040 General Plan EIR) to replace farmland that would be impacted by any proposed development. Ventura County Counsel, Michael Walker, informed both LAFCo and Supervisor Parks that the proposed mitigation measure did not meet the standard for economic feasibility, and, for that and other reasons, LAFCo could not adopt Supervisor Park’s proposed mitigation measure. He referenced a 2015 legal decision, *City of Irvine v. County of Orange*, in which the Court stated, “the sheer astronomical expense of land supports the finding of the EIR that the purchase of an agricultural conservation easement is a non-starter.”

I120-2
cont.

In addition to being infeasible, CoLAB does not believe that this mitigation measure will reduce impacts on agricultural land, as it does not address the actual issues that will impact farmland under the 2040 General Plan: lack of economic sustainability, the increasing regulatory demands on agriculture, increased competition for water resources, and increased compatibility conflicts from development.

Indirect Impacts

The EIR dismisses “indirect impacts” that will occur as a result of implementing the 2040 General Plan as “less than significant.”

Page 4.2-13 of the EIR states “AG-2.3 maintains the Right-to-Farm Ordinance to protect agricultural land uses from conflicts with non-agricultural uses, as well as to help land purchasers and residents understand the potential for nuisance, (e.g., dust, noise, odors) that may occur as the natural result of living in or near agricultural areas...These sections of the code protect farmers engaged in agricultural activity from public nuisance claims...This protects the farming community, including Important Farmlands and farms less than 10 acres, from developments that would inhibit their ability to continue agricultural production.”

Page 4.2-17 of the EIR states: “Residential growth in areas nearby agricultural lands has the potential to result in land use conflicts. Residential land uses are generally more sensitive and prone to conflict with adjacent agricultural land uses than commercial or industrial land uses. The placement of sensitive land uses, such as residences and schools, nearby classified farmland can negatively impact both uses due to conflict including odor nuisances and noise from agriculture machinery. The countywide Right-to-Farm Ordinance protects existing agricultural and farming operations from conflicts attributed to residential development...Therefore, the potential for conflicts would be minimal. This impact would be less than significant” (*emphasis added*).

I120-3

This is simply not true. Historic and recent County actions have shown that the County has and will continue to create new restrictions and ordinances that have a significant impact on existing agricultural

Ventura County Coalition of Labor, Agriculture and Business / 1672 Donlon Street, Ventura, CA 93003 / 805-633-2260 / info@colabvc.org

Page 3 of 4

and farming operations because of conflicts attributed to residential development. The recent interim urgency ordinance restricting hemp cultivation is one such example.

Contrary to statements made today by Ventura County Planning staff, an EIR, whether it is labeled as “programmatic” or “project”, must analyze all reasonably foreseeable consequences of the action that is proposed. For the 2040 General Plan EIR, the action proposed is the implementation of all policies and programs within. Therefore, if the implementation of a policy in the 2040 General Plan will result in an impact, that impact must be analyzed. For example, the 2040 General Plan contains land use designation changes that will increase allowable housing density near agricultural land. It is reasonably foreseeable that more houses will create more compatibility conflicts with normal farming operations. The impact of these compatibility conflicts must be addressed in the EIR.

I120-4

In 2014, the California Court of Appeal stated in a ruling that “[T]he fact that this EIR is labeled a ‘project’ rather than a ‘program’ EIR matters little....Designating an EIR as a program EIR ... does not by itself decrease the level of analysis otherwise required in the EIR. All EIRs must cover the same general content. The level of specificity of an EIR is determined by the nature of the project and the “rule of reason,” rather than any semantic label accorded to the EIR.”

It is CoLAB’s opinion that indirect impacts from increasing urban-ag interface are SIGNIFICANT and cannot be dismissed in the EIR.

Direct and indirect impacts of increased costs

The 2040 General Plan has policies that will increase the costs of normal farming operations. CoLAB believes that the most effective way to minimize conversion of agricultural land to non-agricultural uses is to take active measures to allow farming to remain profitable. And even the County admits that reducing the cost of farming reduces conversion of agricultural land in their discussion of the Williamson Act in Chapter 4.2 of the EIR.

But the County fails to analyze direct and indirect impacts of 2040 General Plan policies that will increase the cost of normal farming operations, such as:

- Policy AG-5.2: Electric- or Renewable-Powered Agricultural Equipment. The County shall encourage and support the transition to electric- or renewable-powered or lower emission agricultural equipment in place of fossil fuel-powered equipment when feasible.
- Policy AG-5.3: Electric- or Renewable-Powered Irrigation Pumps. The County shall encourage farmers to convert fossil fuel-powered irrigation pumps to systems powered by electric or renewable energy sources, such as solar power, and encourage electric utilities to eliminate or reduce standby charges.

I120-5

Direct and indirect impacts of increased competition for water resources The County fails to evaluate the impact of increased competition for water resources caused by development allowed in the 2040 General Plan on either the conversion of agricultural land or the loss of agricultural lands through the loss of topsoil.

The EIR states on page 4.2-3 that “...a reduction in available water resources for irrigation” is an example of indirect impacts on agricultural land due to loss of topsoil from increased wind and water erosion. But the County fails to analyze or propose mitigation measures to address this significant impact.

I120-6

Ventura County Coalition of Labor, Agriculture and Business / 1672 Donlon Street, Ventura, CA 93003 / 805-633-2260 / info@colabvc.org

Page 4 of 4

APAC is the expert charged with advising County decision-makers on agricultural issues in Ventura County. And the County should be seeking guidance from APAC about the actual issues that will impact farmland under the 2040 General Plan: lack of economic sustainability, the increasing regulatory demands on agriculture, increased competition for water resources, and increased compatibility conflicts from development.

CoLAB encourages APAC to provide guidance to the County on appropriate and effective mitigation measures to prevent the conversion of agricultural land to non-agricultural uses. These may include:

1. 1) Strengthen the Right-to-Farm ordinance to prevent nuisance complaints from being used to justify the creation or expansion of setbacks or regulatory restrictions on normal farming practices;
2. 2) Expand the Land Conservation Act Program to include Open Space zoned properties that are engaged in farming (including grazing); and
3. 3) Protect agricultural land from urban-ag interface encroachment and compatibility conflicts by establishing setbacks on NON-AE-zoned land that will restrict the construction of bike paths, public trails, and sensitive receptors within 2000' of any land zoned A/E.

I120-7

Thank you again for the opportunity to provide comments on this issue. We appreciate your consideration and leadership at this time.

Sincerely,

Louise Lampara Executive Director

In support of this letter-

This comment letter repeats many of the same comments provided in Letter A13. The responses below provide cross references to the portions of Letter A13 where responses to the same comments have already been provided.

- I120-1 The comment describes that the Ventura County Coalition of Labor, Agriculture, and Business (CoLAB) has provided the following comments to the Agricultural Policy Advisory Committee describing issues with the draft EIR “that CoLAB believes will negatively impact the viability of local agriculture.” This comment is introductory in nature and does not raise a significant environmental issue for which a response is required.

- I120-2 Refer to response to comment A13-7 and Master Response MR-5 regarding the feasibility of Mitigation Measure AG-2.

- I120-3 Refer to response to comment A13-8 regarding the Right-to-Farm Ordinance and land use conflicts.

- I120-4 Refer to response to comment A13-9 regarding impacts related to urban-agriculture interface.

- I120-5 Refer to response to comment A13-10 regarding 2040 General Plan Policies AG-5.2 and AG-5.3.

- I120-6 Refer to response to comment A13-11 regarding water resources and loss of topsoil.

- I120-7 Refer to response to comment A13-12 regarding mitigation measure suggestions.

**Letter
I121**

To: Susan Curtis-

County failed to evaluate mitigation measure for feasibility- 500' set back for "sensitive receptors" from freeways and high traffic roads.

Mitigation Measure AQ-3 (Policy HAZ10-X) creates a minimum 500' set back for "sensitive receptors" from freeways and high traffic roads. Yet the County states in the Land Use section of the EIR that "the majority of the anticipated build out will be within the freeway corridors."

Has the County completed a "buildout study" to ensure that the establishment of this set back still leaves enough room for development to occur? Will this mitigation measure be economically feasible?

I121-1

Subject: Draft EIR 2040 County General Plan

Letter
I122

Attn: Board of Supervisors

As you review the Draft EIR for the County 2040 General Plan, I hope you pay close attention to some serious problems evident in the current draft. I have highlighted a few below.

I122-1

As a farmer affected by the Thomas Fire in December 2017, I find it astonishing that the EIR makes no mention of policies from the proposed General Plan that will significantly increase fuel load in high fire risk areas. Watching houses burn one after another, seeing orchards so seriously damaged the only recourse was to remove and replace all trees, and listening to friends, family members, and others recount the horrors of losing valued possessions and livelihoods, I am appalled that this proposed General Plan contains policies that will once again put this county at severe risk. CEQA demands that policies that increase risk from wildfire be analyzed. Where is this done?

I122-2

Over and over I read how Supervisors in this county value agriculture. Yet, the County has failed to analyze the impact on agriculture of competition for water supplies. Where is the analysis when the EIR admits increased development resulting from the General Plan will result in less water for irrigation? And WHY is data older than 2015 used in the Agriculture chapter? This does not speak to an understanding of farming in this county. Experts have long lauded this county for effective water management long before it was ever mandated by state regulation. And that water management was undertaken by FARMERS.

I122-3

Mitigation Measure AG-2 requires small development projects to purchase farmland to preserve in perpetuity. The County and Supervisors are well aware this mitigation measure is infeasible. County Counsel stated that a similar measure proposed at LAFCO in 2016 was infeasible and could not be included in an EIR. That has not changed.

I122-4

Please approach this important document thoughtfully for ALL constituencies in the county.

Margaret Kimball
Kimball McPheron Ranch

| | |
|------------------------|----------------------------------------------|
| Letter I122 | Margaret Kimball February 27, 2020 |
|------------------------|----------------------------------------------|

- I122-1 The comment asserts that there are issues with the draft EIR that are referenced in comments I122-2 to I122-4. This comment is introductory in nature and does not raise a significant environmental issue for which a response is required.
- I122-2 The commenter expresses concern that the 2040 General plan contains policies “that will significantly increase fuel load in high fire risk areas,” that were not evaluated in the draft EIR. However, the comment does not indicate which specific policies could increase wildfire risk. Refer to response to comment O32-30 for a discussion of the potential for 2040 General Plan policies and programs that encourage tree planting and preservation to increase wildland fire hazard.
- I122-3 The comment states that the draft EIR does not analyze the impact on agriculture from competition for water supplies. Refer to response to comment I4-3 regarding water availability and cost. Additionally, the commenter expresses concern regarding data used in the Background Report from 2015. Refer to Master Response MR-6 regarding Background Report content and response to comment I10-2. While the information provides context for the analysis in the draft EIR, it does not directly influence the analysis of potential impacts on farmland and agricultural resources pursuant to the thresholds of significance established in Appendix G of the State CEQA Guidelines and the County’s Initial Study Assessment Guidelines. Therefore, the age of these data does not affect the analysis or conclusions in the draft EIR.
- I122-4 Refer to Master Response MR-5 regarding the feasibility of Mitigation Measure AG-2.

Subject: 2040 General Plan Draft EIR Comments

| |
|------------------------|
| Letter I123 |
|------------------------|

To: RMA Planning Division:

Thank you for your work on this DEIR, it takes time and dedication to get the document to this point. There are a few areas that are lacking in evidence and analysis when concerning the local oil and gas industry. I would like to see these serious issues addressed and corrected for a recirculated DEIR. I I123-1

The proposed oil and gas setback policies are unnecessary, lack justification, and will only make the Ventura County homeless crisis worse. Multiple studies have failed to demonstrate negative public health effects as a result of oil and gas operations in California. The state which has the most stringent environmental standards for operations. I I123-2

The DEIR relies too heavily on the unsettled legislation-AB 345- and incorrectly assumes that direction drilling is a viable setback mitigation option. I I123-3

These misguided and flawed policies truly need to be corrected for a recirculated DEIR. I I123-3

Thank You, Margo Ferris

COMMENT LETTER RE DRAFT DEIR TO COUNTY GENERAL PLAN UPDATE 2020-2040

February 25, 2020

TO WHOM IT MAY CONCERN:

The DEIR fails to recognize the true impact of climate change. It fails to declare the existing state of climate emergency that the general plan must be formulated to address in 2020-2040. It fails to provide enough emissions reduction to meet, or even make a sizeable dent in, the California state mandated climate goals. It fails to include a CLIMATE ACTION PLAN with measurable targets and goals as a separate document as requested by CFROG, 350 and other climate activists.

I124-1

The policies set in the general plan are not measurable or enforceable. Language used in the plan such as “encourage” or “support” rather than “require” or “mandate” is weak, insufficient and meaningless to meet acknowledged greenhouse gas reduction targets.

Furthermore, crucially, in the first place the DEIR is based on a wholly inadequate inventory of existing county emissions. The inventory was conducted from top down rather than bottom up and fails to include, or even consider, a significant portion of present emissions.

I124-2

To the best of my information Ventura County is the third largest producer of fossil fuels of all California counties and California is the largest producer of fossil fuels of all the states. This can be said to place a high fiduciary duty on Ventura County, owed to the rest of life on planet Earth, to drastically reduce its greenhouse gas emissions (fossil fuel production) in the next five years.

I124-3

ACTION NEEDED

- 1) Recognize and declare the global climate emergency as it exists in Ventura County today.
- 2) Reassess and make a complete bottom to top inventory of Ventura County greenhouse gas emissions at present.
- 3) Create a CLIMATE ACTION PLAN 2020-2040 with measurable targets and outcomes as a separate document.
- 4) Set clear climate action goals and mandate enforceable climate policies based on 1) and 2) above.
- 5) Rather than aim at 2040, start by aiming at 2025 and 2030, recognizing the urgency declared. As part of the CLIMATE ACTION PLAN include five and ten year climate emergency goals to be reached by 2025 and 2030.

I124-4

I124-5

FIVE AND TEN YEAR EMERGENCY CLIMATE GOALS

- A) Decrease total county greenhouse gas emissions that have been newly inventoried by 20% per year to zero emissions by 2025.
- B) Wind down existing discretionary oil and gas production 10% per year to zero fossil fuel production in Ventura County by 2030. Achieve this goal by starting with oil and gas facilities located within one mile buffer zones of schools, public parks, mobile home parks and homes.

I124-6

- C) Flaring and venting toxic gases and climate pollutants like methane into the atmosphere by prohibited before 2025.
 - D) All small gas engines used in agriculture and landscape businesses, as well as by private citizens (leaf blowers, edgers, mowers, hedge trimmers, etc.) which do not at all curb emissions, be banned and replaced by electric models before 2025. County should subsidize this transition to the extent possible by securing state, federal or private grant clean energy funding.
 - E) Implement an agricultural policy in Ventura County requiring a transition to 100% regenerative farming, eliminating toxic pesticide use and including carbon sequestration by 2030.
 - F) Implement a county policy requiring transition to full electric vehicles for all public transportation (buses, trolleys, county and municipal vehicles) by 2025.
 - G) Implement a policy working with existing oil and gas industry facilities to train laid off workers and bring clean energy jobs and electric vehicle production to Ventura County.
- H) GREENHOUSE GAS SUPER EMITTERS : A recent NASA study documents that several Ventura County facilities, including oil and gas operations, make up approximately 26% of all emissions in California. The CLIMATE ACTION PLAN must include strong policies to detect and curb emissions from these super emitters by 2030.

Respectfully submitted,

Margot Davis
148 West Simpson
Ventura, CA 93001

| | |
|------------------------|------------------------------------------|
| Letter I124 | Margot Davis February 25, 2020 |
|------------------------|------------------------------------------|

- I124-1 The comment states that the draft EIR does not recognize the true impacts of climate change. The anticipated physical effects of climate change are characterized in the Background Report included as Appendix B to the draft EIR. The comment also states that the language of the 2040 General Plan policies is insufficient to result in meaningful reductions.
- The draft EIR evaluates the efficacy of the 2040 General Plan policies under the assumption that these policies would be implemented as written and derives a significance conclusion based on these reductions. The draft EIR concludes that greenhouse gas (GHG) emissions associated with the 2040 General Plan would be potentially significant and recommends seven feasible mitigation measures to achieve additional GHG emissions reductions. See Master Response MR-1 for additional discussion.
- Finally, the comment requests preparation of a Climate Action Plan (CAP) separate from the 2040 General Plan. The 2040 General Plan sets GHG reduction targets and goals at 10-year intervals that were developed in consideration of statewide GHG reduction targets and other reduction goals. Because the 2040 General Plan encompasses policies and targets that would similarly be contained in a standalone CAP, the 2040 General Plan can be used in the same way to reduce countywide emissions.
- I124-2 The comment pertains to the GHG inventory performed in the draft EIR. Refer to Master Response MR-1 regarding the development of the GHG inventory.
- I124-3 The information summarizing fossil fuel production in Ventura County and California, Ventura County's duty to reduce its greenhouse gas emissions, and the need to recognize and declare a global climate emergency is noted. This comment is not related to the adequacy of the draft EIR and does not raise a significant environmental issue for which a response is required. Refer to response to comment I23-3 for further discussion of emergency declarations.
- I124-4 The comment pertains to the GHG inventory performed in the draft EIR. Refer to Master Response MR-1 regarding the development of the GHG inventory.
- I124-5 The comment suggests that a CAP should be presented as a separate document from the 2040 General Plan and include enforceable, measurable targets. Refer to response to comment I124-1, above.
- The comment also suggests that the CAP include 5- and 10-year goals, including a goal to reduce total county emissions by 20 percent annually and to zero by 2025. The 2040 General Plan includes measurable targets and goals for GHG reductions for 2030, 2040, and 2050 that are aligned with the State's legislative greenhouse gas reduction targets and other reduction goals (draft EIR page 4.8-6). Refer to Master Response MR-1 for discussion of how the GHG reduction

targets and goals were developed and their alignment with State targets and goals for GHG reduction. In addition, Implementation Program AA in the Conservation and Open Space Element of the 2040 General Plan would require updates to the GHG emissions inventory to track GHG reduction performance at 5-year intervals.

- I124-6 Refer to Master Response MR-4, Sections MR-4.J Potential to Stop Issuing Permits for New Wells (Phase Out Oil and Gas Operations), MR-4.H Buffers (Setbacks), and MR-4.A County’s Authority to Regulate Oil and Gas Development, regarding the findings and conclusions related to phasing out oil and gas operations, buffers (setbacks) for oil and gas operations, and the County’s authority to regulate oil and gas operations. The remainder of the comment addresses implementation of the 2040 General Plan and is not related to the adequacy of the draft EIR. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.
- I124-7 The comment suggests climate change goals for 2025 and 2030 that could be considered in the 2040 General Plan. These suggestions are noted and are generally congruent with the types of policies and programs included in the 2040 General Plan and analyzed in the draft EIR. The 2040 General Plan does include policies and programs to restrict flaring and venting of gases from new discretionary oil and gas wells (Policy COS-7.8), transition farm equipment away from fossil fuels (Programs AG-I and AG-H), and sequester carbon through changes in farming practices (Program AG-L). Because the County lacks legal authority to mandate some of the changes proposed to personal and business practices, such as the types of vehicles procured by public transit operators, the County cannot feasibly implement the types of programs envisioned by the commenter. This comment is not related to the adequacy of the draft EIR. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.
- I124-8 The comment cites a National Aeronautics and Space Administration study regarding “super-emitters” and states that the 2040 General Plan must include strong policies to detect and curb emissions from these “super-emitters.” Refer to Master Response MR-1 regarding super-emitters and their representation in the GHG inventory prepared for the 2040 General Plan and draft EIR.

Letter
I125

February 24, 2020

Ventura County Board of Supervisors
Attn: RMA Planning Division
General Plan Update
800 Victoria Avenue L#1740
Ventura, California 93009-1740

Dear Board of Supervisors and Staff:

We are writing this letter to urge the Board of Supervisors to reconsider moving forward with the Draft General Plan EIR. The draft EIR has been accelerated to the point that too many issues and impacts have not been properly addressed or studied. These impacts and the corresponding mitigation measures will have severe impacts to land owners and especially those, like us in the agricultural industry and other productive economic segments.

I125-1

Our family has been involved in the agricultural industry for more than 100 years in Ventura County. We have owned numerous land holdings that remain in the family to this date. We have farmed throughout Ventura County and hope to continue to do so in the future.

The Draft EIR is deficient on many levels. CEQA requires that all mitigation measures must be technically and economically feasible. Numerous proposed mitigation measures are neither. We have in the past attempted to identify land and any owners that would be open to sell their development rights for land that was converting from agricultural to commercial use. Not only did we not find anyone that would do so, no one would even quote a price. The only positive response from numerous land owners were that you can buy my property for full market value and then you can do what you want. There is not a project that can be built by adding double land cost to the equation. This was very recently experienced based on proposed policies at LAFCo. These policies were eventually not enacted due to the inability to purchase development rights in an economical feasible manner. This was when LAFCo was contemplating an acre for acre ag preserve. The new policy that is proposed in the 2040 General Plan is requiring 2 acres for every 1 acre of land converted from ag to any other use. This will eliminate the ability to add any new required ag buildings or even farm worker housing. The Draft EIR must study these impacts, since they are not feasible.

I125-2

The Draft EIR also deals with water in a manner that is not properly studied. There is no analysis on increased water costs and diminishing availability of water. Without reasonable water costs and supply, there is no agricultural industry.

I125-3

The General Plan indicates that agriculture is a high priority in the County. However, new policies and requirements in the General Plan add additional mitigation measures that will make ag virtually impossible. These include new setbacks, limiting types of fumigants pesticides and fertilizers. The General Plan also requires the conversion of all farm equipment to be all electric. Again, not feasible. The costs to purchase new pumps, farm equipment and other existing fuel using equipment will increase operational costs to a point that the County crops will not be competitive in the open market. These new mitigation measures are not sufficiently studied and again are not economically feasible.

I125-4

The Draft EIR is extremely difficult to read and understand. The background reports are lacking in depth of what has been studied other than numerous general statements and very poor mapping. Detailed studies must be added to sufficiently identify impacts and the related mitigation measures for both direct and indirect impacts on the agricultural industry. It is our understanding that reports and studies need to be timely prepared. However numerous studies are older than 5 years. Not timely.

I125-5

After numerous devastating wildfires over the last few years, which significantly impacted ag, the General Plan continues to lay out limiting mitigation measures for fire prevention. The Wildlife corridor eliminates any ag operation or fire prevention in the proposed corridor areas. This is also a major concern not studied in the Draft EIR.

I125-6

The Draft EIR for the 2040 General plan does not provide adequate analysis for the expansion of permanent bike paths and pedestrian walking trails throughout the County. These impacts are very severe due to constant conflicts from trail users and ag operations. Spraying, dust, odors from ag operations, along with impacts created by the trail users. These are usually theft, vandalism, litter and pet waste. The proposed mitigation measures require additional setbacks from these trails which renders additional land unusable for ag operations.

I125-7

In addition to the above comments on the agricultural aspects and related land use concerns of the DEIR, the undersigned is also a mineral owner directly interested in the impacts on oil and gas production of the DEIR and related General Plan 2040 proposed provisions. In these documents there is a total failure to address the economic impacts of the various policies proposed in violation of the requirements for this process, including but not limited to the loss of royalty income to a large group of County residents. I join in the detailed comments on the various deficiencies and concerns identified in the DEIR as described in the concurrent submissions on behalf of Aera Energy and other operators delivered this week to the County.

I125-8

Please look at the long-term consequences of these General Plan policies and mitigation measures. We formally request additional studies and a revised Draft EIR that will properly look at these and many more issues. The DEIR must be corrected with details of the revisions. Then it can be recirculated.

I125-9

Sincerely,

Marianne McGrath

Ms. Curtis,

I appreciate the value of your time and request your attention to the following letter. I am one of the many of the McLoughlin family members. My family has been tied to this land for many years and I have a great deal of interest preserving this land for our family and future generations. My daughter's middle name is McLoughlin as we are very proud of our family heritage. I understand that as population exponentially increases additional roadways need to be created to provide access for all, however, I believe that there are options. Please consider the impact that the current plans will have on our family.

I126-1

Sincerely,
Marie Taylor

Ventura County Resource Management Agency, Planning Division
Attn: Susan Curtis, Manager, General Plan Update Section
800 South Victoria Avenue, L#1740
Ventura, CA 93009-1740

Re: Comments on Ventura County General Plan DEIR

Dear Ms. Curtis:

I am a part of the McLoughlin Family. We have been farming in Ventura County for approximately 150 years. We currently own 300 acres of agricultural property off of Olivas Park Road in the County of Ventura near the Ventura Marina on Harbor Rd, in proximity to the City of Ventura.

The McLoughlin family has farmed this land and other parcels for generations going back to 1863. It remains our desire to continue this legacy, however, in the face of never-ending changes to the regulatory environment, we again find ourselves attempting to ascertain how new policies and programs as proposed in the draft 2040 General Plan will impact and challenge our ability to serve as stewards of this heritage.

It had been our hope that the DEIR would provide some clarity and insight into how the new policies and programs within the revised General Plan would impact our farming operation. That, however, is not the case. Simply said, we believe the General Plan Update and subsequent Environmental Impact Report fail to adequately analyze or study impacts on the farming industry.

With that said, we would like to specifically present the following:

I126-2

- The Background report Table 6-26: Transportation Department Planned Capital Projects lists sections of roadways the County plans for expanded capacity or widening, along with the scope of those enhancements. It also covers in length the plan to add bike paths and bike lanes in accordance with existing County wayfarer plans. The DEIR, however, never analyzes the loss of farmland resulting from these changes in infrastructure – it’s not even mentioned as a possibility in the DEIR.
 Olivas Park Road between Victoria and Harbor is listed as one of the areas planned for road widening, a stretch of roadway that borders the entire eastern portion of our farmland and property. While the impact on our farming operation and financial losses due to property loss are clearly quantifiable, the report fails to list or quantify these impacts.

I126-3
 - In Section 3-8, The DEIR states that because there will be no “substantive” change to the agricultural, open space, or rural designations, the General Plan Update (GPU) will be consistent with SOAR. No further details beyond this conclusory statement are provided. There is no way for the reader to come to his or her own conclusion on whether the GPU will result in inconsistencies with SOAR that might lead to physical environmental impacts. There is no description of the changes to the Agriculture, Open Space, and Rural policies to determine whether they are in fact non-substantive.

I126-4
- Given the length and breath of the Draft General Plan update and CEQA analysis, we made an attempt to focus our initial review and subsequent comments to issues specific to agriculture and farming. It’s clear that the 2040 General Plan will impact the Ventura County local economy across sectors – all of which influence the ability to live and work in this region. The DEIR’s lack of analysis of those economic impacts, calls into question the legitimacy of both the draft General Plan update, and the CEQA analysis. As such, we respectfully request that the DEIR be recirculated in the hopes that further study will resolve these shortcomings.
- I126-5

I appreciate your consideration.
 Sincerely,

| | |

Subject: 2040 General Plan Draft EIR Comment

| |
|------------------------|
| Letter I127 |
|------------------------|

Dear Ms. Curtis: The EIR is based on incomplete analysis of policies, contains several false and ill-advised policies, and fails to understand key challenges related to Ventura County.

I
I127-1

Some of the issues are:

1. CEQA requires that the EIR contain enough detailed information to allow the reader to understand and evaluate the County's impact analysis. But the EIR and its 1000-page Background Report are filled with errors, vague statements, and outdated information. All information in the Agricultural Chapter is older than 2015! The maps in the EIR and the Background Report are such poor resolution and detail that some are blurry and illegible.

I
I127-2

2. CEQA requires that both direct and indirect impacts be analyzed. Yet the County failed to analyze indirect impacts (complaints, competition for water supplies, theft and vandalism, etc.) on agricultural land from increased development and more urban-ag interface, because the County assumes that the Right-to-Farm Ordinance will prevent any impacts on agriculture that may occur from urban-property owner complaints.

I
I127-3

3. CEQA says that all policies that may cause impacts to ag lands must be evaluated. But the County failed to analyze or even discuss the policies in the General Plan that will increase farming operational costs (converting ag equipment to electric, requiring all electric water pumps, increasing costs for water supply, etc.).

I
I127-4

Please do the correct thing for Ventura County and take the time to correct and recirculate the EIR!

I
I127-5

Marjie Bartels, Certified Organic Valencia Orange Grower in Bardsdale

| | |
|------------------------|--------------------------------------------|
| Letter I127 | Marjie Bartels February 27, 2020 |
|------------------------|--------------------------------------------|

I127-1 This comment regarding the adequacy of the draft EIR is noted. However, no specific issues related to the content, analysis, conclusions, or overall adequacy of the draft EIR are raised in this comment. Therefore, no further response is provided.

I127-2 The commenter's opinion about the accuracy and level of detail in the draft EIR and Background Report are noted. It is not clear from the comment what errors, vague statements, or outdated materials resulted in the commenter's inability to understand the impact analysis provided in Section 4.2, "Agriculture and Forestry Resource," of the draft EIR. The data and maps in the Background Report characterize the entire county with sufficient clarity to inform the analysis in the draft EIR. The evaluation of the potential significance of impacts is not predicated on an understanding of the various and changing dynamics of local crop production, export, or sales. As explained in the "Methodology" subsection (page 4.2-3 of the draft EIR), the EIR analysis considers whether future development under the 2040 General Plan could result in loss of agricultural resources or conversion of agricultural resources to non-agricultural uses or result in indirect loss of agricultural resources by allowing for non-agricultural land uses adjacent to classified farmland. The comment provides no evidence that the most current

data would substantially differ from that presented or change the analysis in the draft EIR. No revisions to the draft EIR have been made in response to this comment. Refer also to Master Response MR-6 for discussion of how the County appropriately uses the Background Report to describe the existing environmental setting in the draft EIR.

- I127-3 The comment states that the draft EIR does not analyze indirect impacts such as “complaints, competition for water supplies, theft and vandalism.” on agricultural land from increased development. Further, the comment expresses concern regarding reliance on the Right-to-Farm Ordinance to reduce impacts. The draft EIR does analyze the potential for development under the 2040 General Plan to result in conflicts with classified farmland in Impact 4.2-2 (starting at page 4.2-17). This analysis notes that “the County protects and preserves agricultural land through the [Save Open Space and Agricultural Resources] Initiative, Agricultural/Urban Buffer Policy, Greenbelt Agreements, the Agricultural/Urban Buffer Policy, the Right-to-Farm Ordinance, GP Policy AG-1.1, GP Policy AG-1.2, GP Policy AG-2.1, GP Policy AG-2.2, GP Policy AG-2.3, and Guidelines for Orderly Development” and basis the analysis on the implementation of all of these policies (draft EIR page 4.2-17). Refer to response to comment A13-9 regarding impacts related to urban-agriculture interface and response to comment A13-11 for a further discussion of available water resources for irrigation. Refer to response to comment O7-8 regarding potential impacts related to theft and vandalism.
- I127-4 The comment states that the draft EIR does not analyze the 2040 General Plan policies that would increase farming operational costs such as “converting ag equipment to electric, requiring all electric water pumps, increasing costs for water supply, etc.” Refer to response to comment A13-10 regarding 2040 General Plan Policies AG-5.2 and AG-5.3.
- I127-5 For the reasons described in the cross-referenced responses, above, no revisions to the draft EIR are warranted. Refer to Master Response MR-7, which explains in detail why recirculation of the draft EIR is not required.

I128**

CAUTION: If this email looks suspicious, DO NOT click. Forward to Spam.Manager@ventura.org

Susan Curtis,

Dear Ventura County Board of Supervisors and Planning Department,

Climate issues are something I feel worried about. Ventura County is warming faster than any county in the nation. Our ocean is acidifying faster. Drought and floods have hit us worse, and we can expect more extreme weather.

I128-1

My family and community are counting on you to assure analysis of the full scope of environmental impacts and mitigations in the Draft EIR.

First, it is necessary that all greenhouse gas emissions be counted based on the most current science.

I128-2

There are many ways to mitigate climate impacts, like a sunset plan for oil and gas production, decarbonization of transportation and buildings, zero waste, incentives for regenerative agriculture and water management, and reducing emissions from tailpipes.

I128-3

I want an EIR that covers major climate impacts via a systematic plan.

Thank you—

Subject: 2040 General Plan Draft EIR Comment

**Letter
1129**

Ventura County Board of Supervisors
 Attn: RMA Planning Division
 General Plan Update
 800 Victoria Avenue L#1740
 Ventura, California 93009-1740

Dear Board of Supervisors and Staff:

My family has owned for generations and continues to own agricultural properties in Ventura County, including mineral rights under a number of currently and previously owned parcels. I'm writing to you as an owner of mineral rights in Ventura County.

I129-1

The 2040 General Plan Draft EIR fails to give proper analysis to mineral resources and must be corrected to more adequately and fairly assess the impact of the proposed general plan on owners of mineral rights.

Neither the EIR nor the Background Report provide a complete and thorough description of the existing regulations affecting the management and production of mineral resources in the County and the State of California. The EIR and the Background Report only disclose federal and state agencies that regulate pipelines and flaring, which is not applicable to all mineral resources that must be analyzed in an EIR under CEQA guidelines. The EIR should be revised to include an overview and description of all potential regulations, regulatory bodies, and programs that regulate mineral resources in Ventura County.

I129-2

The EIR fails to analyze the direct and indirect impacts to mineral resource development as a result of the 2040 Plan. The County admits that Land Use Designation changes in the 2040 General Plan will result in changes to land uses General Plan. The County admits that Land Use Designation changes in the 2040 General Plan will result in changes to land uses over known and important mineral reserves. But neither the EIR nor the Background Report provide any information regarding the anticipated "buildout" in terms of acreage, actual location, number of dwelling units, and development density and intensity.

I129-3

As incompatible land uses (such as residential development) occur on or adjacent to mineral production and mineral reserves, compatibility conflicts will increase. Reasonably foreseeable indirect impacts include nuisance complaints, traffic conflicts, theft, vandalism and attempted trespass on mineral production sites. The EIR must analyze and evaluate these impacts on the ability to develop and manage mineral resources in the County.

Gaps in the 2040 General Plan Draft EIR must be corrected, and the Draft EIR recirculated, to fairly present the foreseeable impacts on owners of mineral rights in the County.

I129-4

Sincerely,
 Marshall C. Milligan
 805-570-0332

| | |
|------------------------|-------------------------------------------------|
| Letter I129 | Marshall C Milligan February 25, 2020 |
|------------------------|-------------------------------------------------|

I129-1 The comment provides information summarizing the commenter’s ownership of agricultural properties and mineral rights in Ventura County and states that the draft EIR does not properly analyze the effects of the 2040 General Plan on individuals that own mineral rights. The draft EIR evaluates the potential physical effects on the environment that could result from implementation of the 2040 General Plan in a manner consistent with the County’s adopting Initial Study Assessment Guidelines and the California Environmental Quality Act Guidelines. Refer to the analysis in Section 4.12, “Petroleum and Mineral Resources,” which correctly evaluates the potential to result in loss of availability of mineral resources. California Environmental Quality Act does not require evaluation of social or economic impacts on property owners. This comment is introductory in nature and does not raise a significant environmental issue for which a response is required.

I129-2 The commenter indicates that the draft EIR and Background Report do not provide a complete description of the existing and current regulatory setting for production of mineral resources. The Background Report Section 8.4, “Mineral Resources,” 8.5, “Energy Resources,” and Section 10.2 “Legal and Regulatory Framework for Water Management (Class II Underground Injection Control Program),” provide relevant regulatory information necessary for understanding and evaluating the impacts of the 2040 General Plan on petroleum resources. Additionally, the draft EIR Mineral and Petroleum Resources Section 4.12.1, Background Report Setting Updates, includes additional information laws and regulations that pertain to petroleum development. This includes federal laws and regulations related to gas pipelines, state laws and regulations related to the California Pipeline Safety Act of 1981, Ventura County Air Pollution Control District (VCAPCD) Rule No. 71.1 – Crude Oil Production and Separation and Rule No. 54 – Sulfur Compounds, VCAPCD Primary (Non-Emergency) Flares, VCAPCD Emergency Flares, and VCAPCD Permitted Flare Variances, and Non-Coastal and Coastal Zoning Ordinances. In the response to this comment, and based on the April 9, 2020 comment letter from the California Geologic Energy Management Division (CalGEM) describing its current regulatory program, the regulatory framework section has been augmented. The enhance discussion of regulatory framework would not alter the findings or analysis in the EIR. These augments to the regulatory setting for Section 4.12 are provided in final EIR Chapter 3, “Revisions to the Draft EIR.”

I129-3 The commenter indicates that the draft EIR and Background Report do not provide a complete description of the existing and current regulatory setting for production of mineral resources. The Background Report Section 8.4, “Mineral Resources,” 8.5, “Energy Resources,” and Section 10.2 “Legal and Regulatory Framework for Water Management (Class II Underground Injection Control Program),” provide relevant regulatory information necessary for understanding and evaluating the impacts of the 2040 General Plan on petroleum resources.

Additionally, the draft EIR Mineral and Petroleum Resources Section 4.12.1, Background Report Setting Updates, includes additional information laws and regulations that pertain to petroleum development. This includes federal laws and regulations related to gas pipelines, state laws and regulations related to the California Pipeline Safety Act of 1981, Ventura County Air Pollution Control District (VCAPCD) Rule No. 71.1 – Crude Oil Production and Separation and Rule No. 54 – Sulfur Compounds, VCAPCD Primary (Non-Emergency) Flares, VCAPCD Emergency Flares, and VCAPCD Permitted Flare Variances, and Non-Coastal and Coastal Zoning Ordinances. In the response to this comment, and based on the April 9, 2020 comment letter from the California Geologic Energy Management Division (CalGEM) describing its current regulatory program, the regulatory framework section has been augmented. The enhanced discussion of regulatory framework would not alter the findings or analysis in the EIR. These augments to the regulatory setting for Section 4.12 are provided in final EIR Chapter, “Revisions to the Draft EIR.”

- I129-4 For the reasons described in the responses above, no revisions to the draft EIR are warranted. Refer to Master Response MR-7, which explains in detail why recirculation of the draft EIR is not required.

To: Curtis, Susan <Susan.Curtis@ventura.org>
Subject: 2040 General Plan

Dear Ms Curtis,

I think the board's assessment of Ventura County's vulnerability is out of date. In 2018 the IPCC released a revised report of the climate crisis and the projection is far more dire. We are already suffering the effects of global warming and we have only a few years to make a difference in our planet's fate. You have plans that extend to 2040, 2050, and 2090! This will be far too little far too late. I believe you should take a much stronger approach to your net zero emissions goals, and I would like to see real quantifiable plans explaining how you will reach net zero.

I130-1

I believe you have a responsibility to begin shutting down the fossil fuel industry in our county. I do understand how costly it will be, but I also understand the economic cost and the cost to human lives, and to our planet if you allow the drilling to continue.

I130-2

Sincerely,

Martha Brown

| | |
|------------------------|------------------------------------------|
| Letter I130 | Martha Brown February 27, 2020 |
|------------------------|------------------------------------------|

I130-1 The comment expresses concern about climate change and suggests that the County take a stronger approach to reaching net zero emissions goals. The statement that the Board of Supervisor’s assessment of the county’s vulnerability is out of date is noted. Note that Chapter 12 of the Background Report is incorporated into Section 4.8, “Greenhouse Gas Emissions,” of the draft EIR, which summarizes anticipated effects of climate change on Ventura County. Further, the draft EIR does not evaluate the effects of the climate change on the 2040 General Plan and it is not required under the California Environmental Quality Act for the 2040 General Plan to mitigate existing or anticipated effects of the environment on the plan area; the EIR analyzes the physical environmental changes that would occur as a result of 2040 General Plan implementation.

Although the 2040 General Plan does provide a long term planning framework through 2040, it also includes interim targets and goals at 10-year intervals out to 2050 that were developed in consideration of statewide greenhouse gas (GHG) reduction targets and other reduction goals and would require updates to the GHG emissions inventory to track GHG reduction performance at 5-year intervals. Note that the horizon year of the 2040 General Plan is the year 2040. Refer to Master Response MR-1 for additional discussion.

This comment is not related to the adequacy of the draft EIR. Therefore, no further response is required. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.

I130-2 Refer to Master Response MR-4, Sections MR-4.J Potential to Stop Issuing Permits for New Wells (Phase Out Oil and Gas Operations) and MR-4.A County’s Authority to Regulate Oil and Gas Development, regarding the findings and conclusions related to the potential to stop issuance of oil and gas related permits and the County’s authority to regulate oil and gas operations.

Subject: Comments on General Plan/EIR

**Letter
1132**

Dear Ms. Curtis:

I am writing to call your attention to significant flaws in the process, data, and conclusions of the Ventura County General Plan, Draft EIR, and supplemental documents.

My great grandfather, Mark McLoughlin (1843-1914), was a true Ventura County pioneer, purchasing his first 318 acres of undeveloped land in Ventura County in 1875. He was a hard-working visionary, revered by his community. With his son—my grandfather, James Patrick McLoughlin—he raised livestock and farmed the land, providing jobs and feeding the growing towns of Oxnard and Ventura.

I1132-1

Our land, in a vitally important location on Olivas Park Drive across from the Ventura Marina, has been in the family, and part of the economic fabric of the community, for 100 years. And we want it to be part of the future of this community, with a flourishing economy, a thriving job market, and unsurpassed quality of life for its residents.

But the General Plan and DEIR do not describe a viable path for us as landowners going forward.

I will begin with some specific issues regarding language in the Coastal Area Plan, 4-82-83 and 4-94-95. Part of our land is located in the Central Coastal Zone, adjacent to the Ventura Marina, on Olivas Park Drive at Harbor Blvd. The only conclusion the Plan draws about our land is the statement that, “unlike the Preble area, services are not readily available to the Olivas lands.” This is false. Our property has access to all utilities, water, main roads, and the freeway. Indeed, easements on our property serve surrounding areas with utilities.

The Plan also claims that our property is “not included in the City’s sanitation district because of problems with water pressure.” This language is irrelevant and incorrect. There is no evidence that there are water pressure issues, and the sanitation district’s pipelines actually traverse our property.

I1132-2

While we do not know the original source of these misstatements, such misrepresentations—now repeated in the Plan—threaten to diminish the value of our land in relation to the Preble property. And, of course, they undermine the goal and the value of the Plan itself.

The General Plan also speaks of the widening of Olivas Park Drive, our southern boundary. This would have a direct impact on our property. But the Plan does not address how this would happen or how it would affect our land.

Damaging misstatements about our property also appear in the DEIR. Contrary to the portrayal in the DEIR, our property has significant infrastructure in place, as well as prime accessibility to the highway and the harbor. In fact, with easy access to the marina and beach community, and with the railroad as part of our eastern boundary, our land is uniquely suited to be an important part of future economic development in the area. We are entitled to have all these matters corrected.

I1132-3

I would also like to raise some additional concerns:

1. The General Plan and DEIR continue to ignore the 28% increase in the homeless population in our community.
2. According to the General Plan, if we were to build an acre of low income /worker housing we would need to buy two replacement acres of same Ag land to be placed into perpetual agricultural preservation. This is unrealistic and infeasible, and certainly not in line with the State government’s housing policies.
3. The EIR does not adequately address the enormous “indirect impacts” that will occur as a result of implementing the General Plan, calling them “less than significant.”
4. The General Plan contains policies that will increase the costs of normal farming operations, making it difficult for farming to remain profitable.
5. The Plan does not adequately evaluate the impacts of increased competition for water in our community.

I1132-4

I1132-5

I1132-6

I1132-7

I1132-8

The EIR is a flawed document, full of errors, that does not disclose all impacts, direct and indirect, caused by the General Plan. It was obviously rushed—completed in six weeks. It is inaccurate and incomplete, and fails to provide members of the community with the information that they are legally entitled to. This EIR should be corrected and reconsidered, and a reasonable time period should be allowed for meaningful and thoughtful community input.

I132-9

Sincerely,
Mary Chambers Moro

Subject: Comments on General Plan/EIR

Letter
I133

Sanger Hedrick, Chair
Agricultural Policy Advisory Committee (APAC) County of Ventura
800 S. Victoria Blvd.
Ventura, CA 93003

Re: 2040 General Plan Environmental Impact Report (EIR)

Dear Mr. Hedrick and Honorable Members of APAC:

Thank you for the opportunity to provide comments following today’s presentation by Ventura County Planning staff on the 2040 General Plan EIR.

I133-1

There are several issues with the 2040 General Plan EIR that CoLAB believes will negatively impact the viability of local agriculture.

Proposed mitigation measure AG-2: The County proposes that any project that either directly or indirectly results in the loss of farmland must obtain and place into perpetual agricultural preservation twice the total of the farmland loss. This mitigation measure is infeasible. Contrary to statements made by County Planning staff today at the APAC meeting, the California Environmental Quality Act (CEQA) requires that all mitigation proposed in an EIR be feasible. CEQA Section 21061.1 defines feasible as “capable of being accomplished in a successful manner within a reasonable period of time, ” (emphasis added). All mitigation measures proposed in an EIR must be shown to reduce impacts and an infeasible mitigation measure, by definition, cannot and will not reduce impacts.

The EIR does not provide evidence of any of the following:

1. 1) Whether there is sufficient land available for purchase/conservation easement for each farmland category;
2. 2) The cost per acre to purchase each category of farmland;
3. 3) The anticipated cost of establishing a conservation easement for each category of farmland;
4. 4) The anticipated cost associated with managing each category of farmland under a conservation easement;
5. 5) The anticipated cost associated with monitoring these mitigation parcels scattered throughout the County and who will bear that cost;
6. 6) Any information that could constitute a “plan” for management of farmland in conservation easements;

I133-2

February 19, 2020

Ventura County Coalition of Labor, Agriculture and Business / 1672 Donlon Street, Ventura, CA 93003 / 805-633-2260 / info@colabvc.org

Page 2 of 4

7. 7) An analysis of direct and indirect impacts caused by this mitigation measure (including impacts associated with LU compatibility conflicts and increased urban-ag-interface);
8. 8) Whether the smallest possible mitigation acreage required will achieve the minimum to ensure viability of agriculture on the parcel; and
9. 9) Whether the proposed mitigation is in conflict with other ordinances and regulations, such as the County’s Zoning Ordinance and the County’s minimum lot sizes.

The County is already aware that this proposed mitigation measure is infeasible. On March 24, 2016, at a Local Agency Formation Commission (LAFCo) hearing, Supervisor Linda Parks attempted to establish

an “Agricultural Mitigation Measure” through the LAFCo project approval process. The mitigation measure would have required the 1-to-1 purchase of local farmland (half of what is proposed in the 2040 General Plan EIR) to replace farmland that would be impacted by any proposed development. Ventura County Counsel, Michael Walker, informed both LAFCo and Supervisor Parks that the proposed mitigation measure did not meet the standard for economic feasibility, and, for that and other reasons, LAFCo could not adopt Supervisor Park’s proposed mitigation measure. He referenced a 2015 legal decision, *City of Irvine v. County of Orange*, in which the Court stated, “the sheer astronomical expense of land supports the finding of the EIR that the purchase of an agricultural conservation easement is a non-starter.”

I133-2
cont.

In addition to being infeasible, CoLAB does not believe that this mitigation measure will reduce impacts on agricultural land, as it does not address the actual issues that will impact farmland under the 2040 General Plan: lack of economic sustainability, the increasing regulatory demands on agriculture, increased competition for water resources, and increased compatibility conflicts from development.

Indirect Impacts

The EIR dismisses “indirect impacts” that will occur as a result of implementing the 2040 General Plan as “less than significant.”

Page 4.2-13 of the EIR states “AG-2.3 maintains the Right-to-Farm Ordinance to protect agricultural land uses from conflicts with non-agricultural uses, as well as to help land purchasers and residents understand the potential for nuisance, (e.g., dust, noise, odors) that may occur as the natural result of living in or near agricultural areas...These sections of the code protect farmers engaged in agricultural activity from public nuisance claims...This protects the farming community, including Important Farmlands and farms less than 10 acres, from developments that would inhibit their ability to continue agricultural production.”

Page 4.2-17 of the EIR states: “Residential growth in areas nearby agricultural lands has the potential to result in land use conflicts. Residential land uses are generally more sensitive and prone to conflict with adjacent agricultural land uses than commercial or industrial land uses. The placement of sensitive land uses, such as residences and schools, nearby classified farmland can negatively impact both uses due to conflict including odor nuisances and noise from agriculture machinery. The countywide Right-to-Farm Ordinance protects existing agricultural and farming operations from conflicts attributed to residential development...**Therefore, the potential for conflicts would be minimal. This impact would be less than significant**” (*emphasis added*).

I133-3

This is simply not true. Historic and recent County actions have shown that the County has and will continue to create new restrictions and ordinances that have a significant impact on existing agricultural

[Ventura County Coalition of Labor, Agriculture and Business / 1672 Donlon Street, Ventura, CA 93003 / 805-633-2260 / info@colabvc.org](http://VenturaCountyCoalitionofLabor,AgricultureandBusiness/1672DonlonStreet,Ventura,CA93003/805-633-2260/info@colabvc.org)

Page 3 of 4

and farming operations because of conflicts attributed to residential development. The recent interim urgency ordinance restricting hemp cultivation is one such example.

Contrary to statements made today by Ventura County Planning staff, an EIR, whether it is labeled as “programmatic” or “project”, must analyze all reasonably foreseeable consequences of the action that is proposed. For the 2040 General Plan EIR, the action proposed is the implementation of all policies and programs within. Therefore, if the implementation of a policy in the 2040 General Plan will result in an impact, that impact must be analyzed. For example, the 2040 General Plan contains land use designation changes that will increase allowable housing density near agricultural land. It is reasonably foreseeable that more houses will create more compatibility conflicts with normal farming operations. The impact of these compatibility conflicts must be addressed in the EIR.

I133-4

In 2014, the California Court of Appeal stated in a ruling that “[T]he fact that this EIR is labeled a ‘project’ rather than a ‘program’ EIR matters little....Designating an EIR as a program EIR ... does not by itself decrease the level of analysis otherwise required in the EIR. All EIRs must cover the same general content. The level of specificity of an EIR is determined by the nature of the project and the “rule of reason,” rather than any semantic label accorded to the EIR.”

It is CoLAB’s opinion that indirect impacts from increasing urban-ag interface are SIGNIFICANT and cannot be dismissed in the EIR.

Direct and indirect impacts of increased costs

The 2040 General Plan has policies that will increase the costs of normal farming operations. CoLAB believes that the most effective way to minimize conversion of agricultural land to non-agricultural uses is to take active measures to allow farming to remain profitable. And even the County admits that reducing the cost of farming reduces conversion of agricultural land in their discussion of the Williamson Act in Chapter 4.2 of the EIR.

But the County fails to analyze direct and indirect impacts of 2040 General Plan policies that will increase the cost of normal farming operations, such as:

- Policy AG-5.2: Electric- or Renewable-Powered Agricultural Equipment. The County shall encourage and support the transition to electric- or renewable-powered or lower emission agricultural equipment in place of fossil fuel-powered equipment when feasible.
- Policy AG-5.3: Electric- or Renewable-Powered Irrigation Pumps. The County shall encourage farmers to convert fossil fuel-powered irrigation pumps to systems powered by electric or renewable energy sources, such as solar power, and encourage electric utilities to eliminate or reduce standby charges.

I133-5

Direct and indirect impacts of increased competition for water resources

The County fails to evaluate the impact of increased competition for water resources caused by development allowed in the 2040 General Plan on either the conversion of agricultural land or the loss of agricultural lands through the loss of topsoil.

The EIR states on page 4.2-3 that "...a reduction in available water resources for irrigation" is an example of indirect impacts on agricultural land due to loss of topsoil from increased wind and water erosion.

But the County fails to analyze or propose mitigation measures to address this significant impact.

I133-6

Ventura County Coalition of Labor, Agriculture and Business / 1672 Donlon Street, Ventura, CA 93003 / 805-633-2260 / info@colabvc.org

Page 4 of 4

APAC is the expert charged with advising County decision-makers on agricultural issues in Ventura County. And the County should be seeking guidance from APAC about the actual issues that will impact farmland under the 2040 General Plan: lack of economic sustainability, the increasing regulatory demands on agriculture, increased competition for water resources, and increased compatibility conflicts from development.

CoLAB encourages APAC to provide guidance to the County on appropriate and effective mitigation measures to prevent the conversion of agricultural land to non-agricultural uses. These may include:

- 1) Strengthen the Right-to-Farm ordinance to prevent nuisance complaints from being used to justify the creation or expansion of setbacks or regulatory restrictions on normal farming practices;
- 2) Expand the Land Conservation Act Program to include Open Space zoned properties that are engaged in farming (including grazing); and
- 3) Protect agricultural land from urban-ag interface encroachment and compatibility conflicts by establishing setbacks on NON-AE-zoned land that will restrict the construction of bike paths, public trails, and sensitive receptors within 2000' of any land zoned A/E.

I133-7

Thank you again for the opportunity to provide comments on this issue. We appreciate your consideration and leadership at this time.

Sincerely,

Louise Lampara Executive Director

REC'D FEB 27 2020

VIA ELECTRONIC MAIL: GeneralPlanUpdate@ventura.org

February 25, 2020

Ventura County Board of Supervisors
Attn: RMA Planning Division
General Plan Update
800 Victoria Avenue L#1740
Ventura, California 93009-1740

Dear Board of Supervisors and Staff:

We are writing this letter to urge the Board of Supervisors to reconsider moving forward with the Draft General Plan EIR. The draft EIR has been accelerated to the point that too many issues and impacts have not been properly addressed or studied. These impacts and the corresponding mitigation measures will have severe impacts to land owners and especially those, like us in the agricultural industry and other productive economic segments.

I134-1

Our family has been involved in the agricultural industry for more than 100 years in Ventura County. We have owned numerous land holdings that remain in the family to this date. We have farmed throughout Ventura County and hope to continue to do so in the future.

The Draft EIR is deficient on many levels. CEQA requires that all mitigation measures must be technically and economically feasible. Numerous proposed mitigation measures are neither. We have in the past attempted to identify land and any owners that would be open to sell their development rights for land that was converting from agricultural to commercial use. Not only did we not find anyone that would do so, no one would even quote a price. The only positive response from numerous land owners were that you can buy my property for full market value and then you can do what you want. There is not a project that can be built by adding double land cost to the equation. This was very recently experienced based on proposed policies at LAFCo. These policies were eventually not enacted due to the inability to purchase development rights in an economical feasible manner. This was when LAFCo was contemplating an acre for acre ag preserve. The new policy that is proposed in the 2040 General Plan is requiring 2 acres for every 1 acre of land converted from ag to any other use. This will eliminate the ability to add any new required ag buildings or even farm worker housing. The Draft EIR must study these impacts, since they are not feasible.

I134-2

The Draft EIR also deals with water in a manner that is not properly studied. There is no analysis on increased water costs and diminishing availability of water. Without reasonable water costs and supply, there is no agricultural industry.

I134-3

The General Plan indicates that agriculture is a high priority in the County. However, new policies and requirements in the General Plan add additional mitigation measures that will make ag virtually

I134-4

impossible. These include new setbacks, limiting types of fumigants pesticides and fertilizers. The General Plan also requires the conversion of all farm equipment to be all electric. Again, not feasible. The costs to purchase new pumps, farm equipment and other existing fuel using equipment will increase operational costs to a point that the County crops will not be competitive in the open market. These new mitigation measures are not sufficiently studied and again are not economically feasible.

I134-4
cont.

The Draft EIR is extremely difficult to read and understand. The background reports are lacking in depth of what has been studied other than numerous general statements and very poor mapping. Detailed studies must be added to sufficiently identify impacts and the related mitigation measures for both direct and indirect impacts on the agricultural industry. It is our understanding that reports and studies need to be timely prepared. However numerous studies are older than 5 years. Not timely.

I134-5

After numerous devastating wildfires over the last few years, which significantly impacted ag, the General Plan continues to lay out limiting mitigation measures for fire prevention. The Wildlife corridor eliminates any ag operation or fire prevention in the proposed corridor areas. This is also a major concern not studied in the Draft EIR.

I134-6

The Draft EIR for the 2040 General plan does not provide adequate analysis for the expansion of permanent bike paths and pedestrian walking trails throughout the County. These impacts are very severe due to constant conflicts from trail users and ag operations. Spraying, dust, odors from ag operations, along with impacts created by the trail users. These are usually theft, vandalism, litter and pet waste. The proposed mitigation measures require additional setbacks from these trails which renders additional land unusable for ag operations.

I134-7

In addition to the above comments on the agricultural aspects and related land use concerns of the DEIR, the undersigned is also a mineral owner directly interested in the impacts on oil and gas production of the DEIR and related General Plan 2040 proposed provisions. In these documents there is a total failure to address the economic impacts of the various policies proposed in violation of the requirements for this process, including but not limited to the loss of royalty income to a large group of County residents. I join in the detailed comments on the various deficiencies and concerns identified in the DEIR as described in the concurrent submissions on behalf of Aera Energy and other operators delivered this week to the County.

I134-8

Please look at the long-term consequences of these General Plan policies and mitigation measures. We formally request additional studies and a revised Draft EIR that will properly look at these and many more issues. The DEIR must be corrected with details of the revisions. Then it can be recirculated.

I134-9

Sincerely,

Mary Ellen Gravel
President, Elkins Royalty Group

Subject: VC 2040 Draft General Plan & EIR

| |
|------------------------|
| Letter I135 |
|------------------------|

We need much stronger measures to protect Ventura County from increasingly rapid and negative climate changes than the current proposals in this draft general plan. Suggestions are worthless. If we want positive climate changes the County must require them. Start with changing the County vehicle fleet to all electric. Stop all oil extraction in the county. Develop a workable public transit system county wide. Provide incentives for farmers to change to organic and regenerative methods. Make this plan tough enough to actually make a dent in climate changes.
 Mary Freed, Thousand Oaks

|--------|

| | |
|------------------------|----------------------------------------|
| Letter I135 | Mary Freed February 26, 2020 |
|------------------------|----------------------------------------|

I135-1 The comment suggests policies that could be considered in the 2040 General Plan, including making the County’s vehicle fleet electric powered, stopping oil and gas extraction, improving public transit, and encouraging sustainable farming practices. These suggestions are noted and are generally congruent with the types of policies and programs included in the 2040 General Plan and analyzed in the draft EIR. The 2040 General Plan includes policies and programs to purchase alternative fuel vehicles (Policy PFS-2.6), facilitate alternative transportation modes including public transit (Policies HAZ-10.6 and HAZ-10.8), and sequester carbon through changes in farming practices (Program AG-L). Refer to Master Response MR-4 regarding the suggestion that the County prohibit petroleum extraction. Because this comment is not related to the adequacy of the draft EIR, no further response is required. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.

Letter
I136

Ventura County Resource Management Agency, Planning Division
Attn: Susan Curtis, Manager, General Plan Update Section
800 S. Victoria Ave., L #1740
Ventura, CA 93009-1740

GeneralPlanUpdate@ventura.org

Dear Ms. Curtis:

I am writing to call your attention to significant flaws in the process, data, and conclusions of the Ventura County General Plan, Draft EIR, and supplemental documents.

My great great grandfather, Mark McLoughlin (1843-1914), was a true Ventura County pioneer, purchasing his first 318 acres of undeveloped land in Ventura County in 1875. He was a hard-working visionary, revered by his community. With his son—my great grandfather, James Patrick McLoughlin—he raised livestock and farmed the land, providing jobs and feeding the growing towns of Oxnard and Ventura.

I136-1

Our land, in a vitally important location on Olivas Park Drive across from the Ventura Marina, has been in the family, and part of the economic fabric of the community, for 100 years. And we want it to be part of the future of this community, with a flourishing economy, a thriving job market, and unsurpassed quality of life for its residents.

But the General Plan and DEIR do not describe a viable path for us as landowners going forward.

I will begin with some specific issues regarding language in the Coastal Area Plan, 4-82-83 and 4-94-95. Part of our land is located in the Central Coastal Zone, adjacent to the Ventura Marina, on Olivas Park Drive at Harbor Blvd. The only conclusion the Plan draws about our land is the statement that, “unlike the Preble area, services are not readily available to the Olivas lands.” This is false. Our property has access to all utilities, water, main roads, and the freeway. Indeed, easements on our property serve surrounding areas with utilities.

The Plan also claims that our property is “not included in the City’s sanitation district because of problems with water pressure.” This language is irrelevant and incorrect. There is no evidence that there are water pressure issues, and the sanitation district’s pipelines actually traverse our property.

I136-2

While we do not know the original source of these misstatements, such misrepresentations—now repeated in the Plan—threaten to diminish the value of our land in relation to the Preble property. And, of course, they undermine the goal and the value of the Plan itself.

The General Plan also speaks of the widening of Olivas Park Drive, our southern boundary. This would have a direct impact on our property. But the Plan does not address how this would happen or how it would affect our land.

Damaging misstatements about our property also appear in the DEIR. Contrary to the portrayal in the DEIR, our property has significant infrastructure in place, as well as prime accessibility to the highway and the harbor. In fact, with easy access to the marina and beach community, and with the railroad as part of our eastern boundary, our land is uniquely suited to be an important part of future economic development in the area. We are entitled to have all these matters corrected.

I136-3

I would also like to raise some additional concerns:

- 1. The General Plan and DEIR continue to ignore the 28% increase in the homeless population in our community. I136-4
 - 2. According to the General Plan, if we were to build an acre of low income/worker housing we would need to buy two replacement acres of same Ag land to be placed into perpetual agricultural preservation. This is unrealistic and infeasible, and certainly not in line with the State government's housing policies. I136-5
 - 3. The EIR does not adequately address the enormous "indirect impacts" that will occur as a result of implementing the General Plan, calling them "less than significant." I136-6
 - 4. The General Plan contains policies that will increase the costs of normal farming operations, making it difficult for farming to remain profitable. I136-7
 - 5. The Plan does not adequately evaluate the impacts of increased competition for water in our community. I136-8
- The EIR is a flawed document, full of errors, that does not disclose all impacts, direct and indirect, caused by the General Plan. It was obviously rushed—completed in six weeks. It is inaccurate and incomplete, and fails to provide members of the community with the information that they are legally entitled to. This EIR should be corrected and reconsidered, and a reasonable time period should be allowed for meaningful and thoughtful community input. I136-9

Sincerely,

Mary Katherine Chambers McMonigle

Letter
1137

Sanger Hedrick, Chair
Agricultural Policy Advisory Committee (APAC) County of Ventura
800 S. Victoria Blvd.
Ventura, CA 93003

Re: 2040 General Plan Environmental Impact Report (EIR)

Dear Mr. Hedrick and Honorable Members of APAC:

Thank you for the opportunity to provide comments following today’s presentation by Ventura County Planning staff on the 2040 General Plan EIR.

There are several issues with the 2040 General Plan EIR that CoLAB believes will negatively impact the viability of local agriculture.

I1137-1

Proposed mitigation measure AG-2: The County proposes that any project that either directly or indirectly results in the loss of farmland must obtain and place into perpetual agricultural preservation twice the total of the farmland loss. This mitigation measure is infeasible. Contrary to statements made by County Planning staff today at the APAC meeting, the California Environmental Quality Act (CEQA) requires that all mitigation proposed in an EIR be feasible. CEQA Section 21061.1 defines feasible as “capable of being accomplished in a successful manner within a reasonable period of time,
” (emphasis added). All mitigation measures proposed in an EIR must be shown to reduce impacts and an infeasible mitigation measure, by definition, cannot and will not reduce impacts.

The EIR does not provide evidence of any of the following:

1. 1) Whether there is sufficient land available for purchase/conservation easement for each farmland category;
2. 2) The cost per acre to purchase each category of farmland;
3. 3) The anticipated cost of establishing a conservation easement for each category of farmland;
4. 4) The anticipated cost associated with managing each category of farmland under a conservation easement;
5. 5) The anticipated cost associated with monitoring these mitigation parcels scattered throughout the County and who will bear that cost;
6. 6) Any information that could constitute a “plan” for management of farmland in conservation easements;

I1137-2

February 19, 2020

Ventura County Coalition of Labor, Agriculture and Business / 1672 Donlon Street, Ventura, CA 93003 / 805-633-2260 / info@colabvc.org

Page 2 of 4

7. 7) An analysis of direct and indirect impacts caused by this mitigation measure (including impacts associated with LU compatibility conflicts and increased urban-ag-interface);
8. 8) Whether the smallest possible mitigation acreage required will achieve the minimum to ensure viability of agriculture on the parcel; and
9. 9) Whether the proposed mitigation is in conflict with other ordinances and regulations, such as the County’s Zoning Ordinance and the County’s minimum lot sizes.

The County is already aware that this proposed mitigation measure is infeasible. On March 24, 2016, at a Local Agency Formation Commission (LAFCo) hearing, Supervisor Linda Parks attempted to establish an “Agricultural Mitigation Measure” through the LAFCo project approval process. The mitigation measure would have required the 1-to-1 purchase of local farmland (half of what is proposed in the 2040 General Plan EIR) to replace farmland that would be impacted by any proposed development. Ventura County Counsel, Michael Walker, informed both LAFCo and Supervisor

Parks that the proposed mitigation measure did not meet the standard for economic feasibility, and, for that and other reasons, LAFCo could not adopt Supervisor Park’s proposed mitigation measure. He referenced a 2015 legal decision, *City of Irvine v. County of Orange*, in which the Court stated, “the sheer astronomical expense of land supports the finding of the EIR that the purchase of an agricultural conservation easement is a non-starter.”

In addition to being infeasible, CoLAB does not believe that this mitigation measure will reduce impacts on agricultural land, as it does not address the actual issues that will impact farmland under the 2040 General Plan: lack of economic sustainability, the increasing regulatory demands on agriculture, increased competition for water resources, and increased compatibility conflicts from development.

Indirect Impacts

The EIR dismisses “indirect impacts” that will occur as a result of implementing the 2040 General Plan as “less than significant.”

Page 4.2-13 of the EIR states “AG-2.3 maintains the Right-to-Farm Ordinance to protect agricultural land uses from conflicts with non-agricultural uses, as well as to help land purchasers and residents understand the potential for nuisance, (e.g., dust, noise, odors) that may occur as the natural result of living in or near agricultural areas...These sections of the code protect farmers engaged in agricultural activity from public nuisance claims...This protects the farming community, including Important Farmlands and farms less than 10 acres, from developments that would inhibit their ability to continue agricultural production.”

Page 4.2-17 of the EIR states: “Residential growth in areas nearby agricultural lands has the potential to result in land use conflicts. Residential land uses are generally more sensitive and prone to conflict with adjacent agricultural land uses than commercial or industrial land uses. The placement of sensitive land uses, such as residences and schools, nearby classified farmland can negatively impact both uses due to conflict including odor nuisances and noise from agriculture machinery. The countywide Right-to-Farm Ordinance protects existing agricultural and farming operations from conflicts attributed to residential development...Therefore, the potential for conflicts would be minimal. This impact would be less than significant” (*emphasis added*).

This is simply not true. Historic and recent County actions have shown that the County has and will continue to create new restrictions and ordinances that have a significant impact on existing agricultural

Ventura County Coalition of Labor, Agriculture and Business / 1672 Donlon Street, Ventura, CA 93003 / 805-633-2260 / info@colabvc.org

Page 3 of 4

and farming operations because of conflicts attributed to residential development. The recent interim urgency ordinance restricting hemp cultivation is one such example.

Contrary to statements made today by Ventura County Planning staff, an EIR, whether it is labeled as “programmatic” or “project”, must analyze all reasonably foreseeable consequences of the action that is proposed. For the 2040 General Plan EIR, the action proposed is the implementation of all policies and programs within. Therefore, if the implementation of a policy in the 2040 General Plan will result in an impact, that impact must be analyzed. For example, the 2040 General Plan contains land use designation changes that will increase allowable housing density near agricultural land. It is reasonably foreseeable that more houses will create more compatibility conflicts with normal farming operations. The impact of these compatibility conflicts must be addressed in the EIR.

In 2014, the California Court of Appeal stated in a ruling that “[T]he fact that this EIR is labeled a ‘project’ rather than a ‘program’ EIR matters little....Designating an EIR as a program EIR ... does not by itself decrease the level of analysis

I137-2
cont.

I137-3

I137-4

In 2014, the California Court of Appeal stated in a ruling that “[T]he fact that this EIR is labeled a ‘project’ rather than a ‘program’ EIR matters little....Designating an EIR as a program EIR ... does not by itself decrease the level of analysis otherwise required in the EIR. All EIRs must cover the same general content. The level of specificity of an EIR is determined by the nature of the project and the “rule of reason,” rather than any semantic label accorded to the EIR.”

I137-4
cont.

It is CoLAB’s opinion that indirect impacts from increasing urban-ag interface are SIGNIFICANT and cannot be dismissed in the EIR.

Direct and indirect impacts of increased costs

The 2040 General Plan has policies that will increase the costs of normal farming operations. CoLAB believes that the most effective way to minimize conversion of agricultural land to non-agricultural uses is to take active measures to allow farming to remain profitable. And even the County admits that reducing the cost of farming reduces conversion of agricultural land in their discussion of the Williamson Act in Chapter 4.2 of the EIR.

But the County fails to analyze direct and indirect impacts of 2040 General Plan policies that will increase the cost of normal farming operations, such as:

I137-5

- Policy AG-5.2: Electric- or Renewable-Powered Agricultural Equipment. The County shall encourage and support the transition to electric- or renewable-powered or lower emission agricultural equipment in place of fossil fuel-powered equipment when feasible.
- Policy AG-5.3: Electric- or Renewable-Powered Irrigation Pumps. The County shall encourage farmers to convert fossil fuel-powered irrigation pumps to systems powered by electric or renewable energy sources, such as solar power, and encourage electric utilities to eliminate or reduce standby charges.

Direct and indirect impacts of increased competition for water resources

The County fails to evaluate the impact of increased competition for water resources caused by development allowed in the 2040 General Plan on either the conversion of agricultural land or the loss of agricultural lands through the loss of topsoil.

The EIR states on page 4.2-3 that “...a reduction in available water resources for irrigation” is an example of indirect impacts on agricultural land due to loss of topsoil from increased wind and water erosion.

I137-6

But the County fails to analyze or propose mitigation measures to address this significant impact.

Ventura County Coalition of Labor, Agriculture and Business / 1672 Donlon Street, Ventura, CA 93003 / 805-633-2260 / info@colabvc.org

Page 4 of 4

APAC is the expert charged with advising County decision-makers on agricultural issues in Ventura County. And the County should be seeking guidance from APAC about the actual issues that will impact farmland under the 2040 General Plan: lack of economic sustainability, the increasing regulatory demands on agriculture, increased competition for water resources, and increased compatibility conflicts from development.

CoLAB encourages APAC to provide guidance to the County on appropriate and effective mitigation measures to prevent the conversion of agricultural land to non-agricultural uses. These may include:

I137-7

- 1) Strengthen the Right-to-Farm ordinance to prevent nuisance complaints from being used to justify the creation or expansion of setbacks or regulatory restrictions on normal farming practices;
- 2) Expand the Land Conservation Act Program to include Open Space zoned properties that are engaged in farming (including grazing); and

- 3. 3) Protect agricultural land from urban-ag interface encroachment and compatibility conflicts by establishing setbacks on NON-AE-zoned land that will restrict the construction of bike paths, public trails, and sensitive receptors within 2000’ of any land zoned A/E.

I137-7
cont.

Thank you again for the opportunity to provide comments on this issue. We appreciate your consideration and leadership at this time.

Sincerely,

Louise Lampara Executive Director

**Letter
I138**

To: Susan Curtis-

County failed to evaluate mitigation measures for feasibility- 500' set back for "sensitive receptors" from freeways and high traffic roads.

Mitigation Measure AQ-3 (Policy HAZ10-X) creates a minimum 500' set back for "sensitive receptors" from freeways and high traffic roads. Yet the County states in the Land Use section of the EIR that "the majority of the anticipated build-out will be within the freeway corridors."

Has the County completed a "buildout study" to ensure that the establishment of this set back still leaves enough room for development to occur? Will this mitigation measure be economically feasible?

I138-1

Ventura County Board of Supervisors
Attn: RMA Planning Division
General Plan Update
800 Victoria Avenue L#1740
Ventura, California 93009-1740

Dear Board of Supervisors and Staff:

We are writing this letter to urge the Board of Supervisors to reconsider moving forward with the Draft General Plan EIR. The draft EIR has been accelerated to the point that too many issues and impacts have not been properly addressed or studied. These impacts and the corresponding mitigation measures will have severe impacts to land owners and especially those, like us in the agricultural industry and other productive economic segments.

I139-1

Our family has been involved in the agricultural industry for more than 100 years in Ventura County. We have owned numerous land holdings that remain in the family to this date. We have farmed throughout Ventura County and hope to continue to do so in the future.

The Draft EIR is deficient on many levels. CEQA requires that all mitigation measures must be technically and economically feasible. Numerous proposed mitigation measures are neither. We have in the past attempted to identify land and any owners that would be open to sell their development rights for land that was converting from agricultural to commercial use. Not only did we not find anyone that would do so, no one would even quote a price. The only positive response from numerous land owners were that you can buy my property for full market value and then you can do what you want. There is not a project that can be built by adding double land cost to the equation. This was very recently experienced based on proposed policies at LAFCo. These policies were eventually not enacted due to the inability to purchase development rights in an economical feasible manner. This was when LAFCo was contemplating an acre for acre ag preserve. The new policy that is proposed in the 2040 General Plan is requiring 2 acres for every 1 acre of land converted from ag to any other use. This will eliminate the ability to add any new required ag buildings or even farm worker housing. The Draft EIR must study these impacts, since they are not feasible.

I139-2

The Draft EIR also deals with water in a manner that is not properly studied. There is no analysis on increased water costs and diminishing availability of water. Without reasonable water costs and supply, there is no agricultural industry.

I139-3

The General Plan indicates that agriculture is a high priority in the County. However, new policies and requirements in the General Plan add additional mitigation measures that will make ag virtually impossible. These include new setbacks, limiting types of fumigants pesticides and fertilizers. The General Plan also requires the conversion of all farm equipment to be all electric. Again, not feasible. The costs to purchase new pumps, farm equipment and other existing fuel using equipment will increase operational costs to a point that the County crops will not be competitive in the open market. These new mitigation measures are not sufficiently studied and again are not economically feasible.

I139-4

The Draft EIR is extremely difficult to read and understand. The background reports are lacking in depth of what has been studied other than numerous general statements and very poor mapping. Detailed studies must be added to sufficiently identify impacts and the related mitigation measures for both direct and indirect impacts on the agricultural industry. It is our understanding that reports and studies need to be timely prepared. However numerous studies are older than 5 years. Not timely.

I139-5

After numerous devastating wildfires over the last few years, which significantly impacted ag, the General Plan continues to lay out limiting mitigation measures for fire prevention. The Wildlife corridor eliminates any ag operation or fire prevention in the proposed corridor areas. This is also a major concern not studied in the Draft EIR.

I139-6

The Draft EIR for the 2040 General plan does not provide adequate analysis for the expansion of permanent bike paths and pedestrian walking trails throughout the County. These impacts are very severe due to constant conflicts from trail users and ag operations. Spraying, dust, odors from ag operations, along with impacts created by the trail users. These are usually theft, vandalism, litter and pet waste. The proposed mitigation measures require additional setbacks from these trails which renders additional land unusable for ag operations.

I139-7

In addition to the above comments on the agricultural aspects and related land use concerns of the DEIR, the undersigned is also a mineral owner directly interested in the impacts on oil and gas production of the DEIR and related General Plan 2040 proposed provisions. In these documents there is a total failure to address the economic impacts of the various policies proposed in violation of the requirements for this process, including but not limited to the loss of royalty income to a large group of County residents. I join in the detailed comments on the various deficiencies and concerns identified in the DEIR as described in the concurrent submissions on behalf of Aera Energy and other operators delivered this week to the County.

I139-8

Please look at the long-term consequences of these General Plan policies and mitigation measures. We formally request additional studies and a revised Draft EIR that will properly look at these and many more issues. The DEIR must be corrected with details of the revisions. Then it can be recirculated.

I139-9

V
Sincerely,

Mary Kathleen McGrath

Subject: 2040 General Plan Draft EIR Comment

| |
|------------------------|
| Letter I140 |
|------------------------|

Ventura County - RMA Planning Division

The DEIR is based on incomplete analysis of policies, contains several false and ill-advised policies, and fails to understand key challenges related to Ventura County. I140-1

Background Report is inaccurate, vague, and contains outdated information that is so poor it cannot be used for analysis. I140-2

Fig 11-11 is of such poor resolution and detail that it is impossible to determine where urban-wildfire interface areas may exist for any parcel. Providing a map of such poor resolution that the entire county is "colored in" does not provide useful data that can be used for any kind of impact analysis. I140-2

Map 9-7 in the Ag Chapter is blurry and the text is impossible to read. Maps like this violate the intent of CEQA as the reader is not given clear and applicable data with which to evaluate the County's impact analysis. I140-3

Please do what is best for Ventura County and halt this flawed document which does not achieve (and negatively affects) its primary purpose, which is to be a tool of disclosure of all impacts caused by the 2040 General Plan. I140-3

Re: Comments on Ventura County General Plan DEIR

Dear Ms. Curtis:

I am a part of the McLoughlin Family. We have been farming in Ventura County for approximately 150 years. We currently own 300 acres of agricultural property off of Olivas Park Road in the County of Ventura near the Ventura Marina on Harbor Rd, in proximity to the City of Ventura.

The McLoughlin family has farmed this land and other parcels for generations going back to 1863. It remains our desire to continue this legacy, however, in the face of never-ending changes to the regulatory environment, we again find ourselves attempting to ascertain how new policies and programs as proposed in the draft 2040 General Plan will impact and challenge our ability to serve as stewards of this heritage.

It had been our hope that the DEIR would provide some clarity and insight into how the new policies and programs within the revised General Plan would impact our farming operation. That, however, is not the case. Simply said, we believe the General Plan Update and subsequent Environmental Impact Report fail to adequately analyze or study impacts on the farming industry.

With that said, we would like to specifically present the following:

I141-1
T I141-2

- The Background report Table 6-26: Transportation Department Planned Capital Projects lists sections of roadways the County plans for expanded capacity or widening, along with the scope of those enhancements. It also covers in length the plan to add bike paths and bike lanes in accordance with existing County wayfarer plans. The DEIR, however, never analyzes the loss of farmland resulting from these changes in infrastructure – it’s not even mentioned as a possibility in the DEIR.

Olivas Park Road between Victoria and Harbor is listed as one of the areas planned for road widening, a stretch of roadway that borders the entire eastern portion of our farmland and property. While the impact on our farming operation and financial losses due to property loss are clearly quantifiable, the report fails to list or quantify these impacts.

I141-2
cont.

- In Section 3-8, The DEIR states that because there will be no “substantive” change to the agricultural, open space, or rural designations, the General Plan Update (GPU) will be consistent with SOAR. No further details beyond this conclusory statement are provided. There is no way for the reader to come to his or her own conclusion on whether the GPU will result in inconsistencies with SOAR that might lead to physical environmental impacts. There is no description of the changes to the Agriculture, Open Space, and Rural policies to determine whether they are in fact non-substantive.

I141-3

Given the length and breath of the Draft General Plan update and CEQA analysis, we made an attempt to focus our initial review and subsequent comments to issues specific to agriculture and farming. It’s clear that the 2040 General Plan will impact the Ventura County local economy across sectors – all of which influence the ability to live and work in this region. The DEIR’s lack of analysis of those economic impacts, calls into question the legitimacy of both the draft General Plan update, and the CEQA analysis. As such, we respectfully request that the DEIR be recirculated in the hopes that further study will resolve these shortcomings.

I141-4

I appreciate your consideration.

Sincerely,

Mary Victoria Taylor

Please consider that we are facing a much worse future for all our health if we continue to put profits for the petroleum industry before people's' health. That is not to say there is not room for plenty of income and profits to be made. Just please do it sensibly with renewable energy. Stop all fracking immediately. Push for electric vehicles. Improve public transportation. Encourage bicycle use, etc. You know how to do it. It will just take the political will to stand up to the petroleum industry that is harming everyone in Ventura County, let alone the entire planet.

Re: Comments on Ventura County General Plan DEIR

Dear Ms. Curtis:

I represent and serve on the McLoughlin Family Committee, a group of family members that own approximately 300 acres of agricultural property off of Olivas Park Road in the County of Ventura, in proximity to the City of Ventura.

The McLoughlin family has farmed this land for generations. It remains our desire to continue this legacy. However, in the face of never-ending changes to the regulatory environment, we again find ourselves attempting to ascertain how new policies and programs as proposed in the draft 2040 General Plan will impact and challenge our ability to serve as stewards of this heritage.

It had been our hope that the DEIR would provide some clarity and insight into how the new policies and programs within the revised General Plan would impact our farming operation. However, that is not the case. Simply said, we believe the General Plan Update and subsequent Environmental Impact Report fail to adequately analyze or study impacts on the farming industry.

With that said, we would like to specifically present the following:

- The Background report Table 6-26: Transportation Department Planned Capital Projects lists sections of roadways the County plans for expanded capacity or widening, along with the scope of those enhancements. It also covers in length the plan to add bike paths and bike lanes in accordance with existing County wayfarer plans. However, the DEIR never analyzes the loss of farmland resulting from these changes in infrastructure – it’s not even mentioned as a possibility in the DEIR.

Olivas Park Road between Victoria and Harbor is listed as one of the areas planned for road widening, a stretch of roadway that borders the entire eastern portion of our farmland and property. While the impact on our farming operation and financial losses due to property loss are clearly quantifiable, the report fails to list or quantify these impacts.

- In Section 3-8, The DEIR states that because there will be no “substantive” change to the agricultural, open space, or rural designations, the General Plan Update (GPU) will be consistent with SOAR. However, no further details beyond this conclusory statement is provided. There is no way for the reader to come to his or her own conclusion on whether the GPU will result in inconsistencies with SOAR that might lead to physical environmental impacts. There is no description of the changes to the Agriculture, Open Space, and Rural policies to determine whether they are in fact non-substantive.

Given the length and breath of the Draft General Plan update and CEQA analysis, we made an attempt to focus our initial review and subsequent comments to issues specific to agriculture and farming. However, it’s clear that the 2040 General Plan will impact the Ventura County local economy across

I143-5
cont.

1202897.1

sectors – all of which influence the ability to live and work in this region. The DEIR’s lack of analysis of those economic impacts, calls into question the legitimacy of both the draft General Plan update, and the CEQA analysis. As such, we respectfully request that the DEIR be recirculated in the hopes that further study will resolve these shortcomings.

I143-5
cont.

I appreciate your consideration.

To: Susan Curtis-

County failed to evaluate mitigation measure for feasibility- 500' set back for "sensitive receptors" from freeways and high traffic roads.

Mitigation Measure AQ-3 (Policy HAZ10-X) creates a minimum 500' set back for "sensitive receptors" from freeways and high traffic roads. Yet the County states in the Land Use section of the EIR that "the majority of the anticipated build out will be within the freeway corridors."

Has the County completed a "buildout study" to ensure that the establishment of this set back still leaves enough room for development to occur? Will this mitigation measure be economically feasible?

GeneralPlanUpdate@ventura.org

Dear Ms. Curtis:

I am writing to call your attention to significant flaws in the process, data, and conclusions of the Ventura County General Plan, Draft EIR, and supplemental documents.

My great great grandfather, Mark McLoughlin (1843-1914), was a true Ventura County pioneer, purchasing his first 318 acres of undeveloped land in Ventura County in 1875. He was a hard-working visionary, revered by his community. With his son—my great grandfather, James Patrick McLoughlin—he raised livestock and farmed the land, providing jobs and feeding the growing towns of Oxnard and Ventura.

I145-1

Our land, in a vitally important location on Olivas Park Drive across from the Ventura Marina, has been in the family, and part of the economic fabric of the community, for 100 years. And we want it to be part of the future of this community, with a flourishing economy, a thriving job market, and unsurpassed quality of life for its residents.

But the General Plan and DEIR do not describe a viable path for us as landowners going forward.

I will begin with some specific issues regarding language in the Coastal Area Plan, 4-82-83 and 4-94-95. Part of our land is located in the Central Coastal Zone, adjacent to the Ventura Marina, on Olivas Park Drive at Harbor Blvd. The only conclusion the Plan draws about our land is the statement that, "unlike the Preble area, services are not readily available to the Olivas lands." This is false. Our property has access to all utilities, water, main roads, and the freeway. Indeed, easements on our property serve surrounding areas with utilities.

The Plan also claims that our property is "not included in the City's sanitation district because of problems with water pressure." This language is irrelevant and incorrect. There is no evidence that there are water pressure issues, and the sanitation district's pipelines actually traverse our property.

I145-2

While we do not know the original source of these misstatements, such misrepresentations—now repeated in the Plan—threaten to diminish the value of our land in relation to the Preble property. And, of course, they undermine the goal and the value of the Plan itself.

The General Plan also speaks of the widening of Olivas Park Drive, our southern boundary. This would have a direct impact on our property. But the Plan does not address how this would happen or how it would affect our land.

Damaging misstatements about our property also appear in the DEIR. Contrary to the portrayal in the DEIR, our property has significant infrastructure in place, as well as prime accessibility to the highway and the harbor. In fact, with easy access to the marina and beach community, and with the railroad as part of our eastern boundary, our land is uniquely suited to be an important part of future economic development in the area. We are entitled to have all these matters corrected.

I154-3

I would also like to raise some additional concerns:

- 1. The General Plan and DEIR continue to ignore the 28% increase in the homeless population in our community. I154-4
- 2. According to the General Plan, if we were to build an acre of low income / worker housing we would need to buy two replacement acres of same Ag land to be placed into perpetual agricultural preservation. This is unrealistic and infeasible, and certainly not in line with the State government's housing policies. I154-5
- 3. The EIR does not adequately address the enormous "indirect impacts" that will occur as a result of implementing the General Plan, calling them "less than significant." I154-6
- 4. The General Plan contains policies that will increase the costs of normal farming operations, making it difficult for farming to remain profitable. I154-7
- 5. The Plan does not adequately evaluate the impacts of increased competition for water in our community. I154-8

The EIR is a flawed document, full of errors, that does not disclose all impacts, direct and indirect, caused by the General Plan. It was obviously rushed—completed in six weeks. It is inaccurate and incomplete, and fails to provide members of the community with the information that they are legally entitled to. This EIR should be corrected and reconsidered, and a reasonable time period should be allowed for meaningful and thoughtful community input. I154-9

Sincerely,

Meghan Elizabeth McMonigle

Sanger Hedrick, Chair
Agricultural Policy Advisory Committee (APAC) County of Ventura
800 S. Victoria Blvd.
Ventura, CA 93003

Re: 2040 General Plan Environmental Impact Report (EIR)

Dear Mr. Hedrick and Honorable Members of APAC:

Thank you for the opportunity to provide comments following today’s presentation by Ventura County Planning staff on the 2040 General Plan EIR.

I146-1

There are several issues with the 2040 General Plan EIR that CoLAB believes will negatively impact the viability of local agriculture.

Proposed mitigation measure AG-2: The County proposes that any project that either directly or indirectly results in the loss of farmland must obtain and place into perpetual agricultural preservation twice the total of the farmland loss. This mitigation measure is infeasible. Contrary to statements made by County Planning staff today at the APAC meeting, the California Environmental Quality Act (CEQA) requires that all mitigation proposed in an EIR be feasible. CEQA Section 21061.1 defines feasible as “capable of being accomplished in a successful manner within a reasonable period of time, ” *(emphasis added)*. All mitigation measures proposed in an EIR must be shown to reduce impacts and an infeasible mitigation measure, by definition, cannot and will not reduce impacts.

The EIR does not provide evidence of any of the following:

1. 1) Whether there is sufficient land available for purchase/conservation easement for each farmland category;
2. 2) The cost per acre to purchase each category of farmland;
3. 3) The anticipated cost of establishing a conservation easement for each category of farmland;
4. 4) The anticipated cost associated with managing each category of farmland under a conservation easement;
5. 5) The anticipated cost associated with monitoring these mitigation parcels scattered throughout the County and who will bear that cost;
6. 6) Any information that could constitute a “plan” for management of farmland in conservation easements;

I146-2

February 19, 2020

Ventura County Coalition of Labor, Agriculture and Business / 1672 Donlon Street, Ventura, CA 93003 / 805-633-2260 / info@colabvc.org

Page 2 of 4

7. 7) An analysis of direct and indirect impacts caused by this mitigation measure (including impacts associated with LU compatibility conflicts and increased urban-ag-interface);
8. 8) Whether the smallest possible mitigation acreage required will achieve the minimum to ensure viability of agriculture on the parcel; and
9. 9) Whether the proposed mitigation is in conflict with other ordinances and regulations, such as the County’s Zoning Ordinance and the County’s minimum lot sizes.

The County is already aware that this proposed mitigation measure is infeasible. On March 24, 2016, at a Local Agency Formation Commission (LAFCo) hearing, Supervisor Linda Parks attempted to establish an “Agricultural Mitigation Measure” through the LAFCo project approval process. The mitigation measure would have required the 1-to-1 purchase of local farmland (half of what is proposed in the 2040 General Plan EIR) to replace farmland that would be impacted by any proposed development. Ventura County Counsel, Michael Walker, informed both LAFCo and Supervisor Parks that the proposed mitigation measure did not meet the standard for economic feasibility, and, for that and other reasons, LAFCo could not adopt Supervisor Park’s proposed mitigation measure. He referenced a 2015 legal decision, *City of Irvine v. County of Orange*, in which the Court stated, “the sheer astronomical expense of land supports the finding of the EIR that the purchase of an agricultural conservation easement is a non-starter.”

I146-2
cont.

In addition to being infeasible, CoLAB does not believe that this mitigation measure will reduce impacts on agricultural land, as it does not address the actual issues that will impact farmland under the 2040 General Plan: lack of economic sustainability, the increasing regulatory demands on agriculture, increased competition for water resources, and increased compatibility conflicts from development.

Indirect Impacts

The EIR dismisses “indirect impacts” that will occur as a result of implementing the 2040 General Plan as “less than significant.”

Page 4.2-13 of the EIR states “AG-2.3 maintains the Right-to-Farm Ordinance to protect agricultural land uses from conflicts with non-agricultural uses, as well as to help land purchasers and residents understand the potential for nuisance, (e.g., dust, noise, odors) that may occur as the natural result of living in or near agricultural areas...These sections of the code protect farmers engaged in agricultural activity from public nuisance claims...This protects the farming community, including Important Farmlands and farms less than 10 acres, from developments that would inhibit their ability to continue agricultural production.”

Page 4.2-17 of the EIR states: “Residential growth in areas nearby agricultural lands has the potential to result in land use conflicts. Residential land uses are generally more sensitive and prone to conflict with adjacent agricultural land uses than commercial or industrial land uses. The placement of sensitive land uses, such as residences and schools, nearby classified farmland can negatively impact both uses due to conflict including odor nuisances and noise from agriculture machinery. The countywide Right-to-Farm Ordinance protects existing agricultural and farming operations from conflicts attributed to residential development...**Therefore, the potential for conflicts would be minimal. This impact would be less than significant**” (*emphasis added*).

I146-3

This is simply not true. Historic and recent County actions have shown that the County has and will continue to create new restrictions and ordinances that have a significant impact on existing agricultural

[Ventura County Coalition of Labor, Agriculture and Business / 1672 Donlon Street, Ventura, CA 93003 / 805-633-2260 / info@colabvc.org](http://www.colabvc.org)

Page 3 of 4

and farming operations because of conflicts attributed to residential development. The recent interim urgency ordinance restricting hemp cultivation is one such example.

Contrary to statements made today by Ventura County Planning staff, an EIR, whether it is labeled as “programmatic” or “project”, must analyze all reasonably foreseeable consequences of the action that is proposed. For the 2040 General Plan EIR, the action proposed is the implementation of all policies and programs within. Therefore, if the implementation of a policy in the 2040 General Plan will result in an impact, that impact must be analyzed. For example, the 2040 General Plan contains land use designation changes that will increase allowable housing density near agricultural land. It is reasonably foreseeable that more houses will create more compatibility conflicts with normal farming operations. The impact of these compatibility conflicts must be addressed in the EIR.

I146-4

In 2014, the California Court of Appeal stated in a ruling that “[T]he fact that this EIR is labeled a ‘project’ rather than a ‘program’ EIR matters little....Designating an EIR as a program EIR ... does not by itself decrease the level of analysis otherwise required in the EIR. All EIRs must cover the same general content. The level of specificity of an EIR is determined by the nature of the project and the “rule of reason,” rather than any semantic label accorded to the EIR.”

It is CoLAB’s opinion that indirect impacts from increasing urban-ag interface are SIGNIFICANT and cannot be dismissed in the EIR.

Direct and indirect impacts of increased costs

The 2040 General Plan has policies that will increase the costs of normal farming operations. CoLAB believes that the most effective way to minimize conversion of agricultural land to non-agricultural uses is to take active measures to allow farming to remain profitable. And even the County admits that reducing the cost of farming reduces conversion of agricultural land in their discussion of the Williamson Act in Chapter 4.2 of the EIR.

I146-5
cont.

But the County fails to analyze direct and indirect impacts of 2040 General Plan policies that will increase the cost of normal farming operations, such as:

- Policy AG-5.2: Electric- or Renewable-Powered Agricultural Equipment. The County shall encourage and support the transition to electric- or renewable-powered or lower emission agricultural equipment in place of fossil fuel-powered equipment when feasible.
- Policy AG-5.3: Electric- or Renewable-Powered Irrigation Pumps. The County shall encourage farmers to convert fossil fuel-powered irrigation pumps to systems powered by electric or renewable energy sources, such as solar power, and encourage electric utilities to eliminate or reduce standby charges.

Direct and indirect impacts of increased competition for water resources The County fails to evaluate the impact of increased competition for water resources caused by development allowed in the 2040 General Plan on either the conversion of agricultural land or the loss of agricultural lands through the loss of topsoil.

I146-6

The EIR states on page 4.2-3 that “...a reduction in available water resources for irrigation” is an example of indirect impacts on agricultural land due to loss of topsoil from increased wind and water erosion. But the County fails to analyze or propose mitigation measures to address this significant impact.

Ventura County Coalition of Labor, Agriculture and Business / 1672 Donlon Street, Ventura, CA 93003 / 805-633-2260 / info@colabvc.org

Page 4 of 4

APAC is the expert charged with advising County decision-makers on agricultural issues in Ventura County. And the County should be seeking guidance from APAC about the actual issues that will impact farmland under the 2040 General Plan: lack of economic sustainability, the increasing regulatory demands on agriculture, increased competition for water resources, and increased compatibility conflicts from development.

I146-7

CoLAB encourages APAC to provide guidance to the County on appropriate and effective mitigation measures to prevent the conversion of agricultural land to non-agricultural uses. These may include:

1. 1) Strengthen the Right-to-Farm ordinance to prevent nuisance complaints from being used to justify the creation or expansion of setbacks or regulatory restrictions on normal farming practices;
2. 2) Expand the Land Conservation Act Program to include Open Space zoned properties that are engaged in farming (including grazing); and
3. 3) Protect agricultural land from urban-ag interface encroachment and compatibility conflicts by establishing setbacks on NON-AE-zoned land that will restrict the construction of bike paths, public trails, and sensitive receptors within 2000' of any land zoned A/E.

I146-7
cont.

Thank you again for the opportunity to provide comments on this issue. We appreciate your consideration and leadership at this time.

Sincerely,

Louise Lampara Executive Director

VIA ELECTRONIC MAIL: GeneralPlanUpdate@ventura.org

February 25, 2020

Ventura County Board of Supervisors

Attn: RMA Planning Division

General Plan Update

800 Victoria Avenue L#1740

Ventura, California 93009-1740

Dear Board of Supervisors and Staff:

We are writing this letter to urge the Board of Supervisors to reconsider moving forward with the Draft General Plan EIR. The draft EIR has been accelerated to the point that too many issues and impacts have not been properly addressed or studied. These impacts and the corresponding mitigation measures will have severe impacts to land owners and especially those, like us in the agricultural industry and other productive economic segments.

I147-1

Our family has been involved in the agricultural industry for more than 100 years in Ventura County. We have owned numerous land holdings that remain in the family to this date. We have farmed throughout Ventura County and hope to continue to do so in the future.

The Draft EIR is deficient on many levels. CEQA requires that all mitigation measures must be technically and economically feasible. Numerous proposed mitigation measures are neither. We have in the past attempted to identify land and any owners that would be open to sell their development rights for land that was converting from agricultural to commercial use. Not only did we not find anyone that would do so, no one would even quote a price. The only positive response from numerous land owners were that you can buy my property for full market value and then you can do what you want. There is not a project that can be built by adding double land cost to the equation. This was very recently experienced based on proposed policies at LAFCo. These policies were eventually not enacted due to the inability

I147-2

to purchase development rights in an economical feasible manner. This was when LAFCo was contemplating an acre for acre ag preserve. The new policy that is proposed in the 2040 General Plan is requiring 2 acres for every 1 acre of land converted from ag to any other use. This will eliminate the ability to add any new required ag buildings or even farm worker housing. The Draft EIR must study these impacts, since they are not feasible.

I147-2
cont.

The Draft EIR also deals with water in a manner that is not properly studied. There is no analysis on increased water costs and diminishing availability of water. Without reasonable water costs and supply, there is no agricultural industry.

I147-3

The General Plan indicates that agriculture is a high priority in the County. However, new policies and requirements in the General Plan add additional mitigation measures that will make ag virtually impossible. These include new setbacks, limiting types of fumigants pesticides and fertilizers. The General Plan also requires the conversion of all farm equipment to be all electric. Again, not feasible. The costs to purchase new pumps, farm equipment and other existing fuel using equipment will increase operational costs to a point that the County crops will not be competitive in the open market. These new mitigation measures are not sufficiently studied and again are not economically feasible.

I147-4

The Draft EIR is extremely difficult to read and understand. The background reports are lacking in depth of what has been studied other than numerous general statements and very poor mapping. Detailed studies must be added to sufficiently identify impacts and the related mitigation measures for both direct and indirect impacts on the agricultural industry. It is our understanding that reports and studies need to be timely prepared. However numerous studies are older than 5 years. Not timely.

I147-5

After numerous devastating wildfires over the last few years, which significantly impacted ag, the General Plan continues to lay out limiting mitigation measures for fire prevention. The Wildlife corridor eliminates any ag operation or fire prevention in the proposed corridor areas. This is also a major concern not studied in the Draft EIR.

I147-6

The Draft EIR for the 2040 General plan does not provide

I147-7

adequate analysis for the expansion of permanent bike paths and pedestrian walking trails throughout the County. These impacts are very severe due to constant conflicts from trail users and ag operations. Spraying, dust, odors from ag operations, along with impacts created by the trail users. These are usually theft, vandalism, litter and pet waste. The proposed mitigation measures require additional setbacks from these trails which renders additional land unusable for ag operations.

1147-7
cont.

In addition to the above comments on the agricultural aspects and related land use concerns of the DEIR, the undersigned is also a mineral owner directly interested in the impacts on oil and gas production of the DEIR and related General Plan 2040 proposed provisions. In these documents there is a total failure to address the economic impacts of the various policies proposed in violation of the requirements for this process, including but not limited to the loss of royalty income to a large group of County residents. I join in the detailed comments on the various deficiencies and concerns identified in the DEIR as described in the concurrent submissions on behalf of Aera Energy and other operators delivered this week to the County.

1147-8

Please look at the long-term consequences of these General Plan policies and mitigation measures. We formally request additional studies and a revised Draft EIR that will properly look at these and many more issues. The DEIR must be corrected with details of the revisions. Then it can be recirculated.

1147-9

Sincerely,

| | |

These impacts and the corresponding mitigation measures will have severe impacts to land owners and especially those, like us in the agricultural industry and other productive economic segments.

I148-1

Our family has been involved in the agricultural industry for more than 100 years in Ventura County. We have owned numerous land holdings that remain in the family to this date. We have farmed throughout Ventura County and hope to continue to do so in the future.

The Draft EIR is deficient on many levels. CEQA requires that all mitigation measures must be technically and economically feasible. Numerous proposed mitigation measures are neither. We have in the past attempted to identify land and any owners that would be open to sell their development rights for land that was converting from agricultural to commercial use. Not only did we not find anyone that would do so, no one would even quote a price. The only positive response from numerous land owners were that you can buy my property for full market value and then you can do what you want. There is not a project that can be built by adding double land cost to the equation. This was very recently experienced based on proposed policies at LAFCo. These policies were eventually not enacted due to the inability to purchase development rights in an economical feasible manner. This was when LAFCo was contemplating an acre for acre ag preserve. The new policy that is proposed in the 2040 General Plan is requiring 2 acres for every 1 acre of land converted from ag to any other use. This will eliminate the ability to add any new required ag buildings or even farm worker housing. The Draft EIR must study these impacts, since they are not feasible.

I148-2

The Draft EIR also deals with water in a manner that is not properly studied. There is no analysis on increased water costs and diminishing availability of water. Without reasonable water costs and supply, there is no agricultural industry.

I148-3

The General Plan indicates that agriculture is a high priority in the County. However, new policies and requirements in the General Plan add additional mitigation measures that will make ag virtually impossible. These include new setbacks, limiting types of fumigants pesticides and fertilizers. The General Plan also requires the conversion of all farm equipment to be all electric. Again, not feasible. The costs to purchase new pumps, farm equipment and other existing fuel using equipment will increase operational costs to a point that the County crops will not be competitive in the open market. These new mitigation measures are not sufficiently studied and again are not economically feasible.

I148-4

The Draft EIR is extremely difficult to read and understand. The background reports are lacking in depth of what has been studied other than numerous general statements and very poor mapping. Detailed studies must be added to sufficiently identify impacts and the related mitigation measures for both direct and indirect impacts on the agricultural industry. It is our understanding that reports and studies need to be timely prepared. However numerous studies are older than 5 years. Not timely.

I148-5

After numerous devastating wildfires over the last few years, which significantly impacted ag, the General Plan continues to lay out limiting mitigation measures for fire prevention. The Wildlife corridor eliminates any ag operation or fire prevention in the proposed corridor areas. This is also a major concern not studied in the Draft EIR.

I148-6

The Draft EIR for the 2040 General plan does not provide adequate analysis for the expansion of permanent bike paths and pedestrian walking trails throughout the County. These impacts are very severe due to constant conflicts from trail users and ag operations. Spraying, dust, odors from ag operations, along with impacts created by the trail users. These are usually theft, vandalism, litter and pet waste. The proposed mitigation measures require additional setbacks from these trails which renders additional land unusable for ag operations.

I148-7

In addition to the above comments on the agricultural aspects and related land use concerns of the DEIR, the undersigned is also a mineral owner directly interested in the impacts on oil and gas production of the DEIR and related General Plan 2040 proposed provisions. In these documents there is a total failure to address the economic impacts of the various policies proposed in violation of the requirements for this process, including but not limited to the loss of royalty income to a large group of County residents. I join in the detailed comments on the various deficiencies and concerns identified in the DEIR as described in the concurrent submissions on behalf of Aera Energy and other operators delivered this week to the County.

I148-8

Please look at the long-term consequences of these General Plan policies and mitigation measures. We formally request additional studies and a revised Draft EIR that will properly look at these and many more issues. The DEIR must be corrected with details of the revisions. Then it can be recirculated.

I148-9

Sincerely,

Michael Diacos

Ventura County Board of Supervisors

Attn: RMA Planning Division

General Plan Update

800 Victoria Avenue L#1740

Ventura, California 93009-1740

Dear Board of Supervisors and Staff:

We are writing this letter to urge the Board of Supervisors to reconsider moving forward with the Draft General Plan EIR. The draft EIR has been accelerated to the point that too many issues and impacts have not been properly addressed or studied. These impacts and the corresponding mitigation measures will have severe impacts to land owners and especially those, like us in the agricultural industry and other productive economic segments.

1149-1

Our family has been involved in the agricultural industry for more than 100 years in Ventura County. We have owned numerous land holdings that remain in the family to this date. We have farmed throughout Ventura County and hope to continue to do so in the future.

The Draft EIR is deficient on many levels. CEQA requires that all mitigation measures must be technically and economically feasible. Numerous proposed mitigation measures are neither. We have in the past attempted to identify land and any owners that would be open to sell their development rights for land that was converting from agricultural to commercial use. Not only did we not find anyone that would do so, no one would even quote a price. The only positive response from numerous land owners were that you can buy my property for full market value and then you can do what you want. There is not a project that can be built by adding double land cost to the equation. This was very recently experienced based on proposed policies at LAFCo. These policies were eventually not enacted due to the inability

1149-2

to purchase development rights in an economical feasible manner. This was when LAFCo was contemplating an acre for acre ag preserve. The new policy that is proposed in the 2040 General Plan is requiring 2 acres for every 1 acre of land converted from ag to any other use. This will eliminate the ability to add any new required ag buildings or even farm worker housing. The Draft EIR must study these impacts, since they are not feasible.

I 1149-2
cont.

The Draft EIR also deals with water in a manner that is not properly studied. There is no analysis on increased water costs and diminishing availability of water. Without reasonable water costs and supply, there is no agricultural industry.

I 1149-3

The General Plan indicates that agriculture is a high priority in the County. However, new policies and requirements in the General Plan add additional mitigation measures that will make ag virtually impossible. These include new setbacks, limiting types of fumigants pesticides and fertilizers. The General Plan also requires the conversion of all farm equipment to be all electric. Again, not feasible. The costs to purchase new pumps, farm equipment and other existing fuel using equipment will increase operational costs to a point that the County crops will not be competitive in the open market. These new mitigation measures are not sufficiently studied and again are not economically feasible.

I 1149-4

The Draft EIR is extremely difficult to read and understand. The background reports are lacking in depth of what has been studied other than numerous general statements and very poor mapping. Detailed studies must be added to sufficiently identify impacts and the related mitigation measures for both direct and indirect impacts on the agricultural industry. It is our understanding that reports and studies need to be timely prepared. However numerous studies are older than 5 years. Not timely.

I 1149-5

After numerous devastating wildfires over the last few years, which significantly impacted ag, the General Plan continues to lay out limiting mitigation measures for fire prevention. The Wildlife corridor eliminates any ag operation or fire prevention in the proposed corridor areas. This is also a major concern not studied in the Draft EIR.

I 1149-6

The Draft EIR for the 2040 General plan does not provide

I 1149-7

adequate analysis for the expansion of permanent bike paths and pedestrian walking trails throughout the County. These impacts are very severe due to constant conflicts from trail users and ag operations. Spraying, dust, odors from ag operations, along with impacts created by the trail users. These are usually theft, vandalism, litter and pet waste. The proposed mitigation measures require additional setbacks from these trails which renders additional land unusable for ag operations.

I149-7

Subject: Ventura County Planning

Letter
I150

Hello Ventura leaders,

My name is Michael Hayes, and over the weekend I had the familiar, yet infrequent pleasure of spending time in Ventura county; coming from what can often seem like the other side of the state (Los Angeles) Ventura county isn't always conveniently accessible.. I wish I could more easily and regularly enjoy the splendors of Ventura county; but that's not the point of this message. Unfortunately, the motivation for this message is about my concern with what I had seen over the weekend.

Nobody wants unsolicited advice or critique, so I apologize for being obtuse, if not flat-out disrespectful; but I feel so strongly about these issues that it really frustrates me to think about the colossal planning mistakes that have taken place in America over the past 60 years, mistakes that I really *really* hope Ventura will not continue to make. That grand failure of American society is truly senseless and completely vapid suburban sprawl.

Without making this some sort of Manifesto... a brief recap of the default planning guidelines introduced in the late '50s. Sprawl has negatively affected the health of, now car-dependent, Americans; the air quality of the, now-smog filled, skies, the foundation of low density residential creates an exhaustive network of financially burdensome infrastructure and public services without an adequate tax base to properly maintain itself; siphoning funds from more essential civic services. Sprawl prohibits the ability to provide affordable housing in job rich areas, it disconnects people from a sense of place and it separates American's into political factions. Controversial or looney as it may seem, I truly believe SPRAWL is the single largest cause of a deflated American Spirit and the harbinger of collapsed American Ideals.

Anyone reading this message that has been in California for at least ~20 years has witnessed the insatiable consumption and the destruction of such beautiful and fertile land. In my short lifetime, I've seen Oxnard, Camarillo and Ventura transform from agrarian paradises and small town havens into an extension of West Covina or San Bernardino. Farms, Bungalows, Main streets, paved over and replaced by beige stucco boxes, banal shopping centers and other characterless vestiges of suburban sprawl. Already frustrated beyond words about the approval and early stage construction of LA County's "Newhall Ranch" I drove along the 126 to see a handful of new Riverside County-esque subdivisions, tracts of homes, the *United States of Generica*-style shopping centers that follow them, freeway-width "roads" and of course the suffocating and unavoidable traffic that comes in thereafter.

I spent an entire day just walking around Fillmore and Santa Paula enjoying the "small town" feel, talking with shop owners, all of whom couldn't believe how the area was changing for the worse. The city and county websites are full of pictures of the area's rich agricultural past, "Last Small Town..." yet at the same time, you're willing to pave over that history and beauty with some garbage cheap homes from KB Homes or Lennar?

I know Ojai as being the quintessential success story for staving off the plague of sprawl and its associated "Generica" monotony. It's a destination within the region precisely because it's different, it's charming, it's human-oriented, it embraces its agricultural roots. So, why isn't the rest of the county following in those footsteps? What is the recourse for city and county to prevent the spread of sprawl and the destruction of the otherwise beautiful landscapes? And most importantly, is this even a priority for leadership?

I150-1

If this type of "growth" is at all a concern, there are really only 2 options. A) halting all growth or B) changing the way in which we grow. A moratorium would seem like the easy route, but a foolish decision in the long run. The real solution is hidden in planning guidelines of yesteryear; the solution is in higher density, village-like, transit oriented communities. Places that are walkable and are rich with character, individuality and some distinguishable uniqueness. A convenient and manageable concentration of people that create an identity and a community. Luckily for Ventura county, its cities and towns already possess many of these qualities, I'd hope that they expand on that identity, rather than erase it.

The foundation for any *great* city, town or village is formed by its accessibility and mobility. After 60 years of planning exclusively for car mobility, we've witnessed its major shortcomings. If there were one piece of transformative infrastructure that could drastically improve access, convenience, quality of life, economic opportunity and preserve open space in Ventura it would be reactivating the rail ROW from Ventura to Piru and operating a Light Rail (perhaps similar to San Diego's Sprinter or LA's E line) this vein could have the capacity to alleviate transit woes for thousands of residents / commuters and contain and concentrate manageable growth around stations allowing for characterful neighborhoods to flourish.

There is so much to love and enjoy about Ventura County and the cities within it, I'd hope those characteristics that make it lovable are preserved, cherished and expanded upon, not dismantled and paved over like the rest of southern california.

All the best and thank you for your commitment to bettering the lives of the people you represent!

-m

Subject: 2040 General Plan Draft EIR Comment

Letter
I151

CAUTION: If this email looks suspicious, DO NOT click. Forward to Spam.Manager@ventura.org

Dear Board of Supervisors,

The more I investigate this document, the more problems become apparent to me.

With this proposal, Ventura County has failed to adequately analyze for impacts to farmland.

For example: the EIR has policies that will create and expand the bike paths and pedestrian trails throughout the County, which is a good thing. However, some of these proposed areas are in or adjacent to existing ag land and the County failed to analyze potential impacts on this ag land from these projects.

These projects will result in the direct loss of ag land in at least two ways. First, by paving a bike lane or path and second, the indirect loss of ag land through increasing public access to working ag areas which will encourage and increase theft, vandalism and trespassing.

In addition, as the public has more access to working farmlands, there will be an increase of complaints of odors, dust, noise, etc.

Ventura County agriculture produced about \$2 Billion in product in 2018 – it is vital to our local economy. The County must protect our local agriculture land from encroachment caused by increasing public access across these working farmlands. Please propose a mitigation measure to establish a set-back (on non-ag land) that prevents the construction of any bike path network or public trail on or adjacent to ag lands.

I look forward to hearing your thoughtful response.

Thank you,

Michael L. Poland

| Letter I151 | Michael L. Poland February 25, 2020 |
|------------------------|-----------------------------------------------|

I151-1

The comment states that the draft EIR does not adequately analyze potential impacts to farmland, and provides an example of indirect impacts to farmland related to the development/expansion of adjacent bike paths and pedestrian trails. Refer to response to comment O7-8 regarding potential incompatibilities with adjacent bicycle and pedestrian paths.

The commenter also suggests “a mitigation measure to establish a set-back (on non-ag land) that prevents the construction of any bike path network or public trail on or adjacent to ag lands.” As explained in this response to comment O7-8, Policy CTM-3.5 states that “[t]he County shall plan for bicycle network connectivity in rural, agricultural, and open space areas in a way that supports and complements business and agricultural activities in those areas.” This and other policies would be implemented through Implementation Program L, Master Bicycle Network Plan. Further, Policy LU-6.1 requires non-agricultural land uses adjacent to agricultural uses to incorporate adequate buffers to limit conflicts with adjoining agricultural operations. The development would be required to implement buffers, and this requirement would not require buffers to be created by existing agricultural operations. Because the requirements of the proposed mitigation measure are already components of the 2040 General Plan, no revisions to the draft EIR have been made in response to this comment.

Letter
I152

Board of Supervisors:

My Name is Michael Penrod and I have worked in commercial/ residential real estate development and land use advising for many years in Ventura County. My family and I love Ventura County and are so lucky to call such a beautiful place our home. However, we have some worries regarding the current Draft EIR and feel that changes need to be implemented in order to better serve Ventura County.

I152-1

As someone who advises landowners on land use, I can confidently say that there is a substantial amount of evidence to why the document is not ready for prime time. The DEIR has not been given the thorough consideration it deserves and is resulting in an incomplete policy analysis. Though I understand the efforts to mitigate serious challenges facing Ventura County, this document as it is currently is incomplete. The housing element is not even completed, yet the DEIR is being pushed out.

I152-2

The Ag conservation policy as proposed in the General Plan Update is not only infeasible, it is overstepping the intent of SOAR that has been voter approved twice in the last over 25 years. If this policy was in place, very few projects would have been able to navigate the purchase of development rights. It creates an inflated land value that will eliminate any economic returns for smart and quality growth. Basically, it could double the land costs which will only punish the residents by greatly increasing housing costs. We have, in the past, attempted to seek potential land owners that would consider selling their future development rights and was not able find one land owner that would even consider the concept. CEQA requires that any mitigation measure must be feasible and reasonable. This is neither.

I152-3

The future of Ventura is greatly hindered based on the lack of housing, both market rate and affordable. This impacts all employers so much that a significant amount of very good companies have and continue to relocate out of our County for economic reasons. Any communities that don't grow gentrifies and eventually stagnates to the point of fiscal disaster for the local governments. Just look at the City of Santa Paula that didn't expand for over 30 years and the financial impact on the City and it's services for their residents.

I152-4

This is a very serious and important document that the County should be taking the appropriate amount of time to ensure it is whole and complete.

I152-5

- I152-1 The commenter’s background and concerns regarding the draft EIR are noted. This comment is introductory in nature and does not raise a significant environmental issue for which a response is required.
- I152-2 This comment regarding the adequacy of the draft EIR is noted. Although the comment suggests that there is “substantial evidence” indicating an “incomplete policy analysis,” no specific issues related to the content, analysis, conclusions, or overall adequacy of the draft EIR are raised in this comment. Therefore, no further response is provided. Regarding the timing of the draft EIR and the Housing Element, refer to Master Response MR-3 for discussion of why the draft EIR correctly excludes discussion and analysis of the County’s projected housing needs for the 2020 Regional Housing Needs Assessment allocation and 2021-2029 Housing Element update.
- I152-3 Refer to Master Response MR-5 regarding the feasibility of Mitigation Measure AG-2.
- I152-4 The comment addresses existing housing conditions and anticipated economic implications of restricted growth. It is not related to the adequacy of the draft EIR. Therefore, no response is required. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan. Refer to Section 4.11, “Population and Housing,” in the draft EIR for a discussion of the potential for the 2040 General Plan to result in insufficient housing supply and Master Response MR-3 for a discussion of future update to the Housing Element.
- I152-5 This comment regarding the adequacy of the draft EIR is noted. However, no specific issues related to the content, analysis, conclusions, or overall adequacy of the draft EIR are raised in this comment. Therefore, no further response is provided. Also, refer to Master Response MR-7, which explains in detail why recirculation of the draft EIR is not required.

To: General Plan Update
Subject: My Comments Re: County's Draft Climate Action portion of the proposed County General Plan

| |
|------------------------|
| Letter I153 |
|------------------------|

To Whom It May Concern -

I must strongly express my objections to the latest draft of Ventura County's Draft Climate Action Plan part of the proposed new General Plan. Frankly - this draft is shockingly flawed given the ample input that has already been presented by countless non-profit organizations and citizens who have been participating in the meetings sponsored by the County in order to build and organize a broad consensus of agreement. I153-1

One of the most striking parts was a chart that illustrated where the County foresaw future oil & gas extraction projects but — tragically — omitted any similar chart/schematic for where foresaw significant set-aside spaces for where an ambitious (for example) Green Industrial Park might be developed to manufacture alternative, clean-green energy-producing jobs, i.e., wind-turbines and/or solar-panel manufacturing. That omission is preposterous given the level of alarm bells already sounding that warn us about climate change in general, and how Ventura County specifically has been “heating-up” faster than all the other California counties. I153-2

No where in the current draft has the “consumption side” of oil and gas and the necessity that significant reduction of same must be taken into account. It simply can't be “business as usual” when it comes to the future consumption and use of dangerous fossil fuels. And if significant consumption reduction is favored, then that goal should be reflected in the amount of future oil and gas production - which must also have significant reductions and certainly not maintain current levels or even worse — expand output. This is dangerous and unacceptable to any citizen who cares about combatting climate change. I153-3
I153-4

Finally — no where did I read that the so-called FIVE POUND LIMIT for the Ojai Valley was being preserved. The health and welfare of the Ojai Valley depends on this limit to be maintained and enforced throughout the duration of any new 20-Year General Plan. To do otherwise could be considered criminal and would signal an obvious intentional effort to ignore the health and welfare of the County citizens that choose to reside in the greater Ojai Valley. I153-5

These above are but several of the deficiencies discovered in the latest County Draft of the new Twenty-Year General Plan. Your draft seems to me to be entirely incomplete and inadequate and it's painfully obvious that it greatly favors the oil and gas extraction industry when it comes to combatting adverse local and global climate changes now taking place at an alarmingly accelerating rate. We must do much-much better! Back to the drawing boards! I153-6

Sincerely -
 Michael J. Shapiro

Michael Shapiro
michael@michaeljshapiro.com

| | |
|------------------------|---------------------------------------------|
| Letter I153 | Michael Shapiro February 22, 2020 |
|------------------------|---------------------------------------------|

- I153-1 This comment expresses an opinion about the 2040 General Plan and is not related to the adequacy of the draft EIR. Therefore, no response is required. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.
- I153-2 The commenter indicates that the draft EIR should foresee future significant set-aside spaces for green industrial parks or other clean-green energy-producing jobs. Policies which identify set-aside spaces in the unincorporated County for green industrial parks or other clean-green energy-producing jobs are not a component of the project under evaluation (i.e., the 2040 General Plan). CEQA requires evaluation of the environmental effects of a project; consequently, potential policies that are not a component of the project under evaluation are not required to be evaluated in the EIR. This comment addresses implementation of the 2040 General Plan and is not related to the adequacy of the draft EIR. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.
- I153-3 The comment asserts that the 2040 General Plan does not address the consumption of fossil fuels. This is inaccurate. Refer to Master Response MR-1 for additional information pertaining to the development of the 2040 General Plan’s greenhouse gas inventory, policies, and programs. The draft EIR includes a detailed quantitative and qualitative analysis of the 118 policies and 45 implementation programs included in the 2040 General Plan to reduce greenhouse gas emissions in the county (pages 4.8-37 to 4.8-45), many of which relate to the consumption of oil and gas.
- I153-4 Refer to Master Response MR-4, Sections MR-4.J Potential to Stop Issuing Permits for New Wells (Phase Out Oil and Gas Operations), MR-4.A County’s Authority to Regulate Oil and Gas Development, and MR-4.K Effects Outside the Study Area, regarding the findings and conclusions related to phasing out oil and gas operations, the County authority to regulate oil and gas operations, and effects outside of the study area.
- I153-5 The comment states there is no evidence that the 2040 General Plan would “preserve” the 5-pound-per-day limit on reactive organic gases and oxides of nitrogen for the Ojai Valley. As discussed in the draft EIR and explained further in response to comment O20-14, the comment refers to a threshold of significance for daily reactive organic gases and nitrogen oxide emissions in the Ojai Valley which is referenced in the Ojai Valley Area Plan. This threshold, which applies to sources that are not permitted by the Ventura County Air Pollution Control District, was added to the Ventura County Air Pollution Control District’s Air Quality Assessment Guidelines in 1989 and the reference to this threshold was thereafter added to the Ojai Valley Area Plan in 1995. The 2040 General Plan would not change this threshold.

The comment is not related to the adequacy of the draft EIR. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.

I153-6 This comment expresses an opinion about the 2040 General Plan and is not related to the adequacy of the draft EIR. Therefore, no response is required. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.

Subject: General Plan 2040

| |
|------------------------|
| Letter I154 |
|------------------------|

To Whom It May Concern,

Climate change is here, its effects are already evident in out county. The General Plan update fails to provide enough emissions reduction to meet the state-mandated goals. A robust plan, with the help of technical and scientific input, needs to be included for the 2040 General Plan, including a strong defense of the five pound air emissions limit for the Ojai Valley.

|------------------------|---------------------------------------------|
| Letter I154 | Michele DuPratt February 23, 2020 |
|------------------------|---------------------------------------------|

I154-1 This comment expresses an opinion about the 2040 General Plan and is not related to the adequacy of the draft EIR. Therefore, no response is required. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan. Refer to Master Response MR-1 for a discussion of the policies in the 2040 General Plan and the factors that restrict the County’s ability to ensure that State goals will be met.

As discussed in the draft EIR and explained further in response to comment O20-14, the comment refers to a threshold of significance for daily reactive organic gas and oxides of nitrogen emissions in the Ojai Valley which is referenced in the Ojai Valley Area Plan. This threshold, which applies to sources that are not permitted by the Ventura County Air Pollution Control District, was added to the Ventura County Air Pollution Control District’s Air Quality Assessment Guidelines in 1989 and the reference to this threshold was thereafter added to the Ojai Valley Area Plan in 1995. The 2040 General Plan would not change this threshold.

|------------------------|
| Letter I155 |
|------------------------|

We are in a climate emergency. Humanity is facing an existential threat.

In October 2018, the United Nations Intergovernmental Panel on Climate Change sounded the alarm bells in a dire report, warning that governments everywhere, much take "rapid, far-reaching and unprecedented changes in all aspects of society" to dramatically cut emissions by 2030 if we hope to avoid climate catastrophe. And by all governments, that includes Ventura County. So we've got just ten years, and likely even less than that, since more sobering findings regarding tipping points and feedback loops have come out in recent months. As Bill McKibben puts it, "Winning slowly is the same as losing" when it comes to climate change.

Since we neglected to take the necessary actions decades ago, we no longer have the luxury to take small incremental steps; the magnitude and urgency of the crisis requires big, bold, swift action. It means no more business as usual, no more kicking the can down the road, no more catering to fossil fuel interests, no more short-term thinking, no more excuses. It means coming together and working toward our collective common good. It means a moon shot, putting a stake in the ground and committing to achieving it.

The good news is that solutions are readily available, we just need to start acting on them.

The current draft EIR of the general plan update does not meet the urgency of action that the climate crisis demands. All policy decisions must be seen through a climate impact and mitigation lens.

I155-1

- Michelle Ellison, Ojai

|------------------------|----------------------------------------------|
| Letter I155 | Michelle Ellison February 27, 2020 |
|------------------------|----------------------------------------------|

I155-1

This comment regarding the adequacy of the 2040 General Plan and the draft EIR is noted. The comment suggests that the draft EIR "does not meet the urgency of action that the climate crisis demands." The draft EIR provides a California Environmental Quality Act-compliant analysis of the potential environmental effects of the 2040 General Plan. Refer to Master Response MR-1 for discussion of the draft EIR's detailed quantitative and qualitative analysis of the 118 policies and 45 implementation programs included in the 2040 General Plan to reduce greenhouse gas (GHG) emissions in the county and the seven feasible mitigation measures included in the draft EIR to address the potentially significant GHG impacts of the 2040 General Plan and achieve additional GHG emissions reductions. However, no specific issues related to the content, analysis, conclusions, or overall adequacy of the draft EIR are raised in this comment. Therefore, no further response is provided.

To whom it may concern,

My name is Michelle Kenney. I am the head chef and owner of La Dolce Vita 1901. As a small business owner in Ventura I have concerns about some of the more flawed elements of the DEIR as it currently is written that lack proper analysis. In my business I must be thorough and have a solid understanding of the laws that govern my business. I ask that this document hold that same standard.

I156-1

This DEIR is based on incomplete policy analysis, attempts to hide important information in violation of CEQA, and fails to recognize when policies are preempted by State and Federal law. The DEIR attempts to hide important information and fails to support its claims with credible evidence. The DEIR currently buries required information that forms the cornerstone of its analyses in a 1,000 plus page appendix. This is obviously in violation of CEQA.

I156-2

I want this DEIR to be open and accessible and not hide information. Please make these corrections for recirculation.

I156-3

Thank you,
Michelle Kenney

Subject: 2040 General Plan Draft EIR Comment

Letter
1157

Dear Ms. Curtis,

I understand the county did not conduct the CEQA required analysis for impacts that will hamper access to petroleum reserves.

CEQA is very clear that the intent of the impact analysis required here is to evaluate the potential impact of the General Plan on the future access to petroleum reserves.

Yet the County does not do this. Instead, the County provides a long discussion of the potential health and safety impacts that may occur near oil and gas production. While this "optional", not required "analysis is admirable, the County has failed to comply with CEQA requirements for this analysis. The County must redo this analysis, this time following CEQA intent, and the EIR must be recirculated.

The County must conduct an analysis that meets the CEQA standard by evaluating the impact of future development under the General Plan on the ability to access reserves. The analysis outlined in the EIR has no bearing as the county failed to meet the CEQA standard.

| Letter I157 | Mike Maulhardt February 25, 2020 |
|------------------------|--------------------------------------------|

I157-1

Refer to Master Response MR-4, Sections MR-4.L Oil Reserves, regarding the findings and conclusions related to oil reserves in the County. The commenter asserts that the draft EIR does not include analysis for impacts that will hamper access to petroleum reserves. The draft EIR analyzes implementation of the 2040 General Plan for Impact 4.12-3: Result in Development on or Adjacent to Existing Petroleum Resources Extraction Sites or Areas Where Petroleum Resources Are Zoned, Mapped, or Permitted for Extraction, Which Could Hamper or Preclude Access to the Resources (4.12-11), and Impact 4.12-4: Result in the Loss of Availability of a Known Petroleum Resource That Would Be of Value to the Region and the Residents of the State (4.12-22).

The draft EIR Section 4.12.2 Environmental Impacts and Mitigation Measures (page 4.12-6) indicates that “the evaluation of impacts on petroleum resources is based on the petroleum resources map (Figure 8-10 in the Background Report) and well data published by the State Division of Oil, Gas, and Geothermal Resources. These resources were compared to the proposed land use diagram in the geographic information system software to assess the overall proximity of potential land use changes to identified resource areas (i.e., oil fields and wells). Consistent with ISAG Section 3b, any land use designation that could result in development on or immediately adjacent to any known petroleum resource area, or adjacent to a principal access road to a property with an existing use permit for petroleum exploration and production, is considered to have the potential to hamper or preclude access to petroleum resources. The evaluation is program-level and identifies potential effects of the 2040 General Plan relative to existing conditions, based on reasonable inference and using readily available information.”

The draft EIR concludes that Policy COS-7.2 Oil Well Distance Criteria. Policy COS-7.2 could theoretically affect local oil and gas exports and increase the reliance on imports from outside of the 2040 General Plan area. Furthermore, there are no actions or policies that the County could feasibly mandate to fully reduce the impact that Policy COS 7.2 would have on hampering or precluding access to petroleum resources and would therefore remain significant and unavoidable for Impact 4.12-3: Result in Development on or Adjacent to Existing Petroleum Resources Extraction Sites or Areas Where Petroleum Resources Are Zoned, Mapped, or Permitted for Extraction, Which Could Hamper or Preclude Access to the Resources (4.12-22).

The draft EIR also concludes that Policies COS-7.7 Limited Conveyance for Oil and Produced Water and COS-7.8 Limited Gas Collection, Use, and Disposal could result in the loss of known petroleum resources of value to the region and the State because Policies COS-7.7 and COS-7.8 would mandate infrastructure that may be technologically or economically infeasible to install. However, based on the analysis the draft EIR, the volume of loss for this petroleum resource would

likely be at a smaller scale and concentrated on oil operators located outside of a two-mile radius of a major oil or gas transmission pipeline (page 4.12-31). The draft EIR concludes that the policies would nonetheless render a substantial quantity of petroleum resources inaccessible and result in the loss of availability of known petroleum resources of value to the region and the State in at least some parts of the plan area (page 4.12-31). However, with implementation of draft EIR Mitigation Measure PR-2: Revised Policy COS-7.7: Limited Conveyance for Oil and Produced Water and Mitigation Measure PR-3: Revised Policy COS-7.8: Limited Gas Collection, Use, and Disposal (4.12-31), which would continue to allow the County's approval of new oil and gas wells that utilize flaring or venting of produced gas and/or trucking of oil and produced water in situations where there is no feasible alternative, Impact 4.12-4: Result in the Loss of Availability of a Known Petroleum Resource That Would Be of Value to the Region and the Residents of the State would be less than significant (4.12-32).

VIA ELECTRONIC MAIL: GeneralPlanUpdate@ventura.org

February 25, 2020
Ventura County Board of Supervisors
Attn: RMA Planning Division
General Plan Update
800 Victoria Avenue L#1740
Ventura, California 93009-1740

Dear Board of Supervisors and Staff:

We are writing this letter to urge the Board of Supervisors to reconsider moving forward with the Draft General Plan EIR. The draft EIR has been accelerated to the point that too many issues and impacts have not been properly addressed or studied. These impacts and the corresponding mitigation measures will have severe impacts to land owners and especially those, like us in the agricultural industry and other productive economic segments.

I158-1

Our family has been involved in the agricultural industry for more than 100 years in Ventura County. We have owned numerous land holdings that remain in the family to this date. We have farmed throughout Ventura County and hope to continue to do so in the future.

The Draft EIR is deficient on many levels. CEQA requires that all mitigation measures must be technically and economically feasible. Numerous proposed mitigation measures are neither. We have in the past attempted to identify land and any owners that would be open to sell their development rights for land that was converting from agricultural to commercial use. Not only did we not find anyone that would do so, no one would even quote a price. The only positive response from numerous land owners were that you can buy my property for full market value

I158-2

and then you can do what you want. There is not a project that can be built by adding double land cost to the equation. This was very recently experienced based on proposed policies at LAFCo.

These policies were eventually not enacted due to the inability to purchase development rights in an economical feasible manner. This was when LAFCo was contemplating an acre for acre ag preserve. The new policy that is proposed in the 2040 General Plan is requiring 2 acres for every 1 acre of land converted from ag to any other use. This will eliminate the ability to add any new required ag buildings or even farm worker housing. The Draft EIR must study these impacts, since they are not feasible.

I158-2
cont.

The Draft EIR also deals with water in a manner that is not properly studied. There is no analysis on increased water costs and diminishing availability of water. Without reasonable water costs and supply, there is no agricultural industry.

I158-3

The General Plan indicates that agriculture is a high priority in the County. However, new policies and requirements in the General Plan add additional mitigation measures that will make ag virtually impossible. These include new setbacks, limiting types of fumigants pesticides and fertilizers. The General Plan also requires the conversion of all farm equipment to be all electric. Again, not feasible. The costs to purchase new pumps, farm equipment and other existing fuel using equipment will increase operational costs to a point that the County crops will not be competitive in the open market. These new mitigation measures are not sufficiently studied and again are not economically feasible.

I158-4

The Draft EIR is extremely difficult to read and understand. The background reports are lacking in depth of what has been studied other than numerous general statements and very poor mapping. Detailed studies must be added to sufficiently identify impacts and the related mitigation measures for both direct and indirect impacts on the agricultural industry. It is our understanding that reports and studies need to be timely prepared. However numerous studies are older than 5 years. Not timely.

I158-5

After numerous devastating wildfires over the last few years, which significantly impacted ag, the General Plan continues to lay out limiting mitigation measures for fire prevention. The Wildlife corridor eliminates any ag operation or fire prevention in the proposed corridor areas. This is also a major concern not studied in the Draft EIR.

I158-6

The Draft EIR for the 2040 General plan does not provide adequate analysis for the expansion of permanent bike paths and pedestrian walking trails throughout the County. These impacts are very severe due to constant conflicts from trail users and ag operations. Spraying, dust, odors from ag operations, along with impacts created by the trail users. These are usually theft, vandalism, litter and pet waste. The proposed mitigation measures require additional setbacks from these trails which renders additional land unusable for ag operations.

I158-7

In addition to the above comments on the agricultural aspects and related land use concerns of the DEIR, the undersigned is also a mineral owner directly interested in the impacts on oil and gas production of the DEIR and related General Plan 2040 proposed provisions. In these documents there is a total failure to address the economic impacts of the various policies proposed in violation of the requirements for this process, including but not limited to the loss of royalty income to a large group of County residents. I join in the detailed comments on the various deficiencies and concerns identified in the DEIR as described in the concurrent submissions on behalf of Aera Energy and other operators delivered this week to the County.

I158-8

Please look at the long-term consequences of these General Plan policies and mitigation measures. We formally request additional studies and a revised Draft EIR that will properly look at these and many more issues. The DEIR must be corrected with details of the revisions. Then it can be recirculated.

I158-9

Sincerely,

| | |

EIR and draft plan

Your Comment:

Provide a computation of all GHG emissions in ONE EASY TO FIND LOCATION OF THE PLAN. Include everything! err on the side of overestimating and not omitting sources. CHANGE GOALS and MITIGATION MEASURE SO THE State reaches carbon neutrality by 2045. THE USA IS NOT A LEADER for climate change. CALIFORNIA has that role for our country and VENTURA COUNTY has the money and citizen support to fill that role. DO NOT weaken our state with a poor climate change element in the general plan.

I I161-1
I I161-2

Subject: Climate change has environmental impacts!

**Letter
I162**

CAUTION: If this email looks suspicious, DO NOT click. Forward to Spam.Manager@ventura.org

Susan Curtis,

Dear Ventura County Board of Supervisors and Planning Department,

Climate issues are something I feel worried about. Ventura County is warming faster than any county in the nation. Our ocean is acidifying faster. Drought and floods have hit us worse, and we can expect more extreme weather.

I162-1

My family and community are counting on you to assure analysis of the full scope of environmental impacts and mitigations in the Draft EIR.

First, it is necessary that all greenhouse gas emissions be counted based on the most current science.

I162-2

There are many ways to mitigate climate impacts, like a sunset plan for oil and gas production, decarbonization of transportation and buildings, zero waste, incentives for regenerative agriculture and water management, and reducing emissions from tailpipes.

I162-3

I want an EIR that covers major climate impacts via a systematic plan.

Thank you—

Letter
I163

February 21, 2020

Attn: RMA Planning Division
General Plan Update
800 S. Victoria Avenue, L#1740
Ventura, CA 93009-1740

Dear Planning Division:

I have serious concerns about some of the language in the Draft EIR.

Page 2-17 Ag Mitigation AG-2

Loss of farmland, requires purchase of like kind land at 2-1 ratio to be placed into a conservation easement. This is not practical. There is very little land available in the County for sale and this would be cost prohibitive. Was this the intent? Needs additional discussion and evaluation.

The EIR recognizes that "water for irrigation will be reduced as a result of the implementation of the 2040 General Plan."

Since there is no actual policy that states "we will reduce water for irrigation," the County did not analyze this impact. Although they state the impact will occur as a direct RESULT of their policies. Simply not acceptable.

The Courts are extremely clear that the EIR must analyze for all reasonably foreseeable impact that result from implementation of the "project."

Additionally, the intent of CEQA EIR impact analysis is to evaluate the potential impact of development/policies on future access to oil reserves. However, Section 4.12 primarily evaluates the impact of oil and gas production on H&S. The County's analysis does not meet the intent and standard of review for CEQA.

In summary, CEQA mandates that the EIR contain sufficient detailed data to allow the reader to understand and evaluate the County's impact analysis. The EIR and its 1,000-page Background Report and filled with errors, vague statements and outdated information. All the information is older than 2015. The maps in the EIR and Background Report are not legible and therefore not useful.

I urge you to take the time to correct and recirculate the EIR.

Thank you.

Sincerely,

Noelle C Burkey
Chief Executive Officer
The Wood-Claeyssens Foundation

| Letter I163 | Noelle C Burkey February 21, 2020 |
|------------------------|---------------------------------------------|

- I163-1 This comment summarizes more detailed comments provided later in the letter, for which responses are provided below.

- I163-2 Refer to Master Response MR-5 regarding the feasibility of Mitigation Measure AG-2.

- I163-3 The comment states that the draft EIR does not analyze impacts resulting from implementation of 2040 General Plan policies, including reduced water for irrigation. Refer to response to comment I4-3 regarding water availability and cost.

- I163-4 Refer to Master Response MR-4, Section MR-4.D Mitigation Measures and the Role of the Board of Supervisors, regarding the findings and conclusions related to analysis conducted, significance conclusions, and mitigations measures developed as part of the environmental review process, and Refer to Master Response MR-4, Sections MR-4.L Oil Reserves, regarding the findings and conclusions related to oil reserves in the County. The commenter asserts that the draft EIR does not include analysis for impacts on future access to oil reserves. The draft EIR analyzes implementation of the 2040 General Plan for Impact 4.12-3: Result in Development on or Adjacent to Existing Petroleum Resources Extraction Sites or Areas Where Petroleum Resources Are Zoned, Mapped, or Permitted for Extraction, Which Could Hamper or Preclude Access to the Resources (4.12-11), and Impact 4.12-4: Result in the Loss of Availability of a Known Petroleum Resource That Would Be of Value to the Region and the Residents of the State (4.12-22).

The draft EIR Section 4.12.2 Environmental Impacts and Mitigation Measures (page 4.12-6) indicates that “the evaluation of impacts on petroleum resources is based on the petroleum resources map (Figure 8-10 in the Background Report) and well data published by the State Division of Oil, Gas, and Geothermal Resources. These resources were compared to the proposed land use diagram in the geographic information system software to assess the overall proximity of potential land use changes to identified resource areas (i.e., oil fields and wells). Consistent with ISAG Section 3b, any land use designation that could result in development on or immediately adjacent to any known petroleum resource area, or adjacent to a principal access road to a property with an existing use permit for petroleum exploration and production, is considered to have the potential to hamper or preclude access to petroleum resources. The evaluation is program-level and identifies potential effects of the 2040 General Plan relative to existing conditions, based on reasonable inference and using readily available information.”

The draft EIR concludes that Policy COS-7.2 Oil Well Distance Criteria. Policy COS-7.2 could theoretically affect local oil and gas exports and increase the reliance on imports from outside of the 2040 General Plan area. Furthermore,

there are no actions or policies that the County could feasibly mandate to fully reduce the impact that Policy COS 7.2 would have on hampering or precluding access to petroleum resources and would therefore remain significant and unavoidable for Impact 4.12-3: Result in Development on or Adjacent to Existing Petroleum Resources Extraction Sites or Areas Where Petroleum Resources Are Zoned, Mapped, or Permitted for Extraction, Which Could Hamper or Preclude Access to the Resources (4.12-22).

The draft EIR also concludes that Policies COS-7.7 Limited Conveyance for Oil and Produced Water and COS-7.8 Limited Gas Collection, Use, and Disposal could result in the loss of known petroleum resources of value to the region and the State because Policies COS-7.7 and COS-7.8 would mandate infrastructure that may be technologically or economically infeasible to install. However, based on the analysis the draft EIR, the volume of loss for this petroleum resource would likely be at a smaller scale and concentrated on oil operators located outside of a two-mile radius of a major oil or gas transmission pipeline (page 4.12-31). The draft EIR concludes that the policies would nonetheless render a substantial quantity of petroleum resources inaccessible and result in the loss of availability of known petroleum resources of value to the region and the State in at least some parts of the plan area (page 4.12-31). However, with implementation of draft EIR Mitigation Measure PR-2: Revised Policy COS-7.7: Limited Conveyance for Oil and Produced Water and Mitigation Measure PR-3: Revised Policy COS-7.8: Limited Gas Collection, Use, and Disposal (4.12-31), which would continue to allow the County's approval of new oil and gas wells that utilize flaring or venting of produced gas and/or trucking of oil and produced water in situations where there is no feasible alternative, Impact 4.12-4: Result in the Loss of Availability of a Known Petroleum Resource That Would Be of Value to the Region and the Residents of the State would be less than significant (4.12-32).

- I163-5 The commenter's opinion about the accuracy and level of detail in the Background Report are noted. Refer to Master Response MR-6 for discussion of how the County appropriately uses the Background Report to describe the existing environmental setting in the draft EIR.
- I163-6 Refer to Master Response MR-7, which explains in detail why recirculation of the draft EIR is not required.

Subject: TOTALLY FRUSTRATED TRYING TO SUBMIT A COMMENT ONLINE!!!

| |
|------------------------|
| Letter I164 |
|------------------------|

Dear Ms. Curtis:

I have written a comment about the Climate Action Plan proposed in the General Plan Update and tried mightily to submit it as an online comment. I have repeatedly failed in cracking the code that proves I'm human (I guess that is what it's trying to prove.). I keep coming up "invalid".

I164-1

HOW FRUSTRATING. Now I have to write the message all over again. I hope you can help me get it to the Board of Supervisors or to whomever it should go to! Thank you so much. **Someone should check that code. I bet a lot of people have just given up!!!**

TO WHOM IT MAY CONCERN;

Regarding the Climate Action Plan in the General Plan Update, I agree with the comments submitted by the organization CFROG.

I164-2

Especially, I feel that the Climate Action Plan policies must result in measurable, enforceable reductions in pollution, sufficient to meet the climate goals of our State. If the Climate Action Plan is vague, voluntary or not enforceable, future projects might "skate by" and avoid proper environmental review.

The Climate Action Plan and corresponding policies in the General Plan must require specific, measurable, enforceable reductions in greenhouse gas emissions.

Thank you for your attention to this crucially important matter!

Sincerely,
 Norene Charnofsky
 10180 Norwalk St.
 Ventura, CA 93004

February 24, 2020

RE: Comments on Ventura County draft General Plan, Draft EIR, Draft Climate Action Plan

According to a recent study of data by the Washington Post, with an average temperature increase of 2.6 degrees Celsius since preindustrial times, Ventura ranks as the fastest-warming county in the Lower 48 states. It is critical that Ventura County gets its climate policies right in the General Plan Update which extends to 2040 – if the proposed plan is accepted as is, we’ll be getting nothing less than a guarantee for a climate crisis by the next plan update.

I165-1

My comments are about specific issues related to the oil and gas industry operations in our County that the draft plan and EIR inadequately address, or completely overlook.

Flaring at Oil and Gas Facilities

Flaring is a poorly regulated and controlled process that releases toxic and greenhouse gases into the atmosphere. The draft EIR puts substantial weight on the costs to industry for controlling flaring, including alternative means for transporting the gases. The draft EIR *DOES NOT CONSIDER* the costs and societal impacts of climate change of allowing greenhouse and toxic gas releases from oil and gas facilities. Rather, the draft EIR treats climate change mitigation as a nice wish-list item best ignored, perhaps just too complicated for the authors to consider seriously.

I165-2

Methane Releases Not Addressed:

The draft EIR does not consider the potential impacts, including the public health and economic impacts, due to climate change forcing by releases of greenhouse gases to the atmosphere. Climate change mitigation is treated as a nice but non-consequential “wish list” item rather than a real and necessary goal for long-term management of oil and gas production in the County. The EIR considers short-term costs to oil producers more important than the future insurmountable costs that would be incurred by all Ventura County residents in the face of uncontrolled warming, drought, and sea level rise (proposed revised policies COS-7.7 and COS-7.8). The Ventura County Climate Action Plan must include immediate, robust action to mitigate climate change. Stringent controls on proposed new oil and gas well development should be imposed to prevent release of greenhouse gases, prevent flaring, require monitoring and mitigation of methane releases. To do less is to place the short-term profits of a non-sustainable extractive industry over the long-term health and well-being of Ventura and State of California residents.

I165-3

According to NASA’s Jet Propulsion Laboratory’s methane source finder website (<https://earthdata.nasa.gov/esds/competitive-programs/access/msf>), based on data collected during State of California funded fly-over surveys during 2016-2017, Ventura County is a significant source of methane leaks to the atmosphere. Methane is 85 times more potent at trapping heat in the atmosphere as compared to carbon dioxide, therefore the County’s Climate Action Plan must address methane leaks

I165-4

Comments on Ventura County draft General Plan, Draft EIR, Draft Climate Action Plan
February 24, 2020

to protect human health and the environment. Ventura County methane sources include oil and gas production wellfields and related facilities as well as landfills.

The draft Environmental Impact Report mentions methane once and with no consideration of the climate change impact or the need to mitigate this potent greenhouse gas. The State-funded NASA data were available to the consultant writing the EIR; there is absolutely no excuse to ignore these data in the EIR or CAP. All potential methane leak sources within Ventura County must be inventoried and addressed as part of the Climate Action Plan, including permit modifications requiring monitoring, leak mitigation action requirements, strict deadlines for addressing methane leaks, and reporting to authorities and the general public.

I165-4
cocnt.

Abandoned Oil/Gas Wells and Cost to Taxpayers Not Addressed

Abandoned oil and gas wells are a big problem in the State of California and Ventura County that will cost the taxpayer millions of dollars. In its report released January 23, 2020 (<https://ccst.us/reports/orphan-wells-in-california/>), the California Council on Science and Technology (CCST) announced:

“Responding to a request from the Division of Oil, Gas, and Geothermal Resources, now the California Geologic Energy Management Division (CalGEM), under the California Department of Conservation, the California Council on Science and Technology (CCST) conducted a study entitled “Orphan Wells in California: An Initial Assessment of the State’s Potential Liabilities to Plug and Decommission Orphan Oil and Gas Wells.” Orphan wells are wells that have no known responsible operator or no financially viable operator capable of plugging the well and decommissioning the well’s production facilities. An active or idle well can potentially become an orphan well when deserted by a financially insolvent operator. Responsibilities for plugging and decommissioning these wells may ultimately fall to the State. As the United States’ fourth largest producer of crude oil and fifteenth of natural gas, with approximately 107,000 active and idle wells in the state, the issue of ensuring that resources exist to properly plug and decommission every well is significant for California.

I165-5

The CCST report uses broad categorizations to screen for wells that may already be orphaned or that are at high risk of becoming orphan wells soon. The analysis finds that 5,540 wells in California may already have no viable operator, and that the potential net liability for the State appears to be about \$500 million, after subtracting available bonds. An additional 69,425 economically marginal and idle wells could become orphaned in the future.”

Abandoned wells pose a significant potential source of greenhouse emissions, toxic and flammable gas leaks, groundwater pollution, and other hazards. The LA Times and Center for Public Integrity published their investigation into this matter on February 6, 2020 (<https://www.latimes.com/projects/california-oil-well-drilling-idle-cleanup/#nt=lik0promoLarge-7030col1-7030col1>).

“The Times/Public Integrity investigation found that bonds posted to the state by California’s seven largest drillers, which account for more than 75% of oil and gas wells, amount to about \$230, on average, for every well they must decommission. Other bonds held by federal and local regulators don’t significantly raise those amounts.

Comments on Ventura County draft General Plan, Draft EIR, Draft Climate Action Plan
February 24, 2020

By contrast, the average per-well cost for capping wells and dismantling associated surface infrastructure in California is between \$40,000 and \$152,000, depending on whether a well is in a rural or urban area, according to a study released in January by the California Council on Science and Technology.”

There is a shocking number of abandoned or idle wells in Ventura County, many near residents (see interactive map in LA Times article). The General Plan Update must include provisions requiring oil and gas producers to fully-fund and properly abandon non-producing wells. Permits should strictly prohibit the transference of low-producing wells from large profitable companies to small limited liability corporations, which subsequently file for bankruptcy. Especially alarming is the reported costs for decommissioning offshore oil facilities which will be in the billions of dollars and have long-term impacts to Ventura County’s natural environment and fisheries if not properly addressed.

The California oil industry is in rapid decline and climate change is upon us – NOW is the time to require the industry take full responsibility for oil and gas production facilities and wells for the full lifespan of the facility.

I165-5
cont.

The County Board needs to pull back the draft Climate Action Plan and enter a more robust and effective planning process to address this existential threat. The Climate Action Plan must be based on sound science, not a weak “environmental impact report” that takes better care of a dying industry than the people of Ventura County.

I165-6

Thank you,

nova3773@gmail.com

| | |
|------------------------|----------------------------------------|
| Letter I165 | Nova Clite February 24, 2020 |
|------------------------|----------------------------------------|

- I165-1 The comment provides introductory language and expresses concern related to climate change policies presented in the 2040 General Plan. Refer to Master Response MR-1 regarding climate policies and efficacy.

- I165-2 Refer to Master Response MR-4, Section MR-4.F, “Flaring,” regarding the findings and conclusions related to flaring in oil and gas operations. Additionally, the comment asserts that the draft EIR fails to analyze the “costs and societal impacts” of climate change. However, EIRs are not required to treat a project’s economic or social effects as significant effects on the environment (CEQA Guidelines § 15131). Social and economic effects need only be considered in an EIR where there is a clear link between those economic or social effects and physical environmental changes. Therefore, no further response is provided.

- I165-3 Refer to Master Response MR-4, Section MR-4.J, “Potential to Stop Issuing Permits for New Wells (Phase Out Oil and Gas Operations),” regarding the findings and conclusions related to phasing out oil and gas operations.

The remainder of the comment addresses implementation of the 2040 General Plan and is not related to the adequacy of the draft EIR. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.

I165-4 The comment cites a study by the National Aeronautics and Space Administration indicating that Ventura County is a significant source of fugitive methane and suggests that the draft EIR should have reflected this data. Refer to Master Response MR-1 regarding oil and gas operations, methane leaks, and how these activities are addressed in the greenhouse gas inventories prepared for, and policies and programs included in, the 2040 General Plan and draft EIR. Also, refer to Master Response MR-4 for additional detail pertaining to the County’s authority to regulate the oil and gas industry.

I165-5 The commenter indicates that the draft EIR does not address abandoned oil wells and cost to taxpayers and recommends that the 2040 General Plan include provisions requiring oil and gas producers to fully-fund and properly abandon non-producing wells. The 2040 General Plan includes Policy COS-7.6 Abandoned Oil and Gas Well Identification which requires that the County, “shall evaluated discretionary development to identify any abandoned oil and gas wells on a project site.” (page 6-12). Additionally, the Non-Coastal Zoning Ordinance (NCZO) Oil Development Standards Section 8107-5.6.11 - Site Restoration requires that “Within 90 days of revocation, expiration or surrender of any permit, or abandonment of the use, the permittee shall restore and revegetate the premises to as nearly its original condition as is practicable, unless otherwise requested by the landowner.” Finally, the California Geologic Energy Management Division (CalGEM) has the responsibility for approving oil and gas well activities in California and Public Resources Code section 3208.1 establishes well re-abandonment responsibility when a previously plugged and abandoned well will be impacted by planned property development of construction activities.

While NCZO Section 8107-5.6.11 requires oil and gas operators within 90 days of revocation, expiration or surrender of any permit, or abandonment of the use, restore and revegetate the premises to as nearly its original condition as is practicable, the 2040 General Plan does not include mirror policies which require oil and gas producers to fully-fund and properly abandon non-producing wells. This requirement is currently addressed NCZO Section 8107-5.6.11 This comment addresses implementation of the 2040 General Plan and is not related to the adequacy of the draft EIR. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.

I165-6 This comment regarding the adequacy of the Climate Action Plan and draft EIR is noted. However, no specific issues related to the content, analysis, conclusions, or overall adequacy of the draft EIR are raised in this comment. Therefore, no further response is provided.

Subject: P.LynMiddleton/Climate

Letter
I166

As a ventura county resident, here below are what I copied and what I see that needs done. Cfrog says it all. I agree! See Below. We need to do everything to help our world.

I 1166-1

Thank you, P. Lyn Middleton/ 204 N. Blanche Street / Ojai CA 93023

Buffer Requirements – The proposed buffers for locating oil and gas facilities a safe distance from schools and homes are inadequate. Studies show adverse health impacts from oil and gas facilities at distances of at least half a mile.

I 1166-2

Action Needed: Buffers should be increased from the currently proposed 1,500 feet to 2,500 feet.

Trucking vs. Pipeline – Currently, oil and produced water from local oil wells are mostly transported by truck. Trucking creates safety hazards on county roads, exposes residents to toxic diesel pollution, and causes substantial amounts of greenhouse gas emissions. Draft General Plan Policy COS-7.7 attempts to address this problem by requiring newly permitted oil wells to use pipelines instead of trucks to transport oil and produced water.

I 1166-3

However, the DEIR attempts to undermine Policy COS-7.7, concluding that the added costs of constructing pipeline connections make this policy infeasible and may lead to a loss of petroleum resources. The DEIR proposes to allow trucking if pipelines are deemed infeasible. This would create a loophole allowing oil companies to simply claim that the cost of a pipeline connection is too high.

Action Needed: Maintain Policy COS-7.7 as recommended by the Board of Supervisors, so that all newly permitted discretionary oil wells are required to convey oil and produced water via pipelines instead of trucking.

Flaring – Draft General Plan Policy COS-7.8 requires gases from all new discretionary oil and gas wells to be collected and used, or removed for sale or proper disposal, instead of being flared or vented to the atmosphere. The policy would allow flaring only in cases of emergency or for testing purposes. This is important because venting and flaring release both toxic gases and powerful climate pollutants like methane to the atmosphere.

I 1166-4

The DEIR tries to undermine this policy, too. It concludes that the added costs of treating the gas on site or constructing pipeline connections would make this requirement infeasible and may lead to a loss of petroleum resources. The DEIR instead would allow flaring if conveyance by pipeline is deemed infeasible, creating another loophole that could allow oil producers to simply claim that the cost is too high and continue with business as usual.

Action Needed: Maintain Policy COS-7.8 as recommended by the Board of Supervisors, so that all newly permitted discretionary oil wells are required to collect gases and use or remove them for sale or proper disposal instead of flaring or venting. Flaring should be allowed only in cases of emergency or for testing purposes.

Climate Action Plan – The draft General Plan and the DEIR conclude that the county’s greenhouse gas emissions would have significant impacts. However, the Climate Action Plan proposed as part of the General Plan is inadequate and will not reduce emissions in a meaningful way. Most proposed Climate Action Plan policies are vague and aspirational, relying on noncommittal assurances that the county will “encourage” and “support” change rather than clearly require measurable reductions in climate pollution.

I 1166-5

Climate Action Plan policies must result in measurable, enforceable reductions sufficient to meet California’s climate goals. This is important because the General Plan and related Climate Action Plan can be used to streamline approval of future development projects. The county may not carefully analyze the climate consequences of future projects —including discretionary oil and gas development — if those projects claim they’re consistent with the Climate Action Plan. If the Climate Action Plan consists mostly of vague, voluntary, or otherwise unenforceable policies, future projects could easily be found consistent and could evade proper environmental review.

I166-5
cont.

Action Needed: Revise the Climate Action Plan and corresponding policies in the General Plan to achieve measurable, enforceable reductions in greenhouse gas emissions.

Greenhouse Gas “Super-Emitters” – A recent NASA study documents that several Ventura County facilities, including oil and gas operations, are “super-emitters” of powerful climate pollutants. Stationary source emissions, including those from oil and gas operations, make up approximately 26 percent of all emissions in California. The General Plan must include strong policies to detect and curb emissions from these “super-emitters.”

I166-6

Action Needed: The county should adopt the strongest possible measures to ensure that greenhouse gas emissions are curbed to protect air quality and to ensure a safe, sustainable future for all county residents.

For Ojai residents:

The 2040 General Plan must include a strong defense of the five-pound air emissions limit for the Ojai Valley. All projects subject to CEQA review must include an evaluation of the totality of air emissions in order to understand and mitigate the impacts to local air quality.

I166-7

| | |
|------------------------|----------------------------------------------|
| Letter I166 | P. Lyn Middleton February 23, 2020 |
|------------------------|----------------------------------------------|

I166-1 The commenting individual’s agreement with the Climate First: Replacing Oil & Gas comment letter is noted; see responses to Letter O20. This comment is introductory in nature and does not raise a significant environmental issue for which a response is required.

I166-2 Refer to Master Response MR-4, Section MR-4.H, “Buffers (Setbacks),” regarding the findings and conclusions related to buffers (setbacks) for oil and gas operations. The remainder of the comment addresses implementation of the 2040 General Plan and is not related to the adequacy of the draft EIR. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.

I166-3 Refer to Master Response MR-4, Section MR-4.G, “Pipeline Requirements,” regarding the findings and conclusions related to the conveyance of oil and produced water from oil and gas operations.

The remainder of the comment addresses implementation of the 2040 General Plan and is not related to the adequacy of the draft EIR. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.

- I166-4 Refer to Master Response MR-4, Section MR-4.F, “Flaring,” regarding the findings and conclusions related to flaring in oil and gas operations. The remainder of the comment addresses implementation of the 2040 General Plan and is not related to the adequacy of the draft EIR. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.
- I166-5 The comment makes assertions about the adequacy of 2040 General Plan policies to reduce greenhouse gas (GHG) emissions and requests that such policies be revised to achieve measurable, enforceable reductions in GHG emissions. Refer to Master Response MR-1 for discussion of the draft EIR’s detailed quantitative and qualitative analysis of the 118 policies and 45 implementation programs included in the 2040 General Plan to reduce GHG emissions in the county and the seven feasible mitigation measures included in the draft EIR to address the potentially significant GHG impacts of the 2040 General Plan and achieve additional GHG emissions reductions. Regarding streamlining approval of future development projects consistent with the 2040 General Plan, the draft EIR includes Mitigation Measure GHG-3, which would remove the CEQA streamlining provision proposed in Program COS-EE from the 2040 General Plan and specify that the potential GHG emissions impacts of future, discretionary projects be reviewed in accordance with the most recent adopted version of the ISAGs at the time of project-level environmental review.
- I166-6 The comment addresses oil and gas operations that are “super-emitters.” Refer to Master Response MR-1 for a discussion of “super-emitters” and their representation in the GHG inventories prepared for the 2040 General Plan and draft EIR.
- I166-7 As discussed in the draft EIR and explained further in response to comment O20-14, the comment refers to a threshold of significance for daily reactive organic gas and nitrogen oxide emissions in the Ojai Valley which is referenced in the Ojai Valley Area Plan. This threshold, which applies to sources that are not permitted by the Ventura County Air Pollution Control District (VCAPCD), was added to the VCAPCD’s Air Quality Assessment Guidelines in 1989 and the reference to this threshold was thereafter added to the Ojai Valley Area Plan in 1995. The 2040 General Plan would not change this threshold. Also refer to the response to comment O20-15 for discussion regarding the types of air emissions sources addressed by VCAPCD guidance and thresholds.

Subject: Climate change has impacts!

**Letter
I167**

CAUTION: If this email looks suspicious, DO NOT click. Forward to Spam.Manager@ventura.org

Susan Curtis,

Dear Ventura County Board of Supervisors and Planning Department,

Ventura County is warming faster than any county in the nation. Our ocean is acidifying faster. We can also expect more extreme weather, producing both droughts (with associated wildfire risk) and floods.

I167-1

My family and community are counting on you to ensure that the draft EIR addresses the full scope of environmental impacts and mitigations.

This means that all greenhouse gas emissions must be counted based on the most current science.

I167-2

I favor using a wide variety of methods to mitigate climate impacts, like a sunset plan for oil and gas production, decarbonization of transportation and buildings, zero waste, incentives for regenerative agriculture and water management, and reducing emissions from tailpipes.

I167-3

I want an EIR that covers major climate impacts via a comprehensive and systematic plan. This is important to me because I care about the world my grandchildren will inhabit. That world will be shaped by the planning you do now.

Thank you.

Re: Comments on Ventura County General Plan DEIR

Dear Ms. Curtis:

I represent and serve on the McLoughlin Family Committee, a group of family members that own approximately 300 acres of agricultural property off of Olivas Park Road in the County of Ventura, in proximity to the City of Ventura.

The McLoughlin family has farmed this land for generations. It remains our desire to continue this legacy. However, in the face of never-ending changes to the regulatory environment, we again find ourselves attempting to ascertain how new policies and programs as proposed in the draft 2040 General Plan will impact and challenge our ability to serve as stewards of this heritage.

It had been our hope that the DEIR would provide some clarity and insight into how the new policies and programs within the revised General Plan would impact our farming operation. However, that is not the case. Simply said, we believe the General Plan Update and subsequent Environmental Impact Report fail to adequately analyze or study impacts on the farming industry.

With that said, we would like to specifically present the following:

- The Background report Table 6-26: Transportation Department Planned Capital Projects lists sections of roadways the County plans for expanded capacity or widening, along with the scope of those enhancements. It also covers in length the plan to add bike paths and bike lanes in accordance with existing County wayfarer plans. However, the DEIR never analyzes the loss of farmland resulting from these changes in infrastructure – it’s not even mentioned as a possibility in the DEIR.

Olivas Park Road between Victoria and Harbor is listed as one of the areas planned for road widening, a stretch of roadway that borders the entire eastern portion of our farmland and property. While the impact on our farming operation and financial losses due to property loss are clearly quantifiable, the report fails to list or quantify these impacts.

- In Section 3-8, The DEIR states that because there will be no “substantive” change to the agricultural, open space, or rural designations, the General Plan Update (GPU) will be consistent with SOAR. However, no further details beyond this conclusory statement is provided. There is no way for the reader to come to his or her own conclusion on whether the GPU will result in inconsistencies with SOAR that might lead to physical environmental impacts. There is no description of the changes to the Agriculture, Open Space, and Rural policies to determine whether they are in fact non-substantive.

Given the length and breath of the Draft General Plan update and CEQA analysis, we made an attempt to focus our initial review and subsequent comments to issues specific to agriculture and farming. However, it’s clear that the 2040 General Plan will impact the Ventura County local economy across sectors – all of which influence the ability to live and work in this region. The DEIR’s lack of analysis of those economic impacts, calls into question the legitimacy of both the draft General Plan update, and the CEQA analysis. As such, we respectfully request that the DEIR be recirculated in the hopes that further study will resolve these shortcomings.

I appreciate your consideration.

Susan Curtis,

County failed to evaluate mitigation measure for feasibility- 500' set back for "sensitive receptors" from freeways and high traffic roads.

Mitigation Measure AQ-3 (Policy HAZ10-X) creates a minimum 500' set back for "sensitive receptors" from freeways and high traffic roads. Yet the County states in the Land Use section of the EIR that "the majority of the anticipated build out will be within the freeway corridors."

Has the County completed a "buildout study" to ensure that the establishment of this set back still leaves enough room for development to occur? Will this mitigation measure be economically feasible?

I170-1

Sanger Hedrick, Chair
Agricultural Policy Advisory Committee (APAC) County of Ventura
800 S. Victoria Blvd.
Ventura, CA 93003

Re: 2040 General Plan Environmental Impact Report (EIR)

Dear Mr. Hedrick and Honorable Members of APAC:

Thank you for the opportunity to provide comments following today’s presentation by Ventura County Planning staff on th

There are several issues with the 2040 General Plan EIR that CoLAB believes will negatively impact the viability of local agri

I171-1

Proposed mitigation measure AG-2: The County proposes that any project that either directly or indirectly results in the lo into perpetual agricultural preservation twice the total of the farmland loss. This mitigation measure is infeasible. Contrar Planning staff today at the APAC meeting, the California Environmental Quality Act (CEQA) requires that all mitigation pro Section 21061.1 defines feasible as “capable of being accomplished in a successful manner within a reasonable period of t

” (*emphasis added*). All mitigation measures proposed in an EIR must be shown to reduce impacts and an infeasible mitigation measure, by definition, cannot and will not reduce impacts.

The EIR does not provide evidence of any of the following:

1. 1) Whether there is sufficient land available for purchase/conservation easement for each farmland category;
2. 2) The cost per acre to purchase each category of farmland;
3. 3) The anticipated cost of establishing a conservation easement for each category of farmland;
4. 4) The anticipated cost associated with managing each category of farmland under a conservation easement;
5. 5) The anticipated cost associated with monitoring these mitigation parcels scattered throughout the County and who will bear that cost;
6. 6) Any information that could constitute a “plan” for management of farmland in conservation easements;

I171-2

February 19, 2020

Ventura County Coalition of Labor, Agriculture and Business / 1672 Donlon Street, Ventura, CA 93003 / 805-633-2260 / info@colabvc.org

Page 2 of 4

- 7. 7) An analysis of direct and indirect impacts caused by this mitigation measure (including impacts associated w increased urban-ag-interface);
- 8. 8) Whether the smallest possible mitigation acreage required will achieve the minimum to ensure viability of a
- 9. 9) Whether the proposed mitigation is in conflict with other ordinances and regulations, such as the County's Z minimum lot sizes.

The County is already aware that this proposed mitigation measure is infeasible. On March 24, 2016, at a Local Agency For Supervisor Linda Parks attempted to establish an "Agricultural Mitigation Measure" through the LAFCo project approval p have required the 1-to-1 purchase of local farmland (half of what is proposed in the 2040 General Plan EIR) to replace farm proposed development. Ventura County Counsel, Michael Walker, informed both LAFCo and Supervisor Parks that the pro meet the standard for economic feasibility, and, for that and other reasons, LAFCo could not adopt Supervisor Park's prop referenced a 2015 legal decision, City of Irvine v. County of Orange, in which the Court stated, "the sheer astronomical exp the EIR that the purchase of an agricultural conservation easement is a non-starter."

I171-2
cont.

In addition to being infeasible, CoLAB does not believe that this mitigation measure will reduce impacts on agricultural lan issues that will impact farmland under the 2040 General Plan: lack of economic sustainability, the increasing regulatory de competition for water resources, and increased compatibility conflicts from development.

Indirect Impacts

The EIR dismisses "indirect impacts" that will occur as a result of implementing the 2040 General Plan as "less than significan

Page 4.2-13 of the EIR states "AG-2.3 maintains the Right-to-Farm Ordinance to protect agricultural land uses from conflic

as to help land purchasers and residents understand the potential for nuisance, (e.g., dust, noise, odors) that may occur as agricultural areas...These sections of the code protect farmers engaged in agricultural activity from public nuisance claims. community, including Important Farmlands and farms less than 10 acres, from developments that would inhibit their abili production."

I171-3

Page 4.2-17 of the EIR states: "Residential growth in areas nearby agricultural lands has the potential to result in land use generally more sensitive and prone to conflict with adjacent agricultural land uses than commercial or industrial land uses. such as residences and schools, nearby classified farmland can negatively impact both uses due to conflict including odor n machinery. The countywide Right-to-Farm Ordinance protects existing agricultural and farming operations from conflicts a development...**Therefore, the potential for conflicts would be minimal. This impact would be less than significant"** (*empha*

This is simply not true. Historic and recent County actions have shown that the County has and will continue to create new a significant impact on existing agricultural

Ventura County Coalition of Labor, Agriculture and Business / 1672 Donlon Street, Ventura, CA 93003 / 805-633-2260 / info@colabvc.org

Page 3 of 4

and farming operations because of conflicts attributed to residential development. The recent interim urgency ordinance restricting hemp cultivation is one such example.

I171-3
cont.

Contrary to statements made today by Ventura County Planning staff, an EIR, whether it is labeled as “programmatically” or “foreseeable consequences of the action that is proposed. For the 2040 General Plan EIR, the action proposed is the implement within. Therefore, if the implementation of a policy in the 2040 General Plan will result in an impact, that impact must be General Plan contains land use designation changes that will increase allowable housing density near agricultural land. It i houses will create more compatibility conflicts with normal farming operations. The impact of these compatibility conflict

I171-4

In 2014, the California Court of Appeal stated in a ruling that “[T]he fact that this EIR is labeled a ‘project’ rather than a ‘pr an EIR as a program EIR ... does not by itself decrease the level of analysis otherwise required in the EIR. All EIRs must cove of specificity of an EIR is determined by the nature of the project and the “rule of reason,” rather than any semantic label

It is CoLAB’s opinion that indirect impacts from increasing urban-ag interface are SIGNIFICANT and cannot be dismissed in

Direct and indirect impacts of increased costs

The 2040 General Plan has policies that will increase the costs of normal farming operations. CoLAB believes that the mos of agricultural land to non-agricultural uses is to take active measures to allow farming to remain profitable. And even the of farming reduces conversion of agricultural land in their discussion of the Williamson Act in Chapter 4.2 of the EIR.

I171-5

But the County fails to analyze direct and indirect impacts of 2040 General Plan policies that will increase the cost of norm

- Policy AG-5.2: Electric- or Renewable-Powered Agricultural Equipment. The County shall encourage and support renewable-powered or lower emission agricultural equipment in place of fossil fuel-powered equipment when
- Policy AG-5.3: Electric- or Renewable-Powered Irrigation Pumps. The County shall encourage farmers to convert to systems powered by electric or renewable energy sources, such as solar power, and encourage electric utiliti charges.

Direct and indirect impacts of increased competition for water resources

The County fails to evaluate the impact of increased competition for water resources caused by development al either the conversion of agricultural land or the loss of agricultural lands through the loss of topsoil.

I171-6

The EIR states on page 4.2-3 that “...a reduction in available water resources for irrigation” is an example of ind to loss of topsoil from increased wind and water erosion.

But the County fails to analyze or propose mitigation measures to address this significant impact.

Ventura County Coalition of Labor, Agriculture and Business / 1672 Donlon Street, Ventura, CA 93003 / 805-633-2260 / info@colabvc.org

Page 4 of 4

APAC is the expert charged with advising County decision-makers on agricultural issues in Ventura County. And the County APAC about the actual issues that will impact farmland under the 2040 General Plan: lack of economic sustainability, the i agriculture, increased competition for water resources, and increased compatibility conflicts from development.

CoLAB encourages APAC to provide guidance to the County on appropriate and effective mitigation measures to prevent non-agricultural uses. These may include:

1. 1) Strengthen the Right-to-Farm ordinance to prevent nuisance complaints from being used to justify setbacks or regulatory restrictions on normal farming practices;
2. 2) Expand the Land Conservation Act Program to include Open Space zoned properties that are engaged and
3. 3) Protect agricultural land from urban-ag interface encroachment and compatibility conflicts by estab land that will restrict the construction of bike paths, public trails, and sensitive receptors within 2000'

I171-7

Thank you again for the opportunity to provide comments on this issue. We appreciate your consideration and Sincerely,
Louise Lampara Executive Director

To: Curtis, Susan <Susan.Curtis@ventura.org>
Subject: Ventura County General Plan

Letter
I172

Dear Ms. Curtis,

I am writing to express my concern over the flaws in the process, data, and conclusions of the Ventura County General Plan, Draft EIR, and supplemental documents.

My great-great grandfather, Mark McLoughlin (1843-1914), was a true Ventura County pioneer, purchasing his first 318 acres of undeveloped land in Ventura County in 1875. He was a hard-working visionary, revered by his community. With his son—my great grandfather, James Patrick McLoughlin he raised livestock and farmed the land, providing jobs and feeding the growing towns of Oxnard and Ventura.

I172-1

Our land, in a vitally important location on Olivas Park Drive across from the Ventura Marina, has been in the family, and part of the economic fabric of the community, for 100 years. And we want it to be part of the future of this community, with a flourishing economy, a thriving job market, and unsurpassed quality of life for its residents.

But the General Plan and DEIR do not describe a viable path for us as landowners going forward.

I will begin with some specific issues regarding language in the Coastal Area Plan, 4-82-83 and 4-94-95. Part of our land is located in the Central Coastal Zone, adjacent to the Ventura Marina, on Olivas Park Drive at Harbor Blvd. The only conclusion the Plan draws about our land is the statement that, “unlike the Preble area, services are not readily available to the Olivas lands.” This is false. Our property has access to all utilities, water, main roads, and the freeway. Indeed, easements on our property serve surrounding areas with utilities.

The Plan also claims that our property is “not included in the City’s sanitation district because of problems with water pressure.” This language is irrelevant and incorrect. There is no evidence that there are water pressure issues, and the sanitation district’s pipelines actually traverse our property.

I172-2

While we do not know the original source of these misstatements, such misrepresentations—now repeated in the Plan—threaten to diminish the value of our land in relation to the Preble property. And, of course, they undermine the goal and the value of the Plan itself.

The General Plan also speaks of the widening of Olivas Park Drive, our southern boundary. This would have a direct impact on our property. But the Plan does not address how this would happen or how it would affect our land.

Damaging misstatements about our property also appear in the DEIR. Contrary to the portrayal in the DEIR, our property has significant infrastructure in place, as well as prime accessibility to the highway and the harbor. In fact, with easy access to the marina and beach community, and with the railroad as part of our eastern boundary, our land is uniquely suited to be an important part of future economic development in the area. We are entitled to have all these matters corrected.

I172-3

I would also like to raise some additional concerns:

1. The General Plan and DEIR continue to ignore the 28% increase in the homeless population in our community.

I172-4

2. According to the General Plan, if we were to build an acre of low income / worker housing we would need to buy two replacement acres of same Ag land to be placed into perpetual agricultural preservation. This is unrealistic and infeasible, and certainly not in line with the State government's housing policies.

I172-5

3. The EIR does not adequately address the enormous “indirect impacts” that will occur as a result of implementing the General Plan, calling them “less than significant.”

I172-6

4. The General Plan contains policies that will increase the costs of normal farming operations, making it difficult for farming to remain profitable.

I172-7

5. The Plan does not adequately evaluate the impacts of increased competition for water in our community.

I172-8

The EIR is a flawed document, full of errors, that does not disclose all impacts, direct and indirect, caused by the General Plan. It was obviously rushed—completed in six weeks. It is inaccurate and incomplete, and fails to provide members of the community with the information that they are legally entitled to. This EIR should be corrected and reconsidered, and a reasonable time period should be allowed for meaningful and thoughtful community input.

I172-9

Sincerely,
Patrick de Nicola

800 South Victoria Avenue, L#1740
Ventura, CA 93009-1740

Re: Comments on Ventura County General Plan DEIR

Dear Ms. Curtis:

I represent and serve on the McLoughlin Family Committee, a group of family members that own approximately 300 acres of agricultural property off of Olivas Park Road in the County of Ventura, in proximity to the City of Ventura.

The McLoughlin family has farmed this land for generations. It remains our desire to continue this legacy. However, in the face of never-ending changes to the regulatory environment, we again find ourselves attempting to ascertain how new policies and programs as proposed in the draft 2040 General Plan will impact and challenge our ability to serve as stewards of this heritage.

I173-1

It had been our hope that the DEIR would provide some clarity and insight into how the new policies and programs within the revised General Plan would impact our farming operation. However, that is not the case. Simply said, we believe the General Plan Update and subsequent Environmental Impact Report fail to adequately analyze or study impacts on the farming industry.

With that said, we would like to specifically present the following:

- The Background report Table 6-26: Transportation Department Planned Capital Projects lists sections of roadways the County plans for expanded capacity or widening, along with the scope of those enhancements. It also covers in length the plan to add bike paths and bike lanes in accordance with existing County wayfarer plans. However, the DEIR never analyzes the loss of farmland resulting from these changes in infrastructure – it’s not even mentioned as a possibility in the DEIR.

I173-2

Olivas Park Road between Victoria and Harbor is listed as one of the areas planned for road widening, a stretch of roadway that borders the entire eastern portion of our farmland and property. While the impact on our farming operation and financial losses due to property loss are clearly quantifiable, the report fails to list or quantify these impacts.

- In Section 3-8, The DEIR states that because there will be no “substantive” change to the agricultural, open space, or rural designations, the General Plan Update (GPU) will be consistent with SOAR. However, no further details beyond this conclusory statement is provided. There is no way for the reader to come to his or her own conclusion on whether the GPU will result in inconsistencies with SOAR that might lead to physical environmental impacts. There is no description of the changes to the Agriculture, Open Space, and Rural policies to determine whether they are in fact non-substantive.

I173-3

Given the length and breath of the Draft General Plan update and CEQA analysis, we made an attempt to focus our initial review and subsequent comments to issues specific to agriculture and farming. However, it's clear that the 2040 General Plan will impact the Ventura County local economy across sectors – all of which influence the ability to live and work in this region. The DEIR's lack of analysis of those economic impacts, calls into question the legitimacy of both the draft General Plan update, and the CEQA analysis. As such, we respectfully request that the DEIR be recirculated in the hopes that further study will resolve these shortcomings.

I173-4

I appreciate your consideration.

FEB 28 2020

Letter
1174

25 February 2020

RMA Planning Division
General Plan Update
800 Victoria Ave, L# 1740
Ventura, CA 93009-1740

Dear Ms. Susan Curtis;

The 2040 General Plan Environmental Impact Report (EIR) has been released for public comment. The County rushed to complete this analysis! Usually EIR's take 12-18 months or more. The County finished theirs in 6 weeks. The quality of the EIR reflects that timeline.

MAR 3 2020 PM 1:17

I174-1

There are so many extremely flawed and deficient analyses throughout the EIR, however I am a small business owner and have other responsibilities. time only permits me just a few comments.

- A) The county failed to analyze the impact of mitigation measure NOI-1 on wildfire risks. Milt Measure NOI-1 (policy HAZ-X) demands that noise reduction measures must be installed to reduce sound near sensitive receptors near roads.

This mitigation measures states "noise control measures may include increased vegetation..."

HOWEVER, the County did not evaluate the feasibility of this mitigation measure. Vegatative noise control barriers have very precise technical standards for height, weight, AND SOLID BRUSH DENSITY FROM GROUND TO TOP. The required brush density for vegetation to actually reduce noise often conflicts with Fire Code requirements for brush reduction below certain heights.

I174-2

If the County wishes to encourage vegetation noise buffers, then this mitigation measure needs to be evaluated for impacts to wildfire risk.

- B) County failed to evaluate the impact of policies that restrict energy choice on health and safety.

Policy COS-8.11:

Improve Energy Conservation Awareness. The County shall encourage community members to conserve energy and reduce greenhouse gas emissions and increase awareness about energy efficiency and climate change and adaptation.

I174-3

Further, to conduct targeted outreach to homeowners and contractors to encourage installation of electric appliances upon routine replacement of natural gas appliances and heaters and provide information regarding financial incentives.

The Background Report fails to include pertinent data regarding Ventura County's existing energy source and supply condition, which include "public safety shutdown" of large sections of the electrical grid. County residents have suffered through extended power outages that prevent the use of electrical appliances (including hot water heaters, HVAC systems, and cooking appliances).

I174-3
cont.

The County has failed miserably to consider existing conditions and failed to analyze the impact of this policy on public health and safety.

C) The County did not conduct the CEQA required analysis for impacts.

CEQA is very clear that the intent of the impact analysis required here is to evaluate the potential impact of the General Plan on future access to the petroleum reserves.

Yet the County DID NOT DO THIS. Instead the County provides a long discussion of the potential health and safety impacts that may occur near oil and gas production. While this "optional, not required" analysis is admirable, the County has failed to comply with CEQA requirements for this analysis. The County MUST redo this analysis, this time following the CEQA intent, and the EIR must be recirculated.

I174-4

Legalese:

The County MUST conduct an analysis that meets CEQA standard by evaluating the impact of future development under the General Plan on the ability to access reserves. The analysis outlined in the EIR has no bearing as the County failed to meet the CEQA standard.

Thank you,

Patsy Turner, Small Business Owner
Oxnard, CA

|------------------------|------------------------------------------|
| Letter I174 | Patsy Turner February 25, 2020 |
|------------------------|------------------------------------------|

- I174-1 This comment regarding the adequacy of the draft EIR is noted. However, no specific issues related to the content, analysis, conclusions, or overall adequacy of the draft EIR are raised in this comment. Therefore, no further response is provided.
- I174-2 See response to comment O32-40 regarding wildfire risk related to vegetation noise buffers.
- I174-3 The comment states that the draft EIR does not evaluate the impacts of Policy COS-8.11 on public health and safety. Through this policy the County would encourage community members to conserve energy and reduce greenhouse gas emissions, increase awareness of energy efficiency and climate change, and include outreach to homeowners and contractors. The commenter does not provide any evidence or information regarding why this policy would result in impacts to public health and safety that require analysis in the draft EIR, so no further response can be provided.

The comment also references existing public safety shutdowns of the electrical grid. The commenter’s concerns about the impacts of such shutdowns are noted. However, an EIR is not required to analyze the impacts of existing conditions on public health and safety. The draft EIR appropriately focuses on the physical environmental changes that would result from implementation of the 2040 General Plan.
- I174-4 Refer to Master Response MR-4, Section MR-4.D Mitigation Measures and the Role of the Board of Supervisors, regarding the findings and conclusions related to analysis of impacts and mitigations measures relied upon to comply with CEQA.

CAUTION: If this email looks suspicious, DO NOT click. Forward to Spam.Manager@ventura.org

Susan Curtis,

Dear Ventura County Board of Supervisors and Planning Department,

Climate issues are something I feel worried about. Ventura County is warming as fast or faster than any county in the nation. Our ocean is acidifying faster. Drought, fire and floods have hit us worse. and we can expect more extreme weather.

I175-1

My family and community are counting on you to assure analysis of the full scope of environmental impacts and mitigations in the Draft EIR.

First, it is necessary that all greenhouse gas emissions be counted based on the most current science.

I175-2

There are many ways to mitigate climate impacts, like a sunset plan for oil and gas production, decarbonization of transportation and buildings, zero waste, incentives for regenerative agriculture and water management, and reducing emissions from tailpipes.

I175-3

I want an EIR that covers major climate impacts via a systematic plan.

Thank you—

Paul Aist

This comment letter repeats many of the same comments provided in Letter I3. The responses below provide cross references to the portions of Letter I3 where responses to the same comments have already been provided.

- I175-1 Refer to response to comment I3-1 regarding the commenter’s concerns about climate change and the draft EIR analysis.
- I175-2 Refer to response to comment I3-2 regarding the use of the most current climate change science in the draft EIR analysis.
- I175-3 Refer to response to comment I3-3 regarding suggested mitigation measures.

February 20, 2020

To: Ventura County Planning Department

From: Phil White, Ojai

Subject: Comments on the 2040 GPU EIR

Letter
1176

Thank you for the opportunity to comment on the EIR. As a member of the Planning Commission, I have followed closely the development of the General Plan Update for the past three years. I am familiar with the General Plan’s contents and attended the public hearings where the policies and programs were discussed and adopted. My comments are mine alone and do not reflect the positions of the Planning Commission.

I1176-1

1. Executive Summary - Page 2-14. “.the net Zero Net Energy Alternative is proposed to address the county’s contribution to GHG emissions.”

The concept of Zero Net Energy while once at the forefront is now behind the times since it allows continuation of natural gas combustion. The current focus of dealing with Global Warming / Climate Change is an emphasis on Zero Carbon, and if the General Plan has an alternative focusing on building energy use, it needs to be Zero Carbon, not Zero Net Energy. The language needs to be modified to make this change.

I1176-2

2. Executive Summary – Page 2-33 – Impact 4.8-1 – Mitigation Measure GHG-1- Reach Code.

The proposed language talks about prohibiting new natural gas infrastructure in new residential construction. In fact, Program COS-S is not limited to new residential construction, nor are the underlying policies COS-8.6 and 8.7. While reach codes will logically apply first to new construction, there needs to be planning under this program to extend to eventual retrofits of existing buildings of all types. The language needs to be modified to add this comprehensive planning.

I1176-3

3. Executive Summary – Page 2-34 – Impact 4.8-1 – Mitigation Measure GHG-2

The proposed language deals with energy savings, and while that is commendable, a comprehensive plan dealing with Global Warming / Climate Change needs to emphasize reducing carbon emissions. Also, the proposed language covers buildings of 25,000 square feet or more and doesn’t include discussion of non-building sources of GHG. This is short-sighted. Since dealing with the Climate Emergency requires a comprehensive approach, the program needs to cover buildings and other sources regardless of size. The language needs to be modified to add these points.

I1176-4

4. Executive Summary – Page 2-35 and 36 – 4.8-1 – Mitigation Measure GHG-3

I concur that the General Plan should not include tiering and streamlining. The uncertainty of the incomplete GHG emission inventory alone dictates that tiering and streamlining don’t make sense.

I1176-5

5. Executive Summary – Page 2-35 – Mitigation Measure GHG-4

I concur that the proposed program makes sense. However, it must be acknowledged that the Climate Emergency Council will likely come up with more than 52 policies for addressing GHG reductions. For example, a recent LA Times report documents the enormous number of abandoned oil and gas wells in the State and in Ventura County. These abandoned wells are sources of methane leaks which contribute to Global Warming / Climate Change. This is an example of a new policy area that is likely needed to address the County’s contributions to Climate Change. The language in GHG-4 needs to be modified to add that point and create that flexibility.

I176-6

6. Executive Summary – Page 2-39 – Mitigation Measure PR-1

The proposed language, purportedly implementing adopted policy COS-7.2, deals with setbacks from oil and gas wells to sensitive receptors including residences and schools. While I concur with the addition of added language covering childcare facilities, hospitals, and health clinics, I am very bothered to see the proposed language removing the 2500 foot criterion adopted by the Board of Supervisors in September. I think it is outrageous for staff and the consultant to use the EIR process to try to undo specific policies adopted by the Board of Supervisors in public hearings. The already adopted 2500 foot limit needs to be reinstated.

I176-7

7. Biological Resources – Pages 4.4-14 – 17

Several important adopted policies affecting biological resources are omitted from this section. Policy WR-7.1 Water for the Environment, Policy PFS-6.6 Natural Drainage Courses, and Policy PFS-6.7 Flood Control and Beach Sand Nourishment each make important contributions to protecting biological resources. This section needs to be modified to include them.

I176-8

8. Mineral and Petroleum Resources – Chapter 4.12

In adopting policies in the General Plan, the Planning Commission and the Board of Supervisors considered balancing the development and conservation of oil and gas resources with economic, health, safety, social and environmental protection values.

For example, the oil and gas industry is a large source of air pollution and greenhouse gas emissions and it is a source of health issues, water contamination, and environmental injustice. Reasonable limitations imposed on oil and gas development to reduce these impacts were considered in the development of the General Plan and the Board of Supervisors adopted a number of policies intended to reduce these impacts while still allowing responsible development.

I176-9

The text in this chapter has been written with a strong emphasis on protecting the extraction of petroleum resources while downplaying the consequent air pollution, climate change, water contamination, health impacts, and environmental injustice. This bias needs to be eliminated in the EIR. The EIR should reflect the balanced intent of the policies adopted by the Board of Supervisors.

9. Mineral and Petroleum Resources – Page 4.12-31 – Mitigation Measures PR-2 and PR-3

The Board of Supervisors in September approved adoption of Policies COS-7.7 and COS-7.8 to reduce the impacts of new oil and gas development on air pollution, greenhouse gas emissions, environmental justice, and other health and safety concerns. Those two policies were designed to balance the responsible development and conservation of oil and gas resources with the need to reduce the environmental, health, and social impacts of that development.

I176-9
cont.

I was very disturbed to see that County staff and their consultant have, by proposing Mitigation Measures PR-2 and PR-3, attempted to effectively undo and cancel the policies adopted by the Board. I think it is outrageous for staff and the consultant to use the EIR process to try to undo specific policies adopted by the Board of Supervisors in public hearings. Proposed Mitigation Measures PR-2 and PR-3 need to be rejected and the original Policies COS-7.7 and COS-7.8 reinstated.

10. Appendix D – GHG Calculations

Ventura County is faced with developing a Climate Action Plan to accomplish its fair share of reducing greenhouse gases to meet State and International targets. The first step in developing the plan is to accurately summarize the existing emissions of greenhouses gases; particularly carbon dioxide and methane. What is presented in Appendix D does not do that.

I176-10

During the public hearings on the General Plan before the Planning Commission and the Board of Supervisors, it was repeatedly pointed out that the County’s consultant had failed to accurately prepare an inventory of greenhouse gas emissions. The inventory in the EIR still does not do so. Two examples of deficiencies are the failure to calculate emissions from large industrial sources, and the failure to address the realistic global warming potential of methane.

Whether it is done as part of the EIR or not, the County will need an accurate GHG emissions inventory. I suggest hiring the Ventura County APCD to prepare it.

Thank you for the opportunity to present comments on the EIR. I sincerely hope my comments are useful.

I176-11

Phil White

|------------------------|----------------------------------------|
| Letter I176 | Phil White February 20, 2020 |
|------------------------|----------------------------------------|

I176-1 The commenting individual’s membership on the Planning Commission and familiarity with the 2040 General Plan are noted. This comment is introductory in nature and does not raise a significant environmental issue for which a response is required.

I176-2 The comment states that the Zero Net Energy Alternative is “behind the times since it allows the continuation of natural gas combustion.” The comment offers a zero carbon alternative as an option that should be evaluated. This alternative would address greenhouse gas (GHG) emissions from the building sector by establishing requirements for new construction and retrofit of existing buildings through replacement of appliances and addition of features such as solar panels.

Through 2040 General Plan Policy COS-8.6, the County shall “support the transition to zero net energy and zero net carbon buildings, including electrification of new buildings (page 4.8-23).” To quantify GHG emissions reductions in the draft EIR analysis, it was assumed that new buildings in the county would be zero carbon (page 4.8-47). However, the intent of Policy COS-8.6, which is to reduce GHG emissions through advanced building design, could also be supported through the construction of Zero Net Energy buildings. The draft EIR assessed an alternative that would extend this support for Zero Net Energy to existing structures as well because existing buildings account for a greater proportion of GHG emissions from buildings than expected from new construction. Alternative 4 proposed in the draft EIR focuses on creating incentive programs to encourage the retrofit of existing building stock, which account for a larger proportion of forecast energy consumption and GHG emissions in the County’s building energy sector, compared to newly constructed buildings. As summarized in Chapter 6, “Alternatives,” of the draft EIR (page 6-21), Alternative 4 would result in similar impacts to the 2040 General Plan. This alternative would be anticipated to result in only a modest reduction to significant and unavoidable greenhouse gas emission impacts because participation of private property owners in a zero net energy retrofit program would be voluntary and the achievement of zero net energy performance is not limited to building design, but also occupant behavior. While it is possible for existing buildings to be retrofitted to become zero net energy the transformation of all existing buildings in the County to this performance standard and the ability to achieve and maintain this standard is limited by participant behavior. A zero-carbon alternative would face similar potential obstacles to implementation and would generate similar GHG reductions as Alternative 4.

The Zero Net Energy Alternative was developed by the County in accordance with CEQA Guidelines Section 15126.6 as an alternative that would “feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project.” The draft EIR is not obligated to consider the commenter’s proposed zero carbon alternative because it is

substantially similar to the alternative evaluated and “an EIR need not consider every conceivable alternative to a project. Rather it must consider a reasonable range of potentially feasible alternatives that will foster informed decision making and public participation” (CEQA Guidelines, § 15126.6). No further response is required.

- I176-3 The comment suggests edits to the text of Mitigation Measure GHG-1. Note that the citation provided in the comment is from the Table 2-4 in Chapter 2, “Executive Summary,” of the draft EIR, which compiles the impact determinations and mitigation measures proposed in the 17 resource sections that comprise Chapter 4, “Environmental Impact Analysis.” The mitigation measure is separate from Program S in the Conservation and Open Space Element and does not reflect on the application of Policies COS-8.6 and COS-8.7 as proposed in the 2040 General Plan. The commenter is referred to Section 4.8, “Greenhouse Gas Emissions,” for discussion of these policies and programs, as well as the analysis that supports proposal of Mitigation Measure GHG-1. Refer to response to comment O28-3 for discussion of revised Mitigation Measure GHG-1.

The comment suggests that Program COS-S and Mitigation Measure GHG-1 apply to retrofits of existing buildings. While the commenter states that Mitigation Measure GHG-1 should be revised “to extend to eventual retrofits of existing buildings of all types,” it is unclear what specific revisions the commenter is recommending. Assuming the commenter recommends the mitigation measure be revised to require existing structures to be retrofitted with all-electric infrastructure, there is not a clear regulatory authority within State law for local governments to require retrofitting for the specific purpose of GHG reduction or energy efficiency. In addition, mandating the retrofitting of existing buildings with all-electric infrastructure would likely be economically infeasible given the significant costs of replacing such infrastructure before the end of its useful life. Although Policy HAZ-11.7 addresses green building retrofits, which could include removal of existing natural gas infrastructure, the County can only encourage, not require, these actions in existing buildings. Therefore, the County considers mandating the retrofitting of existing buildings with all-electric infrastructure infeasible and has not made any revisions to this measure in response to this comment. Note also that the County Executive Office’s Sustainability Division actively manage existing programs related to improved energy efficiency in existing residential and commercial buildings. Current funds come from the California Public Utilities Commission (residential retrofits) and Southern California Edison (residential and commercial retrofits).

- I176-4 The comment recommends a comprehensive plan to address climate change that includes reductions in carbon emissions and addresses non-building sources of GHG emissions. As discussed in response to comment I176-4, above, the citation provided is from the Table 2-4 in Chapter 2, “Executive Summary,” of the draft EIR, which compiles the impact determinations and mitigation measures proposed in the 17 resource sections that comprise Chapter 4, “Environmental Impact Analysis.” The 2040 General Plan includes policies and programs to reduce carbon emissions that would apply to a variety of sectors. Refer to Section 4.8, “Greenhouse Gas Emissions,” for discussion of comprehensive planning

framework in the 2040 General Plan. Mitigation Measure GHG-2 was developed based on the analysis in Section 4.8, “Greenhouse Gas Emissions,” as a method to reduce greenhouse gas emissions that is not already incorporated into the 2040 General Plan. Also refer to Master Response MR-1 for discussion of the draft EIR’s detailed quantitative and qualitative analysis of the 118 policies and 45 implementation programs included in the 2040 General Plan to reduce GHG emissions in the county and the seven feasible mitigation measures included in the draft EIR to address the potentially significant GHG impacts of the 2040 General Plan and achieve additional GHG emissions reductions.

The comments suggest modifications to the language of Mitigation Measure GHG-2 to apply to all industrial buildings, not limited to those over 25,000 square feet (sq. ft.) in size. The building size selected for GHG-2 was developed to align with the 25,000 square feet floorspace used by the U.S. Energy Information Administration (EIA) to distinguish smaller commercial buildings apart from larger and more energy intensive projects (EIA 2018). The intent of creating a threshold of 25,000 sq. ft. was to capture a substantial amount of the GHG emissions associated with new discretionary industrial buildings without subjecting smaller businesses to cost-prohibitive benchmarking and retrofitting requirements. It should be noted that the 25,000 sq. ft. threshold captures more existing buildings than the 50,000 sq. ft. threshold specified for commercial building energy efficiency benchmarking since June 1, 2019, under the California Energy Commission’s Building Energy Benchmarking Program (CEC 2020).

The comment also states that the analysis does not include a discussion of non-building sources of GHGs. But it is not clear from this comment which sources specifically are being referred to. Therefore, Mitigation Measure GHG-2 has not been revised in response to this comment. This comment has been noted and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.

1176-5 The comment expresses support for Mitigation Measure GHG-3. No further response is required.

1176-6 The comment recommends that language be added to Mitigation Measure GHG-4 to improve its flexibility. Refer to final EIR Chapter 3, “Revisions to the Draft EIR” for revisions to Mitigation Measure GHG-4.

1176-7 Refer to Master Response MR-4, Sections MR-4.H Buffers (Setbacks), MR-4.E Applicability of Reference Studies for Oil and Gas Operations, and MR-4.D Mitigation Measures and the Role of the Board of Supervisors, regarding the findings and conclusions related to buffers (setbacks) in oil and gas operations, applicability of reference studies relied upon and the rationale for analysis, findings and mitigations measures relied upon as part of the environmental review process.

The remainder of the comment addresses implementation of the 2040 General Plan and is not related to the adequacy of the draft EIR. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.

- I176-8 This comment states that the draft EIR Section 4.4, “Biological Resources,” is missing several 2040 General Plan policies: WR-7.1, PFS-6.6, and PFS-6.7. However, the comment does not explain or address why these policies should be added to this section of the draft EIR. Note, the commenter also identifies these policies as “adopted” in the 2040 General Plan, which is incorrect. These policies are currently proposed in the 2040 General Plan and subject to future adoption by the Board of Supervisors.
- PFS-6.6 and PFS-6.7 are included in Section 4.10, “Hydrology and Water Quality,” of the draft EIR. This section is cross-referenced under Impact 4.4-5: Conflict with Any Local Policies or Ordinances Protecting Biological Resources, which states: “The Aesthetics (Section 4.1), Hydrology and Water Quality (Section 4.10), and Noise and Vibration (Section 4.13) sections of the draft EIR include analysis of local ordinances concerning lighting, noise, and water quality that may have an indirect effect on biological resources.” However, Policy WR-7.1 is not included in this cross-referenced section.
- The draft EIR Section 4.4.2 Environmental Impacts and Mitigation Measures, subsection Conservation and Open Space Element is revised as follows to incorporate Policy WR-7.1 on page 4.4-17 (following the bullet, “Policy COS 9.3: Open Space Preservation”):
- Conservation and Open Space Element
Policy WP-7.1: Water for the Environment. The County encourage the appropriate agencies to effectively manage water quantity and quality to address long-term adequate availability of water for environmental purposes, including maintenance of existing groundwater-dependent habitats and in-stream flows needed for riparian habitats and species protection. (IGC) [New Policy]
- This policy encouraging other agencies to manage water quantity and quality for environmental purposes would not change any of the impact analysis, conclusions, or mitigation measures identified in the draft EIR analysis of biological resources impacts.
- I176-9 Refer to Master Response MR-4, Sections MR-4.D Mitigation Measures and the Role of the Board of Supervisors and MR-4.C Underlying Motives of the Proposed Oil and Gas Policies, regarding the findings and conclusions related to the rationale for analysis, findings and mitigations measures relied upon as part of the environmental review process.
- I176-10 The comment pertains to the GHG inventory in the draft EIR, including the calculation of emissions from large industrial sources and the global warming potential for methane. See Master Response MR-1 for additional discussion of the GHG inventory.
- I176-11 This comment is a concluding statement and does not raise a significant environmental issue for which a response is required.

What about public safety

Attention: Health & Safety
Date: 02/27/2020

What about public safety?

When I built my house at 209 Heavenly Valley Rd, Newbury Park in 1994, it was considered a single-family dwelling. Now 32% of the people on Heavenly Valley Rd rent out their rooms.

If they are a couple they have at least two cars. The houses in our neighborhood range from three to six bedrooms, and when they convert the garage into another unit, they really have a problem with the parking.

My neighbor has a six bedroom house with a bonus room of about 800 square feet. He currently rents out rooms inside his home. He is in the process of converting his garage into a 1200 square foot, three bedroom apartment and an office. He has enough parking for five cars in the driveway. This will require additional parking, but where will this parking be? I don't know, and I don't know that the county knows. It seems the permit was handed out without anyone doing due diligence to find out this answer.

If you do the math, and they have six bedrooms, and a bonus room, add the three bedroom apartment, and the office, how much parking is needed? Everyone in California has a car, and all these cars will be on the street.

Four times in the last 2 1/2 years an ambulance and a firetruck have been stuck to where either they had to wheel the patient down the street or go around the block because the street was blocked off by the parked cars. Again, the streets in this area are only 20 feet wide, and it forces people to park their cars on the street because of over occupancy.

There is also another problem. The street is a gateway to the Santa Monica Mountains which in the past has always been a huge fire concern. Please look on the map and you'll see the gateway I am speaking about. Who says that emergency personnel will be able to get up the street or down the street once these changes are implemented?

Has anyone asked the county/city fire department if they have had issues getting up this street? I hope so, and that should go on record what they had to say. I don't know whether to say no parking on the street or provide more parking but something needs to happen. These homes were meant to be only single-family dwellings and you've converted them into an apartment with absolutely no parking and when I talk to the building department they come up with some nonsense that there's a bus stop within half a mile, which it is slightly over that and we don't need parking, really.

The occupancy has changed but the code has done nothing for the safety or for the provisions of the people living here. It is my understanding that fire sprinklers are not mandatory, and why aren't they?

I hope you think of the public safety before you consider anymore garages changed into units, the Community demands more integrity than you're giving us.

Phillip Fuess (805 630 6212)
209 Heavenly Valley Rd
Newbury Park CA 91320

Comment On:
Buffer Requirements, Trucking vs. Pipeline, Flaring, Climate Action Plan, Greenhouse Gas "Super- Emitters, Ojai

Your Comment:

- *Buffer Requirements – Buffers should be increased from the currently proposed 1,500 feet to 2,500 feet. I 1178-1
- *Trucking vs. Pipeline - Maintain Policy COS-7.7 as recommended by the Board of Supervisors, so that all newly permitted discretionary oil wells are required to convey oil and produced water via pipelines instead of trucking. I 1178-2
- *Flaring – Maintain Policy COS-7.8 as recommended by the Board of Supervisors, so that all newly permitted discretionary oil wells are required to collect gases and use or remove them for sale or proper disposal instead of flaring or venting. Flaring should be allowed only in cases of emergency or for testing purposes. I 1178-3
- *Climate Action Plan – Revise the Climate Action Plan and corresponding policies in the General Plan to achieve measurable, enforceable reductions in greenhouse gas emissions. I 1178-4
- *Greenhouse Gas “Super-Emitters” – The county should adopt the strongest possible measures to ensure that greenhouse gas emissions are curbed to protect air quality and to ensure a safe, sustainable future for all county residents. I 1178-5
- *For Ojai - The 2040 General Plan must include a strong defense of the five-pound air emissions limit for the Ojai Valley. All projects subject to CEQA review must include an evaluation of the totality of air emissions in order to understand and mitigate the impacts to local air quality. I 1178-5

| | |
|------------------------|-----------------------------------------|
| Letter I178 | Polly Nelson February 2, 2020 |
|------------------------|-----------------------------------------|

- I178-1 Refer to Master Response MR-4, Sections MR-4.H Buffers (Setbacks), regarding the findings and conclusions related to buffers (setbacks) for oil and gas operations. Refer to Master Response MR-4, Section MR-4.G Pipeline Requirements, regarding the findings and conclusions related to the conveyance of oil and produced water from oil and gas operations.
- I178-2 Refer to Master Response MR-4, Section MR-4.F, “Flaring,” regarding the findings and conclusions related to flaring in oil and gas operations.
- I178-3 The comment states that the 2040 General Plan should be revised to achieve measurable, enforceable reductions in greenhouse gas emissions. Refer to Master Response MR-1 regarding the development of the 2040 General Plan policies and programs. No specific issues related to the content, analysis, conclusions, or overall adequacy of the draft EIR are raised in this comment. Therefore, no further response is provided.
- I178-4 The comment recommends that the County adopt the strongest measures to ensure greenhouse gas emissions are curbed, particularly from “super-emitters.” Refer to Master Response MR-1 for additional discussion of “super-emitters” and the development of 2040 General Plan policies, as well as discussion of the draft EIR’s detailed quantitative and qualitative analysis of the 118 policies and 45 implementation programs included in the 2040 General Plan to reduce greenhouse gas (GHG) emissions in the county and the seven feasible mitigation measures included in the draft EIR to address the potentially significant GHG impacts of the 2040 General Plan and achieve additional GHG emissions reductions. The comment addresses the draft 2040 General Plan and is not related to the adequacy of the draft EIR. Therefore, no response is required. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.
- I178-5 As discussed in the draft EIR and explained further in response to comment O20-14, the comment refers to a threshold of significance for daily reactive organic gas and nitrogen oxide emissions in the Ojai Valley which is referenced in the Ojai Valley Area Plan. This threshold, which applies to sources that are not permitted by the Ventura County Air Pollution Control District (VCAPCD), was added to the VCAPCD’s Air Quality Assessment Guidelines in 1989 and the reference to this threshold was thereafter added to the Ojai Valley Area Plan in 1995. The 2040 General Plan would not change this threshold. Also refer to the response to comment O20-15 for discussion regarding the types of air emissions sources addressed by VCAPCD guidance and thresholds.

**Letter
1179**

FEB 25 2020

Attn: RMA Planning Division
General Plan Update
800 S. Victoria Avenue, L#1740
Ventura, CA 93009-1740

Dear County of Ventura:

Thank you for inviting comments on the EIR. I am an engineer by trade and have been an operator of LBTH oil field for over 30 years. My experience and knowledge of the oil and gas industry conflicts with critical conclusions in the EIR and I implore the County to revisit the data sources that is being relied on to make major impacts on our County.

I1179-1

I refer you to Page 2-54, the Market Outlook forecasted price per bbl which was pulled from old data taken at market low in 2017. Chapter 8, pages 8-74, "The County's oil reserves are estimated by the State Division of Oil and Gas and Geothermal Resources at 246,141,100 barrels". This calculation does not correctly apply the definition of "reserves", nor does the County discuss what types of data was included or excluded in obtaining that number.

I1179-2

Page 8-74, presents an incomplete and inaccurate description of how and why wells are idled. It implies that the entire industry "shuts down" when the market goes low. "Crude oil prices influence the level of production and well drilling activity in the County's oil fields. When prices are low, wells are placed in idle status and few or no new wells are drilled".

Additionally, on Page 2-54, "Production throughout the State had been declining since the 1980's, as oil reserves in the State have diminished. In recent years, the drilling of oil wells and well stimulation (including hydraulic fracturing), has been reduced in response to current oil prices". Page 8-74 "This level of production represents a 43% decrease in production from 1987 levels (15,659,398 barrels)".

I1179-3

However, Appendix D: GHJ applies base calculations that claim an anticipated future increase of over 1 million barrels of production, without providing references as to what data they have to support this potential increase in reserves and oil production.

Conflicting data and incorrect data in a report that is to govern the future. I urge you to stop and review for consistency and actual valid data before moving forward.

Sincerely,

R W Bowman, PhD, PE

|------------------------|----------------------------------------|
| Letter I179 | R W Bowman February 25, 2020 |
|------------------------|----------------------------------------|

- I179-1 The commenting individual's experience and knowledge of the oil and gas industry are noted. This comment is an introductory statement and does not raise a significant environmental issue for which a response is required.
- I179-2 The comment provides clarification regarding specific statements about the oil and gas production and pricing in the Background Report. These specifics do not directly inform the analysis or impact conclusions of the draft EIR. No revisions to the draft EIR have been made in response to this comment. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.
- I179-3 The comment states that page 2-54 of the Background Report states that oil production in the State has been declining since the 1980's yet the draft EIR assumes an anticipated future increase of oil production of over 1 million barrels. Previously in the draft EIR, there was a calculation error in the scaling factor used to forecast emissions through 2040 that was designed to scale emissions by average annual trends in oil and gas production in the county since 2008. The commenter is correct to include historical oil production earlier than 2008, as oil production in the county between 2008 and 2015 demonstrated an anomalous spike in production, coinciding with the recession during that time. This spike is not indicative of overall oil production trends, when compared to the overall decline in production since 1980. The GHG forecast has been revised in the draft EIR to incorporate historical oil and gas production in the county starting from 1980, instead of 2008, to provide a more accurate assessment of the overall trends in oil and gas production in the county. Additionally, the calculations have been corrected such that oil-related emissions are scaled by oil production and gas-related emissions are scaled by gas production. A discussion has also been added in Attachment 2 of the final EIR to further explain the methodology used to forecast oil and gas emissions.
- For additional information on the methods used to forecast the county's oil production in the GHG projections included in the 2040 General Plan and draft EIR, refer to response to comment O6-30.

In light of the litigation the city of Ventura has began as a counter suit against the Santa Barbara Channel Keepers, I am EXTREMELY concerned that the County of Ventura should also be very worried. I reside in the County of Ventura, work for the County of Ventura and was served by the City Of Ventura. With all the overlap of city and county PLEASE review any and all watershed documents that may have been proposed and placed on the "back burner" in anticipation that this issue will eventually include the County Of Ventura.
Water rights, clean water availability, federal government, State and local ordinances do have to be considered as we look forward to the year 2040

I181-1

Subject: 2040 General Plan Draft EIR Comment

| |
|------------------------|
| Letter I182 |
|------------------------|

2040 General Plan Draft EIR Comment:

The County rushed to complete the EIR. It is too important to be done haphazardly and contain gross flaws that will impact our County so drastically. I I182-1

Just a couple of the issues:

CEQA requires that proposed mitigation be both technically and economically feasible. The County' proposed mitigation measures are **infeasible**. One mitigation measure will require small development projects to purchase farmland to preserve in perpetuity. But the County didn't analyze the costs or indicate who would manage these small ag preservation parcels. I I182-2

CEQA says that the mitigation cannot make the impacts worse. Shortage of farm worker housing was identified as one of the most significant issues facing agriculture in Ventura County. But mitigation proposed by the County will effectively block future farm worker housing, because these projects will bear the costs of land acquisition for preservation! I I182-3

Please do what is right for Ventura County and take the time to correct and re-circulate the EIR. I I182-3

| | |
|------------------------|------------------------------------------|
| Letter I184 | Richard Gray February 21, 2020 |
|------------------------|------------------------------------------|

I184-1 The comment states that the 2040 General Plan does not address conflicts with the California Environmental Quality Act, the draft EIR, Fire Department, insurance companies, and the Coastal Plan pertaining to brush clearance for fire protection. The 2040 General Plan does not include brush clearing requirements. The analysis of wildfire impacts assumes compliance with existing regulations. The draft EIR (page 4.9-21) explains that “Public Resources Code Section 4291 and Government Code Section 51182 require property owners in mountainous areas, forest-covered lands, or any land that is covered with flammable material to create, at minimum, a 100-foot defensible space (or to the property line) around their homes and other structures. Pursuant to Ventura County Fire Protection District Ordinance 31, the Ventura County Fire Protection District Fire Hazard Reduction Program requires mandatory 100-feet of brush clearance around structures located in or adjacent to Hazardous Fire Areas.” The 2040 General Plan would not change the requirement for brush clearing in Hazardous Fire Areas and there is no conflict with existing regulations.

Letter
I185

February 25, 2020

Ventura County Board of Supervisors
Attn: Susan Curtis, Manager, General Plan Update Section
800 South Victoria Avenue, L#1740
Ventura, CA 93009-1740

I'm writing to you as a resident of the County concerned about the viability of the oil and gas industry in Ventura County.

I185-1

The 2040 General Plan Draft EIR fails to give proper analysis to oil and gas mineral resources.

Neither the EIR nor the Background report provide a complete and thorough description of the existing, current regulatory setting that oversees the management and production of mineral resources in the County and the State of California. The EIR and the Background Report only disclose federal and state agencies that regulate pipelines and flaring, which is not applicable to all mineral resources that must be analyzed in an EIR under CEQA guidelines. The EIR should be revised to include an overview and description of all potential regulations, regulatory bodies, and programs that regulate mineral resources in Ventura County.

I185-2

The EIR fails to actually analyze for direct and indirect impacts to mineral resource zones that will occur as a result of the 2040 General Plan. The County admits that Land Use Designation changes in the 2040 General Plan will result in changes to land uses OVER known and important mineral reserves. But neither the EIR nor the Background Report provide any information regarding estimated and anticipated "buildout" in terms of acreage, actual location, number of dwelling units, and development density and intensity. These incompatible land uses will significantly impact future mineral resource production and must be evaluated and mitigated for in the EIR.

I185-3

The EIR never addresses indirect impacts to mineral resource development that will occur under the 2040 General Plan. As incompatible land uses (such as residential development) occur on or adjacent to mineral production and mineral reserves, compatibility conflicts will increase. Reasonably foreseeable indirect impacts include nuisance complaints, traffic conflicts, theft, vandalism and attempted trespass on mineral production sites. The EIR must analyze and evaluate these impacts on the ability to produce mineral resources in the County.

The Draft EIR is lacks critical analysis and must be corrected and recirculated to ensure a fair process for Ventura County residents.

I185-4

Thank you,

| | |
|------------------------|-------------------------------------------------------|
| Letter I185 | Robert & Sandra Kurtz February 25, 2020 |
|------------------------|-------------------------------------------------------|

This comment letter repeats many of the same comments provided in Letter I61. The responses below provide cross references to the portions of Letter I61 where responses to the same comments have already been provided.

- I185-1 Refer to response to comment I61-1 regarding concerns related to the oil and gas industry and the draft EIR’s analysis of oil and gas mineral resources.
- I185-2 Refer to Master Response MR-6 for discussion of how the County appropriately uses the Background Report to describe the existing environmental setting in the draft EIR. The commenter indicates that the draft EIR and Background Report do not provide a complete description of the existing and current regulatory setting for production of mineral resources. The Background Report Section 8.4, “Mineral Resources,” 8.5, “Energy Resources,” and Section 10.2 “Legal and Regulatory Framework for Water Management (Class II Underground Injection Control Program),” provide relevant regulatory information necessary for understanding and evaluating the impacts of the 2040 General Plan on petroleum resources. Additionally, the draft EIR Mineral and Petroleum Resources Section 4.12.1, Background Report Setting Updates, includes additional information laws and regulations that pertain to petroleum development. This includes federal laws and regulations related to gas pipelines, state laws and regulations related to the California Pipeline Safety Act of 1981, Ventura County Air Pollution Control District (VCAPCD) Rule No. 71.1 – Crude Oil Production and Separation and Rule No. 54 – Sulfur Compounds, VCAPCD Primary (Non-Emergency) Flares, VCAPCD Emergency Flares, and VCAPCD Permitted Flare Variances, and Non-Coastal and Coastal Zoning Ordinances. In the response to this comment, and based on the April 9, 2020 comment letter from the California Geologic Energy Management Division (CalGEM) describing its current regulatory program, the regulatory framework section has been augmented. The enhanced discussion of regulatory framework would not alter the findings or analysis in the EIR. The augments to the regulatory setting for Section 4.12 are provided in final EIR Chapter 3, “Revisions to the Draft EIR.”
- I185-3 Refer to response to comment O5-90 regarding the interplay between the land use designations in the 2040 General Plan and mineral resource zones and Master Response MR-2 for a detailed discussion of how buildout was analyzed in the draft EIR. Response to comment O9-8 provides a discussion of the potential for indirect impacts due to incompatible land uses. Refer to Master Response MR-2 2040 General Plan Land Use, Growth Projects, and Buildout Assumptions regarding the assumptions and data relied upon to forecast growth and land use. The commenter asserts that the draft EIR fails to analyze impacts to mineral resource zones that would occur as a result of implementation of the 2040 General Plan. Also refer to response to comment I61-3.
- I185-4 Refer to response to comment I61-4 and Master Response MR-7, which explains in detail why recirculation of the draft EIR is not required.

To: Susan Curtis-

County failed to evaluate mitigation measure for feasibility- 500' set back for "sensitive receptors" from freeways and high traffic roads.

Mitigation Measure AQ-3 (Policy HAZ10-X) creates a minimum 500' set back for "sensitive receptors" from freeways and high traffic roads. Yet the County states in the Land Use section of the EIR that "the majority of the anticipated build out will be within the freeway corridors."

Has the County completed a "buildout study" to ensure that the establishment of this set back still leaves enough room for development to occur? Will this mitigation measure be economically feasible?

Re: Comments on Ventura County General Plan DEIR

Dear Ms. Curtis:

I represent and serve on the McLoughlin Family Committee, a group of family members that own approximately 300 acres of agricultural property off of Olivas Park Road in the County of Ventura, in proximity to the City of Ventura.

The McLoughlin family has farmed this land for generations. It remains our desire to continue this legacy. However, in the face of never-ending changes to the regulatory environment, we again find ourselves attempting to ascertain how new policies and programs as proposed in the draft 2040 General Plan will impact and challenge our ability to serve as stewards of this heritage.

I187-1

It had been our hope that the DEIR would provide some clarity and insight into how the new policies and programs within the revised General Plan would impact our farming operation. However, that is not the case. Simply said, we believe the General Plan Update and subsequent Environmental Impact Report fail to adequately analyze or study impacts on the farming industry.

With that said, we would like to specifically present the following:

- The Background report Table 6-26: Transportation Department Planned Capital Projects lists sections of roadways the County plans for expanded capacity or widening, along with the scope of those enhancements. It also covers in length the plan to add bike paths and bike lanes in accordance with existing County wayfarer plans. However, the DEIR never analyzes the loss of farmland resulting from these changes in infrastructure – it’s not even mentioned as a possibility in the DEIR.

I187-2

Olivas Park Road between Victoria and Harbor is listed as one of the areas planned for road widening, a stretch of roadway that borders the entire eastern portion of our farmland and property. While the impact on our farming operation and financial losses due to property loss are clearly quantifiable, the report fails to list or quantify these impacts.

- In Section 3-8, The DEIR states that because there will be no “substantive” change to the agricultural, open space, or rural designations, the General Plan Update (GPU) will be consistent with SOAR. However, no further details beyond this conclusory statement is provided. There is no way for the reader to come to his or her own conclusion on whether the GPU will result in inconsistencies with SOAR that might lead to physical environmental impacts. There is no description of the changes to the Agriculture, Open Space, and Rural policies to determine whether they are in fact non-substantive.

I187-3

Given the length and breath of the Draft General Plan update and CEQA analysis, we made an attempt to focus our initial review and subsequent comments to issues specific to agriculture and farming. However, it’s clear that the 2040 General Plan will impact the Ventura County local economy across sectors – all of which influence the ability to live and work in this region. The DEIR’s lack of analysis of those economic impacts, calls into question the legitimacy of both the draft General Plan update, and the CEQA analysis. As such, we respectfully request that the DEIR be recirculated in the hopes that further study will resolve these shortcomings.

I187-4

I appreciate your consideration.

Re: 2040 General Plan Environmental Impact Report (EIR)

Dear Mr. Hedrick and Honorable Members of APAC:

Thank you for the opportunity to provide comments following today's presentation by Ventura County Planning staff on the 2040 General Plan EIR.

There are several issues with the 2040 General Plan EIR that CoLAB believes will negatively impact the viability of local agriculture.

Proposed mitigation measure AG-2: The County proposes that any project that either directly or indirectly results in the loss of farmland must obtain and place into perpetual agricultural preservation twice the total of the farmland loss. This mitigation measure is infeasible. Contrary to statements made by County Planning staff today at the APAC meeting, the California Environmental Quality Act (CEQA) requires that all mitigation proposed in an EIR be feasible. CEQA Section 21061.1 defines feasible as "capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, social, and technological factors" (*emphasis added*). All mitigation measures proposed in an EIR must be shown to reduce impacts and an infeasible mitigation measure, by definition, cannot and will not reduce impacts.

The EIR does not provide evidence of any of the following:

- 1) Whether there is sufficient land available for purchase/conservation easement for each farmland category;
- 2) The cost per acre to purchase each category of farmland;
- 3) The anticipated cost of establishing a conservation easement for each category of farmland;
- 4) The anticipated cost associated with managing each category of farmland under a conservation easement;
- 5) The anticipated cost associated with monitoring these mitigation parcels scattered throughout the County and who will bear that cost;
- 6) Any information that could constitute a "plan" for management of farmland in conservation easements;

1188-1

1188-2

Page 2 of 4

- 7) An analysis of direct and indirect impacts caused by this mitigation measure (including impacts associated with LU compatibility conflicts and increased urban-ag-interface);
- 8) Whether the smallest possible mitigation acreage required will achieve the minimum to ensure viability of agriculture on the parcel; and
- 9) Whether the proposed mitigation is in conflict with other ordinances and regulations, such as the County's Zoning Ordinance and the County's minimum lot sizes.

The County is already aware that this proposed mitigation measure is infeasible. On March 24, 2016, at a Local Agency Formation Commission (LAFCo) hearing, Supervisor Linda Parks attempted to establish an "Agricultural Mitigation Measure" through the LAFCo project approval process. The mitigation measure would have required the 1-to-1 purchase of local farmland (half of what is proposed in the 2040 General Plan EIR) to replace farmland that would be impacted by any proposed development. Ventura County Counsel, Michael Walker, informed both LAFCo and Supervisor Parks that the proposed mitigation measure did not meet the standard for economic feasibility, and, for that and other reasons, LAFCo could not adopt Supervisor Park's proposed mitigation measure. He referenced a 2015 legal decision, *City of Irvine v. County of Orange*, in which the Court stated, "the sheer astronomical expense of land supports the finding of the EIR that the purchase of an agricultural conservation easement is a non-starter."

I188-2
cont.

In addition to being infeasible, CoLAB does not believe that this mitigation measure will reduce impacts on agricultural land, as it does not address the actual issues that will impact farmland under the 2040 General Plan: lack of economic sustainability, the increasing regulatory demands on agriculture, increased competition for water resources, and increased compatibility conflicts from development.

Indirect Impacts

The EIR dismisses "indirect impacts" that will occur as a result of implementing the 2040 General Plan as "less than significant."

Page 4.2-13 of the EIR states "AG-2.3 maintains the Right-to-Farm Ordinance to protect agricultural land uses from conflicts with non-agricultural uses, as well as to help land purchasers and residents understand the potential for nuisance, (e.g., dust, noise, odors) that may occur as the natural result of living in or near agricultural areas...These sections of the code protect farmers engaged in agricultural activity from public nuisance claims...This protects the farming community, including Important Farmlands and farms less than 10 acres, from developments that would inhibit their ability to continue agricultural production."

I188-3

Page 4.2-17 of the EIR states: "Residential growth in areas nearby agricultural lands has the potential to result in land use conflicts. Residential land uses are generally more sensitive and prone to conflict with adjacent agricultural land uses than commercial or industrial land uses. The placement of sensitive land uses, such as residences and schools, nearby classified farmland can negatively impact both uses due to conflict including odor nuisances and noise from agriculture machinery. The countywide Right-to-Farm Ordinance protects existing agricultural and farming operations from conflicts attributed to residential development...Therefore, the potential for conflicts would be minimal. This impact would be less than significant" (*emphasis added*).

This is simply not true. Historic and recent County actions have shown that the County has and will continue to create new restrictions and ordinances that have a significant impact on existing agricultural

and farming operations because of conflicts attributed to residential development. The recent interim urgency ordinance restricting hemp cultivation is one such example.

I188-3
cont.

Contrary to statements made today by Ventura County Planning staff, an EIR, whether it is labeled as "programmatic" or "project", must analyze all reasonably foreseeable consequences of the action that is proposed. For the 2040 General Plan EIR, the action proposed is the implementation of all policies and programs within. Therefore, if the implementation of a policy in the 2040 General Plan will result in an impact, that impact must be analyzed. For example, the 2040 General Plan contains land use designation changes that will increase allowable housing density near agricultural land. It is reasonably foreseeable that more houses will create more compatibility conflicts with normal farming operations. The impact of these compatibility conflicts must be addressed in the EIR.

I188-4

In 2014, the California Court of Appeal stated in a ruling that "[T]he fact that this EIR is labeled a 'project' rather than a 'program' EIR matters little....Designating an EIR as a program EIR ... does not by itself decrease the level of analysis otherwise required in the EIR. All EIRs must cover the same general content. The level of specificity of an EIR is determined by the nature of the project and the "rule of reason," rather than any semantic label accorded to the EIR."

It is CoLAB's opinion that indirect impacts from increasing urban-ag interface are SIGNIFICANT and cannot be dismissed in the EIR.

Direct and indirect impacts of increased costs

The 2040 General Plan has policies that will increase the costs of normal farming operations. CoLAB believes that the most effective way to minimize conversion of agricultural land to non-agricultural uses is to take active measures to allow farming to remain profitable. And even the County admits that reducing the cost of farming reduces conversion of agricultural land in their discussion of the Williamson Act in Chapter 4.2 of the EIR.

I188-5

But the County fails to analyze direct and indirect impacts of 2040 General Plan policies that will increase the cost of normal farming operations, such as:

- Policy AG-5.2: Electric- or Renewable-Powered Agricultural Equipment. The County shall encourage and support the transition to electric- or renewable-powered or lower emission agricultural equipment in place of fossil fuel-powered equipment when feasible.
- Policy AG-5.3: Electric- or Renewable-Powered Irrigation Pumps. The County shall encourage farmers to convert fossil fuel-powered irrigation pumps to systems powered by electric or renewable energy sources, such as solar power, and encourage electric utilities to eliminate or reduce standby charges.

Direct and indirect impacts of increased competition for water resources

The County fails to evaluate the impact of increased competition for water resources caused by development allowed in the 2040 General Plan on either the conversion of agricultural land or the loss of agricultural lands through the loss of topsoil.

I188-6

The EIR states on page 4.2-3 that "...a reduction in available water resources for irrigation" is an example of indirect impacts on agricultural land due to loss of topsoil from increased wind and water erosion. But the County fails to analyze or propose mitigation measures to address this significant impact.

Page 4 of 4

APAC is the expert charged with advising County decision-makers on agricultural issues in Ventura County. And the County should be seeking guidance from APAC about the actual issues that will impact farmland under the 2040 General Plan: lack of economic sustainability, the increasing regulatory demands on agriculture, increased competition for water resources, and increased compatibility conflicts from development.

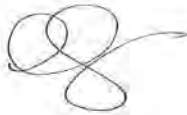

CoLAB encourages APAC to provide guidance to the County on appropriate and effective mitigation measures to prevent the conversion of agricultural land to non-agricultural uses. These may include:

- 1) Strengthen the Right-to-Farm ordinance to prevent nuisance complaints from being used to justify the creation or expansion of setbacks or regulatory restrictions on normal farming practices;
- 2) Expand the Land Conservation Act Program to include Open Space zoned properties that are engaged in farming (including grazing); and
- 3) Protect agricultural land from urban-ag interface encroachment and compatibility conflicts by establishing setbacks on NON-AE-zoned land that will restrict the construction of bike paths, public trails, and sensitive receptors within 2000' of any land zoned A/E.

I188-7

Thank you again for the opportunity to provide comments on this issue. We appreciate your consideration and leadership at this time.

Sincerely,

Louise Lampara
Executive Director

Ventura County Resource Management Agency, Planning Division
Attn: Susan Curtis, Manager, General Plan Update Section
800 S. Victoria Ave., L #1740
Ventura, CA 93009-1740

Letter
I189

GeneralPlanUpdate@ventura.org

Dear Ms. Curtis:

I am writing to call your attention to significant flaws in the process, data, and conclusions of the Ventura County General Plan, Draft EIR, and supplemental documents.

My great grandfather, Mark McLoughlin (1843-1914), was a true Ventura County pioneer, purchasing his first 318 acres of undeveloped land in Ventura County in 1875. He was a hard-working visionary, revered by his community. With his son—my grandfather, James Patrick McLoughlin—he raised livestock and farmed the land, providing jobs and feeding the growing towns of Oxnard and Ventura.

Our land, in a vitally important location on Olivas Park Drive across from the Ventura Marina, has been in the family, and part of the economic fabric of the community, for 100 years. And we want it to be part of the future of this community, with a flourishing economy, a thriving job market, and unsurpassed quality of life for its residents.

But the General Plan and DEIR do not describe a viable path for us as landowners going forward.

I will begin with some specific issues regarding language in the Coastal Area Plan, 4-82-83 and 4-94-95. Part of our land is located in the Central Coastal Zone, adjacent to the Ventura Marina, on Olivas Park Drive at Harbor Blvd. The only conclusion the Plan draws about our land is the statement that, "unlike the Preble area, services are not readily available to the Olivas lands." This is false. Our property has access to all utilities, water, main roads, and the freeway. Indeed, easements on our property serve surrounding areas with utilities.

The Plan also claims that our property is "not included in the City's sanitation district because of problems with water pressure." This language is irrelevant and incorrect. There is no evidence that there are water pressure issues, and the sanitation district's pipelines actually traverse our property.

While we do not know the original source of these misstatements, such misrepresentations—now repeated in the Plan—threaten to diminish the value of our land in relation to the Preble property. And, of course, they undermine the goal and the value of the Plan itself.

I189-1

I189-2

The General Plan also speaks of the widening of Olivas Park Drive, our southern boundary. This would have a direct impact on our property. But the Plan does not address how this would happen or how it would affect our land. I189-2 cont.

Damaging misstatements about our property also appear in the DEIR. Contrary to the portrayal in the DEIR, our property has significant infrastructure in place, as well as prime accessibility to the highway and the harbor. In fact, with easy access to the marina and beach community, and with the railroad as part of our eastern boundary, our land is uniquely suited to be an important part of future economic development in the area. We are entitled to have all these matters corrected. I189-3

I would also like to raise some additional concerns:

1. The General Plan and DEIR continue to ignore the 28% increase in the homeless population in our community. I189-4

2. According to the General Plan, if we were to build an acre of low income / worker housing we would need to buy two replacement acres of same Ag land to be placed into perpetual agricultural preservation. This is unrealistic and infeasible, and certainly not in line with the State government's housing policies. I189-5

3. The EIR does not adequately address the enormous "indirect impacts" that will occur as a result of implementing the General Plan, calling them "less than significant." I189-6

4. The General Plan contains policies that will increase the costs of normal farming operations, making it difficult for farming to remain profitable. I189-7

5. The Plan does not adequately evaluate the impacts of increased competition for water in our community. I189-8

The EIR is a flawed document, full of errors, that does not disclose all impacts, direct and indirect, caused by the General Plan. It was obviously rushed—completed in six weeks. It is inaccurate and incomplete, and fails to provide members of the community with the information that they are legally entitled to. This EIR should be corrected and reconsidered, and a reasonable time period should be allowed for meaningful and thoughtful community input. I189-9

Sincerely,

Susan Curtis,

Dear Ventura County Board of Supervisors and Planning Department,

Climate issues are something I feel worried about. Ventura County is warming faster than any county in the nation. Our ocean is acidifying faster. Drought and floods have hit us worse, and we can expect more extreme weather

I190-1

My family and community are counting on you to assure analysis of the full scope of environmental impacts and mitigations in the Draft EIR.

First, it is necessary that all greenhouse gas emissions be counted based on the most current science.

I190-2

There are many ways to mitigate climate impacts, like a sunset plan for oil and gas production, decarbonization of transportation and buildings, zero waste, incentives for regenerative agriculture and water management, and reducing emissions from tailpipes.

I190-3

I want an EIR that covers major climate impacts via a systematic plan.

Thank you—

To Whom It May Concern,

Climate change is here, its effects are already evident in our county. The General Plan update fails to provide enough emissions reduction to meet the state-mandated goals. A robust plan, with the help of technical and scientific input, needs to be included for the 2040 General Plan, including a strong defense of the five pound air emissions limit for the Ojai Valley.

I191-1

Sincerely,
Scott Hirsch
Ojai, CA

|------------------------|------------------------------------------|
| Letter I191 | Scott Hirsch February 27, 2020 |
|------------------------|------------------------------------------|

I191-1 This comment expresses an opinion about the 2040 General Plan and is not related to the adequacy of the draft EIR. Therefore, no response is required. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan. Refer to Master Response MR-1 for a discussion of the greenhouse gas policies in the 2040 General Plan and the factors related to the County's ability to demonstrate that greenhouse gas targets aligned with State targets will be met. As discussed in the draft EIR and explained further in response to comment O20-14, the comment refers to a threshold of significance for daily reactive organic gas and nitrogen oxide emissions in the Ojai Valley which is referenced in the Ojai Valley Area Plan. This threshold, which applies to sources that are not permitted by the Ventura County Air Pollution Control District, was added to the Ventura County Air Pollution Control District's Air Quality Assessment Guidelines in 1989 and the reference to this threshold was thereafter added to the Ojai Valley Area Plan in 1995. The 2040 General Plan would not change this threshold.

February 24, 2020

Ventura County Board of Supervisors
Attn: RMA Planning Division
General Plan Update
800 Victoria Avenue L#1740
Ventura, California 93009-1740

Dear Board of Supervisors and Staff:

We are writing this letter to urge the Board of Supervisors to reconsider moving forward with the Draft General Plan EIR. The draft EIR has been accelerated to the point that too many issues and impacts have not been properly addressed or studied. These impacts and the corresponding mitigation measures will have severe impacts to land owners and especially those, like us in the agricultural industry and other productive economic segments.

I192-1

Our family has been involved in the agricultural industry for more than 100 years in Ventura County. We have owned numerous land holdings that remain in the family to this date. We have farmed throughout Ventura County and hope to continue to do so in the future.

The Draft EIR is deficient on many levels. CEQA requires that all mitigation measures must be technically and economically feasible. Numerous proposed mitigation measures are neither. We have in the past attempted to identify land and any owners that would be open to sell their development rights for land that was converting from agricultural to commercial use. Not only did we not find anyone that would do so, no one would even quote a price. The only positive response from numerous land owners were that you can buy my property for full market value and then you can do what you want. There is not a project that can be built by adding double land cost to the equation. This was very recently experienced based on proposed policies at LAFCo. These policies were eventually not enacted due to the inability to purchase development rights in an economical feasible manner. This was when LAFCo was contemplating an acre for acre ag preserve. The new policy that is proposed in the 2040 General Plan is requiring 2 acres for every 1 acre of land converted from ag to any other use. This will eliminate the ability to add any new required ag buildings or even farm worker housing. The Draft EIR must study these impacts, since they are not feasible.

I192-2

The Draft EIR also deals with water in a manner that is not properly studied. There is no analysis on increased water costs and diminishing availability of water. Without reasonable water costs and supply, there is no agricultural industry.

I192-3

The General Plan indicates that agriculture is a high priority in the County. However, new policies and requirements in the General Plan add additional mitigation measures that will make ag virtually impossible. These include new setbacks, limiting types of fumigants pesticides and fertilizers. The General Plan also requires the conversion of all farm equipment to be all electric. Again, not feasible. The costs to purchase new pumps, farm equipment and other existing fuel using equipment will increase operational costs to a point that the County crops will not be competitive in the open market. These new mitigation measures are not sufficiently studied and again are not economically feasible.

I192-4

The Draft EIR is extremely difficult to read and understand. The background reports are lacking in depth of what has been studied other than numerous general statements and very poor mapping. Detailed studies must be added to sufficiently identify impacts and the related mitigation measures for both direct and indirect impacts on the agricultural industry. It is our understanding that reports and studies need to be timely prepared. However numerous studies are older than 5 years. Not timely.

I192-5

After numerous devastating wildfires over the last few years, which significantly impacted ag, the General Plan continues to lay out limiting mitigation measures for fire prevention. The Wildlife corridor eliminates any ag operation or fire prevention in the proposed corridor areas. This is also a major concern not studied in the Draft EIR.

I192-6

The Draft EIR for the 2040 General plan does not provide adequate analysis for the expansion of permanent bike paths and pedestrian walking trails throughout the County. These impacts are very severe due to constant conflicts from trail users and ag operations. Spraying, dust, odors from ag operations, along with impacts created by the trail users. These are usually theft, vandalism, litter and pet waste. The proposed mitigation measures require additional setbacks from these trails which renders additional land unusable for ag operations.

I192-7

In addition to the above comments on the agricultural aspects and related land use concerns of the DEIR, the undersigned is also a mineral owner directly interested in the impacts on oil and gas production of the DEIR and related General Plan 2040 proposed provisions. In these documents there is a total failure to address the economic impacts of the various policies proposed in violation of the requirements for this process, including but not limited to the loss of royalty income to a large group of County residents. I join in the detailed comments on the various deficiencies and concerns identified in the DEIR as described in the concurrent submissions on behalf of Aera Energy and other operators delivered this week to the County.

I192-8

Please look at the long-term consequences of these General Plan policies and mitigation measures. We formally request additional studies and a revised Draft EIR that will properly look at these and many more issues. The DEIR must be corrected with details of the revisions. Then it can be recirculated.

I192-9

Sincerely,

Sean H. McGrath

We need a climate action plan with measurable targets and outcomes. The current policies aren't measurable or enforceable, and are not sufficient to drive the kind of change necessary to meet the greenhouse gas reduction targets.

I194-1

|------------------------|---------------------------------------------------|
| Letter I194 | Sophia Valentina Arce February 27, 2020 |
|------------------------|---------------------------------------------------|

I194-1 The comment states that the Climate Action Plan does not include measurable and enforceable policies or meet State targets. Refer to Master Response MR-1 for further discussion of the 2040 General Plan policies and programs, as well as the factors affecting the County's ability to demonstrate greenhouse gas reductions in alignment with State greenhouse gas reduction targets. No specific issues related to the content, analysis, conclusions, or overall adequacy of the draft EIR are raised in this comment. Therefore, no further response is provided.

Subject: Flawed Ventura County General Plan

Letter
I195

CAUTION: If this email looks suspicious, DO NOT click. Forward to Spam.Manager@ventura.org

Dear Ms. Curtis:

I am writing to call your attention to significant flaws in the process, data, and conclusions of the Ventura County General Plan, Draft EIR, and supplemental documents.

My great- great grandfather, Mark McLoughlin (1843-1914), was a true Ventura County pioneer, purchasing his first 318 acres of undeveloped land in Ventura County in 1875. He was a hard-working visionary, revered by his community. With his son—my great grandfather, James Patrick McLoughlin—he raised livestock and farmed the land, providing jobs and feeding the growing towns of Oxnard and Ventura.

I195-1

Our land, in a vitally important location on Olivas Park Drive across from the Ventura Marina, has been in the family, and part of the economic fabric of the community, for 100 years. And we want it to be part of the future of this community, with a flourishing economy, a thriving job market, and unsurpassed quality of life for its residents.

But the General Plan and DEIR do not describe a viable path for us as landowners going forward.

I will begin with some specific issues regarding language in the Coastal Area Plan, 4-82-83 and 4-94-95. Part of our land is located in the Central Coastal Zone, adjacent to the Ventura Marina, on Olivas Park Drive at Harbor Blvd. The only conclusion the Plan draws about our land is the statement that, “unlike the Preble area, services are not readily available to the Olivas lands.” This is false. Our property has access to all utilities, water, main roads, and the freeway. Indeed, easements on our property serve surrounding areas with utilities.

The Plan also claims that our property is “not included in the City’s sanitation district because of problems with water pressure.” This language is irrelevant and incorrect. There is no evidence that there are water pressure issues, and the sanitation district’s pipelines actually traverse our property.

I195-2

While we do not know the original source of these misstatements, such misrepresentations—now repeated in the Plan—threaten to diminish the value of our land in relation to the Preble property. And, of course, they undermine the goal and the value of the Plan itself.

The General Plan also speaks of the widening of Olivas Park Drive, our southern boundary. This would have a direct impact on our property. But the Plan does not address how this would happen or how it would affect our land.

Damaging misstatements about our property also appear in the DEIR. Contrary to the portrayal in the DEIR, our property has significant infrastructure in place, as well as prime accessibility to the highway and the harbor. In fact, with easy access to the marina and beach community, and with the railroad as part of our eastern boundary, our land is uniquely suited to be an important part of future economic development in the area. We are entitled to have all these matters corrected.

I195-3

I would also like to raise some additional concerns:

1. The General Plan and DEIR continue to ignore the 28% increase in the homeless population in our community.

I195-4

2. According to the General Plan, if we were to build an acre of low income / worker housing we would need to buy two replacement acres of same Ag land to be placed into perpetual agricultural preservation. This is unrealistic and infeasible, and certainly not in line with the State government's housing policies. 1195-5

3. The EIR does not adequately address the enormous "indirect impacts" that will occur as a result of implementing the General Plan, calling them "less than significant." 1195-6

4. The General Plan contains policies that will increase the costs of normal farming operations, making it difficult for farming to remain profitable. 1195-7

5. The Plan does not adequately evaluate the impacts of increased competition for water in our community. 1195-8

The EIR is a flawed document, full of errors, that does not disclose all impacts, direct and indirect, caused by the General Plan. It was obviously rushed—completed in six weeks. It is inaccurate and incomplete, and fails to provide members of the community with the information that they are legally entitled to. This EIR should be corrected and reconsidered, and a reasonable time period should be allowed for meaningful and thoughtful community input. 1195-9

Letter
I196

Dear Ms. Curtis:

I represent and serve on the McLoughlin Family Committee, a group of family members that own approximately 300 acres of agricultural property off of Olivas Park Road in the County of Ventura, in proximity to the City of Ventura.

The McLoughlin family has farmed this land for generations. It remains our desire to continue this legacy. However, in the face of never-ending changes to the regulatory environment, we again find ourselves attempting to ascertain how new policies and programs as proposed in the draft 2040 General Plan will impact and challenge our ability to serve as stewards of this heritage.

I196-1

It had been our hope that the DEIR would provide some clarity and insight into how the new policies and programs within the revised General Plan would impact our farming operation. However, that is not the case. Simply said, we believe the General Plan Update and subsequent Environmental Impact Report fail to adequately analyze or study impacts on the farming industry.

With that said, we would like to specifically present the following:

- The Background report **Table 6-26: Transportation Department Planned Capital Projects** lists sections of roadways the County plans for expanded capacity or widening, along with the scope of those enhancements. It also covers in length the plan to add bike paths and bike lanes in accordance with existing County wayfarer plans. However, the DEIR never analyzes the loss of farmland resulting from these changes in infrastructure – it’s not even mentioned as a possibility in the DEIR.

I196-2

Olivas Park Road between Victoria and Harbor is listed as one of the areas planned for road widening, a stretch of roadway that borders the entire eastern portion of our farmland and property. While the impact on our farming operation and financial losses due to property loss are clearly quantifiable, the report fails to list or quantify these impacts.

- In Section 3-8, The DEIR states that because there will be no “substantive” change to the agricultural, open space, or rural designations, the General Plan Update (GPU) will be consistent with SOAR. However, no further details beyond this conclusory statement is provided. There is no way for the reader to come to his or her own conclusion on whether the GPU will result in inconsistencies with SOAR that might lead to physical environmental impacts. There is no description of the changes

I196-3

to the Agriculture, Open Space, and Rural policies to determine whether they are in fact non-substantive.

I196-3
cont.

Given the length and breath of the Draft General Plan update and CEQA analysis, we made an attempt to focus our initial review and subsequent comments to issues specific to agriculture and farming. However, it's clear that the 2040 General Plan will impact the Ventura County local economy across sectors – all of which influence the ability to live and work in this region. The DEIR's lack of analysis of those economic impacts, calls into question the legitimacy of both the draft General Plan update, and the CEQA analysis. As such, we respectfully request that the DEIR be recirculated in the hopes that further study will resolve these shortcomings.

I196-4

I appreciate your consideration.

Subject: Comments on the Draft Environmental Impact Report for the Ventura County 2040 General Plan.

Letter
I197

Ventura County Resource Management Agency, Planning Division
Attn: Susan Curtis, Manager, General Plan Update Section
800 S. Victoria Ave., L #1740
Ventura, CA 93009-1740

The entire assumption of a General Plan and its supporting documentation is to have a forward-looking plan to deal with land use, potential significant impacts and their mitigation measures within a geographical area. It is my belief, and the belief of many others, that climate disruption caused by greenhouse gas emissions is the primary concern that has to be addressed in this type of document. Any plan that attempts to provide a framework for mitigating significant impacts that does not place climate change at the very forefront of significant impacts is a deeply flawed document and is doomed to fulfill its "raison d'etre" which, ultimately, is to secure a safe and prosperous future for the residents and protect the physical environment under its jurisdiction.

The corrective action is to acknowledge the primacy of climate change and the devastating impacts that will be most severely felt in Ventura County. Climate change is caused by fossil fuel production and consumption. We must do our part to reduce oil production through thoughtful, rigorous policy to phase it out. All Goals and Policies incorporated within a General Plan must have annual quantifiable metrics and measurables that lead to a complete cessation of hydrocarbon extraction practices within the county and the elimination of hydrocarbon usage by a date certain.

Pg. 4.3-7, Policy PFS-2.5: County Employee Trip Reduction. The County shall encourage its employees to reduce the number and distance of single-occupancy vehicle work trips.

> What is the goal and how does the County plan on achieving it and in what time frame?

Pg. 4.3-8, Policy PFS-2.6: County Alternative Fuel Vehicle Purchases. The County shall review market-available technologies for alternative fuel vehicles and prioritize purchase of vehicles to reduce greenhouse gas emissions where economically feasible.

> What is the goal and how does the County plan on achieving it and in what time frame?

Pg. 4.3-8, Policy COS-8.1: Reduce Reliance on Fossil Fuels. The County shall promote the development and use of renewable energy sources (e.g., solar, thermal, wind, tidal, bioenergy) to reduce dependency on petroleum-based energy sources.

> What is the goal and how does the County plan on achieving it and in what time frame?

Pg. 4.3-8, Policy COS-8.6: Zero Net Energy and Zero Net Carbon Buildings. The County shall support the transition to zero net energy and zero net carbon buildings, including the electrification of new buildings.

> What is the goal and how does the County plan on achieving it and in what time frame?

Pg. 4.3-9, Policy HAZ-10.5: Air Pollution Impact Mitigation Measures for Discretionary Development. The County shall work with applicants for discretionary development projects to incorporate bike facilities, solar water heating, solar space heating, incorporation of electric appliances and equipment, and the use of zero and/or near zero emission vehicles and other measures to reduce air pollution impacts and reduce greenhouse gas emissions.

I197-1

> What is the goal and how does the County plan on achieving it via metrics and measurables and in what time frame?

Pg. 4.3-10, Policy HAZ-10.7: Fuel Efficient County Vehicles. When purchasing new County vehicles, the County shall give strong preference to fuel efficient vehicles, include the use of zero emission vehicles when feasible.

> What is the goal and how does the County plan on achieving it via metrics and measurables and in what time frame?

Pg. 4.3-10, Policy AG-5.3: Electric- or Renewable-Powered Irrigation Pumps. The County shall encourage farmers to convert fossil fuel-powered irrigation pumps to systems powered by electric or renewable energy sources, such as solar power, and encourage electric utilities to eliminate or reduce stand-by charges.

> What is the goal and how does the County plan on achieving it via metrics and measurables and in what time frame?

I197-1
cont.

Pg. 4.6-6, For the purpose of this Draft EIR, implementation of the impact on energy resources would be significant if implementation of the 2040 General Plan would: Result in the wasteful, inefficient, or unnecessary consumption of energy resources during project construction or operation that would cause a potentially significant effect on the environment. Conflict with or obstruct a State or local plan for renewable energy or energy efficiency.

> Include "Not meet a 100% renewable energy economy by 2045."

I197-2

Pg. 4.6-7, Policy LU-11.4: Sustainable Technologies. The County shall encourage discretionary development on commercial- and industrial- designated land to incorporate sustainable technologies, including energy- and water-efficient practices and low- or zero-carbon practices.

> What is the goal and how does the County plan on achieving it via metrics and measurables and in what time frame?

Pg. 4.6-8, Policy CTM-2.12: Countywide Bicycle Lane and Trail System. The County shall coordinate with the cities in the county and Ventura County Transportation Commission (VCTC) to plan and implement a system of bicycle lanes and multi-use trails that link the cities, unincorporated communities, schools including colleges and universities, commercial/retail, employment centers, health care service facilities, public transportation, and other points of interest.

> What is the goal and how does the County plan on achieving it via metrics and measurables and in what time frame?

Pg. 4.6-13, Policy PFS-7.6: Smart Grid Development. The County shall work with utility providers to implement smart grid technologies as part of new developments and infrastructure projects.

> What is the goal and how does the County plan on achieving it via metrics and measurables and in what time frame? All large projects will incorporate a micro-grid with solar and battery storage technology.

I197-3

Pg. 4.6-13, Policy COS-7.7: Conveyance for Oil and Produced Water. The County shall require new discretionary oil wells to use pipelines to convey oil and produced water; oil and produced water shall not be trucked.

> All produced water shall be treated on-site so as not unfairly burden disadvantaged and communities of color that have had to accept this toxic waste in the past.

Pg. 4.6-13, Policy COS-8.1: Reduce Reliance on Fossil Fuels. The County shall promote the development and use of renewable energy resources (e.g., solar, thermal, wind, tidal, bioenergy, hydroelectricity) to reduce dependency on petroleum-based energy sources.

> What is the goal and how does the County plan on achieving it via metrics and measurables and in what time frame and by what date-certain?

Pg. 4.6-15, Implementation Program R: Performance-Based Building Code for Green Building. The County shall update the Building Code to establish performance-based standards that incentivize green building techniques.

> What is the goal and how does the County plan on achieving it via metrics and measurables and in what time frame and by what date-certain?

I197-3
cont.

Pg. 4.6-17, Policy WR-3.1: Non-Potable Water Use. The County shall encourage the use of nonpotable water, such as tertiary treated wastewater and household graywater, for industrial, agricultural, environmental, and landscaping needs consistent with appropriate regulations.

> Currently meaningless as written. What is the goal and how does the County plan on achieving it via metrics and measurables and in what time frame and by what date-certain?

Pg. 4.8-1, Executive Order (EO) B-55-18, which calls for California to achieve carbon neutrality by 2045 and achieve and maintain net negative GHG emissions thereafter.

> To provide consistency with the time frame of the General Plan, Ventura County should be carbon neutral by 2040, if not sooner.

Pg. 4.8-11, For the purpose of this draft EIR, implementation of the 2040 General Plan would have a significant GHG emissions impact if it would: Generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment. Conflict with an applicable plan, policy, or regulation for the purpose of reducing the emissions of GHGs.

> If there is no actual program to measure GHG from all sources, nor scheduled, implementable reduction protocols that result in carbon neutrality by a date certain then this is meaningless. What is the goal and how does the County plan on achieving it via metrics and measurables and in what time frame and by what date-certain?

I197-4

Pg. 4.8-12, Implementation Program P: Annual General Plan Implementation Review. The County shall review the General Plan annually, focusing on the status and progress of program implementation. The County shall prepare a report to the Board of Supervisors summarizing the status of implementation programs and any recommendations for General Plan amendments.

> What are the metrics and measurables and in what time frame and by what date-certain will Program P be fully realized?

Pg. 4.8-22, Implementation Program K: Coordination on Large Onsite Wastewater Treatment Systems Repairs. The County shall coordinate with the Los Angeles Regional Water Quality Control Board to address compliance and repair issues for large onsite wastewater treatment systems (over 5,000 gallons) and package treatment systems.

> Wastewater infrastructure is a source of GHG emissions, especially methane. How will these emissions be measured and mitigated/reduced/eliminated?

I197-5

Pg. 4.8-23, Policy COS-7.2: Oil Well Distance Criteria. The County shall require new discretionary oil wells to be located a minimum of 1,500 feet from residential dwellings and 2,500 from any school.

> Why the discrepancy? Make the distance a uniform 2,500 feet.

Pg. 4.8-23, Policy COS-8.6: Zero Net Energy and Zero Net Carbon Buildings. The County shall support the transition to zero net energy and zero net carbon buildings, including electrification of new buildings.

> What is the goal and how does the County plan on achieving it via metrics and measurables and in what time frame and by what date-certain?

Pg. 4.8-24, Policy COS-10.2: Community Greenhouse Gas Emissions Reduction Target for 2030. The County shall achieve a community-wide GHG emissions reduction target of 41 percent below 2015 levels by 2030.

> What are the annual goals and how does the County plan on achieving it via metrics and measurables and in what time frame and by what date-certain?

Pg. 4.8-27, Implementation Program U: Solar Canopies in Non-Residential Projects. The County shall amend the County's Coastal and Non-Coastal Zoning Ordinances to require parking lots for new non-residential construction projects, with floor area of greater than 50,000 square feet, to include solar canopies.
 > Eliminate the floor area requirement and go with a percentage such as 90% of the parking area shall have canopy solar.

Pg. 4.8-27/28, Implementation Program DD: Budget and Staffing Plan for CAP Implementation. The CEO shall, within six months from the adoption of the General Plan Update and Climate Action Plan, present to the Board of Supervisors a proposed budget and staffing plan Greenhouse Gas Emissions Ventura County 4.8-28 2040 General Plan Draft Environmental Impact Report (including qualified technical consultants) to implement the Climate Action Plan, and shall update the budget and staffing plan each year.
 > Include a citizen advisory committee, also.

Pg. 4.8-32, Implementation Program Q: Standards for Solar Photovoltaic (PV) Carports in County Lots. The County shall establish standards for inclusion of solar PV carports in County-owned parking lots.
 > Implement a 90% coverage by canopy solar by date certain.

Pg. 4.8-32, Include the following, "Work with the Clean Power Alliance to plan, permit and build all possible opportunities to implement the CPA's "Local Programs" mandate."

Pg. 4.8-33, Policy AG-5. 5: Carbon Farming Practices. The County shall encourage and support the efforts of resource conservation districts, farmers, and other stakeholders to expand carbon farming practices, such as reduced tilling, cover-cropping, composting, biochar, and other activities that both reduce GHG emissions and increase carbon sequestration and storage, when feasible.
 > Include "regenerative farming".

Pg. 5-11, 5.2.8 Greenhouse Gas Emissions, Thus, the 2040 General Plan's incremental contribution to cumulatively significant climate change effects would be cumulatively considerable.
 > Unacceptable conclusion.

The Los Angeles Sustainability Plan, aimed at meeting the goals of the Paris Climate Agreement, has clear and bold goals: "By eliminating fossil fuel production in the county, including drilling, production and refining, the county will protect its residents from harmful local pollution that inequitably burdens low-income communities and communities of color." We should demand no less from our DEIR/General Plan.

Action Needed: The county should adopt the strongest possible measures to ensure that greenhouse gas emissions are curbed to protect air quality and to ensure a safe, sustainable future for all county residents.

Therefore, in my opinion, this DEIR is inadequate, missing disclosure of plan impacts, lacking in meaningful and enforceable policies (e.g., substituting "shall" with "should"), incompletely quantified, and lacking mitigations for cumulative and incremental impacts.

Thank you for your time and consideration.

Hello Susan,

Please find attached comments I was able to produce in the time allotted. More can be said as the document is lengthy and complex. To facilitate public review the County should have provided revisions to the draft GenPlan in legislative format in the interest of greater transparency. It was a challenge and time-consuming to search out changes from the prior draft and identify responses by County to public comments made in the revised draft. The GHG calculations and tables in Appendix D were also left uncollated and are impossible to validate without access to the "proprietary" model. My comments focus on the attempt by County to embed a CAP in the GenPlan, and on the DEIR sections that address the CAP. I am sorry to be so critical, but I am afraid the County has completely failed to produce a viable CAP.

Regards,

Steven Colome, ScD

I198-1

**Comment Letter on the Draft Environmental Impact Report (DEIR)
for the Ventura County Draft 2040 General Plan**

**Statement of Dr. Steven Colomé,
February 26, 2020**

Climate is the defining challenge of the 21st Century-UC Berkeley¹

I conducted a preliminary review of the Draft EIR for the County’s 2020-2040 General Plan (GenPlan) Update, focusing on the goals, policies, and implementation plans for the Climate Action Plan (CAP) currently incorporated into the draft GenPlan. I do not find that the County has adequately addressed deficiencies in the process, content or promised corrections from earlier drafts of the plan. Consequently, the Draft EIR is deficient in meeting the greenhouse gas (GHG) reduction goals of the State, and even the County’s own stated GenPlan goals. Therefore, the County cannot claim that a CAP is yet contained as part of the GenPlan.

I198-2

The next decade is critical for turning around the global reliance on fossil fuels; and this is an essential period for doing all that can be done at every level of government to combat the crisis that is already upon us.

An EIR is intended as an informational document to provide decision-makers with a factual basis for their decisions. An EIR must describe existing conditions clearly and accurately, evaluate the potential impacts of the project (in this case the General Plan Update), identify and quantify cumulative impacts, evaluate alternatives, and mitigate significant impacts.

I198-3

I am not pleased to report that the DEIR has failed on each and every one of these expectations.

General Plans are required by the State of California and represent the guiding land use document, sometimes referred to as the ‘constitution’, for cities and counties. All land-use policies, ordinances and regulations must be consistent with the General Plan.² California has recently included an option for municipalities and counties to include a Climate Action Plan (CAP) into a GenPlan; and Ventura County (VC) has attempted to develop such a plan during their GenPlan Update process.

I198-4

The problem is that the CAP incorporated into the County draft plan, and accompanying DEIR, fail to make the necessary hard choices and do not contain or describe an acceptable CAP.

¹ <https://vcresearch.berkeley.edu/energy>

² <http://opr.ca.gov/planning/general-plan/guidelines.html>

Failure of the County’s Draft GenPlan and CAP:

- The global climate challenge requires that we take an “all hands-on deck” approach to reducing greenhouse gases (GHG) at every level of government.
- The current policies in the draft GenPlan, and proposed CAP, are inadequate to meet our County’s proportional contribution and needed commitment to addressing the climate crisis. The draft CAP will not adequately contribute toward making the County carbon neutral or meeting the clear goals for GHG emission reductions contained in the draft GenPlan.
- The draft CAP made no attempt to seek input from the ‘deep bench’ of climate expertise that we have in California, including many of the key members of the IPCC.³
- The draft CAP lacks sufficient metrics for evaluating whether the goals of the plan are being met. Policies should have clear action terms like: “by 2024 90,000 native trees shall be planted”. Instead, as an example from Chapter 6 on *Conservation and Open Space*, a draft CAP policy (COS3.2) reads: “The County shall encourage the protection of urban forests and native woodlands, savannahs, and tree canopy along State or County designated scenic roadways.” There are too many “shall encourage” clauses within the CAP policies and this language does not provide clear policy direction or evaluation standards; leading to qualitative policies that are impossible to measure and evaluate.
- The draft CAP barely mentions oil and gas production in VC, which is the third largest producer of fossil fuels in CA on a BTU basis, behind only Kern and LA Counties. The GenPlan and DEIR need more complete description of the oil and gas production activity in Ventura County, including the CO₂ equivalent emission of these fuels that are, to a large extent, transported out of the county to refineries in other jurisdictions.
- This oil and gas (O&G) production takes place under county permits and must be included in the emission inventory.
- To meet the GHG emission reduction goals it will be necessary to show the systematic reduction of this portion of the County’s inventory. This substantial source of GHG emission is ignored in the present DEIR and GenPlan draft. There is no good excuse for this omission, which has been pointed out in prior public comments.
- When we properly count the ‘downstream’ use and combustion of fossil fuels extracted in the county, our GHG ‘footprint’ almost triples. These downstream GHG emissions must be counted in the emission inventory and a commitment must be made to wind down this activity by the end of the GenPlan period in 2040. The planet demands it.
- Methane emissions are improperly handled in the DEIR and CAP and consequently appropriate policy options have not been made available to County decision makers⁴.

I198-4
cont.

I198-5

³ See Attachment 1

⁴ See Attachment 2

- The emission inventory not only uses a scientifically inappropriate GWP value of methane for policy development, but the County has missed important emission sources and source strengths—as recently identified by JPL and NASA.⁵
- NOP and other public comments made during the GenPlan development suggested that the county reduce O&G production by 10%/year in order to systematically and consistently match the reduction in production with the necessary reduction in consumption of fossil fuels to meet state and county GHG emission goals. This approach was wrongly rejected by the County in 6.4.4 (pg 6-8) based on unquantified emission reductions claimed to derive from alternate policies. None of the listed alternate policies and programs contained in the County response in 6.4.4 represent anything near the needed gradual and consistent winding down of production activity.
- The problem with not directly addressing the wind-down of O&G production is that even more drastic and economically consequential remedies will be required when it is recognized that the current draft policies are insufficient to meet goals, and when the county realizes that the expected 2030-2050 GHG reductions will not be met.
- It is better to immediately confront that future and begin the logical, necessary and systematic process of reducing simultaneously the production and consumption of fossil fuels. **The economic and environmental consequences of delay far exceed the immediate costs of planning and implementing a rational and gradual cessation of O & G production.** This must be an integral part of a CAP for a County like ours and is essential to avoid unnecessary future disruption and even greater costs.
- The current emission inventory is upside down and is derived from a top-down utility-centric approach to calculating GHG emissions. This led to missing controllable emission sources and the incorrect calculation of impacts from key sources. For example, the extent of methane leaks throughout the County is seriously underreported.⁶ A new, bottoms-up emission inventory conducted by a competent and qualified outside engineering, scientific and planning team is needed in order to develop meaningful and cost-effective emission reduction strategies. These issues are complicated and require expert input.
- In Chapter 10 on *Economic Vitality* the county embraces clean energy in the most modest and inadequate way. For example, policy EV4.2 states that the county “shall support the development” of green technologies. By contrast LA County and City are aggressively attempting to attract and promote green energy jobs. Again, measurable standards are needed to evaluate progress. The county should strive to be a state-wide and national leader in clean energy and not a laggard and follower.
- VC should commit to adding two clean energy jobs for every job lost in the oil patch; and the county should provide for a just employment transition by insuring that current oil and gas workers are able to remain on the job while production is gradually decreased,

I198-5
cont.

I198-6

I198-7

⁵ See Attachment 3

⁶ <https://www.jpl.nasa.gov/news/news.php?feature=7535>

well fields are shut in and the fields are restored to a condition where final closure and land rehabilitation is accomplished. Retraining should also be provided to transition any displaced oil workers into the faster-growing opportunities in the clean energy sector.

- Existing buildings should be incentivized to improve energy efficiency and convert to all-electric appliances.

I198-7
cont.

These factors add up to the current plan being totally inadequate to justify the label of a Climate Action Plan. It is too late in the process to salvage and develop a proper CAP in the time remaining to adopt the EIR and approve the General Plan before the end of this year.

All references to a CAP currently included within the GenPlan should be deleted (e.g., P. 2-5 of the Executive Summary: “The 2040 General Plan also includes a Climate Action Plan...”) The seven quantified GHG policies listed in *Appendix D: GHG Calculations* in the GHG Gap Analysis table, are insufficient to constitute mitigation strategies under a county general plan and fail to meet the GenPlan goals and state mandates for GHG emission reduction. Due to poorly constructed and unenforceable policies, only these seven policies were available to attempt a crude quantitative Gap Analysis. Unfortunately, that quantitative analysis is mostly wishful thinking and could not be made to ensure the County would meet GHG reduction goals.

While the County extolled that the GenPlan contains 118 climate-related policies, only slightly less than half are associated with implementation programs and the policies are so weak as to be qualitative and without quantifiable GHG reduction. As has been pointed out in earlier public comments, the qualitative measures are not sufficient to meet the climate goals and fail to demonstrate a commitment on the part of the County to seriously attempt to meet our share of GHG emission reduction. Instead, we should be leaders showing the way for other jurisdictions, particularly since we are on the front lines of the climate crisis with wildfires, droughts and sea-level rise.

I198-8

A viable option for the County is to concurrently undertake a two-to-three-year project to develop a serious CAP using the scientific, planning and legal expertise that abounds in this state in order to produce an acceptable Climate Action Plan. The County should develop a plan that we can proudly promote, and that has us meeting our moral and ethical contribution to the global climate challenges.

The project to develop a proper CAP should be undertaken as a mitigation to the currently inadequate DEIR and failure to demonstrate an ability to meet state climate goals. The remaining portions of the draft GenPlan could then proceed to approval during the current year as a new and technically competent team with advanced engineering, scientific, planning and legal skill are brought in to develop a CAP capable of demonstrating that the County will meet and exceed its obligations under CEQA and take a leadership role in the climate crisis that is now upon us.

Attachment 1

Climate Policy and Science Programs in California

We have less than a decade to ensure the habitability of our planet. Policy decisions to prevent the untenable costs of inaction rely on the best scientific, legal and planning minds.

We do not have to go far in order to access some of the leading scholars on the causes, technical solutions and adaptation to climate change. California has several of the world-leading institutions working on solutions to this global challenge.

Climate change and the current climate crisis is one of the most complex environmental challenges the world has ever faced. If Ventura County does not give climate status the highest attention, utilizing the tremendous technical and scientific skill we have within driving distance of this county, the General Plan is guaranteed to be out of date before it is even approved. That unfortunately appears to be the case.

A partial listing of resources that Ventura County could and should access as it develops General Plan policies to reduce the County's contribution to GHG and plan for changes to the climate and environment we cannot control. Unfortunately, the County has yet to tap the deep bench of expertise this state has to offer.

UC San Diego/Scripps Institute – Center for Climate Change Impacts and Adaptation

<https://scripps.ucsd.edu/centers/adaptation/>

Scripps has been a world-leader in climate science since the early 1960s with scientific giants including Drs. Charles David Keeling and Roger Revelle. That tradition continues to this day with the Center's mission statement: *"to build interdisciplinary partnerships to advance climate change science and test adaptation solutions."*

I198-9

UC Irvine

"Addressing the urgent challenges we face in air and water quality, human health, climate change, as well as green technology through the integration of research, education, and outreach." The foci of this group of scholars encompasses atmospheric chemistry, climate modeling, fuel cells and combustion technologies, and health effects.

<http://airuci.uci.edu/>

https://scienceandtechnology.jpl.nasa.gov/people/e_rignot

<https://www.ess.uci.edu/~sjdavis/>

UC Riverside/Global Climate and Environmental Change – Dept of Earth Sciences

<https://earthsciences.ucr.edu/gcec.html>

"The decisions about climate change society makes in the next decade will determine the habitability of our planet." The focus of this group is to rigorously measure changes in the environment caused by climate alteration.

Caltech-Environmental Science and Engineering

<http://ese.caltech.edu/>

“The Environmental Science and Engineering (ESE) program reaches across traditional disciplinary boundaries in its aim to provide a comprehensive understanding of our complex environment and offer efficient and effective engineering solutions to environmental problems... Research and teaching in Environmental Science and Engineering (ESE) span the large scales of global climate variations, the local scales of urban air pollution, and the microscales of microbial ecosystems.” With over 20 faculty the program focuses on the science and engineering of atmospheric chemistry and climate effects.

UCLA-Institute of Environmental Sustainability/Center for Climate Science

“UCLA’s Center for Climate Science enables real-world climate change problem-solving by leveraging fine-scale projections of future climate to conduct interdisciplinary climate impacts research of practical use to stakeholders.” They are working to ensure water sustainability in light of climate change, are conducting regional climate assessments, and evaluating the future of drought and fire, and vulnerability of the electric grid to rising temperatures.

UC Berkeley, Energy, Climate & Environment

<https://vcresearch.berkeley.edu/energy>

“Energy is the defining challenge of the 21st century. Leading the way on finding solutions to some of the most important global challenges, UC Berkeley and Berkeley Lab are pooling their vast expertise to help achieve an affordable, sustainable and clean supply of global energy.

Faculty and researchers at UC Berkeley and the Berkeley Lab are developing renewable and sustainable energy sources, advancing new technologies to help curb energy demand, understanding the implications for climate change and the environment, and formulating appropriate and timely policy responses.”

Their programs are organized around the Climate Readiness Institute and the Berkeley Energy and Climate Institute in addition to programs throughout the University.

UC Davis/Science & Climate: Climate Change from Science to Solutions

<https://climatechange.ucdavis.edu/news/>

<https://www.ess.uci.edu/~sjdavis/>

With a major emphasis on ways in which agriculture can contribute to climate solutions, UC Davis has a lot to offer Ventura County. Their research ranges from renewable energy solutions to responsible land use, creating flood resistant coastlines, and helping species adapt.

“When we think of climate change solutions, what typically comes to mind is the transportation we use, the lights in our home, the buildings we power and the food we eat. Rarely do we think about the ground beneath our feet..... Solutions are actions that work: They address causes, lessen impacts, raise awareness and even create new opportunities. California offers one example of how solutions can involve and benefit multiple parties. The state demonstrates that strong economic growth is compatible with strong actions to limit global warming and related risks.”

I198-9

ATTACHMENT 2

Global Warming Potential (GWP) for Methane

The County Staff and Consultants appear to misunderstand the proper use of global warming potential (GWP) values for methane (natural gas) and the implications of its proper use for climate-related policies.

The US EPA, California Air Resources Board and Intergovernmental Panel on Climate Change (IPCC) all advocate use of a consistent GWP for *accounting purposes* in inventory development. This is essential if we are to compare cross-sectional progress. For example, comparing emissions from the US and EU. A consistent value is also important for temporal comparisons. Again, for example, to track the progress of emission reductions over time in California.

However, failure to properly account for the ‘true’ short-term global warming potential of methane leads to missed emission-reduction opportunities and policies. That is because the accounting convention for emission inventories is not based on the current scientific understanding of the near-term climate impacts from methane emissions. Control of methane sources today provides a powerful short-term mechanism for reducing climate impacts when understood in the context of a proper timeframe that is on the order of the atmospheric lifetime of this gas.

I198-10

It is useful to review the relevant section from AR5:

“Global warming potential (GWP) is a relative measure of how much heat a [greenhouse gas](#) traps in the atmosphere. It compares the amount of heat trapped by a certain mass of the [gas](#) in question to the amount of heat trapped by a similar mass of [carbon dioxide](#). A GWP is calculated over a specific time interval, commonly 20, 100 or 500 years. GWP is expressed as a factor of carbon dioxide (whose GWP is standardized to 1). In the Fifth Assessment Report of the Intergovernmental Panel on Climate Change, [methane](#) has a lifetime of 12.4 years and with climate-carbon feedbacks a global warming potential of 86 over 20 years and 34 over 100 years in response to emissions. User related choices such as the time horizon can greatly affect the numerical values obtained for carbon dioxide equivalents. For a change in time horizon from 20 to 100 years, the GWP for methane decreases by a factor of approximately 3.⁷ The substances subject to restrictions under the [Kyoto protocol](#) either are rapidly increasing their concentrations in [Earth's atmosphere](#) or have a large GWP”. GWP values and lifetimes from 2013 IPCC AR5 p714⁷

⁷ <http://www.climatechange2013.org/report/full-report/>

The County staff and climate consultant insisted during development of the GenPlan on using an outdated global warming potential for methane, claiming that emission inventories were mandated to be based on the outdated IPCC Second Assessment Report (SAR) GWP value of 21x the potency of CO₂, (based on a 100-year timeframe). The County continued to insist on use the outdated SAR value of 21 through most of the GenPlan deliberations based on the false claim that a GWP value of 21 was required by CARB and was part of a (nonexistent) *EPA Mandatory Rule*. What is ignored by that logic is that the only reason for this convention is to be able to compare ‘apples to apples’ from jurisdiction to jurisdiction and over time within a single jurisdiction. This outdated value is only an *accounting* convenience and does not reflect current scientific understanding.

Responding to NOP comments, the staff and consultants finally updated their use of the 100-year value for methane to be consistent with the AR5 IPCC GWP value of 28x the potency of CO₂ in the DEIR⁸:

“GWP values apply a weight to gases that have been determined by scientific studies to have increased GHG effects relative to the most common GHG, carbon dioxide (CO) [sic]. These weighted gasses are combined with CO [sic] to form a common unit of measurement called CO₂e. For this analysis GWP values of 28 for methane and 265 for nitrous oxide were used for consistency with AR5 (Myhre et. al 2013).” Pages 4.8.4-5, DEIR

Unfortunately, the GWP value of 28 is still only an *accounting* value. Policy, however, should and must be based on science. The ‘real’ impact of methane on climate is approaching four times the *accounting* value used by the County and its consultant.

The reason this is important for the DEIR and draft GenPlan is that numerous sources of methane are permitted and regulated by the County, including oil & gas production, landfills, and wastewater treatment facilities.

Turning to *Appendix D: GHG Calculations* of the DEIR, it is unclear from the unannotated tables what GHG value was used in the quantitative modeling, as numerous values are given throughout the tables⁹.

For example:

- The *Assumptions* table in Appendix D references the IPCC Fifth Report GWP value of 28 but does not indicate whether that is the value that is used in the model (a clear reason why a proprietary model is totally inappropriate for use in this public process). The DEIR states that the value of 28 was used but there is no way for an outside reviewer to verify that fact, especially when tables in Appendix D contain several different 100-year and 20-year GWP values.
- Further, the cited IPCC value of 28 is for a 100-year timeframe while the atmospheric lifetime for methane is on the order of 7 to 10 years compared with up to 200 years for carbon dioxide. Therefore, using a 100-year timeframe for methane’s GWP is appropriate for *inventory*

⁸ https://www.ghgprotocol.org/sites/default/files/ghgp/Global-Warming-Potential-Values%20%28Feb%2016%202016%29_1.pdf

⁹ This is an example of why it is completely inappropriate for the County to have allowed their environmental consultant to produce results using a proprietary model which the consultants refused to make available for verification of inputs, outputs and model execution.

I198-10
cont.

accounting purposes only but completely inappropriate for development of CAP policies and GHG mitigation strategies – **climate policies must be based on methane science and not on an accounting convention designed to provide useful comparisons and promote tracking evaluations.**

- A more appropriate and scientifically valid GWP value for policy evaluation is between 85 and 100 (consistent with the atmospheric methane lifetime). Use of this scientifically appropriate value has dramatic implications for the climate impacts and mitigation strategies within Ventura County. A simple sensitivity analysis within this range of GWP values would direct the county decision-makers to appropriate and necessary policies to mitigate those impacts.
- Much later in Appendix D in the table on *Residential Wastewater Methods*, the GWP for methane is given again as 21. So, which was used in the modeling? Once more, this points out the inappropriateness of the county allowing the consultant to build and rely upon a proprietary model.
- Similarly, in the table on *Stationary CH4 from Incomplete Combustion of Digester Gas*, the GWP for methane is given as 21.
- Further into Appendix D on the *Conversions and GWP* table the IPCC Fifth Assessment value of 28 (100-year timeframe) is listed along with the IPCC Second Assessment Value of 21 and the Fifth Assessment 20-year value of 84. The actual value in the Fifth Assessment was presented as a range of 84-87 for 20 years.¹⁰
- This illustrates the problem with the County having allowed the environmental consultant to provide GHG data that is processed through a proprietary model. This is inconsistent with transparency and integrity of data used for making public policy. If a competent reviewer cannot look under the hood of a model to inspect the engine and evaluate its veracity, there is no way to trust the model results. As all modelers know, it's garbage-in-garbage-out, and without being able to check the engine, there is no way to know whether the model itself is valid.
- As has been suggested by several reviewers, the consultants should have included a clear sensitivity analysis of GHG emissions using alternate GWP values for methane. A reasonable sensitivity range would be to use a GWP value of 28 and 100. I can state with confidence that County decision-makers would need to consider additional methane reduction policies if they were to evaluate the implications for the higher GWP.
- As a result, the County is sorely deficient in policies within the draft GenPlan to address the various control options available for methane.

ATTACHMENT 3

Methane: Missed Emission Inventory Sources

NASA/JPL has recently completed a multi-year study with remote measurement of methane emissions throughout the state of California.¹¹ Ventura County is shown as having numerous 'hot spot' sources of methane associated with facilities under permit and regulation by the County. Prior public comments have identified missed sources of this GHG during the GenPlan review process.

I198-11

An article published last week in the prestigious scientific journal *Nature* indicates that anthropogenic (man-made) emissions are likely to be up to 40% higher than previously estimated.¹² From that article:

"Atmospheric methane (CH₄) is a potent greenhouse gas, and its mole fraction has more than doubled since the preindustrial era. Fossil fuel extraction and use are among the largest anthropogenic sources of CH₄ emissions, but the precise magnitude of these contributions is a subject of debate.... This result indicates that anthropogenic fossil CH₄ emissions are underestimated by about 38 to 58 teragrams CH₄ per year, or about 25 to 40 per cent of recent estimates."

|--------------------|-------------------------------------------|
| Letter I198 | Steven Colome February 26, 2020 |
|--------------------|-------------------------------------------|

- I198-1 This comment expresses an opinion about the 2040 General Plan and is not related to the adequacy of the draft EIR. Therefore, no response is required. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan. Also, the comment summarizes more detailed comments provided elsewhere in the comment letter. See responses to comments I198-2 through I198-11, below, for responses to the commenter’s more detailed comments.
- I198-2 The comment states that the draft EIR greenhouse gas analysis does not meet the greenhouse gas (GHG) reduction goals of the State. The draft EIR correctly includes an analysis of the 2040 General Plan’s consistency with State goals. Page 4.8-52 of the draft EIR acknowledges this in its post mitigation significant conclusion and states “although the 2040 General Plan would not conflict with State GHG reduction targets and recommended local actions established in the 2017 Scoping Plan, and the 2040 General Plan would set future GHG emissions on a downward trajectory consistent with State reduction targets, it cannot be determined at this program level of analysis that future emissions within the county meet State 2030 and post-2030 targets for GHG reduction. Therefore, this impact would be significant and unavoidable.”
- Contrary to the commenter’s assertion, neither Climate Action Plans (CAPs) nor General Plans are obligated to meet State goals. For additional detail pertaining to the development of the 2040 General Plan policies and programs, refer to Master Response MR-1.
- I198-3 This comment regarding the adequacy of the draft EIR is noted. However, no specific issues related to the content, analysis, conclusions, or overall adequacy of the draft EIR are raised in this comment. Therefore, no further response is provided.
- I198-4 This comment expresses an opinion about the 2040 General Plan and is not related to the adequacy of the draft EIR. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan. Also refer to Master Response MR-1 for discussion of the draft EIR’s detailed quantitative and qualitative analysis of the 118 policies and 45 implementation programs included in the 2040 General Plan to reduce GHG emissions in the county and the seven feasible mitigation measures included in the draft EIR to address the potentially significant GHG impacts of the 2040 General Plan and achieve additional GHG emissions reductions..
- I198-5 The comment highlights the emissions from the oil and gas sector, suggesting that petroleum production and downstream uses of petroleum should be included in the GHG inventory, and that the global warming potential for methane used in the inventory is inaccurate. The comment also suggests that the 2040 General

Plan should include a systematic reduction in petroleum extraction, and questions the dismissal of the Limit Active and Idle Wells and Reduce Oil Well Emissions Alternative in the draft EIR.

Refer to Master Response MR-1 regarding concerns with the completeness and accuracy of the baseline GHG inventory, particularly regarding GHG emissions associated with oil and gas production. Emissions associated with oil and gas wells were included in the inventory. Petroleum use within the county is also accounted for. Use of oil and gas produced in the county but consumed outside of the county is not included in the inventory. Refer to Master Response MR-1 and response to comment O1-2 for a discussion of the global warming potential of methane.

The draft EIR describes, but dismisses from detailed evaluation, an alternative to the project that would limit oil wells in the county. As noted by the commenter, this dismissal was based, in part, on the fact that the 2040 General Plan includes policies that address the address the emission of air pollutants from these wells. For the purposes of evaluation under the California Environmental Quality Act, alternatives should address the significant environmental impacts of implementing the whole of the project while obtaining the project's objectives. The Limit Active and Idle Wells and Reduce Oil Well Emissions Alternative focuses on one specific land use and does not comprehensively address most of the basic project objectives. As explained in the draft EIR analysis of alternatives:

As an initial matter, major elements of this alternative are included in the 2040 General Plan. For example, the 2040 General Plan includes several policies that would have the effect of limiting increases in the number of new discretionary oil and gas wells in the county. Policy COS-7.2 would require that new oil wells subject to discretionary approval are located a minimum of 1,500 feet from residential dwellings and 2,500 feet from any school. The substantial increases in setback requirements for new wells subject to discretionary permitting established by this policy would likely reduce the number of new discretionary oil and gas wells by prohibiting new discretionary wells within certain areas. In addition, there are two policies proposed in the 2040 General Plan that would result in new requirements that would apply to new oil and gas projects subject to discretionary action by the County that would reduce the number of new discretionary oil and gas wells without placing a physical limitation on location or access: Policy COS-7.8 would require oil wells to use pipelines to convey oil and produced water (rather than trucking) and Policy COS-7.9 would require that gases emitted from all new discretionary oil and gas wells are collected and used or removed for sale or proper disposal (rather than flaring) except for cases of emergency or for testing purposes. For several economic, legal, technological, and other reasons described in more detail in Section 4.12, "Mineral and Petroleum Resources," Policies COS-7.8 and COS-7.9 could make new oil and gas wells subject to the County's discretionary approval process infeasible (page 6-9).

Refer also to Master Response MR-4, which discusses the proposal to phase out oil and gas production.

- I198-6 This comment asserts that the GHG inventory does not include emissions sources such as methane leaks and should be revised. Refer to Master Response MR-1 for a detailed discussion of the inventory prepared for the 2040 General Plan, including discussion of fugitive methane emissions.
- I198-7 The comment expresses disapproval of the 2040 General Plan’s policies related to clean energy. The comment suggests additional topics that could be considered in the 2040 General Plan, specifically related to employment in clean energy and incentives to improve energy efficiency, and is not related to the adequacy of the draft EIR. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.
- The comment suggests that the County should adopt a policy of creating two clean energy jobs for every job lost due to phase out of oil and gas production. Note that the 2040 General Plan includes Policy EV-6.3, in addition to Policy EV-4.2, “prepare workers for jobs in green construction.” Refer also to the discussion of the Carbon Neutrality Alternative in Chapter 6, “Alternatives,” the draft EIR, which explains that the County has limited authority to set aside jobs in the renewable energy sector specifically for individuals employed in the oil and gas industry. Refer to responses to comments O1-29 and I176-3 for a discussion of incentives and energy savings from the existing building stock.
- I198-8 The comment’s requests to delete references to “CAP” from the 2040 General Plan are noted. Note that there is no statutory or regulatory requirement defining what constitutes a CAP. Refer to Master Response MR-1 for discussion of the draft EIR’s detailed quantitative and qualitative analysis of the 118 policies and 45 implementation programs included in the 2040 General Plan to reduce GHG emissions in the county and the seven feasible mitigation measures included in the draft EIR to address the potentially significant GHG impacts of the 2040 General Plan and achieve additional GHG emissions reductions
- The comment states that the draft EIR should recommend the development of a CAP that meet State goals as a mitigation measure. The County has revised Mitigation Measure GHG-4 to clarify that, “The CEC [Climate Emergency Council] shall demonstrate in the materials submitted to the Board of Supervisors that the proposed subprograms and policies would result in quantifiable GHG emission reductions that further the County’s progress towards achieving the 2030, 2040, and 2050 GHG reduction targets and goals established in the 2040 General Plan.” The full text of revised Mitigation Measure GHG-4 is provided in final EIR Chapter 3, “Revisions to the Draft EIR.”
- I198-9 The comment references attachments to the main body of the letter, which provides a list of experts that the commenter believes should have been consulted during preparation of the 2040 General Plan. The County has reviewed the attachment and determined that it did not contain comment on the content or conclusions of the draft EIR, nor did it raise any significant environmental issues for which a response is required.

- I198-10 The comment references attachments to the main body of the letter and is related the global warming potential of methane assumed in the GHG inventory. GHG emissions for the unincorporated county in 2015 are summarized in Table 4.8-1 on page 4.8-5 of the draft EIR. Page 4.8-4 includes a discussion explaining the methodology used to determine these levels of emissions. To reiterate what is explained in the draft EIR, the 2015 community-wide GHG inventory was prepared using the U.S. Community Protocol for Accounting and Reporting of GHG Emissions, Version 1.1 with the most recent global warming potential values derived from the Intergovernmental Panel on Climate Change's Fifth Assessment Report, which is the most recently published assessment report. These global warming potential values represent the current climate change science and are appropriate for use in this analysis. Refer to Master Response MR-1 for further discussion. The County has reviewed the attachment and determined that it did not contain comment on the content or conclusions of the draft EIR, nor did it raise any significant environmental issues for which a response is required. All comment letters submitted to the County on the draft EIR are provided with complete attachments in Attachment 1 to this final EIR.
- I198-11 See Master Response MR-1 for detailed information pertaining to the development of the GHG inventory prepared for the 2040 General Plan and draft EIR, including methane and the recent National Aeronautics and Space Administration report.

Draft Environmental Impact Report

Your Comment:

revise the Climate Action Plan and corresponding policies in the General Plan to achieve measurable, enforceable reductions in greenhouse gas emissions. The county should adopt the strongest possible measures to ensure that greenhouse gas emissions are curbed to protect air quality and to ensure a safe, sustainable future for all county residents.

Subject: 2040 General Plan Draft EIR Comment

Letter
I200

Dear County Board of Supervisors,

I have grave concerns about the General Plan EIR and the way it's being pushed through with an incredibly brief review period.

I200-1

Among my concerns are provisions that would affect all of us who own or live in older homes... Namely: The County failed to analyze the impact of solar installation and net zero energy modifications on historic resources. Proposed Mitigation Measure CUL-1C (Impl Program COS-X) demands that "before altering or otherwise affecting a building or structure 50 years old or older..." the applicant must retain a qualified architectural historian. This means everyone who has a house built in 1970 or older who wants to upgrade to more energy efficient standards must first consult with and get a report/approval from an architectural historian. This will include improvements that the County is claiming to "encourage" such as solar installation, energy efficient windows, etc.

I200-2

Clearly this requirement will either delay or put an end to people moving to more energy efficiency building standards in their homes, which will, in turn, impact the County's ability to achieve their goals for net-zero carbon building and GHG emissions. As the owner of a simple home initially built in 1940, this would be an unreasonably burdensome requirement.

Thank you for giving this point full consideration. I look forward to hearing your response to this particular item.

Sincerely,
Susan Poland
Oak View

| | |
|------------------------|------------------------------------------|
| Letter I200 | Susan Poland February 25, 2020 |
|------------------------|------------------------------------------|

I200-1 This comment regarding the adequacy of the draft EIR is noted. However, no specific issues related to the content, analysis, conclusions, or overall adequacy of the draft EIR are raised in this comment. Therefore, no further response is provided.

I200-2 The comment states that the draft EIR does not analyze the impacts of solar installation and net zero energy modifications on historic resources. The draft EIR analyzes at a programmatic level, the physical changes that could occur upon implementation of the 2040 General Plan. While policies and programs relevant to each resource topic (specifically, those relevant to the impact analysis performed under the significance criteria for that topic) are identified throughout the draft EIR in Sections 4.1 through 4.17, the complete draft 2040 General Plan was reviewed in preparation of the draft EIR. Refer to Section 4.4, “Cultural, Tribal Cultural, and Paleontological Resources,” for an analysis of the effects of 2040 General Plan policies on historic resources.

The comment also asserts that Mitigation Measure CUL-1c would result in an unreasonably burdensome requirement that would discourage properties owner from conducting energy improvements to their properties. Mitigation Measure CUL-1c does not include the provision about evaluation of structures over 50 years old quoted by the commenter and would not preclude energy efficiency upgrades. Mitigation Measure CUL-3 does propose project-level historic resource surveys, but would only apply during project-specific environmental review of discretionary development. Improvements involving basic maintenance and repair or minor rehabilitation that do not involve a change of design, material, appearance or visibility of the property and its character-defining features further described in Ventura County Cultural Heritage Board Resolution No. 2017-2.1, including solar installations installed in a manner that minimizes visibility from any public right-of-way and window upgrades involving like-for-like materials on residential properties are not subject to discretionary review and would not be subject to this requirement. Also refer to the response to comment O32-27.

Ventura County Resource Management Agency, Planning Division
Attn: Susan Curtis, Manager, General Plan Update Section
800 S. Victoria Avenue., L #1740
Ventura CA 93009-1740

Re: The 2040 General Plan Update's Draft Environmental
Impact Report's Public Review Period.

Dear Ms. Curtis:

The following comments, questions, and suggestions address Section 4.9 (Hazards, Hazardous Materials and Wildfire) of the Draft EIR's Chapter 4 (Environmental Setting, Impacts, and Mitigation Measures). My concerns come not from the study of or employment in these fields, but from life's experiences: years of attending Santa Susana Field Laboratory (Rocketdyne) meetings, addressing City, County, State and Federal government emergency plans, and following wildfire incidents since 2003 in the news on television, newspapers, and now the Internet. More devastating than the devastation left behind by the extraordinary disasters is the public's perception that first responders will always rise to the occasion to save lives, property, businesses, jobs, ecosystems, and California!!!! Nothing could be further from the truth!!!!

I202-1

#1 - Pages 4.9-2 and 4.9-3, while the Thomas Fire (2017) and Woolsey Fire (2018) are mentioned, so should the the Hill Fire (2018), and the October 30, 2019 Easy Fire be included in the 2040 General Plan Update! Overwhelming stress on first responders has been attributed to the major incidents occurring: all at once, back-to-back, during hurricane strength winds, and in an all year fire season!!!!

I202-2

#2 - Page 4.9-2, the Ventura County Fire Apparatus Access Code "establishes the minimum and cumulative design and maintenance standards for emergency fire access roads"!!!! First responders will be able to truly respond effectively to and keep people and property safe when maximum standards are the norm!!!!

I202-3

- #3 - Page 4.9-6, Policy HAZ-1.1, the City of Simi Valley back in the 1990's required a Fire Safety Plan for the Big Sky development project. The County must require similar planning documents for proposed development in high fire risk areas!!!!
- #4 - Page 4.9-6, Policy HAZ-1.2, the Ventura County Fire Department's defensible space clear zones is 100', in some cases 200'. Devastating fires show this does not limit the damage from flying embers!!!! In the California Governor's Office 2004 Blue Ribbon Fire Commission's Westlake Village hearing a more comprehensive defensible space was 400'!!!! The Ventura County Fire Department's Fire Hazard Reduction Program (FHRP) must be implemented twice or three times a year to be effective!!!! Are grants available to those property owners who cannot afford additional clean-ups? Include public donations made through Go Fund Me type programs, or by check!!!!
- #5 - Page 4.9-6, Policy HAZ-1.3, are controlled burns truly going to be undertaken? Such clearings would have limited the devastation from the Thomas Fire in Ventura County and Santa Barbara Counties!!!! Was this the same case with the Hill and Woolsey Fires?
- #6 - Page 4.9-6, Policy HAZ-1.4, while I concur with having a Notice of Fire Hazard recorded "with the County Recorder for all new discretionary entitlements (including subdivisions and land use permits) within areas designated as Hazardous Fire Areas by the Ventura County Fire Department or High Fire Hazard Severity Zones by the California Department of Forestry and Fire Protection (CAL FIRE)" more has to be done to inform the public of this! What information is contained in a Notice of Fire Hazard? What law makes the NOTICE a legal document?
- #7 - Page 4.9-6, Policy HAZ-1.5, see COMMENTS 2, 3 and 4! In updates of the County's EOP and the Multi-Hazard Mitigation Plan, the "Team" must include County Planning Commission, and SSFL representatives!!!! Require water trucks on large lots!!!! Such vehicle was instrumental during the 2003 Simi Fire in saving a family's life!!!! Is the County's Emergency Operations Plan truly updated on a tri-annual basis? Evacuation routes must never be second guessed!!!!

I202-4

- #8 - Page 4.9-6, Policy HAZ-1.6, *New Policy*, I concur!
Because people think that "fire safe" means safety
the education programs and information must state
"fire wise"!!!!
- #9 - Page 4.9-6, Policy HAZ-1.7, *New Policy*, I concur!
- #10 - Page 4.9-6, Policy HAZ-1.8, *New Policy*, I concur!
Update of the Santa Monica Mountains Community
Wildfire Protection Plan adopted in 2013 was
supposed to be updated in 2018!!!! What is the
update status of this crucial document?
- #11 - Page 4.9-7, Policy HAZ-5.2, in January, I learned
about the closed Tierra Rejada Landfill's Easy Fire
damage to the gas extraction system(methane), flare
controls, etc.! I have not found the Landfill in
the 2040 General Plan Update and 2018 Background
Report! Because the Landfill's Consortium partners
(4) share costs equally for after closure permit
work, and now for the Easy Fire Emergency repairs
(\$548,554 each), the "66-acre site located 1 mile
west of Madera Road and north of Tierra Rejada Road
along the Arroyo Simi must be included in the 2040
General Plan Update!!!!
- #12 - Page 4.9-7, Policy HAZ-5.3, *New Policy*, I concur!
- #13 - Page 4.9-7, Policy HAZ-5.4, *New Policy*, I concur!
- #14 - Page 4.9-7, Policy HAZ-5.7, *modified*, I concur!
Because the Tierra Rejada Landfill's waste footprint
is 26 acres, it's quite possible that future
development could occur on the 66-acre site!!!!
- #15 - Page 4.9-9, Policy HAZ-12.1, *modified*, I concur with
two means of access! I do not concur with deviation
policy for a single proposed access road!!!!
- #16 - Page 4.9-9, Policy HAZ-12.2, *modified*, the update to
the Ventura County Emergency Operations Plan must
state "tri-annually"!!!! The update to the Ventura
County Hazard Mitigation Plan must state "every
five years"!!!!

I202-4
cont.

#17 - Page 4.9-9, Policy HAZ-12.3, *modified*, interesting that public safety or emergency service facilities should not be sited in the areas listed without hazard mitigation, yet there is no mention of Open Space areas in light of Page 4.9-11 (bottom of page) which allows fire stations in the Open Space land use designation!!!!

I202-4
cont.

#18 - Page 4.9-20, what is the status of the MHMP's "new vegetation management program that provides vegetation management services to elderly, disabled, or low-income property owners who lack the resources to remove flammable vegetation from around their homes" mitigation strategy? Do mobile homes qualify? First responders going door-to-door to alert people during a fire incident must always be utilized even in the age of technological communications!!!!

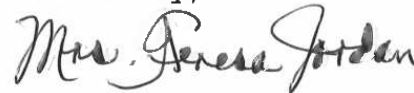

I202-5

#19 - Because the 2040 General Plan Update's January 2018 Background Report has been "Revised" for January 2020, the name "Santa Felica" (Dam) must be corrected to read "Santa Felicia" on Page 11-29, Figure 11-6, Individual Dam Failure Inundation Areas!!!!

I202-6

Ms. Curtis, I kindly request a written response from County staff to my letter. Thank you.

Sincerely,

Mrs. Teresa Jordan

|------------------------|------------------------------------------|
| Letter I202 | Teresa Jordan February 5, 2020 |
|------------------------|------------------------------------------|

- I202-1 The comment provides introductory language outlining concerns responded to below. This comment does not raise a significant environmental issue for which a response is required.
- I202-2 The comment states that the draft EIR should include mention of the Hill Fire and Easy Fire. The “Environmental Setting” in Section 4.9, “Hazards, Hazardous Materials, and Wildfire,” provides a brief summary of recent fires in the County. The Hill Fire, and its connection to the Woolsey Fire is explained on page 4.9-3. This information is intended to inform the analysis of the potential to expose people to risk of wildfire, impair implementation of emergency response plans, or exacerbate wildfire risk in Impact 4.9-6. The October 2019 Easy Fire was not included because it occurred after the January 2019 release of the Notice of Preparation.
- The impact discussion describes the existing economic and environmental barriers, acknowledging that “adequate fire response staff may not be available within the county, requiring the need to enlist established mutual aid agreements with other neighboring fire agencies and the California Department of Forestry and Fire Protection” during major or multiple wildland fire events and “response times for a wildland fire event may be inadequate due to insufficient access because of limited lane roads, inadequately maintained roads, and remote areas that need to be accessed” (draft EIR page 4.9-20).
- I202-3 The comment expresses an opinion about the standards set by the Ventura County Fire Apparatus Access Code, an existing regulation summarized in the draft EIR. The comment is not related to the adequacy of the draft EIR. Therefore, no response is required. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.
- I202-4 The comment provides suggested edits to and opinions about policies proposed in the 2040 General Plan and is not related to the adequacy of the draft EIR. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.
- I202-5 The comment addresses the draft 2040 General Plan and is not related to the adequacy of the draft EIR. Therefore, no response is required. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.
- I202-6 The comment notes a typographical error in Figure 11-6 on page 11-29 of the Background Report. As noted by the commenter, “Santa Felica” should be “Santa Felicia.” This error will be corrected on Figure 11-6 in the Background

Report. However, this misspelling is unrelated to the impact analysis and conclusions in the draft EIR.

I202-7

The comment references attachments to the main body of the letter. The County has reviewed the attachments and determined that they do not contain comment on the content or conclusions of the draft EIR, nor do they raise any significant environmental issues for which a response is required. All comment letters submitted to the County on the draft EIR are provided with complete attachments in Attachment 1 to this final EIR.

Date: February 27, 2020
 Re: Comment on VC 2040
 To: Susan Curtis & the Ventura County Planning Department,

Letter
I203

My comments focus on the Agriculture Element of the General Plan regarding issues that need to be discussed in Background Report under Existing Conditions or more thoroughly addressed in the draft EIR. I offer policy solutions to address each issue area, which should be included in the General Plan.

Given the state of climate change, the State’s mandate to climate action planning, and the fact that Ventura ranks the fastest warming county in the lower 48 states¹, policy for climate change mitigation and adaptation that outlines a supportive transition and requires action is essential.

I203-1

I also want to note that I have a deep respect for the farmers of Ventura County and work closely with many of the largest growers in Ventura County including Driscolls, Boskovich, and Deardorff. I understand the challenges they face every day regarding food safety standards, pest management, soil management, unpredictable markets, unpredictable and changing weather patterns, the cost of land, and labor management. Given that Ventura County is 57% agricultural land, I also acknowledge the unique potential we have to mitigate climate by adopting new practices and managing agriculture as part of a larger eco-system.

1. Pesticide and nutrient management:

Issues missing from report

- Annual pounds pesticide used in Ventura County
 - One study from 2009 shows pesticides and nutrients found above benchmark rates.²
- Amount and location of use of artificial nitrogen, which is a significant driver of agricultural greenhouse gas emissions in manufacture, transport and oxidizing of soil carbon³
 - The proposed greenhouse gas inventory shows no decrease in nitrogen use.
- Nutrient leaching into groundwater as well as storm water runoff into ocean
- Reliance on applicant to have considered alternative pest management strategies when applying to use regulated materials.
- Limited expertise to provide science-based guidance about the range of alternatives to application of synthetic pesticides and benefits of alternatives

I203-2

¹ Scott Wilson, *Fires, floods and free parking: California’s unending fight against climate change* (2019). <https://www.washingtonpost.com/graphics/2019/national/climate-environment/climate-change-california/>

² Salvatore S. Mangiafico, *Nutrients and Pesticides in Stormwater Runoff* (2009). (<https://journals.ashs.org/horttech/view/journals/horttech/19/2/article-p360.xml>)

³ Rushan Chai, *Greenhouse gas emissions from synthetic nitrogen* (2019). <https://cbmjournals.biomedcentral.com/articles/10.1186/s13021-019-0133-9>

- Some growers choose synthetic pesticides as first approach to pest management because they lack knowledge, expertise, curiosity, or motivation to question prevailing norms
- Some growers may rely on the advice of consultants who have a conflict of interest because they make their living selling pesticides
 - The University of California definition of Integrated Pest Management (IPM) needs to be the default policy in the General Plan that begins with preventive measures and biologically based approaches
 - IPM needs to be mainstream and discussed in the General Plan as the strategy to be used by all growers, not just for “alternative, sustainable” or “innovative” farmers. Pest management, with a specific focus on IPM, should be a separate goal in the Ag Element.
- Unknown cumulative effects of single pesticides used over time and multiple pesticides used simultaneously
 - Particularly with respect to the impact on farmworkers and neighboring receptors (residents, schools, hospitals, etc.)
- Decrease in biodiversity and resulting decline in ecosystem function
- Impacts of Roundup and other herbicides, which can have a material cost in orchards of +/- \$400 per acre not including labor.
 - Round impacts include killing plants and beneficial fungi that give soil tilth, particularly toxic to the beneficial bacteria that help plants grow; active ingredient glyphosate harms metabolic functioning in gut linings of all organisms
 - Limited awareness of how to design weeds out with mulch, cover crops, native plants that create plant communities that allow no space;
 - Limited awareness about studies, which prove carcinogenicity. Even when used according to label, many herbicides and pesticides are not safe to ecosystems, waterway, children, etc.
- Practices for building soil health, which is impacted by the use of all synthetic inputs, need to be outlined and assessed.
 - Healthy soil retains more water, is more effective in managing invasive pests and plants, and is less susceptible to erosion.
- Background Report does outline the reasons our county is susceptible to more agricultural pests and disease (Port Hueneme imports, proximity to urban LA, mild climate, diverse crops, etc)
 - This provides justification for a sharp assessment and action plan for preventive forms of pest management instead of a reactionary approach as problems arise.
 - Ex: Asian citrus psyllid (ACP) = threat to citrus; Glassy winged sharpshooter (GWSS); Invasive Shot Hole Borer, Polyphagous Shot Hole Borer; Fusarium wilt on celery and cilantro

I203-2
cont.

Solutions & Policy guidance

- The top two resources I recommend drawing from are here:
 - Roadmap for Integrated Pest Management https://www.cdpr.ca.gov/docs/pestmgmt/ipm_roadmap.pdf
 - Roadmap to an Organic California: Policy Report <https://www.ccof.org/roadmap-organic-california>

I203-3

- Run off should be limited by reducing the use of certain herbicides and pesticides and by preventing soil erosion and retaining onsite eroded sediments that could contain residual pesticide; increase rain water infiltration through building soil health
- IPM solutions; ban glyphosate and other toxic herbicides, toxic synthetic pesticides from public landscape management. There are many local governments which have already adopted such policy⁴
- County Agriculture Commissioner has a large role in supporting local agriculture practices and the County should invest in Ag Commission staff with relevant expertise
- As outlined in a report by UCLA Law⁵, the Ag Commissioner should:
 - Assure consideration of alternatives to synthetic pesticides
 - Collaborate with the CA Department of Pesticide Regulation to track, study and advise regarding cumulative effects. Please see report for more detail.
- Ventura County Agricultural Commission issues permits to pesticide applicators; they are responsible for pest detection, management, and prevention and should engage in documented discussion as part of their permit process about IPM
 - IPM offers a pest management system that prevents outbreaks, saves farmers money and builds ecological systems instead of degrading them. It primarily supports the Sustainability Goal #5. IPM is misplaced in the Niche and Specialty Agriculture Goal #3. The General Plan should be updated to reflect the relevance and feasibility of this management approach.
- The narrative that pesticides (used outside of an IPM strategy) are needed for food security within the County is unsubstantiated. Omit Policy AG 4.4 to frame all pest management policy under IPM.

I203-3
cont.

2. Ag land as a resource

Issues to consider

- The impacts of tillage and exposed soil are not addressed in this report. These aspects of our farming system in Ventura County create an environment susceptible to erosion, nutrient and water runoff, less water retention, less carbon sequestration potential
- Between 2004 and 2016, land designated as Prime Farmland decreased by 6,216 acres or 13.17 percent, according to the Background Report
 - Important Farmland declined by approximately 7.5 percent (p9-9)
 - Impacts of farmland conversion to the environment include less permeable land, less potential carbon sequestration, less potential ecosystem services
- The impact of local agricultural practices such as pesticide & NPK use, tilling, monoculture, and bare soil that lack cover crops, on the changing quality and condition over time of Important Farmland.
 - These factors all lead to the degradation of soil quality, water retention, biological ecosystems, and economic vitality of the agriculture sector

I203-4

⁴ Gosia Wozniacka, *Community-Led Efforts to Ban Glyphosate in Public Spaces Pick up Speed* (2019). <https://civileats.com/2019/12/17/community-led-efforts-to-ban-glyphosate-in-public-spaces-pick-up-speed/>

⁵ Tim Malloy, *Governance on the Ground*. <https://law.ucla.edu/centers/environmental-law/emmett-institute-on-climate-change-and-the-environment/publications/governance-on-the-ground/>

- Rates and causes of local erosion should be discussed.

Policy solutions

- Identify, develop and promote technical and financial support for building healthy soil.
- Collaborate with our local Cooperative Extension
- Funding is available for farmers through CDFAs Healthy Soils Program
<https://www.cdfa.ca.gov/oeffi/healthysouils/>

I203-4
cont.

3. Food Security

Issues to consider

- The lack of institutional or community attention to barriers to food security
- Supply chains are vulnerable to road damage from earthquakes, extreme weather events and floods.
- Exporting 60% of county production to foreign countries impacts their capacity to achieve food security. Exporting increases greenhouse gas emissions.
- Address the carbon footprint and quality as well as food security implications from 85% of food consumed in Ventura County being sourced outside the County.

Policy solutions

- Identify and remove barriers to marketing and increased consumption of local agriculture products; strengthen Policy AG-4.1 to localize food supply
- Adopt the Good Food Purchasing Program at the City level and include school districts in these efforts. <https://goodfoodpurchasing.org/>
- Require a growing measurable proportion of food purchased by county hospital, jail and cafeteria be from local sources
- Encourage and recognize school districts and businesses that steadily increase procurement of products grown in the county
- Assure that buy-local policy includes all agriculture products, not just fresh produce

I203-5

4. Water

Issues to consider

- Background Report does not discuss surface water and ground water quality or contamination baseline data or impacts on ecosystems, humans and agriculture
 - This report should include existing levels of sediment, agricultural inputs including nutrients and pesticides, and other pollutants from other industries such as chloride and other salts.
- Report acknowledges that drought reduced crop values in the 2013-2014, which was the 2nd lowest rainfall since 1930
 - Specific farm and soil management practices can improve soil health and water retention
- Ag water sources in 2013: Only 4.2% was recycled water, according to the Background Report
- Report outlines how many gallons of water are used to grow 1 pound food of various crops, but does not include how much of our water is exported to other countries in agriculture products

I203-6

| | |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <ul style="list-style-type: none"> ● Ag water sources: Surface water 8.8% <ul style="list-style-type: none"> ○ Diverting surface water causes ecosystem damage and reduces river flow ● This report lacks an assessment of and commentary on over-fertilization and excess irrigation. UCCE should be consulted for relevant studies such as excess nitrogen in strawberries by local advisor Andre S. Biscaro. ● It should be noted if and when there is a lack of available data from UCCE, CDFA, and other resource agencies in order to help shape their research agenda priorities. <p><i>Policy solutions</i></p> <ul style="list-style-type: none"> ● Increase water efficiency and retention through building healthy soil, which means encouraging cover crops, low or no till, crop rotation and reducing inputs. ● Establish measurable and enforceable goals for water conservation and use of recycled water for all sectors ● Increase infrastructure and ability to use more recycled water throughout the County. ● Support growers with financial and technical resources to adopt practices that retain more water | <p>I203-6 cont.</p> |
| <p><u>5. Regulatory setting</u></p> <ul style="list-style-type: none"> ● There are 7 Area plans in our county, which are listed in the Background Report and contain goals and policies related to agricultural resources. <ul style="list-style-type: none"> ○ These Area Plans should consider environmental impact review and hyper localized mitigations for the affected area. ● According to the Background Report: <ul style="list-style-type: none"> ○ The Farmland Protection Policy Act is a federal law to minimize loss of prime agricultural land. ○ The Farmland Mapping and Monitoring Program requires counties to report land converted to or from agricultural land every two years <ul style="list-style-type: none"> ▪ We should be tracking and monitoring the causes and outcomes of loss that occurs in Ventura County. ▪ The causes should be addressed thoroughly in the Land Use Element. ▪ The climate impacts of this loss should be better understood, discussed and mitigated. | <p>I203-7</p> |
| <p><u>6. General comments & recommendations</u></p> <ul style="list-style-type: none"> ● The Background Report and draft EIR lack a discussion of how to build healthy soils and their important role in climate change mitigation, as well as water supply, reducing drought, and reducing flooding. The benefits to farmers and local ecosystems and biodiversity are also essential factors to highlight. ● The Background Report outlines that buying local commodities has gained traction in recent years due to climate change concerns and its potential effects on crop production. <ul style="list-style-type: none"> ○ Therefore, the structure of our local markets and supply chains must be included in this discussion. ○ Mitigations should center on building out our regional supply chain infrastructure to increase local sales (only 15% of our local production is currently consumed within County) | <p>I203-8</p> |

- Food security and long-term economic stability are weakened by long-distance exports. Regional export of agricultural products also reduces local consumption and misses the opportunity for local economic development I203-8
cont.
- Greenhouse gas emissions inventory does not cover emissions associated with exports and imports I203-9
- Section 9.2 Agricultural Production; Existing Conditions discusses weather patterns such as average temperature and moisture I203-10
 - This section lacks a discussion of climatic changes over time. Ventura is fastest warming county in lower 48 states⁶. The unpredictable changes occurring at a faster rate than even before will require agile adaptation and mitigation of further climate change specifically through preventative pest management and practices that retain water.
- All figures and tables should be current: Table 9-8 Top 10 Commodity Sales and subsequent tables are 2015 data. 2018 data is available.

Summary of Recommendations

- IPM is about prevention instead of treating the symptoms and should be the most predominate pest management strategy in our County.
- Create infrastructure for consideration of alternatives and cumulative effects of pesticides.
- Adopt programs and policies for building soil health
- Consider all barriers to food security
- Assess water quality as indicator of all land management practices
- Assess energy and water embodied in exports
- Reference the resources included in this policy recommendation letter, specifically regarding a roadmap moving forward towards IPM and organic. I203-11

If we do not consider all of these factors, which contribute to and exacerbate climate change, then the factors that are considered and outlined in the Existing Conditions section will soon be obsolete.

Thank you for you consideration. Please feel free to reach out with questions or for further discussion.

|------------------------|-------------------------------------------|
| Letter I203 | Tessa Salzman February 27, 2020 |
|------------------------|-------------------------------------------|

- I203-1 The comment provides introductory language outlining concerns that are responded to below; see responses to comments I203-2 through I203-10. This comment does not raise a significant environmental issue for which a response is required.
- I203-2 The comment summarizes issues related to existing pesticide and nutrient management that are not included in the Background Report. The effects of these existing practices are appropriately excluded from the draft EIR because the 2040 General Plan would not increase agricultural land use, expand the use of pesticides, or promote agricultural practices that reduce soil health. The data characterizing existing conditions in the County provides a reasonable representation of conditions to inform an analysis of potential effects in the draft EIR. Note that the 2040 General Plan includes Policies AG-3.2 and AG-3.3, which encourage and support the use of Integrated Pest Management practices and provide information on how to do so. Similarly, Policy AG-5.1 encourages the use of inorganic, nitrogen-based fertilizers to reduce nitrogen emissions.
- I203-3 The comment suggests additional topics related to solutions and policies for pesticide and nutrient management that could be considered in the 2040 General Plan and suggests omission of Policy AG-4.4. This comment is not related to the adequacy of the draft EIR. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.
- I203-4 The comment outlines additional concerns about current agricultural processes. As described above, the environmental effects of existing agricultural operations that would not be affected by implementation of the 2040 General Plan are correctly omitted from the evaluation of impacts in the draft EIR. The draft EIR evaluates the potential for conversion of farmland as a result of the 2040 General Plan in Section 4.2, "Agriculture and Forestry Resources." The effects (e.g., increased impermeability, loss of carbon sequestration potential, effect on natural ecosystems) that could result from the identified potential for conversion is evaluated throughout the draft EIR.
- The policy suggestions are not related to the environmental impacts identified in the draft EIR. Therefore, no further evaluation is required. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.
- I203-5 The comment suggests additional topics and policy solutions related to food security that could be considered in the 2040 General Plan and is not related to the adequacy of the draft EIR. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.

I203-6 The comment provides a listing of issues related to agriculture and water use that for consideration, some of which are derived from the Background Report and some that are supplemental, and provides suggestions that could support water efficiency in the agricultural sector. Water quality and sources of contamination are described in Chapter 10, “Water Resources,” of the Background Report. The comment highlights existing conditions and agricultural practices where the commenter identifies an area of concern, but is not related to potential environmental impacts associated with implementation of the 2040 General Plan or the analysis and conclusions in the draft EIR.

Note that the 2040 General Plan includes policies to encourage sustainable and regenerative farming (such as Policy AG-5.1, which encourages reduced use of nitrogen-based fertilizers, and Policy AG-5.4, which encourages water-saving irrigation techniques), as well as three policies (WR-6.1 through WR-6.3) intended to sustain the agricultural sector by ensuring and adequate water supply through water efficiency and conservation. These policies are evaluated in the draft EIR.

I203-7 The comment suggests that the Area Plans should include mitigation to address agricultural concerns, but does not provide specific information about what this mitigation would be or how such mitigating policies would address impacts identified in the draft EIR. The comment also suggests that the County should develop a program that builds on the data required by the Farmland Mapping and Mitigation Program to track and monitor the causes and outcomes of loss of agricultural land so that these causes can be addressed through the Land Use Element. The comment also suggests that evaluation of any effect on climate caused by the conversion of agriculture should be evaluated. Note that the Area Plans are part of the 2040 General Plan evaluated in the draft EIR. Refer to Master Response MR-2 for additional discussion of how the Area Plans were included in the development of the 2040 General Plan.

Section 4.2, “Agriculture and Forestry Resources,” in the draft EIR concludes that potential loss of Prime Farmland, Farmland of Statewide Importance, Unique Farmland, and Farmland of Local Importance as a result of future development under the 2040 General Plan would be significant. The conversion is unavoidable despite the addition of feasible mitigation, including a new policy that the County shall ensure that discretionary development located on land identified as Important Farmland on the State’s Important Farmland Inventory is conditioned to avoid direct loss of Important Farmland as much as feasibly possible (Mitigation Measure AG-1) and an Implementation Program that would require the establishment of conservation easements as compensatory mitigation (Mitigation Measure AG-2). The applicability of the commenter’s suggestion to track and address the causes of loss of farmland through the Land Use Element is acknowledged. However, because it is not clear what changes would be made in the Land Use Element and how these changes would address the conversion of farmland in a manner not already provided in the 2040 General Plan or mitigation measures in the draft EIR, the suggestion cannot be considered further. No revisions to the draft EIR have been made in response to this comment.

- I203-8 The comment summarizes why the Background Report and draft EIR should include discussion of local markets and supply chains. However, EIRs are not required to treat a project's economic or social effects as significant effects on the environment (CEQA Guidelines, § 15131). Social and economic effects need only be considered in an EIR where there is a clear link between those economic or social effects and physical environmental changes. The economic issues raised in this comment would not result in any adverse physical changes to the environment not already addressed in the draft EIR. Refer to Master Response MR-6 for discussion of how the County appropriately uses the Background Report to describe the existing environmental setting in the draft EIR.
- I203-9 See Master Response MR-1 for detailed information pertaining to the development of the GHG inventory prepared for the 2040 General Plan and draft EIR.
- I203-10 This comment suggests inclusions of climatic changes over time in the discussion of agricultural production and an update to data provided about agricultural sales by commodity in Table 9-8 of the Background Report. This information is immaterial to the analysis and conclusions in the draft EIR regarding the potential environmental effects of implementing the 2040 General Plan. No changes to the draft EIR have been made in response to this comment. Refer also to Master Response MR-6 regarding Background Report content.
- I203-11 The comment summarizes more detailed comments provided above; see responses to comment I203-2 through I203-10. This comment is a concluding statement and does not raise a significant environmental issue for which a response is required.

Appendix B. Climate Change

Your Comment:

NASA, working with the California Air Resources Board using InfraRed sensing while flying over California have determined that a third of California methane emissions can be traced to super emitters in the oil industry. In Ventura County, NASA has identified five methane super emitters at oil facilities. The General Plan must include regulation to eliminate methane emissions.

Re: Comments Regarding Draft General Plan EIR

Dear Ms. Curtis:

I am writing to provide comments on the Draft General Plan EIR. The Background Report and the Draft EIR do not adequately address the impact of pesticide use in the agricultural sector. In its discussion of Environmental Impacts and Mitigation Measures, the Draft EIR identifies impacts associated with the use of pesticides as a concern. It describes the role of the County Agricultural Commissioner's office in evaluating the use of restricted materials but does discuss the efficacy of the program beyond reference to the 2018 report of the Ventura County Grand Jury.¹ That Grand Jury report focused primarily on implementation of monitoring requirements, concluding that "the monitoring of fumigants like 1,3-D, methyl bromide and chloropicrin utilized in County agriculture demonstrates that levels of drift are below cumulative harmful levels."² The Draft EIR then concludes that pesticide exposure would not be addressed further.³ The draft Background Report likewise describes the restricted permitting process but does not evaluate its effectiveness.⁴

The Grand Jury report did not address the efficacy of the restricted materials permitting program. Two recent reports by researchers at UCLA evaluated the restricted materials permitting system. Those reports concluded the restricted permitting system throughout California, including in Ventura County, does not comply with two regulatory requirements established to implement the substantive requirements of CEQA. First, in approving the application of restricted materials, county officials fail to ensure the performance of meaningful alternatives analysis (AA), meaning systematic evaluation of safer alternatives such as more benign pesticides or cultural practices.⁵ Second, in assessing the impacts of restricted materials, county officials do not perform cumulative impacts assessment (CIA), defined as consideration of the additive or

Page 2

synergistic effects of exposing workers, bystanders and environmental receptors to multiple pesticides.⁶

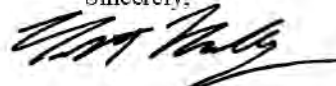

The research focused on mixtures of three restricted materials — chloropicrin, Telone and metam salts — that are frequently used on high-value crops such as strawberries, tomatoes, tree nuts and stone fruits. The UCLA report demonstrated that their combined adverse effects can be greater because the materials may interact to increase damage to cells and can reduce the body's ability to remove or neutralize toxic substances. Using data from the Pesticide Research Institute, which collaborated with UCLA, the research examined the area near Rio Mesa High School in Ventura County from July 26 to August 3, 2013. The air modeling showed contemporaneous exposure to multiple pesticides at locations such as schools, day care centers and parks.⁷ The Ventura County Grand Jury report did not address the impact of cumulative exposure to mixtures of pesticides. Copies of the UCLA reports can be found at <https://law.ucla.edu/centers/environmental-law/emmett-institute-on-climate-change-and-the-environment/publications/governance-on-the-ground/> and <https://law.ucla.edu/centers/environmental-law/emmett-institute-on-climate-change-and-the-environment/publications/exposure-and-interaction/>

I206-1
cont.

Given these identified deficiencies in the restricted materials permitting system, pesticide exposure should not have been excluded from further analysis in the Draft EIR. The EIR should examine how the existing deficiencies impact pesticide exposures and consider implementation of measures to mitigate these problems in the goals of the General Plan.

Thank you for your consideration. If you have any questions, please do not hesitate to contact me via e-mail at malloy@law.ucla.edu. (Please note that the comments represent my views only. Use of the UCLA letterhead is for identification purposes only.)

I206-2

Sincerely,

Timothy F. Malloy

| Letter I206 | Timothy F. Malloy February 27, 2020 |
|------------------------|-----------------------------------------------|

- I206-1 The comment states that the Background Report and draft EIR do not adequately address the existing impacts of pesticide use in the agricultural sector; refer to Master Response MR-6 for discussion of how the County appropriately uses the Background Report to describe the existing environmental setting in the draft EIR. The comment addresses the draft 2040 General Plan, a report produced by the Ventura County Grand Jury, and the efficacy of the restricted materials permitting program and is not related to the adequacy of the draft EIR. The draft EIR includes a discussion of the several ways in which the existing use and regulation of pesticides is addressed by the County (pages 4.2-5 and 4.2-6). The draft EIR correctly omits analysis of the impacts of pesticide and herbicide because such uses are not reasonably foreseeable future activities resulting from 2040 General Plan implementation. In addition, an EIR is not required to mitigate existing environmental problems. This comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.
- I206-2 The comment provides the preferred contact for the individual. The County has noted the information appropriately for future reference.

Ventura County Board of Supervisors
Attn: RMA Planning Division
General Plan Update
800 Victoria Avenue L#1740
Ventura, California 93009-1740

Dear Board of Supervisors and Staff:

We are writing this letter to urge the Board of Supervisors to reconsider moving forward with the Draft General Plan EIR. The draft EIR has been accelerated to the point that too many issues and impacts have not been properly addressed or studied. These impacts and the corresponding mitigation measures will have severe impacts to land owners and especially those, like us in the agricultural industry and other productive economic segments.

I207-1

Our family has been involved in the agricultural industry for more than 100 years in Ventura County. We have owned numerous land holdings that remain in the family to this date. We have farmed throughout Ventura County and hope to continue to do so in the future.

The Draft EIR is deficient on many levels. CEQA requires that all mitigation measures must be technically and economically feasible. Numerous proposed mitigation measures are neither. We have in the past attempted to identify land and any owners that would be open to sell their development rights for land that was converting from agricultural to commercial use. Not only did we not find anyone that would do so, no one would even quote a price. The only positive response from numerous land owners were that you can buy my property for full market value and then you can do what you want. There is not a project that can be built by adding double land cost to the equation. This was very recently experienced based on proposed policies at LAFCo. These policies were eventually not enacted due to the inability to purchase development rights in an economical feasible manner. This was when LAFCo was contemplating an acre for acre ag preserve. The new policy that is proposed in the 2040 General Plan is requiring 2 acres for every 1 acre of land converted from ag to any other use. This will eliminate the ability to add any new required ag buildings or even farm worker housing. The Draft EIR must study these impacts, since they are not feasible.

I207-2

The Draft EIR also deals with water in a manner that is not properly studied. There is no analysis on increased water costs and diminishing availability of water. Without reasonable water costs and supply, there is no agricultural industry.

I207-3

The General Plan indicates that agriculture is a high priority in the County. However, new policies and requirements in the General Plan add additional mitigation measures that will make ag virtually impossible. These include new setbacks, limiting types of fumigants pesticides and fertilizers. The General Plan also requires the conversion of all farm equipment to be all electric. Again, not feasible. The costs to purchase new pumps, farm equipment and other existing fuel using equipment will increase operational costs to a point that the County crops will not be competitive in the open market. These new mitigation measures are not sufficiently studied and again are not economically feasible.

I207-4

The Draft EIR is extremely difficult to read and understand. The background reports are lacking in depth of what has been studied other than numerous general statements and very poor mapping. Detailed studies must be added to sufficiently identify impacts and the related mitigation measures for both direct and indirect impacts on the agricultural industry. It is our understanding that reports and studies need to be timely prepared. However numerous studies are older than 5 years. Not timely.

I207-5

After numerous devastating wildfires over the last few years, which significantly impacted ag, the General Plan continues to lay out limiting mitigation measures for fire prevention. The Wildlife corridor eliminates any ag operation or fire prevention in the proposed corridor areas. This is also a major concern not studied in the Draft EIR.

I207-6

The Draft EIR for the 2040 General plan does not provide adequate analysis for the expansion of permanent bike paths and pedestrian walking trails throughout the County. These impacts are very severe due to constant conflicts from trail users and ag operations. Spraying, dust, odors from ag operations, along with impacts created by the trail users. These are usually theft, vandalism, litter and pet waste. The proposed mitigation measures require additional setbacks from these trails which renders additional land unusable for ag operations.

I207-7

In addition to the above comments on the agricultural aspects and related land use concerns of the DEIR, the undersigned is also a mineral owner directly interested in the impacts on oil and gas production of the DEIR and related General Plan 2040 proposed provisions. In these documents there is a total failure to address the economic impacts of the various policies proposed in violation of the requirements for this process, including but not limited to the loss of royalty income to a large group of County residents. I join in the detailed comments on the various deficiencies and concerns identified in the DEIR as described in the concurrent submissions on behalf of Aera Energy and other operators delivered this week to the County.

I207-8

Please look at the long-term consequences of these General Plan policies and mitigation measures. We formally request additional studies and a revised Draft EIR that will properly look at these and many more issues. The DEIR must be corrected with details of the revisions. Then it can be recirculated.

I207-9

Sincerely,

Timothy Shaw McGrath

Re: General Plan Amendment Environmental Impact Report

Dear Honorable Members of the Board of Supervisors:

We are heartened to see more comprehensive environmental protection measures included the General Plan objectives, as outlined in the Environmental Impact Report, but disappointed that so much focus is still placed on aesthetics as opposed to true health and safety concerns. We also feel that the General Plan Amendment falls short of tackling the full extent of the climate crisis and its likely impact on Ventura County. The new General Plan should provide a blueprint to guide us into the future, but in elevating aesthetics to equal standing with true health and safety issues, it fails as a roadmap to navigate the growing environmental and social challenges of the future.

1. For example, when it comes to telecommunications towers, the emphasis on disguising or hiding them, including protecting the view of the ridgelines, does a great disservice to community health, because cell towers are safest when located away from people. Ridgelines that provide excellent coverage, but are not located near schools, businesses or homes are an ideal location for telecommunications towers, far safer than flagpoles, church steeples, and strip mall facades. This is particularly true as the cell phone carriers migrate to 5G which emits far more EMF and RF than the earlier versions of transmission.

I208-1

2. While maintaining open space is important, the SOAR initiative allows those with existing homes to veto new development, particularly low income and affordable housing, which is desperately needed to provide shelter for our service worker sector. If lower wage earners cannot afford to live near where they work, the commute required increases congestion and air pollution, deteriorating the quality of life for the whole community.

3. Given that the General Plan is projected to take us to 2040, and the existential threat the climate crises poses, we think far more needs to be done to cease fossil fuel extraction and transition to 100% renewables in the short term. We need to have a comprehensive public transit system based on renewable energy, methods for harvesting rain water so

Honorable Board of Supervisors
February 26, 2020
Page Two

less storm water runoff goes to the sea, and planning on what portions of our coast line we may have to abandon to sea level rise.

4. The book, *Drawdown: The Most Comprehensive Plan Ever Proposed to Reverse Global Warming*, edited by Paul Hawken (Penguin Books, 2017), compiles the results of research from hundreds of the world's top scientists and climate experts, and identifies specific actions that governments and local communities can take to reverse global warming. Our General Plan should incorporate those drawdown solutions that can be undertaken on a local level, many of which are surprisingly simple. For example, reduced food waste and encouraging people to adopt a more plant-rich diet can have a profound effect on reducing green house gasses. So can good family planning clinics and incentives to reduce procreation rates. A most effective and inexpensive drawdown action would be to implement regenerative agricultural methods here in Ventura County. By transitioning away from chemical fertilizer and pesticide use, no-till land management, and building soil with organic material, including biochar, we can sequester carbon in the soil while building its quality and productivity, eliminating contamination of ground and surface water, and improving air quality.

5. We do not have to invent solutions to address the current and growing environmental and social challenges. Other forward thinking regions are tackling these challenges and can provide us with a template that can be tailored to our own local conditions. For example, on Salt Spring Island in British Columbia, the community is faced with a housing crisis similar to our own in Ventura County. Strict development restrictions and limited residential units have priced housing beyond the reach of many residents. Meror Krayenhoff, a global consultant on rammed earth building methods and featured on *The Nature of Things* with David Suzuki, suggested that a compliance driven, as opposed to vision driven, policy paradigm can result in anarchic, subversive response when the populace thumbs their noses at regulations that don't represent the will and needs of the population. He proposes a number of innovative solutions, including encouraging the use of local, renewable materials in building. Ventura County, with access to rock, sand, straw bales and other renewables, can become a beacon for permitted home building solutions for the rest of California, and the nation. Green projects could get reduced permitting fees and priority in the permit queue, with a single point advisor. For example, composting toilets should not only be permitted, but encouraged, as it is wasteful in the extreme to use precious potable water to flush away human waste.

I208-2
cont.

6. We suggest Ventura County consider concepts implemented elsewhere, such as Seattle granting a 25-30% increase in allowable floor area and increased height limits for Living Building Challenge ("LBC") projects (See <https://living-future.org/lbc/>); or New Zealand's SIREWALL community center project, which made approval contingent upon demonstrating reconciliation with Maoris, training opportunities for youth, a high environmental standard that the community (of all ages) supported, that it would elevate the well-being of the community, and encourage responsible tourism. (See https://www.nzherald.co.nz/northern-advocate/news/article.cfm?c_id=1503450&objectid=12076863)

7. Ventura County can embrace LBC requirements that buildings be net positive in terms of water, energy, sewage and liquid waste, and contain no red-listed toxic materials, express beauty in terms of spirit, inspiration, and education, create health and happiness through such things as biophilia, among other inspiring attributes.

Honorable Board of Supervisors
 February 26, 2020
 Page Three

8. While the General Plan is intended to cover the length of a generation, it would not be at all unsound to at least contemplate the next seven generations, consistent with indigenous cultural tradition. Measuring progress with such a long term view will require a different framework than juggling one climate or housing emergency after another. Priorities and decision-making can be measured in a rational and holistic manner, with careful thought for the generations yet to come.

I208-2
 cont.

9. The General Plan should explicitly reflect the County’s Climate Action Plan and its evolution. Achieving net zero CO2 emissions (and sequestration) will require a rapid ending to oil and natural gas extraction (and certainly no expansion, no granting new leases, new pipeline permits, etc. It should encourage green energy generation and storage in both distributed and centralized manners.

10. Wildfires are clearly changing in their severity and nature. The County should lead in research and experimentation with methods of fire protection and damage mitigation, such as (un)controlled small burns, and unconventional methods advocated by <http://californiachaparral.com> -- including ember barriers and sprinklers, which are more effective and ecologically sound than enormous denuded hillsides.

I208-3

11. Our General Plan needs to steer our county toward good land and resource stewardship. To recap, aesthetics play far too important a role in our land use planning, particularly because “beauty is in the eye of the beholder,” and what one person sees as creative genius, another sees as a monstrosity. Land use regulations should be focused on environmental safeguards that protect air, water, and soil while at the same time meeting the food and shelter needs of our communities.

I208-4

12. As Meror Krayenhoff has stated, “We are in a time when the scale of the emergencies we face need to be addressed with solutions of a corresponding scale. These emergencies also have urgency. . . . [W]ithout governance that can act with pace, boldness, courage and the power to implement, we are wasting our time.” We hope that Ventura County acts with such pace and boldness to adopt a General Plan that guides us in a new direction of carbon drawdown, while promoting innovation in design, building, and conservation for generations to come.

Thank you for your kind consideration.

Sincerely,

Tina Rasnow and Dr. Brian Rasnow on behalf of the Rasnow Family

|------------------------|--------------------------------------------------------------|
| Letter I208 | Tina Rasnow and Dr. Brian Rasnow February 26, 2020 |
|------------------------|--------------------------------------------------------------|

- I208-1 The comment addresses the draft 2040 General Plan’s treatment of aesthetics relative to health and safety, and is not related to the adequacy of the draft EIR. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.

- I208-2 The comment provides recommendations for climate change policies that could be included in the 2040 General Plan and is not related to the adequacy of the draft EIR. Note that the Climate Action Plan is embedded in the 2040 General Plan. Refer to Master Response MR-1 for discussion of the draft EIR’s detailed quantitative and qualitative analysis of the 118 policies and 45 implementation programs included in the 2040 General Plan to reduce greenhouse gas (GHG) emissions in the county and the seven feasible mitigation measures included in the draft EIR to address the potentially significant GHG impacts of the 2040 General Plan and achieve additional GHG emissions reductions. This comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.

- I208-3 The comment states that the “County should lead in research and experimentation” related to wildfire protection and damage mitigation. The comment is not related to the adequacy of the draft EIR. Therefore, no response is required. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.

- I208-4 The comment summarizes the contents of the comment letter. This comment is a concluding statement and does not raise a significant environmental issue for which a response is required.

| Letter I209 |
|------------------------|

Greetings. As a long-time Ventura County resident, I wanted to be sure to let you know how worried I am about the climate crisis. The news is so bleak, and decisions made for our general plan are going to be crucial for our lives. Please do everything you can to phase out oil and gas production and consumption as soon as possible, and accelerate the cleanup of toxic sites. The time for dithering on this is way past!
 Thank you, Tom Erickson

I209-1 Refer to Master Response MR-4, Section MR-4.J, “Potential to Stop Issuing Permits for New Wells (Phase Out Oil and Gas Operations)”, regarding the findings and conclusions related to phasing out oil and gas operations. The remainder of the comment addresses implementation of the 2040 General Plan and is not related to the adequacy of the draft EIR. However, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.

Ventura County Resource Management Agency, Planning Division
Attn: Susan Curtis, Manager, General Plan Update Section
800 S. Victoria Ave., L #1740
Ventura, CA 93009-1740

**Letter
I210**

GeneralPlanUpdate@ventura.org

Dear Ms. Curtis:

I am writing to call your attention to significant flaws in the process, data, and conclusions of the Ventura County General Plan, Draft EIR, and supplemental documents.

My great grandfather, Mark McLoughlin (1843-1914), was a true Ventura County pioneer, purchasing his first 318 acres of undeveloped land in Ventura County in 1875. He was a hard-working visionary, revered by his community. With his son—my grandfather, James Patrick McLoughlin—he raised livestock and farmed the land, providing jobs and feeding the growing towns of Oxnard and Ventura.

Our land, in a vitally important location on Olivas Park Drive across from the Ventura Marina, has been in the family, and part of the economic fabric of the community, for 100 years. And we want it to be part of the future of this community, with a flourishing economy, a thriving job market, and unsurpassed quality of life for its residents.

But the General Plan and DEIR do not describe a viable path for us as landowners going forward.

I will begin with some specific issues regarding language in the Coastal Area Plan, 4-82-83 and 4-94-95. Part of our land is located in the Central Coastal Zone, adjacent to the Ventura Marina, on Olivas Park Drive at Harbor Blvd. The only conclusion the Plan draws about our land is the statement that, “unlike the Preble area, services are not readily available to the Olivas lands.” This is false. Our property has access to all utilities, water, main roads, and the freeway. Indeed, easements on our property serve surrounding areas with utilities.

The Plan also claims that our property is “not included in the City’s sanitation district because of problems with water pressure.” This language is irrelevant and incorrect. There is no evidence that there are water pressure issues, and the sanitation district’s pipelines actually traverse our property.

I210-1

I210-2

| | |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <p>While we do not know the original source of these misstatements, such misrepresentations—now repeated in the Plan—threaten to diminish the value of our land in relation to the Preble property. And, of course, they undermine the goal and the value of the Plan itself.</p> | <p>I210-2 cont.</p> |
| <p>The General Plan also speaks of the widening of Olivas Park Drive, our southern boundary. This would have a direct impact on our property. But the Plan does not address how this would happen or how it would affect our land.</p> | |
| <p>Damaging misstatements about our property also appear In the DEIR. Contrary to the portrayal in the DEIR, our property has significant infrastructure in place, as well as prime accessibility to the highway and the harbor. In fact, with easy access to the marina and beach community, and with the railroad as part of our eastern boundary, our land is uniquely suited to be an important part of future economic development in the area. We are entitled to have all these matters corrected.</p> | <p>I210-3</p> |
| <p>I would also like to raise some additional concerns:</p> | |
| <p>1. The General Plan and DEIR continue to ignore the 28% increase in the homeless population in our community.</p> | <p>I210-4</p> |
| <p>2. According to the General Plan, if we were to build an acre of low income / worker housing we would need to buy two replacement acres of same Ag land to be placed into perpetual agricultural preservation. This is unrealistic and infeasible, and certainly not in line with the State government’s housing policies.</p> | <p>I210-5</p> |
| <p>3. The EIR does not adequately address the enormous “indirect impacts” that will occur as a result of implementing the General Plan, calling them “less than significant.”</p> | <p>I210-6</p> |
| <p>4. The General Plan contains policies that will increase the costs of normal farming operations, making it difficult for farming to remain profitable.</p> | <p>I210-7</p> |
| <p>5. The Plan does not adequately evaluate the impacts of increased competition for water in our community.</p> | <p>I210-8</p> |
| <p>The EIR is a flawed document, full of errors, that does not disclose all impacts, direct and indirect, caused by the General Plan. It was obviously rushed—completed in six weeks. It is inaccurate and incomplete, and fails to provide members of the community with the information that they are legally entitled to. This EIR should be corrected and reconsidered, and a reasonable time period should be allowed for meaningful and thoughtful community input.</p> | <p>I210-9</p> |
| <p>Sincerely,</p> | |

| | |

| Letter I210 | Toril Raymond February 27, 2020 |
|------------------------|-------------------------------------------|

This comment letter repeats many of the same comments provided in Letter I9. The responses below provide cross references to the portions of Letter I9 where responses to the same comments have already been provided.

- I210-1 Refer to response to comment I9-2 regarding the history of the McLoughlin family and their land in Ventura County.
- I210-2 Refer to response to comment I9-3 regarding statements in the Coastal Area Plan.
- I210-3 Refer to response to comment I9-4 regarding the adequacy of the draft EIR.
- I210-4 Refer to response to comment I9-5 regarding analysis of social and economic issues in the draft EIR.
- I210-5 Refer to Master Response MR-5 regarding the feasibility of Mitigation Measure AG-2.
- I210-6 Refer to response to comment I9-7 regarding the adequacy of the draft EIR.
- I210-7 Refer to response to comment I9-8 regarding analysis of social and economic issues in the draft EIR.
- I210-8 Refer to response to comment I9-9 regarding water supply.
- I210-9 Refer to response to comment I9-10 regarding the adequacy of the draft EIR.

Letter
I211

The County did not conduct a complete analysis of impacts in regard to conversion of farmland.

The EIR erroneously and without supporting evidence states "the General Plan would not result in any other changes that due to location and nature would result in conversion of farmland."

This statement is simply not true and the EIR itself contradicts this statement.

The EIR acknowledges the impacts of both economic burdens and decrease in water supply for irrigation (page 4.2-3). As water supplies decrease and costs to obtain that water increase, land will be removed from agricultural use. This is a direct significant impact that will convert ag land.

Actual issues impacting agriculture in Ventura County that contribute to the conversion of ag land are:

- 1) water
- 2) economics (extremely expensive area to do ag)
- 3) lack of farmworker supply and housing
- 4) increased regulatory burden from increasing compatibility issues from urban/ag interface.

County analyzed NONE of these issues. And proposed no mitigation to address any of these issues.

The EIR needs to be corrected and recirculated.

I211-1

I211-2

| | |
|------------------------|---------------------------------|
| Letter I211 | Toril Raymond No date |
|------------------------|---------------------------------|

I211-1 The commenter states that decreased water supplies and increased costs are a significant impact that would convert agricultural land use. Refer to response to comments I2-4 and I4-3 regarding water availability and cost.

The commenter asserts that economics contribute to the conversion of agricultural land non-agricultural use. However, EIRs are not required to treat a project’s economic or social effects as significant effects on the environment (State CEQA Guidelines, § 15131). Social and economic effects need only be considered in an EIR where there is a clear link between those economic or social effects and physical environmental changes. The economic issues raised in this comment would not result in any adverse physical changes to the environment not already addressed in the draft EIR.

Lack of farmworker supply and housing are also referenced as an issue that contributes to the conversion of agricultural land use to non-agricultural. CEQA Guidelines Section 15126.2(a) explains that “[a]n EIR shall identify and focus on the significant effects of the proposed project on the environment.” Therefore, only the impacts of agricultural changes caused by adoption of the 2040 General Plan need to be addressed in the EIR. Lack of farmworker supply and housing are not an environmental impact related to agriculture changes caused by the implementation of the 2040 General Plan EIR and no further response is required to address this issue.

Lastly, the commenter cites an “increased regulatory burden from increasing compatibility issues from urban/ag interface” as an issue that contributes to the conversion of agricultural land non-agricultural use. Refer to response to comment A13-9 regarding impacts related to urban-agriculture interface and response to comment O32-15 regarding competition for water, the cost of agriculture in the county, lack of farmworker housing, and regulatory burdens.

I211-2 Refer to Master Response MR-7, which explains in detail why recirculation of the draft EIR is not required.

A friend of mine sent the following comments but the email bounced back. I am re-sending it on his behalf. Commenters name is "Walt Beil". His email is docdoggr@gmail.com. Please respond to him.

27 February 2020

Ventura County Resource Management Agency
 800 S. Victoria Ave
 Ventura, CA 93009

To whom it may concern:

My name is Walt. I have worked in the local oil and gas industry for many years. I am writing because many local oil and gas employees have expressed deep concern about the overall direction that the 2040 General Plan Update appears to be taking. I have reviewed the Draft Environmental Impact Report (DEIR) document and believe it unfairly targets the industry with the goal of shutting down local oil and gas production completely.

I
I212-1
I

The DEIR recognizes the importance of the oil and gas industry when it states, "The County shall promote the extraction of mineral resources locally to minimize economic costs and environmental effects associated with transporting these resources." With this in mind, it is troubling that the DEIR then proposes several new policies that would further restrict local production, therefore jeopardizing the livelihoods of hundreds of workers in our industry.

Policy COS-7.8, for example, essentially prohibits oil and gas producers from flaring except in emergency cases. Flaring is an industrywide practice that operators use to burn off excess natural gas that cannot be captured or used in other ways. It is used as a safety practice used to safeguard workers on site and preserve local air quality. It is the most environmentally friendly alternative to releasing excess natural gas into the atmosphere or back into the ground. The alternatives do not adequately explain the impacts of restricting flaring.

I
I212-2
I

The DEIR acknowledges that the policies included in the General Plan Update would result in the construction and operation of new pipelines (Page 4.8-38). The DEIR does not go far enough to show that construction and operation of new pipelines for the conveyance of oil, gas and produced water is feasible and will result in GHG emissions reductions. In addition, the policies promoting new pipelines are contradictory to proposed policies related to fault lines.

I
I212-3
I

The General Plan is critical to the county's future success. API Coastal Chapter firmly believes that it should be used to strike a balance between economic vitality and environmental protection, not unfairly regulate the oil and gas industry out of the county.

I
I212-4
I

With regards,
 Walt Beil
 Ventura

|------------------------|
| <p>Letter I213</p> |
|------------------------|

Dear County Supervisors and members of the Planning Commission:

I am deeply concerned about our future if we do not take significant action to curb green house gas emissions. Fossil fuel use is driving climate change. The impacts associated with climate change include droughts, fires, forced migration of animal and humans (which is one of the treats to national security), sea level rise, spread of disease and threats to biodiversity, to name a few. Also fossil fuels threaten the ocean ecosystem (because of acidification), reduce air quality, pose threats to our water supplies, are a fire threat (note recent refinery fires), and threaten economic stability because of volatile fossil fuel markets. Current levels of CO2 are at historic highs yet we still put more into the atmosphere. The scary thought to me is that it takes decades for nature to take CO2 out of the atmosphere. Estimates range from 30 – 90 years (Ref: *Archer, David (2009). "Atmospheric lifetime of fossil fuel carbon dioxide". Annual Review of Earth and Planetary Sciences. 37. pp. 117–34*). Other literature cites ranges from 20 – 200 years. So even if we stop all GHG emissions today, the earth will still be coasting to a warmer climate for decades.

Oil Production

I am concerned that Ventura has oil operations that I feel pose a risk. Some financial advisors are advising investment firms to be wary of fossil fuel investments. As renewable and green energy become increasingly less costly than fossil fuels and the projected displacement of petrol fueled cars by EVs, the market for fossil fuels will drop dramatically in the 2020s causing many oil operations to drop out of the market, leaving stranded assets. (Ref: See works by authors Ross Tessian and Tony Seba. Blackrock Investments.) So, not only could oil operations in Ventura become uneconomical, there is a risk to Ventura that cleanup of abandoned operations will be dropped on Ventura's doorstep.

Oil production threatens the health of residents located close oil operations. Benzene, toluene, and hydrogen sulfide, among others, pose health risks, especially to children. To many in the community this is an environmental justice issue. Wells must be properly shutdown to insure safe environment for the community.

I213-1

I recommend phasing out oil operations in the county as soon as possible and cleaning up the operation sites before they become a County financial liability.

Transportation

Technology will disrupt transportation in the 2020s. Many transportation experts are predicting economics will price petrol-fueled vehicles out of the market mid 2020s. Why, because EV's will be cheaper to produce, cheaper per mile to drive and much cheaper to maintain. (They have typically about 18 moving parts compared to 1,000+ moving parts for a petrol car.) Also, battery improvements will lead to cheaper, longer range, faster charging and longer lasting batteries. Already there are many Teslas that have more than 250,000 miles on their batteries and Tesla estimates that their new batteries will last to about 1 million miles). Note that electric vehicles don't use much, if any, oil for lubrication. This will lessen the roadway oil runoff and its associated impacts. And EVs are quieter.

Autonomous electric vehicles will start to come online in the 2020s. This will start a dramatic change in the transportation model. Ride hailing of autonomous vehicles will become the norm. In the future, most people will not own cars – It will be cheaper to just hail a ride with your smartphone. Just tell your phone where you want to go and when, and the ride hailing service will send an autonomous vehicle to pick you up. I envision most future urban transportation will be done this way. (Ref Three Revolutions: Steering Automated, Shared and Electric Vehicles to a Better Future by Daniel Sperling, 2018).

This revolution will mean less land is needed for parking and many parking lots may be repurposed. Transportation over long distances could be done with rail lines and the last miles be done with hailed autonomous vehicles. Rail lines could be built in the medians of many of the existing highways. One specific project could be a light rail connecting CSUCI to the 101 Freeway (Camarillo MetroLink Station). Autonomous trains could provide continuous and on demand service to greatly increase travel convenience. This could be modeled after airport transportation light rails, such as at Hartsfield Airport in Atlanta. (An aside, rail service should be used where possible in place of vehicles with rubber tires to reduce hazardous air particulates). Because of the coming changes, the County should carefully look at the wisdom of investing in road expansions with the possibility that fewer cars will be on the roads in the future.

Also note that the authors Ross Tessian and Tony Seba, to name a few, predict that these changes to will occur quicker than we think, maybe less than a decade.

Economics

Many of the investments in renewal energy will pay for themselves in less than a decade. Implementation of renewable projects should be viewed as an investment. To me it is a no-brainer.

I would encourage the County to assist home owners, builders and apartment owners to find financing for renewal and energy saving investments. Maybe bundling, facilitated by government agencies, would create opportunities for more and less expensive funds to be available.

Renewables have few external costs, whereas fossil fuels have many such as climate change impacts, air pollution, water pollution, health hazards, fire hazard, security costs (domestic and foreign), subsidies, spills, and oil runoff from vehicles to name a few. We all pay for these hidden costs. Considering these costs make the renewables even more attractive.

I213-1
cont.

Other

In the future homes and buildings should run only on electricity – Use heat pumps for heating and cooling, hybrid electrical water heaters and electrical cooking appliances.

Solar panels on rooftops & batteries for housing increases grid stability, reliability and security. It reduces electrical distribution costs and reduces the need for peaker plants. Peaker plants will be a thing of the past.

Environmental justice is a problem in the County, especially near oil operations. Environment justice should be given a heavy weight in considering the future projects to protect Ventura citizens, especially the children.

Comments on some specifics:

CTM-6.6 Policy CTM-6.5: Electric Vehicle Charging Stations.

Comment: Electric vehicles could offer electrical grid stabilization at a low capital cost by utilizing part of their storage to supply power during high electrical demand or when other renewals are not available. This applies to EVs used for personal as well as ride hailing services. As such, charging during daylight hours becomes very desirable and thus charging stations

should be required at all public buildings and parking lots. Businesses should also offer charging at their facilities. Charging hubs that have storage capability to allow for very rapid charging, say, less than 10 minutes, should be built and possibly located at under utilized sites.

Policy COS-8.10: Battery Energy Storage Systems.

Comment: County buildings and critical services should be backed-up using battery storage. This battery storage could be part of a Virtual Power Plant concept (need to coordinate with electrical utilities) and could bring revenue to the County by supply excess capacity during peak demand. Back-up has become very important due to disruptions in electrical service due to fires and fire prevention. These comments also apply to **Implementation Program T: Energy Consumption Performance.**

I213-1
cont.

Policy PFS-7.6: Smart Grid Development.

Comment: Smart grid development is vitally needed to stabilize the grid through both load leveling and utilizing electrical storage efficiently. Battery storage can instantly respond to load variations which will greatly improve efficiency and reduce reserve power levels from variable sources. County building should be equipped with storage and made part of the smart grid.

Thank you for you time and consideration.

Respectfully,

Wayne Morgan
Ventura, CA

|------------------------|------------------------------------------|
| Letter I213 | Wayne Morgan February 27, 2020 |
|------------------------|------------------------------------------|

I213-1

The comment addresses policies of the draft 2040 General Plan related to electric vehicle charging, battery energy storage, and smart grids, expresses concerns about climate change and oil production, and provides commentary about transportation technologies, the economics of renewable energy, and other topics. Refer to Master Response MR-4 regarding the comment to phase out oil production in the county. This comment is acknowledged for the record and will be forwarded to the decision-making bodies for their consideration prior to making a decision on adopting a final 2040 General Plan.

Additionally, the comment expresses concerns about environmental justice. Environmental justice is a social concept that melds concepts of racism, classism, and sexism with environmental conditions and advocates for the equitable distribution of environmental hazards. The federal government evaluates environmental justice pursuant to the National Environmental Policy Act to ensure the fair treatment and meaningful involvement of all people regardless of race, color, national origin, or income with respect to the development, implementation and enforcement of environmental laws, regulations and policies. The California Environmental Quality Act focuses on physical environmental changes, however, and EIRs are not required to treat a project's economic or social effects as significant effects on the environment (State CEQA Guidelines, § 15131). Social and economic effects need only be considered in an EIR where there is a clear link between those economic or social effects and physical environmental changes. The social and economic issues raised in this comment would not result in adverse physical changes to the environment not already addressed in the draft EIR.

February 25, 2020

Ventura County Board of Supervisors
Attn: RMA Planning Division
General Plan Update
800 Victoria Avenue L#1740
Ventura, California 93009-1740

Dear Board of Supervisors and Staff:

We are writing this letter to urge the Board of Supervisors to reconsider moving forward with the Draft General Plan EIR. The draft EIR has been accelerated to the point that too many issues and impacts have not been properly addressed or studied. These impacts and the corresponding mitigation measures will have severe impacts to land owners and especially those, like us in the agricultural industry and other productive economic segments.

I214-1

Our family has been involved in the agricultural industry for more than 100 years in Ventura County. We have owned numerous land holdings that remain in the family to this date. We have farmed throughout Ventura County and hope to continue to do so in the future.

The Draft EIR is deficient on many levels. CEQA requires that all mitigation measures must be technically and economically feasible. Numerous proposed mitigation measures are neither. We have in the past attempted to identify land and any owners that would be open to sell their development rights for land that was converting from agricultural to commercial use. Not only did we not find anyone that would do so, no one would even quote a price. The only positive response from numerous land owners were that you can buy my property for full market value and then you can do what you want. There is not a project that can be built by adding double land cost to the equation. This was very recently experienced based on proposed policies at LAFCo. These policies were eventually not enacted due to the inability to purchase development rights in an economical feasible manner. This was when LAFCo was contemplating an acre for acre ag preserve. The new policy that is proposed in the 2040 General Plan is requiring 2 acres for every 1 acre of land converted from ag to any other use. This will eliminate the ability to add any new required ag buildings or even farm worker housing. The Draft EIR must study these impacts, since they are not feasible.

I214-2

The Draft EIR also deals with water in a manner that is not properly studied. There is no analysis on increased water costs and diminishing availability of water. Without reasonable water costs and supply, there is no agricultural industry.

I214-3

The General Plan indicates that agriculture is a high priority in the County. However, new policies and requirements in the General Plan add additional mitigation measures that will make ag virtually

I214-4

1601 EASTMAN AVENUE, SUITE 100
VENTURA, CALIFORNIA 93003
(805) 642-4773 FAX (805) 642-4662

impossible. These include new setbacks, limiting types of fumigants pesticides and fertilizers. The General Plan also requires the conversion of all farm equipment to be all electric. Again, not feasible. The costs to purchase new pumps, farm equipment and other existing fuel using equipment will increase operational costs to a point that the County crops will not be competitive in the open market. These new mitigation measures are not sufficiently studied and again are not economically feasible.

I214-4
cont.

The Draft EIR is extremely difficult to read and understand. The background reports are lacking in depth of what has been studied other than numerous general statements and very poor mapping. Detailed studies must be added to sufficiently identify impacts and the related mitigation measures for both direct and indirect impacts on the agricultural industry. It is our understanding that reports and studies need to be timely prepared. However numerous studies are older than 5 years. Not timely.

I214-5

After numerous devastating wildfires over the last few years, which significantly impacted ag, the General Plan continues to lay out limiting mitigation measures for fire prevention. The Wildlife corridor eliminates any ag operation or fire prevention in the proposed corridor areas. This is also a major concern not studied in the Draft EIR.

I214-6

The Draft EIR for the 2040 General plan does not provide adequate analysis for the expansion of permanent bike paths and pedestrian walking trails throughout the County. These impacts are very severe due to constant conflicts from trail users and ag operations. Spraying, dust, odors from ag operations, along with impacts created by the trail users. These are usually theft, vandalism, litter and pet waste. The proposed mitigation measures require additional setbacks from these trails which renders additional land unusable for ag operations.

I214-7

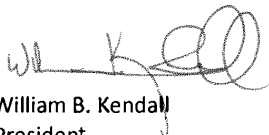

In addition to the above comments on the agricultural aspects and related land use concerns of the DEIR, the undersigned is also a mineral owner directly interested in the impacts on oil and gas production of the DEIR and related General Plan 2040 proposed provisions. In these documents there is a total failure to address the economic impacts of the various policies proposed in violation of the requirements for this process, including but not limited to the loss of royalty income to a large group of County residents. I join in the detailed comments on the various deficiencies and concerns identified in the DEIR as described in the concurrent submissions on behalf of Aera Energy and other operators delivered this week to the County.

I214-8

Please look at the long-term consequences of these General Plan policies and mitigation measures. We formally request additional studies and a revised Draft EIR that will properly look at these and many more issues. The DEIR must be corrected with details of the revisions. Then it can be recirculated.

I214-9

Sincerely,

William B. Kendall
President

Subject: 2040 General plan comment

| |
|------------------------|
| Letter I215 |
|------------------------|

Ventura County fails to adequately analyze for impacts to farmland.

The EIR has policies that will create and expand the bike paths and pedestrian trails throughout the County. Some of these proposed areas are in or adjacent to existing ag land. But the County failed to analyze impacts on ag land from these projects.

These projects will result in the direct loss of ag land (through paving a bike land or path) and in the indirect loss of ag land through increasing public access to working ag lands and encouraging theft, vandalism, and trespassing.

In addition, as the public has more access to working farmlands, there will be an increase of complaints of odors, dust, noise, etc.

The County must protect ag land from encroachment caused by increasing public access across ag lands-propose a mitigation measure to establish a set-back (on non-ag land) that prevents the construction of any bike path network or public trail on or adjacent to ag lands.

I215-1

Sincerely, William A. "Bill" Miller

When we have socialism...what is your fair share of what someone else has worked for?

| | |
|------------------------|----------------------------------------------|
| Letter I215 | William A Miller February 26, 2020 |
|------------------------|----------------------------------------------|

I215-1 The comment states that the draft EIR does not adequately analyze potential impacts to farmland, and provides an example of indirect impacts to farmland related to the development/expansion of adjacent bike paths and pedestrian trails. Refer to responses to comments O7-8 and I4-7 regarding potential incompatibilities with adjacent bicycle and pedestrian paths. The potential for development under the 2040 General Plan to directly cause conversion of Important Farmland to nonagricultural use is addressed in Impact 4.2-1. The draft EIR concludes that impacts would be significant and unavoidable, even after implementation of Mitigation Measures AG-1 and AG-2. This conclusion covers all development undertaken pursuant to the 2040 General Plan, and therefore includes development of bicycle paths.

Re: Comments on Ventura County General Plan DEIR

Dear Ms. Curtis:

I am a part of the McLoughlin Family. We have been farming in Ventura County for approximately 150 years. We currently own 300 acres of agricultural property off of Olivas Park Road in the County of Ventura near the Ventura Marina on Harbor Rd, in proximity to the City of Ventura.

The McLoughlin family has farmed this land and other parcels for generations going back to 1863. It remains our desire to continue this legacy, however, in the face of never-ending changes to the regulatory environment, we again find ourselves attempting to ascertain how new policies and programs as proposed in the draft 2040 General Plan will impact and challenge our ability to serve as stewards of this heritage.

I216-1

It had been our hope that the DEIR would provide some clarity and insight into how the new policies and programs within the revised General Plan would impact our farming operation. That, however, is not the case. Simply said, we believe the General Plan Update and subsequent Environmental Impact Report fail to adequately analyze or study impacts on the farming industry.

With that said, we would like to specifically present the following:

- The Background report Table 6-26: Transportation Department Planned Capital Projects lists sections of roadways the County plans for expanded capacity or widening, along with the scope of those enhancements. It also covers in length the plan to add bike paths and bike lanes in accordance with existing County wayfarer plans. The DEIR, however, never analyzes the loss of farmland resulting from these changes in infrastructure – it’s not even mentioned as a possibility in the DEIR.

I216-2

Olivas Park Road between Victoria and Harbor is listed as one of the areas planned for road widening, a stretch of roadway that borders the entire eastern portion of our farmland and property. While the impact on our farming operation and financial losses due to property loss are clearly quantifiable, the report fails to list or quantify these impacts.

- In Section 3-8, The DEIR states that because there will be no “substantive” change to the agricultural, open space, or rural designations, the General Plan Update (GPU) will be consistent with SOAR. No further details beyond this conclusory statement are provided. There is no way for the reader to come to his or her own conclusion on whether the GPU will result in inconsistencies with SOAR that might lead to physical environmental impacts. There is no description of the changes to the Agriculture, Open Space, and Rural policies to determine whether they are in fact non-substantive.

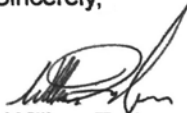

I216-3

Given the length and breath of the Draft General Plan update and CEQA analysis, we made an attempt to focus our initial review and subsequent comments to issues specific to agriculture and farming. It's clear that the 2040 General Plan will impact the Ventura County local economy across sectors – all of which influence the ability to live and work in this region. The DEIR's lack of analysis of those economic impacts, calls into question the legitimacy of both the draft General Plan update, and the CEQA analysis. As such, we respectfully request that the DEIR be recirculated in the hopes that further study will resolve these shortcomings.

I216-4

I appreciate your consideration.

Sincerely,

William Taylor

Kasey Taylor

This comment letter repeats many of the same comments provided in Letter I8. The responses below provide cross references to the portions of Letter I8 where responses to the same comments have already been provided.

- I216-1 Refer to response to comment I8-12 regarding the history of the McLoughlin family, and the adequacy of the 2040 General Plan and draft EIR.
- I216-2 Refer to response to comment I8-3 regarding roadway expansion, addition of bike paths and lanes, and the resulting loss of farmland and impacts related to farming operations.
- I216-3 Refer to response to comment I8-4 and Master Response MR-2 regarding the 2040 General Plan's consistency with the Save Open Space and Agricultural Resources initiative.
- I216-4 Refer to response to comment I8-5 regarding analysis of economic issues in the draft EIR. Also, refer to Master Response MR-7, which explains in detail why recirculation of the draft EIR is not required.

3 REVISIONS TO THE DRAFT EIR

This chapter presents specific text changes made to the draft EIR since its publication and public review. The changes are presented in the order in which they appear in the original draft EIR and are identified by the draft EIR page number. Text deletions are shown in double ~~strike~~through, and text additions are shown in double underline.

The information contained within this chapter clarifies and expands on information in the draft EIR and does not constitute “significant new information” requiring recirculation. (See the Master Response regarding recirculation; see also Public Resources Code Section 21092.1; CEQA Guidelines Section 15088.5.)

3.1 REVISIONS TO CHAPTER 1: INTRODUCTION

To provide clarification, the text of the second paragraph of Section 1.4, “Lead, Responsible, and Trustee Agencies,” on page 1-5 of the draft EIR is revised as follows:

Responsible agencies are agencies other than the lead agency that have discretionary power over carrying out or implementing a specific component of the general plan or for approving a project (such as an annexation) that implements the goals and policies of the general plan. Agencies that may be responsible agencies include: the California Department of Transportation, which has responsibility for approving future improvements to the state highway system; the Department of Conservation, which has responsibility for ~~approving~~ reviewing and commenting on surface mining Reclamation Plans pursuant to the Surface Mining and Reclamation Act and, through its California Geologic Energy Management Division (CalGEM), responsibility for approving oil and gas wells; and the Local Agency Formation Commission of Ventura County, which has responsibility for approving any annexations within the county that might occur over the life of the 2040 General Plan.

3.2 REVISIONS TO CHAPTER 2: EXECUTIVE SUMMARY

For consistency, the text of Table 2-4 beginning on page 2-16 of the draft EIR is revised as follows:

Table 2-4 Summary of Impacts and Mitigation Measures

| Impacts | Significance Before Mitigation | Mitigation Measures | Significance with Mitigation Measures |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------|

New noise sensitive uses proposed to be located near railroads shall incorporate noise control measures so that indoor noise levels in habitable rooms do not exceed Community Noise Equivalent Level (CNEL) 45 and outdoor noise levels do not exceed L_{10} of 60 dB(A) 3. New noise sensitive uses proposed to be located near airports: <ol style="list-style-type: none"> a. Shall be prohibited if they are in a Community Noise Equivalent Level (CNEL) 65 <u>dB</u> or greater, noise contour; or b. Shall be permitted in the Community Noise Equivalent Level (CNEL) 60 <u>dB</u> to CNEL 65 <u>dB</u> noise contour area only if means will be taken to ensure interior noise levels of CNEL 45 <u>dB</u> or less. 4. New noise generators, proposed to be located near any noise sensitive use, shall incorporate noise control measures so that ongoing outdoor noise levels received by the noise sensitive receptor, measured at the exterior wall of the building, does not exceed any of the following standards: <ol style="list-style-type: none"> a. $L_{eq}1H$ of 55dB(A) or ambient noise level plus 3dB(A), whichever is greater, during any hour from 6:00 a.m. to 7:00 p.m.; b. $L_{eq}1H$ of 50dB(A) or ambient noise level plus 3dB(A), whichever is greater, during any hour from 7:00 p.m. to 10:00 p.m.; and c. $L_{eq}1H$ of 45dB(A) or ambient noise level plus 3dB(A), whichever is greater, during any hour from 10:00 p.m. to 6:00 a.m. 5. Construction noise <u>and vibration</u> shall be evaluated and, if necessary, mitigated in accordance with the Construction Noise Threshold Criteria and Control Measures <u>Plan</u> (Advanced Engineering Acoustics, November 2005). <p>Mitigation Measure NOI-3: New Implementation Program HAZ-X: Revise the Construction Noise Threshold Criteria and Control Plan The County shall include the following new implementation program in the 2040 General Plan.</p> | |

Implementation Program HAZ-X: Revise the Construction Noise Threshold Criteria and Control Plan

The County shall revise the Construction Noise Threshold Criteria and Control Plan within one year of 2040 General Plan adoption to consider all potential vibration-inducing activities and include various measures, setback distances, precautions, monitoring programs, and alternative methods to traditional construction activities with the potential to result in structural damage or excessive groundborne noise. Items that shall be addressed in the plan include, but are not limited to, the following:

Ground vibration-producing activities, such as pile driving and blasting, shall be limited to the daytime hours between 7:00 a.m. to 7:00 p.m. on weekdays or 9:00 a.m. to 7:00 p.m. on weekends and holidays.

If pile driving is used, pile holes shall be predrilled to the maximum feasible¹ depth to reduce the number of blows required to seat a pile.

All construction equipment on construction sites shall be operated as far away from vibration-sensitive sites as reasonably possible.

Earthmoving, blasting and ground-impacting operations shall be phased so as not to occur simultaneously in areas close to sensitive receptors, to the extent feasible.¹ The total vibration level produced could be significantly less when each vibration source is operated at separate times.

Minimum setback requirements for different types of ground vibration-producing activities (e.g., pile driving and blasting) for the purpose of preventing damage to nearby structures shall be established. Factors to be considered include the specific nature of the vibration producing activity (e.g., type and duration of pile driving), local soil conditions, and the fragility/resiliency of the nearby structures. Established setback requirements (i.e., 100 feet) can be breached if a project-specific, site specific analysis is conducted by a qualified geotechnical engineer or ground vibration specialist that indicates that no structural damage would occur at nearby buildings or structures.

Minimum setback requirements for different types of ground vibration producing activities (e.g., pile driving and blasting) for the purpose of preventing negative human response shall be established based on the specific nature of the vibration producing activity (e.g., type and duration of pile driving), local soil conditions, and the type of sensitive receptor. Established setback requirements (i.e., 300 feet) can be breached only if a project-specific, site-specific, technically adequate ground vibration study indicates that the buildings would not be exposed to ground vibration levels in excess of 80 VdB, and ground vibration

Table 2-4 Summary of Impacts and Mitigation Measures

| Impacts | Significance Before Mitigation | Mitigation Measures | Significance with Mitigation Measures |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------|

3.3 REVISIONS TO CHAPTER 3: PROJECT DESCRIPTION

No revisions have been made to this chapter of the draft EIR.

3.4 REVISIONS TO CHAPTER 4: ENVIRONMENTAL IMPACT ANALYSIS

No revisions have been made to this section of the draft EIR.

3.5 REVISIONS TO SECTION 4.1: AESTHETICS, SCENIC RESOURCES, AND LIGHT POLLUTION

No revisions have been made to this section of the draft EIR.

3.6 REVISIONS TO SECTION 4.2: AGRICULTURE AND FORESTRY RESOURCES

Mitigation Measure AG-2 has been revised to (1) exempt farmworker housing projects from the requirements Mitigation Measure AG-2; (2) reduce the farmland mitigation ratio from 2:1 to 1:1, and (3) require the deposit of funds to the County to contract with a qualified third-party agricultural economic consultant to review and advise the Planning Division and Agricultural Commissioner regarding the establishment and implementation of the agricultural conservation easement(s). The term “offsite” has also been clarified in the mitigation measure. The revised mitigation measure is as follows:

Implementation Program AG-X: Establish an Agricultural Conservation Easement
Applicants for discretionary projects that would result in direct or indirect loss of Important Farmland in exceedance of the acreage loss thresholds listed in the table below shall be required to ensure the permanent protection of offsite farmland of equal quality at a 1:1 ratio (acres preserved: acres converted) through the establishment of an offsite agricultural conservation easement. “Offsite” means an area that is outside of the project’s permit boundaries if applicable, would not be disturbed by the project with respect to agricultural soils or production, and that otherwise complies with the below-stated requirements. Discretionary projects to develop and provide housing for use by farmworkers and their families are not subject to this agricultural conservation easement requirement.

| <u>General Plan Land Use Designation</u> | <u>Important Farmland Inventory Classification</u> | <u>Acres Lost</u> |
|------------------------------------------|----------------------------------------------------|-------------------|
| <u>Agricultural</u> | <u>Prime/ Statewide</u> | <u>5</u> |
| | <u>Unique</u> | <u>10</u> |
| | <u>Local</u> | <u>15</u> |
| <u>Open Space/Rural</u> | <u>Prime/ Statewide</u> | <u>10</u> |
| | <u>Unique</u> | <u>15</u> |
| | <u>Local</u> | <u>20</u> |
| <u>All Land Use Designations</u> | <u>Prime/ Statewide</u> | <u>20</u> |
| | <u>Unique</u> | <u>30</u> |
| | <u>Local</u> | <u>40</u> |

If the Planning Division, in consultation with the Agricultural Commissioner, determines that a discretionary project would result in direct or indirect loss of Important Farmland in exceedance of the acreage loss thresholds listed in the table above, the project applicant shall prepare and submit a report for the review and approval of the Planning Division in consultation with the Agricultural Commissioner which identifies a minimum of one proposed potential mitigation site suitable for ensuring the permanent protection of offsite farmland of equal quality at a 2:1 ratio (acres preserved: acres converted) through the establishment of ~~an~~ one or more offsite agricultural conservation easements. The preservation of more than one site agricultural conservation easement may be considered in order to meet the required number of acres. The applicant shall also deposit funds with the County to contract with a qualified third-party agricultural economic consultant to review and advise the Planning Division and Agricultural Commissioner regarding the establishment and implementation of the agricultural conservation easement(s). The contents of the report shall be determined, reviewed, and approved by the Planning Division in consultation with the Agricultural Commissioner (hereafter referred to as the “reviewing agencies”), and shall include information necessary for the reviewing agencies and a qualified entity responsible for holding the conservation easement (e.g., a land trust organization) to determine the viability of the proposed mitigation site(s) for the establishment of a permanent agricultural conservation easement.

Among the factors necessary for approval by the reviewing agencies, the proposed mitigation site(s) shall be located in the County of Ventura unincorporated area, must not already have permanent protection, ~~and~~ must be equivalent to or greater than the type of Important Farmland (e.g., Unique farmland) that would be converted by the project, and must be of sufficient size to be viable for long term farming use as determined by the County. Among other terms that may be required by the reviewing agencies in consultation with a qualified entity, the terms of an agricultural conservation easement shall include a requirement that it run with the land. There must also be a provision for annual monitoring by the qualified entity or its representative to ensure adherence to the terms of the conservation easement. Project applicants are responsible for all costs incurred by the County and the qualified entity to successfully implement this mitigation measure. Proof of the successful establishment of an agricultural conservation easement shall be provided to the Planning Division prior to issuance of a zoning clearance for inauguration of the project.

3.7 REVISIONS TO SECTION 4.3: AIR QUALITY

The text of Mitigation Measures AQ-1a and AQ-1b have been revised in the final EIR to include a definition for the term “feasible.” Additionally, Mitigation Measure AQ-1b has been revised for consistency with the Ventura County Air Pollution Control District’s recommendation that measures to reduce construction-related emissions be incorporated into every project requiring discretionary County approval as explained in response to comment A14-2. Revisions made to Mitigation Measures AQ-1a and AQ-1b are provided below.

Mitigation Measure AQ-1a: New Policy HAZ-X: Construction Air Pollutant Best Management Practices
The County shall include the following new Policy HAZ-X in the 2040 General Plan.

Policy HAZ-X: Construction Air Pollutant Best Management Practices

Discretionary development projects that will generate construction-related air emissions shall be required by the County to incorporate best management practices (BMPs) to reduce emissions. These BMPs shall include the measures recommended by VCAPCD in its Air Quality Assessment Guidelines or otherwise to the extent applicable to the project.

~~The County shall ensure that discretionary development will, to the extent feasible, incorporate best management practices (BMPs) to reduce emissions to be less than applicable thresholds. These BMPs include but are not limited to the most recent VCAPCD recommendations for construction BMPs (per the Air Quality Assessment Guidelines or as otherwise identified by VCAPCD).~~

Mitigation Measure AQ-1b: New Implementation Program HAZ-X: Construction Air Pollutant Best Management Practices

The County shall include the following new implementation program in the 2040 General Plan.

Implementation Program HAZ-X: Construction Air Pollutant Best Management Practices

Implementation Program HAZ-X: Construction Air Pollutant Best Management Practices

~~Applicants for future d~~Discretionary development projects that would will generate construction-related air emissions that exceed applicable thresholds, will shall be required to include, but are not limited to, the following types of emission reduction mitigation measures and potentially others, as recommended by VCAPCD (in its Air Quality Assessment Guidelines Guidance or otherwise), to the extent feasible and applicable to the project as determined by the County: The types of measures shall include but are not limited to: maintaining equipment per manufacturer specifications; lengthening construction duration to minimize number of vehicle and equipment operating at the same time during the summer months; use of Tier 3 at a minimum, or Tier 4 if commercially available diesel engines in all off-road construction diesel equipment, at a minimum; and, if feasible¹ using electric-powered or other alternative fueled equipment in place of diesel powered equipment (whenever feasible).

1. "Feasible" means that this mitigation measure shall be applied to future discretionary projects under the 2040 General Plan when and to the extent it is "capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social, and technological factors" as determined by the County in the context of such future projects based on substantial evidence. This definition is consistent with the definition of "feasible" set forth in CEQA (Pub. Res. Code, § 21066.1) and the CEQA Guidelines section 15164). The County shall be solely responsible for making this feasibility determination in accordance with CEQA.

Mitigation Measure AQ-2a on page 4.3-15 is revised as follows:

Mitigation Measure AQ-2a: New Policy HAZ-X: Fugitive Dust Best Management Practices

The County shall include the following new policy in the 2040 General Plan.

Policy HAZ-X: Fugitive Dust Best Management Practices

The County shall ensure that discretionary development which will generate fugitive dust emissions during construction activities will, to the extent feasible, incorporate appropriate BMPs that to reduce emissions to be less than applicable thresholds.

For clarification, Mitigation Measure AQ-2b on page 4.3-15 has been revised to remove the duplicative bullet point and for consistency with the Ventura County Air Pollution Control District's recommendation that measures to reduce construction-related fugitive dust be incorporated into every project requiring discretionary County approval:

Mitigation Measure AQ-2b: New Implementation Program HAZ-X: Fugitive Dust Best Management Practices

The County shall include the following new implementation program in the 2040 General Plan.

Implementation Program HAZ-X: Fugitive Dust Best Management Practices

Applicants for future d) Discretionary development projects that which will generate construction-related fugitive dust emissions that exceed applicable thresholds will shall be required by the County to include, but are not limited to, the types of mitigation dust reduction measures recommended by VCAPCD's in its Air Quality Assessment Guidelines, or otherwise, to the extent feasible and applicable such as:

- ~~▶ The area disturbed by clearing, grading, earth moving, or excavation operations shall be minimized to prevent excess amounts of dust.~~
- ▶ The area disturbed by clearing, grading, earth moving, or excavation operations shall be minimized to prevent excess amounts of dust.
- ▶ Pre-grading/excavation activities shall include watering the area to be graded or excavated before commencement of grading or excavation operations. Application of watering (preferably reclaimed, if available) should penetrate sufficiently to minimize fugitive dust during grading activities.
- ▶ Fugitive dust produced during grading, excavation, and construction activities shall be controlled by the following activities:
 - All trucks shall be required to cover their loads as required by California Vehicle Code Section 23114.
 - All graded and excavated material, exposed soil areas, and active portions of the construction site, including unpaved on-site roadways, shall be treated to prevent fugitive dust. Treatment shall include, but not necessarily be limited to, periodic watering, application of environmentally-safe soil stabilization materials, and/or roll-compaction as appropriate. Watering shall be done as often as necessary and reclaimed water shall be used whenever possible.

- ▶ Graded and/or excavated inactive areas of the construction site shall be monitored by (indicate by whom) at least weekly for dust stabilization. Soil stabilization methods, such as water and roll-compaction, and environmentally-safe dust control materials, shall be periodically applied to portions of the construction site that are inactive for over four days. If no further grading or excavation operations are planned for the area, the area should be seeded and watered until grass growth is evident, or periodically treated with environmentally-safe dust suppressants, to prevent excessive fugitive dust.
- ▶ Signs shall be posted on-site limiting traffic to 15 miles per hour or less.
- ▶ During periods of high winds (i.e., wind speed sufficient to cause fugitive dust to impact adjacent properties), all clearing, grading, earth moving, and excavation operations shall be curtailed to the degree necessary to prevent fugitive dust created by on-site activities and operations from being a nuisance or hazard, either off-site or on-site. The site superintendent/supervisor shall use his/her discretion in conjunction with VCAPCD when winds are excessive.
- ▶ Adjacent streets and roads shall be swept at least once per day, preferably at the end of the day, if visible soil material is carried over to adjacent streets and roads.
- ▶ Personnel involved in grading operations, including contractors and subcontractors, should be advised to wear respiratory protection in accordance with California Division of Occupational Safety and Health regulations.

The County has added the following text to Impact 4.3-3 on page 4.3-17 to clarify and expand on the acute and chronic health impacts associated with emissions of ROG and NOX that exceed VCAPCD thresholds of significance:

As shown in Table 4.3-4, operational activities would result in emissions of ROG and NOX that exceed the VCAPCD thresholds of significance for both countywide and the Ojai Valley. As discussed in the “Thresholds of Significance” section, VCAPCD developed these thresholds in consideration of achieving and maintaining the NAAQS and CAAQS, which represent concentration limits of criteria air pollutants and precursors needed to adequately protect human health. ~~Therefore, the 2040 General Plan’s contribution to operational criteria air pollutants and precursors could result in greater acute or chronic health impacts compared to existing conditions.~~

The addition of ROG and NO_x, which are precursors to ozone, could result in an increase in ambient concentrations in Ventura County and, moreover, increase the likelihood that ambient concentrations exceed the CAAQS and NAAQS. As summarized in the January 2020 Background Report, human exposure to ozone may cause acute and chronic health impacts including coughing, pulmonary distress, lung inflammation, shortness of breath, and permanent lung impairment. Also, the increase in operational emissions of PM₁₀ could impede air quality planning efforts to bring Ventura County into attainment of the CAAQS for PM₁₀. However, it would be misleading to correlate the levels of criteria air pollutant and precursor emissions associated with implementation of the 2040 General Plan to specific health outcomes to sensitive receptors. While the description of the effects noted above could manifest in the recipient receptors, actual

effects on individuals depend on individual factors, such as life stage (e.g., older adults are more sensitive), preexisting cardiovascular or respiratory diseases, and genetic polymorphisms. Even armed with this type of specific medical information (which is confidential to the individual), there are wide ranges of potential health outcomes from exposure to ozone precursors and particulates, from no effect to the effects described above. Therefore, other than determining the types of health effects that could occur, it would be speculative to more specifically correlate exposure to ozone precursors and particulates from the 2040 General Plan to specific health outcomes to receptors. By evaluating emissions of air pollutants against VCAPCD's thresholds, it is foreseeable that health complications associated with ozone and PM₁₀ exposure could be exacerbated to nearby sensitive receptors by operational emissions.

To clarify the discussion provided in the draft EIR, the County has made the following revisions to the discussions of Policy HAZ-10.5 and HAZ-10.12 on page 4.3-18:

~~Policy~~ HAZ-10.5 states that the County shall work with applicants for discretionary development projects to incorporate measures to reduce air pollution impacts and greenhouse gas emissions, such as bike facilities, solar water heating, solar space heating, electric appliances and equipment, and zero and near-zero emission vehicles, and HAZ 10.12 would require that discretionary development with significant adverse air quality impacts only be approved if it is conditioned with all feasible reasonable mitigation measures to avoid, minimize or compensate for the impact.

To provide additional mitigation to reduce local toxic exposure from heavily traveled transportation corridors Mitigation Measure AQ-3 (page 4.3-22) is revised as follows:

Mitigation Measure AQ-3: New Policy HAZ-10.X: ~~Setback Requirements~~ Health Risk Assessments for Sensitive Land Uses Near Heavily Traveled Transportation Corridors

The County shall include the following new policy in the 2040 General Plan.

Policy HAZ-10.X: ~~Setback Requirements~~ Health Risk Assessments for Sensitive Land Uses Near Heavily Traveled Transportation Corridors

The County shall require discretionary development for land uses which that include sensitive receptors which are considered to be populations or uses that are more susceptible to the effects of air pollution than the general population, such as long-term health care facilities, rehabilitation centers, retirement homes, convalescent homes, residences, schools, childcare centers, and playgrounds are be located at least 500 1,000 feet from any freeway or urban road with traffic volumes that exceed 100,000 vehicles per day, or rural roads that exceed 50,000 vehicles per day. New sensitive receptor use structures can be located within 500 1,000 feet from a new or existing freeway or urban road with traffic volumes that exceed 100,000 vehicles per day, or rural road with traffic volumes that exceed 50,000 vehicles per day only if a project applicant first prepares a qualified, site-specific health risk assessment (HRA). The HRA shall be conducted in accordance with guidance from VCAPCD and approved by VCAPCD. If the HRA determines that a nearby sensitive receptor would be exposed to an incremental increase in cancer risk greater than 10 in 1 million, then design measures shall be incorporated to reduce the level of risk exposure to less than 10 in 1 million. No further action shall be required if the HRA demonstrates that the level of cancer risk would be less than 10 in 1 million.

Project design features that may be considered in an HRA may include, but are not limited to: installing air intakes furthest away from the heavily traveled transportation corridor; installing air filtration (as part of mechanical ventilation systems or stand-alone air cleaner); using air filtration devices rated MERV-13 or higher; requiring ongoing maintenance plans for building HVAC air filtration systems; limiting window openings and window heights on building sides facing the heavily traveled transportation corridor; or permanently sealing windows so they don't open on the side of the building facing the heavily traveled transportation corridor; and installing vegetative barriers, considering height and cover thickness, to create a natural buffer between sensitive receptors and the emissions source. For purposes of this policy, "sensitive receptors" means populations or uses that are more susceptible to the effects of air pollution than the general population such as long-term health care facilities, rehabilitation centers, retirement homes, convalescent homes, residences, schools, childcare centers, and playgrounds.

For clarification, the text on page 4.3-24 has been revised as shown below:

To deter ~~from~~ potential conflicts with existing agricultural land uses, as part of the Right to Farm ordinance, ~~the County is~~ buyers of real property are required to give notice of this ordinance to buyers of real property located in the county. The County also has a mediation process for any disputes involving agricultural land uses and issue opinions on whether certain agricultural land uses constitute a nuisance. The County's "Right to Farm" ordinance serves to mitigate issues regarding exposure of sensitive receptors to odors from agricultural land and operations while protecting agricultural land uses in the county. This ordinance would serve to protect agricultural lands in the county during implementation of the 2040 General Plan and mitigate issues regarding exposure of sensitive receptors to odors from agricultural land operation that may be considered a nuisance.

3.8 REVISIONS TO SECTION 4.4: BIOLOGICAL RESOURCES

For clarity, page 4.4-14 is revised as follows:

ISSUES NOT DISCUSSED FURTHER

Consistency with Adopted Habitat Conservation Plans

No habitat conservation plans or natural community conservation plans have been adopted within the plan area of the 2040 General Plan. There would be no impact due to conflict with conservation plans or natural community conservation plans. This issue is not discussed further.

For clarification, Section 4.4.2, "Environmental Impacts and Mitigation Measures," is revised to incorporate Policy WR-7.1 on page 4.4-17 (following the bullet, "Policy COS 9.3: Open Space Preservation"):

Conservation and Open Space Element

- ▶ **Policy WP-7.1: Water for the Environment.** The County encourage the appropriate agencies to effectively manage water quantity and quality to address long-term adequate availability of water for environmental purposes, including maintenance of

existing groundwater-dependent habitats and in-stream flows needed for riparian habitats and species protection. (IGC) [New Policy]

For clarification, page 4.4-20 of the draft EIR has been edited as follows:

The Rural land use designation would allow for low-density and low-intensity land uses such as residential uses and other rural uses which are maintained in conjunction with agricultural and horticultural uses or in conjunction with the keeping of farm animals for recreational purposes, such as greenhouses, principal and accessory structures related to agriculture, and also oil and gas wells, and would apply to approximately 0.9 percent of land in the unincorporated county.

For clarification, in response to public comments and to provide alignment with existing practices identified in the Initial Study Assessment Guidelines for the evaluation of discretionary development that could potentially impact sensitive biological resources Mitigation Measure BIO-1 beginning on page 4.4-23 is revised as follows:

Mitigation Measure BIO-1: New Implementation Program COS-X: Protection of Sensitive Biological Resources
The County shall include the following new implementation program in the 2040 General Plan.

~~**Implementation Program COS-X: Protection of Sensitive Biological Resources**~~

~~The County shall update the Initial Study Assessment Guidelines, Biological Resources Assessment report criteria to evaluate discretionary development that could potentially impact sensitive biological resources with the following:~~

~~The qualified biologist shall conduct an initial data review to determine the sensitive biological resources (i.e., special status plant, special status wildlife, sensitive habitats [e.g., riparian habitat, sensitive plant communities, ESHA, coastal beaches, sand dunes, other sensitive natural communities], wetlands and other non-wetland waters, native wildlife nursery sites, or wildlife corridors) that have the potential to occur within the project footprint. This will include but not be limited to review of the best available, current data including vegetation mapping data, mapping data from the County and California Coastal Commission, and database searches of the CNDDB and the CNPS Inventory of Rare and Endangered Plants of California.~~

~~The qualified biologist shall conduct a reconnaissance level survey for sensitive biological resources within the project footprint (including proposed access roads, proposed staging areas, and the immediate vicinity surrounding the project footprint) to determine whether sensitive biological resources identified during the initial data review have potential to occur.~~

~~If the reconnaissance level survey identifies no potential for sensitive biological resources to occur, the applicant will not be subject to additional mitigation measures.~~

~~If sensitive biological resources are observed or determined to have potential to occur within or adjacent to the project footprint during the reconnaissance level survey, then the following measures shall apply:~~

~~Special Status Species~~

~~If special status species are observed or determined to have potential to occur within or adjacent to the project footprint, a qualified biologist shall conduct focused or protocol level surveys for those species where established, current protocols are available (e.g., Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Natural Communities [CDFW 2018], Staff Report on Burrowing Owl Mitigation [CDFG 2012]). If an established protocol is not available for a special status species, then the qualified biologist will consult with the County, and CDFW or USFWS, to determine the appropriate survey protocol.~~

~~If special status species are identified during protocol level surveys, then the County shall require implementation of mitigation measures that fully account for the adversely affected resource. When feasible, mitigation measures should adhere to the following priority: avoid impacts, minimize impacts, and compensate for impacts.~~

~~If impacts on special status species are unavoidable, then the project proponent shall obtain incidental take authorization from USFWS or CDFW (e.g., for species listed under ESA or CESA) prior to commencing development of the project site, apply minimization measures or other conditions required under incidental take authorization, and shall compensate for impacts to special status species by acquiring or protecting land that provides habitat function for affected species that is at least equivalent to the habitat function removed or degraded as a result of project implementation; generally at least a 1:1 ratio. Compensation may include purchasing credits from a USFWS or CDFW approved mitigation bank or restoring or enhancing habitat within the project site or outside of the project site.~~

~~Sensitive Habitats, Wetlands, Other Non-wetland Waters, Native Wildlife Nursery Sites, and Wildlife Corridors~~

~~If sensitive habitats, wetlands, other non-wetland waters, native wildlife nursery sites, and wildlife corridors are identified within or adjacent to the project footprint, these features shall be avoided, if feasible, by implementing no-disturbance buffers around sensitive habitats, wetlands, other non-wetland waters, or native wildlife nursery sites, and avoiding development within wildlife corridors or implementing project-specific design features (e.g., wildlife-friendly fencing and lighting) within wildlife corridors, such that direct and indirect adverse effects of project development are avoided.~~

~~A delineation of aquatic habitat within a project site (including waters of the United States and other waters including those under State jurisdiction) including identification of hydrology, hydric soils, and hydrophytic vegetation, by a qualified biologist may be required to identify the exact extent of wetlands or other water features identified within or adjacent to the project footprint.~~

~~If impacts to sensitive habitats, wetlands, other non-wetland waters, native wildlife nursery sites, and wildlife corridors cannot be avoided, then the project proponent shall obtain required regulatory authorization (e.g., Section 404 permits for impacts to waters of the United States, 401 water quality certification from the Regional Water Quality Control Board, a Streambed Alteration Agreement for impacts to aquatic or riparian habitats within CDFW jurisdiction under Fish and Game Code Section 1602, a coastal development permit for impacts to ESHA), and shall compensate for unavoidable losses of these resources. Compensation may include restoration of sensitive habitats, wetlands, other non-wetland waters, native wildlife nursery sites, and wildlife corridors within or outside of the project site, preserving the aforementioned resources through a conservation easement at a sufficient ratio to offset the loss of acreage and habitat function, or purchasing credits at an existing authorized mitigation bank or in lieu fee program. The County shall require restoration or compensation for loss of sensitive habitats, wetlands, other non-wetland waters, native wildlife nursery sites, and wildlife corridors at a minimum of a 1:1 ratio or "no net loss."~~

Implementation Program COS-X: Protection of Sensitive Biological Resources

For any future discretionary development project that could potentially impact sensitive biological resources, the project shall be evaluated pursuant to the methodology described in the Ventura County Initial Study Assessment Guidelines which shall be amended within one year of 2040 General Plan adoption to include the following:

A preliminary assessment of the project shall be completed by County staff, in consultation with a qualified biologist, using available mapped biological resource data and aerial imagery to determine if the project has the potential to impact sensitive biological resources in the defined impact area (direct and indirect impacts). County staff will determine if project conditions or mitigation measures can be developed and implemented that would reduce or avoid those impacts to a less than significant level without requiring a more comprehensive biological resource assessment, otherwise known as an Initial Study Biological Assessment. Examples of projects that would not require a biological resource assessment may include but are not limited to: Projects that occur in previously developed areas, if additional vegetation removal is not required or the use may not impact surrounding natural areas; or projects on land consisting of non-native grasslands totaling less than one acre that are completely surrounded by existing urban development (such as urban infill lots).

If County staff find that the project may adversely affect sensitive biological resources, then a County approved qualified biologist shall prepare a biological resource assessment to assess and mitigate the adverse impacts of the proposed project. The procedures detailed in Step 3 of the County of Ventura Initial Study Guidelines, Biological Resources Chapter, Methodology Section shall be followed to prepare this biological resource assessment.

The biological resource assessment shall be conducted by a County approved qualified biologist that meets the minimum qualifications for

biological consultants listed in Attachment 1 to the County of Ventura Initial Study Assessment Guidelines. The qualified biologist shall have expertise in the taxonomic group or species on which the surveys are focused as well as the County's data review procedures and survey methods recommended by natural resource agencies or commonly accepted standards in the taxonomic group, community, or species (e.g., California Native Plant Society survey protocols).

The biological field survey area will be determined by the County agency responsible for administering the project with consideration of recommendations from the qualified biologist. The survey area will include all areas of proposed disturbance, including associated equipment or personnel staging areas, and the surrounding area of potential sensitive biological resources that may be indirectly adversely affected by the project. The size of the survey area will be based on the characteristics of surrounding habitat, the potential for sensitive biological resources to occur, and the nature of the project. For example, an infill project within an already developed area may not require a large survey area; however, a development project adjacent to natural habitat may require a larger survey area based on the potential for disturbance. The procedure for delineating the size of the survey area will follow Step 1 of the County of Ventura Initial Study Guidelines, Biological Resources Chapter, Methodology Section.

Prior to conducting any field surveys, the qualified biologist shall conduct an initial data review to determine the type of sensitive biological resources that may occur within the survey area using the procedures detailed in Step 3 (a) of the County of Ventura Initial Study Guidelines, Biological Resources Chapter, Methodology Section. This will include but not be limited to review of the best available, current data including: vegetation mapping data, mapping data from the County (Locally Important Species, Habitat Connectivity and Wildlife Corridor, Water Protection District data, past biological reports in the area, etc.); National Wetland Inventory Database (NWI); USGS National Hydrographic Dataset; EcoAtlas; and database searches of the US Fish and Wildlife Service Critical Habitat, Environmental Conservation Online System (ECOS) and Information, Planning, and Conservation System (IPaC); California Department of Fish and Wildlife (CDFW) California Natural Diversity Database (CNDDDB); and California Native Plant Society (CNPS) Inventory of Rare and Endangered Plants of California; Audubon Important Bird Areas and Red Lists, Xerces Society, etc.

Biological Inventory -Special Status Species, Sensitive Habitats, Wetlands, Other Non-wetland Waters, Native Wildlife Nursery Sites, and Wildlife Corridors

The biological inventory shall be conducted as detailed in Step 3 (b) Conduct Field Survey and (c) biological inventory, of the County of Ventura Initial Study Guidelines, Biological Resources Chapter, Methodology Section, which includes a general floristic survey of the project impact areas.

Vegetation communities within the survey area shall be inventoried using the CDFW vegetation classification standards (Manual of California Vegetation) and the most

recent version of CDFW vegetation mapping standards “Survey of California Vegetation Classification and Mapping Standards [CDFW, 2019].

If the initial data review shows a wetland or water occurring within 300 feet (in non-coastal zone) or 500 feet (in coastal zone) from the edge of the proposed disturbance areas, then a qualified biologist shall delineate the aquatic habitat (including waters of the United States and other waters including those under State jurisdiction). A summary of the type of aquatic habitat, primary water source, species diversity, connectivity to off-site habitat or other hydrological features, hydric soils, and hydrophytic vegetation, and the boundary of the feature (based upon the outermost limit of associated vegetation (canopy drip line or scrub line), hydric soils, bank and bed – whichever is greater) shall be included in the biological resource assessment.

If the initial data review indicates that sensitive biological resources have the potential to occur within the survey area, a qualified biologist shall conduct additional focused surveys for these species or other protected habitats using the most recently updated protocols recommended by natural resource agencies (e.g., Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Natural Communities [CDFW 2018], Staff Report on Burrowing Owl Mitigation [CDFG 2012]), or if not available, standards accepted in the professional biological community to survey that taxonomic group, community, or species. If an established protocol is not available for a special-status species then the qualified biologist will consult with the County, and CDFW or USFWS, to determine the appropriate survey protocol.

Mitigation for Special-Status Species, Sensitive Habitats, Wetlands, Other Non-wetland Waters, Native Wildlife Nursery Sites, and Wildlife Corridors

If a sensitive biological resource is identified during field surveys, then the County shall require implementation of mitigation measures at the project level that fully account for the adversely affected resource. To the maximum extent feasible, mitigation measures should adhere to the following priority to reduce adverse impacts of a proposed project to the resource: avoid impacts, minimize impacts, and compensate for impacts.

Mitigation measures shall be used on a project level basis and be tailored to on site conditions and sensitive biological resources present as follows:

- Priority 1. Avoid of Impacts: Proposed development shall avoid impacts to the maximum extent feasible by not taking certain actions or parts of an action. Projects shall be sited to avoid direct or indirect impacts on the resource, and include measures such as implementing no-disturbance buffers (e.g., nesting bird buffer areas during construction, siting staging areas outside buffer area), or implementing project-specific design features (e.g., wildlife-friendly fencing and lighting in a wildlife corridor), such that indirect adverse effects of project development are avoided.
- Priority 2. Minimize Impacts: Proposed development shall be conditioned to minimize adverse impacts by limiting the degree or magnitude of the action and its implementation to less than significant to the maximum extent feasible. Other

mitigation measures may include reducing or eliminating the impact over time by preservation and maintenance operations during the life of the action.

Measures to mitigate the spread of invasive plant species and invasive wildlife species (e.g., New Zealand mudsnail) shall include but will not be limited to: cleaning of equipment, footwear, and clothing before entering a construction site and the identification and treatment of significant infestations of invasive plant species within a project site.

- Priority 3. Compensate for Impacts: Compensating for the impact can be done by replacing or providing substitute resources or by rectifying the impact by repairing, rehabilitating, or restoring the impacted environment.

Compensatory mitigation ratios for protected sensitive resources will be established based on the rarity of the resource, quality of affected habitat associated with the resource, temporary and permanent losses to habitat function, the type of mitigation proposed (restoration, enhancement, preservation, establishment), and other requirements associated with state or federal permits. Mitigation ratios will be determined at the project level in consultation with the County, the qualified biologist, and, where applicable, federal or state agencies with jurisdiction over the resource (e.g., CDFW, USACE, USFWS).

If impacts on a protected sensitive biological resource are unavoidable, then the project proponent shall mitigate for the type of resource as follows:

Endangered, Rare, Threatened, or Candidate Species: The applicant shall obtain incidental take authorization from USFWS (16 U.S. Code [U.S.C.] Section 1531 et seq.) or CDFW (California Fish and Game Code Sections 2050–2115.5) prior to commencing development of the project site, apply minimization measures or other conditions required under the incidental take authorization, and shall provide equivalent compensation for the unavoidable losses of these resources, generally at a minimum ratio of 1:1, or greater. Compensation may include purchasing credits from a USFWS- or CDFW-approved mitigation bank or restoring or enhancing habitat within the project site or outside of the project site.

Special-Status Species (includes Locally Important Species): The applicant shall provide equivalent compensation for impacts on special-status species by restoring or significantly enhancing existing habitat where the species occurs, acquiring or protecting land that provides habitat function for affected species that is at least equivalent to the habitat function removed or degraded as a result of project implementation.

If impacts on sensitive habitats, wetlands, other non-wetland waters, riparian habitats, native wildlife nursery sites, and wildlife corridors cannot be avoided, then the project applicant shall:

Federal or State Protected Sensitive Habitats: Obtain the required regulatory authorization (e.g., Section 404 permits for impacts on waters of the United States, 401 water quality certification from the Regional Water Quality Control Board, a Streambed Alteration Agreement for impacts on aquatic or riparian habitats within

CDFW jurisdiction under Fish and Game Code Section 1602, a coastal development permit for impacts on ESHA), and provide equivalent compensation for the unavoidable losses of the above mentioned resources such that there is no net loss.

Other Protected Sensitive Habitats (includes locally important plant communities, sensitive natural communities, habitat connectivity and wildlife corridors, native wildlife nursery or overwintering sites): Provide compensation for other protected sensitive habitats which may include the restoration, enhancement, or preservation of the aforementioned habitats within or outside of the project site, or the purchasing of credits at an existing mitigation bank or in lieu fee program deemed acceptable by the County Planning Director.

All compensatory mitigation sites shall be protected in perpetuity through a conservation easement (if off-site), or deed restriction (or other comparable legal instrument) if on-site.

The County shall, in harmonizing the 2040 General Plan with the Ventura County Initial Study Assessment Guidelines, add definitions for the habitat types included in this mitigation measure, including which components are subject to compliance with the County's Local Coastal Program and Coastal Zoning Ordinance versus non-coastal areas.

1. "Feasible" means that this mitigation measure shall be applied to future discretionary projects under the 2040 General Plan when and to the extent it is "capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social, and technological factors" as determined by the County in the context of such future projects based on substantial evidence. This definition is consistent with the definition of "feasible" set forth in CEQA (Pub. Res. Code, § 21066.1) and the CEQA Guidelines (§ 15164). The County shall be solely responsible for making this feasibility determination in accordance with CEQA.

2. "Mitigation, No-Net-Loss" A principle where if a development project cannot avoid the loss of a valued natural resource, the project mitigates the impacts by replacing the impacted habitat with a newly created or restored habitat of the same size and similar functional condition so that there is no loss of ecological functions and values of that habitat type for a defined area. Similar functional condition means the relative ability to support and maintain the same species composition, diversity, and functional organization as the impacted habitat.

For clarification page 4.4-31 of the draft EIR has been edited as follows:

In addition to existing federal and State laws and permitting processes, the 2040 General Plan includes several policies and implementation programs that would further reduce potential impacts on wildlife corridors and native wildlife nursery sites and require project-level environmental review and mitigation for significant impacts (see "General Plan Update Policies and Implementation Programs," above). For example, Policies COS-1.1 and COS-1.2 address the protection and consideration of sensitive biological resources, which include wildlife movement corridors and native wildlife nursery site. Because these features are typically considered sensitive biological

resources, implementation of Policies COS-1.1 and COS 1.2 would require evaluation of these features during site-specific surveys as well as development of mitigation measures to avoid, minimize, or compensate for impacts. Policies COS-1.7, COS-1.8, COS-1.9, COS-1.10, and COS-1.11 include requirements ~~to requirements~~ for environmental review for projects within 300 feet of wetland habitat, implementation of 100-foot setbacks from wetland habitat, incorporation of protective design features to avoid impacts to riparian habitat, and requirements for consultation with natural resources agencies for guidance regarding avoidance and minimization of impacts to rare, threatened, or endangered species. These requirements would have an indirect benefit on wildlife movement corridors and native wildlife nursery sites as these features are frequently associated with sensitive biological habitats (e.g., wetlands, riparian corridors). Policies COS-2.2, COS-2.4, COS-2.8, COS-2.9, COS-2.10, COS-2.11 address habitat conservation and protection of fisheries and marine resources within the Coastal Zone. Policies COS-1.3, COS-1.4, and COS-1.5 specifically address impacts on wildlife movement. For instance, the County is required to consider impacts to wildlife movement as part of the discretionary project review process, and the design and maintenance of floodplain improvements including culverts and bridges must be reviewed by a qualified biologist to accommodate feasible wildlife passage measures. Policy COS-9.3 addresses preservation of open space lands for habitat protection and wildlife movement. Development within the county will also be guided by nine Area Plans; however, the policies of these Area Plans do not provide additional or more specific protection for resident or migratory wildlife corridors or native wildlife nursery sites than the 2040 General Plan policies.

3.9 REVISIONS TO SECTION 4.5: CULTURAL, TRIBAL CULTURAL, AND PALEONTOLOGICAL RESOURCES

For clarification, the text of Mitigation Measure CUL-1a on page 4.5-15 is refined as shown below:

Mitigation Measure CUL-1a: Revised Policy COS-4.4: Discretionary Development and Cultural, Historical, Paleontological, and Archaeological Resource Preservation

The County shall include the following revised policy in the 2040 General Plan.

Policy COS-4.4: Discretionary Development and Tribal, Cultural, Historical, Paleontological, and Archaeological Resource Preservation

The County shall require that all discretionary development projects be assessed for potential tribal, cultural, historical, paleontological, and archaeological resources by a qualified professional and shall be designed to protect existing resources, and shall avoid potential impacts to these resources whenever to the maximum extent feasible. ~~Whenever possible, significant impacts shall be reduced to a less-than-significant level through the application of feasible mitigation and/or shall be mitigated by extracting extraction of maximum recoverable data. Priority shall be given to measures that avoid resources.~~

In response to the County's tribal consultation process with the Fernandeano Tataviam Band of Mission Indians, the text of Mitigation Measure CUL-1c on page 4.5-16 is revised as shown below:

Mitigation Measure CUL-1c: New Implementation Program COS-X: Cultural, Historical, Paleontological, and Archaeological Resource Assessment Procedures

The County shall include the following new implementation program in the 2040 General Plan.

Implementation Program COS-X: Cultural, Historical, Paleontological, and Archaeological Resource Assessment Procedures

For discretionary projects, the County shall require the following:

Projects shall be designed to protect existing resources and shall avoid potential impacts to the maximum extent feasible.¹

If determined necessary by the County, an archaeological, or paleontological, and/or Native American monitor shall be retained to monitor ground-disturbing activities during construction.

If any materials or artifacts are discovered during ground disturbance and/or construction activities, construction shall halt until a qualified archaeologist, paleontologist, or Native American monitor can access the discovery. A report or memorandum shall be prepared by the qualified monitor documenting any findings and identifying recommendations for protection or avoidance of discovered resources. Recommendations or mitigation identified by the qualified monitor shall be implemented prior to commencing or continuing project activities and/or construction.

1. "Feasible" means that this mitigation measure shall be applied to future discretionary projects under the 2040 General Plan when and to the extent it is "capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social, and technological factors" as determined by the County in the context of such future projects based on substantial evidence. This definition is consistent with the definition of "feasible" set forth in CEQA (Pub. Res. Code, § 21066.1) and the CEQA Guidelines (§ 15164). The County shall be solely responsible for making this feasibility determination in accordance with CEQA.

For clarification, the text of Mitigation Measure CUL-3 beginning on page 4.5-19 is revised to define the term “feasible,” as shown below:

Mitigation Measure CUL-3: New Implementation Program COS-X: Project-Level Historic Surveys and Protection of Historic Resources

The County shall include the following new implementation program in the 2040 General Plan.

Implementation Program COS-X: Project-Level Historic Surveys and Protection of Historic Resources

During project-specific environmental review of discretionary development, the County shall define the project’s area of potential effect for historic buildings and structures. The County shall determine the potential for the project to result in historic resource impacts, based on the extent of ground disturbance and site modification anticipated for the project. The potential for adverse impacts to historic resources shall also be determined pursuant to the requirements and protocol set forth in the Ventura County ISAG and Cultural Heritage Board Ordinance.

Before altering or otherwise affecting a building or structure 50 years old or older, the project-applicant shall retain a qualified architectural historian according to the Secretary of the Interior Standards, to record it on a California Department of Parks and Recreation DPR 523 form or equivalent documentation, if the building has not previously been evaluated. Its significance shall be assessed by a qualified architectural historian, using the significance criteria set forth for historic resources under CEQA Guidelines Section 15064.5. The evaluation process shall include the development of appropriate historical background research as context for the assessment of the significance of the structure in the county and the region. For buildings or structures that do not meet PRC 5024.1 or the CEQA criteria for historical resource, no further mitigation is required.

For a building or structure that qualifies as a historic resource, the architectural historian and the County shall consult to consider measures that would enable the project to avoid direct or indirect impacts to the building or structure. These could include preserving a building on the margin of the project site, using it “as is,” or other measures that would not alter the building. If the project cannot avoid modifications to a historic building or structure, the following shall be considered:

- 1) If the building or structure can be preserved on site, but remodeling, renovation or other alterations are required, this work shall be conducted in compliance with the Secretary of the Interior’s Standards for the Treatment of Historic Properties.
- 2) If a significant historic building or structure is proposed for major alteration or renovation, or to be moved and/or demolished, the County shall ensure that a qualified architectural historian thoroughly documents the building and associated landscape and setting. Documentation shall include still and video photography and a written documentary record/history of the building to the standards of the Historic American Building Survey or Historic American Engineering Record, including accurate scaled mapping, architectural

descriptions, and scaled architectural plans, if available. The record shall be prepared in consultation with State Historic Preservation Officer and filed with the Office of Historic Preservation. The record shall be accompanied by a report containing site-specific history and appropriate contextual information. This information shall be gathered through site specific and comparative archival research, and oral history collection as appropriate.

- 3) If preservation and reuse at the site are not feasible,¹ the historical building shall be documented as described in item (2) and, when physically and financially feasible,¹ be moved and preserved or reused.
- 4) If, in the opinion of the qualified architectural historian, the nature and significance of the building is such that its demolition or destruction cannot be fully mitigated through documentation, the County shall reconsider project plans in light of the high value of the resource, and implement more substantial modifications to the proposed project that would allow the structure to be preserved intact. These could include project redesign, relocation or abandonment. If no such measures are feasible,¹ the historical building shall be documented as described in item (2).

1. “Feasible” means that this mitigation measure shall be applied to future discretionary projects under the 2040 General Plan when and to the extent it is “capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social, and technological factors” as determined by the County in the context of such future projects based on substantial evidence. This definition is consistent with the definition of “feasible” set forth in CEQA (Pub. Res. Code, § 21066.1) and the CEQA Guidelines (§ 15164). The County shall be solely responsible for making this feasibility determination in accordance with CEQA.

In response to the County’s tribal consultation process with the Fernandeano Tataviam Band of Mission Indians, the following revisions are proposed to Mitigation Measure CUL-5 on page 4.5-23:

Mitigation Measure CUL-5: Revised Policy COS-4.2: Cooperation for Cultural, Historical, Paleontological, and Archaeological Resource Preservation

The County shall include the following revised policy in the 2040 General Plan.

Policy COS-4.2a: Cooperation for ~~Tribal~~ Cultural, Historical, Paleontological, and Archaeological Resource Preservation

The County shall cooperate with cities, special districts, ~~other~~ appropriate organizations, ~~including the Native American Heritage Commission~~, and private landowners to identify known tribal cultural, archaeological, historical, and paleontological resources. If necessary, the County shall engage in consultation with local tribes and preservation groups, to and preserve the county’s tribal cultural, historical, paleontological, and archaeological identified resources within the county.

Policy COS-4.2b: Cooperation for Tribal Cultural Resource Preservation

For discretionary projects, the County shall request local tribes contact information from Native American Heritage Commission, to identify known tribal cultural resources. If requested by one or more of the identified local tribes, the County shall engage in consultation with each local tribe to preserve, and determine appropriate handling of, identified resources within the county.

In response to the County's tribal consultation process with the Fernandeño Tataviam Band of Mission Indians, the following revisions are proposed to Mitigation Measure CUL-6 on page 4.5-26:

Mitigation Measure CUL-6: New Implementation Program COS-X: Implement Project-Level Security Measures
The County shall include the following new implementation program in the 2040 General Plan.

Implementation Program COS-X: Implement Project-Level Security Measures

During project-level ground disturbance activities for discretionary development, in areas where paleontologically rich sites or tribal cultural resources are known to be present, project sites shall be secured during non-construction hours to ensure that the unauthorized access and the unlawful curation of fossil materials or tribal cultural resources does not occur. Such security measures may include construction fencing, unauthorized access signage, security lighting, and security cameras. For large-scale development, a security plan may be prepared prior to construction activities to detail security measures and protocol for the project site.

3.10 REVISIONS TO SECTION 4.6: ENERGY

No revisions have been made to this section of the draft EIR.

3.11 REVISIONS TO SECTION 4.7: GEOLOGIC HAZARDS

No revisions have been made to this section of the draft EIR.

3.12 REVISIONS TO SECTION 4.8: GREENHOUSE GAS EMISSIONS

To provide clarification, the California Air Resources Board's (CARB's) Methane Municipal Waste Landfill Regulation on has been added to the "Regulatory Settings" subsection page 4.8-1 of the draft EIR is revised as follows:

The California Air Resources Board (CARB) adopted regulations to reduce Methane Emissions from Municipal Solid Waste Landfills (June 2010) which require the installation and proper operation of gas collection and control systems at active, inactive, and closed municipal solid waste landfills having 450,000 tons of waste-in-place or greater that received waste after January 1, 1977 unless certain exemption conditions have been met. The regulations contain performance standards for the gas collection and control system and specify monitoring requirements to ensure that the system is being maintained and operated in a manner to minimize methane emissions. The regulations include a leak standard for gas collection and control

system components, a monitoring requirement for wellheads, methane destruction efficiency requirements for most control devices, surface methane emission standards, and reporting requirements.

The following discussion of the Regulation for Mandatory Reporting of Greenhouse Gas Emissions and the Cap-and-Trade regulation pertaining to GHG emissions sources is added on page 4.8-2:

In 2011, CARB adopted the Cap-and-Trade regulation and created the Cap-and-Trade program. The program covers GHG emissions sources that emit more than 25,000 metric tons of carbon dioxide equivalent per year (MTCO₂e/year) such as refineries, power plants, industrial facilities, and transportation fuels. The Cap-and-Trade program includes an enforceable statewide emissions cap that declines approximately 3 percent annually. CARB distributes allowances, which are tradable permits, equal to the emissions allowed under the cap. Sources that reduce emissions more than their limits can auction carbon allowances to other covered entities through the Cap-and-Trade market. Sources subject to the cap are required to surrender allowances and offsets equal to their emissions at the end of each compliance period (CARB 2012). Stationary sources that emit more than 10,000 MTCO₂e/year are required to report their GHG emissions annually to CARB pursuant to the Mandatory Reporting Regulation but are not required to reduce GHG emissions until the 25,000 MTCO₂e/year cap is exceeded. The Cap-and-Trade program was initially slated to sunset in 2020, but the passage of SB 398 in 2017 extended the program through 2030.

To provide clarification, page 4.8-5 of the draft EIR is revised as follows:

This is a change in GWP values from the IPCC Fourth Assessment Report (AR4), which were originally used in the inventory, and in Appendix B of the 2040 General Plan for consistency with the State's Scoping Plan. GWP values apply a weight to gases that have been determined by scientific studies to have increased GHG effects relative to the most common GHG, carbon dioxide (CO₂). These weighted gasses are combined with CO₂ to form a common unit of measurement called CO₂e. For this analysis GWP values of 28 for methane and 265 for nitrous oxide were used for consistency with AR5 (Myhre et. al 2013). Table 4.8-1 shows the 2015 GHG emissions for Ventura County, which were used as the baseline for the integrated CAP.

Table 4.8-1 Baseline 2015 GHG Emissions for the Unincorporated County

| Sector | MT CO ₂ e | % of countywide emissions ¹ |
|----------------------|---------------------------------------|----------------------------------------|
| Agriculture | 260,849 | 13.5 43.7 |
| Building Energy | 322,048 | 16.6 47.0 |
| Off Road Equipment | 52 | <0.1 |
| Solid Waste | 333,167 | 17.2 47.6 |
| Stationary Source | 317,222 275,096 | 16.4 44.5 |
| Transportation | 692,753 | 35.7 36.5 |
| Water and Wastewater | 13,148 | 0.7 0.4 |
| Total | 1,939,238 1,897,142 | 100 |

1: Percentages may not add to 100 percent due to rounding.

Projections

GHG emissions for most sectors in the unincorporated area of the county were forecast through 2020, 2030, 2040, and 2050 using growth rates for population, employment, and housing prepared by the Southern California Association of Governments (SCAG) for the 2020 Regional Transportation Plan and Sustainability Communities Strategy (SCAG 2017). Transportation sector GHG emissions for on-road vehicles were projected using VMT forecasts obtained from the Ventura County Transportation Commission (VCTC). These VMT forecasts were adjusted using recommended methods from the SB 375 (2008) Regional Targets Advisory Committee and converted to CO₂e using emissions factors from CARB’s Emissions Factor model. Stationary source emissions sector GHG emissions were scaled according to the Ventura County’s historical trends in oil production over the last 40 years, starting from 1980, using data from CARB and the annual report from the California Department of Conservation (California Department of Conservation 2020, CARB 2013). The business-as-usual forecasts were adjusted to account for State and federal legislative and regulatory actions that will reduce future emissions from activities within the unincorporated area, without any additional local government action. Legislation and regulations considered include:

Table 4.8-2 on page 4.8-6 is revised to reflect the changes in draft EIR Appendix D:

Table 4.8-2 Forecast GHG Emissions for Unincorporated Ventura County 2020 to 2050

| Sector | Forecast Emissions ¹ (MT CO ₂ e) | | | |
|----------------------|--------------------------------------------------------|---------------------------------------|---------------------------------------|---------------------------------------|
| | 2020 | 2030 | 2040 | 2050 |
| Agriculture | 256,223 | 248,882 | 241,541 | 234,200 |
| Building Energy | 308,629 | 285,079 | 225,567 | 197,996 |
| Off Road Equipment | 52 | 54 <u>52</u> | 56 <u>52</u> | 59 <u>52</u> |
| Solid Waste | 323,611 <u>302,814</u> | 316,441 <u>278,381</u> | 288,020 <u>270,289</u> | 262,405 <u>262,560</u> |
| Stationary Source | 245,340 <u>287,845</u> | 198,432 <u>314,526</u> | 160,660 <u>343,679</u> | 130,212 <u>375,535</u> |
| Transportation | 625,263 | 487,058 | 446,355 | 450,232 |
| Water and Wastewater | 13,420 <u>13,148</u> | 13,576 <u>13,148</u> | 13,699 <u>13,148</u> | 13,788 <u>13,148</u> |
| Total | 1,772,537 <u>4,793,974</u> | 1,549,522 <u>4,627,124</u> | 1,375,898 <u>4,540,630</u> | 1,288,892 <u>4,533,723</u> |

Notes: MT CO₂e = metric tons of carbon dioxide equivalents, comprised of carbon dioxide, methane, and nitrous oxides. ¹Includes legislative reductions from State and federal programs.

Table 4.8-3 on page 4.8-7 is also revised to reflect the changes in draft EIR Appendix D:

Table 4.8-3 2040 General Plan Target Reduction from 2015 Baseline Emissions Levels, 2020 to 2050

| | 2020 | 2030 | 2040 | 2050 |
|------------------------------------------------------------------------------------------|---------------------------------------|---------------------------------------|-----------------------------------|-----------------------------------|
| Target Percentage Below 2015 Baseline GHG Emission Levels | 2.1% | 41.3% | 60.9% | 80.4% |
| GHG Emissions Target (MT CO ₂ e) | 1,897,847 <u>4,856,620</u> | 1,138,708 <u>4,113,072</u> | 759,139 <u>742,648</u> | 379,569 <u>371,324</u> |
| GHG Reductions Needed from Forecast GHG Emissions to Meet Targets (MT CO ₂ e) | -125,310 | <u>410,813</u> | <u>616,760</u> | <u>909,323</u> |
| | -62,649 | 513,153 | 797,982 | 4,162,398 |

Notes: The negative number for GHG reductions in 2020 means that the forecast GHG emissions for 2020 will be below the 2020 target.

Source: Ascent Environmental, 2020~~19~~

For clarification, the discussion of Impact 4.8-1 on page 4.8-38 is revised as follows:

Under the business-as-usual scenario adjusted for federal and State climate and energy legislation, as described above in the methodology subsection, GHG emissions in unincorporated Ventura County are projected to decrease from 1,772,537 ~~1,793,971~~ MT CO_{2e} in 2020 to 1,375,898 ~~1,540,630~~ MT CO_{2e} in 2040, a decrease of 396,639 ~~253,344~~ MT CO_{2e} or 44-22 percent (as shown in Table 4.8-2). Between 2015 and 2040, GHG emissions are projected to decrease from 1,939,238 ~~1,897,112~~ MT CO_{2e} to 1,375,898 ~~1,540,630~~ MT CO_{2e}, a decrease of 563,340 ~~356,482~~ MT CO_{2e} or 49-29 percent.

These GHG reductions are primarily due to State and federal implementation of legislation with local benefits, such as increases to the pace and scale of renewable energy generation replacing fossil-fuel power plants in compliance with RPS mandates, local implementation of actions associated with CARB's Short-Lived Climate Pollutant Strategy, and improvements to the fuel economy of new motor vehicles resulting from implementation of the State's Advanced Clean Cars Program. Additionally, emissions related to oil and gas production under the stationary source sector has been declining since 1980 and is expected to continue to decline into the future as oil and gas resources in the area are reduced. While these regulations and resource trends result in meaningful GHG reductions at the local level, additional actions, local or otherwise, would be needed to meet the GHG 2030 reduction target of 41 percent below 2015 levels by 2030, as identified in the 2040 General Plan under Policy COS-10.2.

In addition, the following changes have been made to Table 4.8-5 and the text that follows on pages 4.8-39 and 4.8-40:

Table 4.8-5 Quantified GHG Reductions

| Program / Policy | 2030 GHG Reductions – MT CO_{2e} | Assumptions |
|-------------------------------------------------------|-----------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AG-H: Nutrient Management Plans | 33,830 | Replace inorganic nitrogen fertilizer with organic fertilizer from locally sourced organic waste – 25 percent replacement by 2030. |
| COS-8.4: Clean Power Alliance | 59,972 | Community Choice Aggregation Program increases enrollment in Green Choice Program (100 percent renewable electricity) to 95 percent of all residential and commercial customers by 2030. |
| COS-H: County Tree Planting Program | 354 | Tree planting program, 1,000 annually for 10,000 new trees by 2030. |
| COS-S: Building Code Update | 2,019 | Enhance energy efficiency of new residential and commercial construction and major retrofits over standard Title 24 building code. All new residential construction all-electric by 2030 with solar photovoltaic panels sized to offset annual electricity demand. |
| COS-W: Energy Efficiency and Conservation Program | 5,042 | Behavior change energy efficiency program results in residential energy savings; 5 percent reduction in commercial building energy use. |
| CTM-B: Initial Study Assessment Guidelines | <u>19,617</u> 5,042 | 15 percent VMT reduction from new development (relative to a 2030 business as usual scenario) through incorporation of VMT thresholds into the ISAG pursuant to SB 743 implementation. |
| CTM-C: Vehicle Miles Traveled (VMT) Reduction Program | 47,231 | After accounting for the 15 percent VMT reduction from new development per CTM-B, this measure would achieve an additional 5 percent overall reduction in VMT by 2030, and 10 percent by 2040 (relative to 2030 and 2040 business as usual scenarios, respectively). |
| Total | <u>151,993</u> 168,065 | |

Implementation of the quantified policies and programs in Table 4.8-5 would collectively provide reductions of ~~168,065~~ ~~151,903~~ MTCO₂e by 2030, an approximate ~~9~~ 11 percent reduction from forecast 2030 levels and ~~40~~ ~~39~~ percent of the reductions needed to meet a target of ~~1,113,972~~ 1,138,708 MT CO₂e for consistency with emissions targets identified in Policy COS-10.2 (41 percent below 2015 levels by 2030). An additional ~~242,748~~ ~~361,250~~ MT CO₂e of reductions would be needed to close the gap with the 2030 target.

The analysis of Implementation Program COS-M on page 4.8-44 of the draft EIR has been corrected as shown below:

Under Implementation Program COS-~~LM~~, the County would evaluate the feasibility of an excise tax on oil and gas operations, which would be intended to partially fund the County’s response to climate change impacts. These taxes would presumably be in addition to fees already collected by the County for these activities. Before an oil excise tax could be levied, it would need to be approved by both the Board of Supervisors and at least a majority vote of the electorate.

Policy COS-7.2 was inadvertently included in Table 4.8-7 in the draft EIR, and the County has corrected this error to remove Policy COS-7.2 from Table 4.8-7, as shown below (page 4.8-45):

Table 4.8-7 GHG-Reducing Policies Not Associated with Implementation Programs

| GP Policy Element | Policy |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Land Use | LU-11.3, LU-11.4, LU-16.5, LU-16.9, LU-18.5 |
| Circulation, Transportation | CTM-2.5, CTM-2.6, CTM-2.7, CTM-2.8, CTM-2.9, CTM-2.11, CTM-2.17, CTM-2.22, CTM-2.24, CTM-2.25, CTM-2.27, CTM-6.1, CTM-6.3, CTM-6.4, CTM-6.5, CTM-6.6, CTM-6.7 |
| Public Facilities | PFS-1.10, PFS-2.2, PFS-2.3, PFS-2.6, PFS-5.5, PFS-5.6, PFS-6.4, PFS-7.2, PFS-7.6, PFS-12.4 |
| Conservation | COS-1.13, COS-2.10, COS-3.3, COS-5.3, COS-7.2 , COS-7.4, COS-7.8, COS-8.2, COS-8.3, COS-8.4, COS-8.10, COS-9.1, COS-9.3 |
| Hazard | HAZ-10.1, HAZ-1.3, HAZ-1.4, HAZ-10.1, HAZ-10.5, HAZ-10.6, HAZ-10.7, HAZ-10.8, HAZ-11.9 |
| Agriculture | AG-1.1, AG-3.2, AG-4.3, AG-4.4 |
| Water | WR-4.4, WR-6.1, WR-6.2, WR-6.3 |
| Economic Vitality | EV-4.4 |

For clarification, the language of Mitigation Measure GHG-1 beginning on page 4.8-45 is revised as follows:

Mitigation Measure GHG-1: New Implementation Program HAZ-X: Prohibit Natural Gas Infrastructure in New Residential and New Commercial Development

The County shall include the following new implementation program in the 2040 General Plan.

Implementation Program HAZ-X: Prohibit Natural Gas Infrastructure in New Residential and New Commercial Development

To support the proposed reach codes under COS-S, the 2040 General Plan shall include a new program in the Hazards and Safety element that prohibits the installation of new natural gas infrastructure in new residential development

~~construction through amendments to the Ventura County Building Code. This program shall also be extended to include new commercial development building types such as including but not limited to offices, retail buildings, and hotels, where the use of natural gas is not critical to business operations and contain appliances that can be feasibility substituted with electricity powered equivalents. The County shall allow~~ may exempt certain new commercial development to be exempt from these requirements where the County can make upon making findings based on substantial evidence that supports why the use of natural gas is critical to business operations, and that it is not feasible¹ to replace critical appliances or equipment with electricity powered equivalents. This program shall be completed no later than 2023.

1. “Feasible” means that this mitigation measure shall be applied to future discretionary projects under the 2040 General Plan when and to the extent it is “capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social, and technological factors” as determined by the County in the context of such future projects based on substantial evidence. This definition is consistent with the definition of “feasible” set forth in CEQA (Pub. Res. Code, § 21066.1) and the CEQA Guidelines (§ 15164). The County shall be solely responsible for making this feasibility determination in accordance with CEQA.

The language of Mitigation Measure GHG-2 beginning on page 4.8-46 is revised as follows to clarify the County’s commitment to implementation:

Mitigation Measure GHG-2: New Implementation Program HAZ-X: Building Energy Saving Ordinance for Industrial Buildings

The County shall include the following new implementation program in the 2040 General Plan.

Implementation Program HAZ-X: Building Energy Saving Ordinance for Industrial Buildings

To address GHG emissions associated with electricity consumption by industrial buildings, which were not quantified in the GHG Inventory and Forecasting due to utility privacy rules, the County shall implement a program to adopt a Building Energy Saving Ordinance, no later than 2025, for industrial buildings over 25,000 square feet in size, modeled after the local benchmarking ordinances adopted in other local jurisdictions in California (CEC 2019). The County shall prepare reports showing the energy performance of industrial buildings relative to similar buildings in California and the United States and make these reports available to the public by request. The County, through ~~the~~ its building department shall provide recommendations on energy efficiency retrofits and green building strategies to improve energy performance to property owners and tenants subject to the reporting requirements.

The County has revised Mitigation Measure GHG-4 on page 4.8-47 to clarify the scope of its Greenhouse Gas Reduction Policy Enhancement Program and to clarify the membership and scope of the Climate Emergency Council, as provided below:

Mitigation Measure GHG-4: New Implementation Program ~~COS-X HAZ-X~~: Greenhouse Gas Reduction Policy Enhancement Program and Revised Implementation Program COS-CC: Climate Emergency Council

The County shall include the following new implementation program in the 2040 General Plan.

Implementation Program ~~COS-X HAZ-X~~: Greenhouse Gas Reduction Policy Enhancement Program

The Climate Emergency Council (CEC) that would be established under COS-CC shall develop recommended subprograms which implement the 52 policies identified in Table 4.8-7 of the draft EIR that do not have associated implementation programs in the 2040 General Plan. ~~Any recommendations that would require amendments to the General Plan, including any subprograms that may include expansions to programs already proposed in the 2040 General Plan, shall be provided to the County Planning Director. The Planning Director shall include the recommendation in a report for consideration by the Planning Commission and Board of Supervisors. This report shall be presented to the Board of Supervisors.~~

For any additional future policies that may be adopted as part of the County's Greenhouse Gas (GHG) Reduction Strategy (2040 General Plan, Policy COS-10.1), the CEC may recommend new subprograms. The CEC shall demonstrate in the materials submitted to the Board of Supervisors that the proposed subprograms and policies would result in quantifiable GHG emission reductions that further the County's progress towards achieving the 2030, 2040, and 2050 GHG reduction targets and goals established in the 2040 General Plan. The GHG emission reduction policy topics that may be considered and analyzed by the CEC for recommendation to the Board of Supervisors are identified in the Table 4.8-7 and include but are not limited to the following:

- Sustainable Technologies:
- Regional Bicycle Infrastructure:
- Funding and Maintenance for Sidewalks:
- Amtrak Service Improvements:
- Routine Use of Alternative Transportation Options:
- Permeable Pavement:
- Facilities for Emerging Technologies:
- Electric Vehicle Charging Stations:
- Neighborhood Electric Vehicles:
- Shared Mobility Operations:
- Sustainable Community Facility Design:
- Energy Efficient Facility Construction, Purchases, Leases, Retrofits, and Expansions:
- Agricultural Waste Reuse:
- Value-Added Alternatives to Waste Disposal:
- Smart Grid Development:

Consistent Fire Protection Standards for New Development;
Soil Productivity;
Incentives for Energy Efficiency;
Battery Energy Storage Systems;
Air Pollutant Reduction;
Air Pollution Impact Mitigation Measures for Discretionary Development;
Transportation Control Measures Programs;
Alternative Transportation Modes;
Urban Greening;
Integrated Pest Management Practices;
Technological Innovation; and
Renewable Energy Facilities.

The CEC's recommended GHG reduction subprograms and policies shall be presented to the Planning Commission for review and recommendation to the Board of Supervisors, and then to the Board of Supervisors for consideration and approval, no later than 2025. The Board of Supervisors shall have sole authority to adopt (including as modified) and direct the County's implementation of the subprograms and policies that are developed and recommended by the CEC. Any CEC recommendation that would require amendments to the 2040 General Plan, County ordinances, policies or regulations shall be processed and approved by the County in accordance with all applicable legal requirements.

~~Any recommendations that would require amendments to the General Plan, including any subprograms that may include expansions to programs already proposed in the 2040 General Plan, shall be provided to the County Planning Director. The Planning Director shall include the recommendation in a report for consideration by the Planning Commission and Board of Supervisors. This report shall be presented to the Board of Supervisors by 2025.~~

The County shall also include the following revised implementation program in the 2040 General Plan.

Implementation Program COS-CC: Climate Emergency Council

The County shall establish a Climate Emergency Council (CEC) by a resolution of the Board of Supervisors to advise the Board of Supervisors on climate action planning and implementation of the Climate Action Plan (CAP) goals, policies, and programs.

The County agency or department responsible for implementation of this program shall draft, administer, and maintain the CEC bylaws. Initial establishment of the CEC and its bylaws shall include the following terms, duties, and membership composition:

- ▶ Term of each member is two years. At the conclusion of a term, a CEC member may be re-appointed or re-selected, as applicable, for a consecutive term by the appointing authority.

- ▶ Duties of the CEC members include attendance at duly called meetings; review, in advance, of all written material provided in preparation for CEC meetings; serve and participate on committees and/or sub-committees; and contribute to the CEC’s advisory recommendations to the Board of Supervisors;
- ▶ The officers of the CEC shall be Chairperson and Vice-Chairperson.
 - Officers shall be elected annually at regular meeting each year by CEC members. Nomination shall be made from the floor. Election shall be by simple majority.
 - Officers shall serve a one-year term. An officer may be re-elected, but no individual shall serve more than three full consecutive terms in the same office. No member shall hold more than one office at a time.
 - The Chairperson shall preside at all meetings of the CEC, sign all correspondence, reports, and other materials produced by the CEC, and perform any and all other duties prescribed by the CEC from time to time. The Chairperson may serve as an ex-officio member of all committees.
 - The Vice-Chairperson shall represent the Chairperson and/or substitute in performance of the Chairperson during their absence.
- ▶ Membership of the CEC shall be comprised of the following:
 - One person representing each Supervisorial District who has demonstrated interest in and knowledge of climate action planning shall be nominated by each of the five members of the Board of Supervisors, and confirmed by a majority of the Board of Supervisors resulting in a total of five Supervisorial District representatives;
 - One resident from each of the designated disadvantaged communities identified in the 2040 General Plan who has demonstrated an understanding of their community’s needs as well as an interest in and knowledge of climate action planning shall be appointed by a majority of the Board of Supervisors; and
 - Two additional at-large members who have demonstrated special interest, competence, experience, or knowledge in climate action planning shall be selected by a majority of the CEC members.
 - Each member is entitled to one vote on each matter submitted to a vote of the CEC.

For clarification, the second paragraph on page 4.8-49 is revised as follows:

With the modest amount of forecast future growth in the county, substantial GHG reductions would need to be derived from measures targeting existing development,

infrastructure, and associated activity levels. Most emissions that are forecast to occur in the county are from energy use in existing buildings, vehicle use and travel behavior influenced by the existing land use pattern and transportation systems, landfilled waste, and established agricultural operations. While the County encourages and promotes the reduction of or changes to these activities contributing to GHG emissions, it may decide that certain mitigation measures are infeasible based, for example, on their ~~does not~~ ~~have the authority to enforce measures that may potentially~~ infringement upon private property rights, reduction in the economic competitiveness of local businesses, or inhibition on the ability for residents to travel between residences, jobs, and amenities. Pursuant to Section 15093 of the State CEQA Guidelines, CEQA requires the lead agency to balance, as applicable, the economic, legal, social, technological, or other benefits of a proposed project against its unavoidable environmental risks when determining whether to approve the project. If the specific economic, legal, social, technological, or other benefits of a proposed project outweigh the unavoidable adverse environmental effects, the adverse environmental effects may be considered acceptable. These factors are considered by the decision-making body of the lead agency following certification of the EIR and prior to making a decision about whether to approve the project ~~constrain the ability for the County to reduce GHG emissions from existing activities through additional mitigation measures.~~

For clarification, the following edit is made to the discussion on page 4.8-50:

However, for these reasons and those described in Impact 4.8-1, the County cannot meaningfully quantify the effect of all its 2040 General Plan policies and programs on future GHG emissions, and ~~there~~ therefore, it cannot conclude, at this program level of analysis, that future GHG emissions in the county under the 2040 General Plan would be sufficiently reduced to meet the State's 2030 or post-2030 targets.

For clarification, the following edit is made to the discussion on page 4.8-52:

However, due to the County's minimal growth, most of the forecast GHG emissions in 2030 and beyond are caused or influenced by ~~from~~ energy use in existing buildings, vehicle use and travel behavior on existing transportation systems, landfilled waste, and agricultural uses where the County has limited authority to enforce stringent actions resulting in GHG reductions beyond what have been already been included in the 2040 General Plan and the mitigation measures identified in Impact 4.8-2.

3.13 REVISIONS TO SECTION 4.9: HAZARDS, HAZARDOUS MATERIALS, AND WILDFIRE

No revisions have been made to this section of the draft EIR.

3.14 REVISIONS TO SECTION 4.10: HYDROLOGY AND WATER QUALITY

To provide clarification, the first full sentence on page 4.10-21 is revised to read:

Lastly, the County has existing regulations, such as the Ventura County Flood Plain Management Ordinance 4521, the Ventura County Flood Control District Design Manual

and the Ventura County Watershed Protection District's 2017 Design Hydrology Manual 2006, that also address flood control and drainage facilities.

The third sentence in the second paragraph on page 4.10-21 is revised to read:

The County's existing regulations, such as the Ventura County Flood Plain Management Ordinance 4521, the Ventura County Flood Control District Design Manual and the Ventura County Watershed Protection District's 2017 Design Hydrology Manual 2006, also address flood control and drainage facilities and implement design standards to ensure that no overflow of watercourses would occur that would result in flooding.

3.15 REVISIONS TO SECTION 4.11: LAND USE AND PLANNING

To provide clarification, the third sentence in the second paragraph on page 4.11-19, and Table 4.11-1, on pages 4.11-19 and 4.11-20, are revised as follows:

The 2040 General Plan would accommodate future development primarily within existing unincorporated communities. By making refinements to the Existing Community and Urban land use designations of the existing general plan, the 2040 General Plan would more clearly distinguish among land uses allowed within each designation and set forth maximum development density and intensity standards. Specifically, the 2040 General Plan would establish ~~43~~¹⁵ new land use designations that provide more detailed information on the types of land uses (e.g., commercial, industrial, residential) that would be allowable within areas currently designated as Existing Community and Urban (Table 4.11-1). The refined land use designations of the 2040 General Plan would result in future development that is compatible with the land uses, densities, and parcel sizes of existing communities.

Table 4.11-1 Existing General Plan Land Use Designations and Proposed New General Plan Land Use Designations

| Acronym | Land Use Designation | Max. Density/ Intensity | Min. Lot Size |
|----------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------|-------------------------------------------------|----------------------------------------------------|
| Existing General Plan Land Use Designations to Remain | | | |
| RUR | Rural | 1 du/2 ac (1 dwelling unit per each 2 acres) | 2 acres |
| AG | Agricultural | 1 du/40 ac | 40 acres |
| OS | Open Space | 1 du per parcel | 10 acres, or 20 acres if contiguous w/Agricultural |
| P | State or Federal Facility (updated to State, Federal, and Other Public Lands) | N/A | None |
| Proposed New Land Use Designations (to be applied only to areas with current Existing Community or Urban land use designations) | | | |
| ECU-R | ECU-Rural | 1 du/2 ac | 2 acres |
| ECU-A | ECU-Agricultural | 1 du/40 ac | 40 acres |
| ECU-OS | ECU-Open Space | 1 du per parcel | 10 acres, or 20 acres if contiguous w/Agricultural |
| VLDR | Very Low Density Residential | 3 du/ac | 10,000 SF |
| LDR | Low-Density Residential | 5 du/ac | 6,000 SF |

| Acronym | Land Use Designation | Max. Density/ Intensity | Min. Lot Size |
|-------------|------------------------------------------------|-------------------------|-------------------|
| MDR | Medium-Density Residential | 13 du/ac | 3,000 SF |
| RHD | Residential High-Density | 20 du/ac | No Minimum |
| RPD | Residential Planned Development | 20 du/ac | No Minimum |
| <u>CRPD</u> | <u>Coastal Residential Planned Development</u> | <u>36 du/ac</u> | <u>No Minimum</u> |
| <u>RB</u> | <u>Residential Beach</u> | <u>36 du/ac</u> | <u>No Minimum</u> |
| MU | Mixed Use | 20 du/ac; 60% coverage | No Minimum |
| C | Commercial | 60% coverage | No Minimum |
| CPD | Commercial Planned Development | 60% coverage | No Minimum |
| I | Industrial | 50% coverage | 10,000 SF |
| PR | Parks & Recreation | N/A | N/A |

For the purpose of clarity, the second and third sentences on page 4.11-21 are revised as follows:

For example, Policies LU-4.1 and LU-4.2 would reduce incompatible land uses by requiring that the County specifying densities and/or intensities of allowed uses within each land use designation and maintaining continuity with neighboring zoning, land uses, and parcel sizes. Policies LU-6.1, LU-7.1 through 7.3, and LU-8.1 through LU-8.4 reduce incompatible uses within agricultural areas by requiring specifying buffers for non-agricultural use, and specifying allowable coverage, and allowable uses within those areas.

3.16 REVISIONS TO SECTION 4.12: MINERAL AND PETROLEUM RESOURCES

The following discussion is added under the subheading “California Public Utilities Commission General Order No. 112-F, State of California Rules Governing Design, Construction, Testing, Operation, and Maintenance of Gas Gathering, Transmission, and Distribution Piping Systems” in Section 4.12.1, “Background Report Setting Updates,” on page 4.12-3:

California Geologic Energy Management Division (CalGEM) has the responsibility for approving oil and gas well activities in California. In a comment letter to Ventura County’s draft EIR on the General Plan Update, CalGEM specified certain of its regulatory authorities for inclusion in the final EIR. As indicated in Public Resources Code section 3106, CalGEM has jurisdictional authority over the drilling, operation, maintenance, and abandonment of oil, gas, and geothermal wells, and attendant facilities, to prevent, as far as possible, damage to life, health, property, and natural resources, damage to underground oil, gas and geothermal deposits and damage to underground and surface waters suitable for irrigation or domestic purposes. In addition to CalGEM’s authority to order work on wells pursuant to PRC sections 3208.1 and 3224, it has authority to issue civil and criminal penalties. CalGEM does not regulate grading, excavations, or other land use issues. Other items specified by CalGEM include the following.

Well Stimulation and Underground Injection.

CalGEM oversees well stimulation treatments and underground injection control. Under the Safe Drinking Water Act, EPA has delegated authority over oil and gas injection

wells to the CalGEM UIC Program. CalGEM collaborates with the State and Regional Water Board to ensure than y useful water is protected.

Well and Lease Restoration Requirements

CalGEM enforces well site and lease restoration through CCR Title 14, Section 1776, including that well sites be returned to as near a natural state as practicable within 60 days of plugging and abandonment of any oil and gas well, and oil lease restoration to include the removal of all tanks, above-ground pipelines, debris, and other facilities and equipment. Lease restoration must begin within three months and completed within one year after the plugging and abandonment of the last wells on the lease.

Pipelines

With respect to pipelines, CalGEM's jurisdiction typically stops at the lease automatic custody transfer unit. CCR require "newly installed pipelines shall be designed, constructed, and all pipelines shall be tested, operated, and maintained in accordance with good oil field practice and applicable methods approved by the Supervisor." CCR also outlines the requirement for submission of pipeline management plans by operators to CalGEM.

Flaring

State PRC section 3300 states that "the unreasonable waste of natural gas by the act, omission, sufferance, or insistence of the lessor, lessee, or operator of any land containing oil or gas or both, whether before or after the removal of gasoline from the gas, is opposed to the public interest and is unlawful."

Identification of Abandoned Wells Prior to Development

Public Resources Code section 3208.1 establishes well reabandonment responsibility t when a previously plugged and abandoned well will be impacted by planned property development of construction activities. Local permitting agencies, property owners, and developers should be aware of, and fully understand that significant and potentially dangerous issues may be associated with development near oil, gas, and geothermal wells. In summary, CalGEM categorically advises against building over, or in any way impeding access to oil, gas, or geothermal wells. PRC section 3208.1 gives CalGEM the authority to order or permit the reabandonment of any well where it has reason to question the integrity of the previous abandonment, or if the well is not accessible or visible. No well work may be performed on any oil, gas, or geothermal well without written approval from CalGEM.

For clarification, the second and third paragraphs on page 4.12-9 will be revised as follows:

The Rural land use designation would allow for low-density and low-intensity land uses such as residential estates and other rural uses which are maintained in conjunction with agricultural and horticultural uses or in conjunction with the keeping of farm animals for recreational purposes, greenhouses, as principal and accessory structures related to agriculture, and also oil and gas ~~wells~~ exploration and production, all of which would apply to approximately 0.9 percent of land in the unincorporated county.

Approximately 97.1 percent of the unincorporated county would remain designated as either Open Space (approximately 88 percent) or Agriculture (approximately 9 percent) under the 2040 General Plan. The Open Space land use designation would allow low

intensity development with a minimum parcel size of 10 acres and 1 dwelling unit per parcel. Other uses could include composting operations, greenhouses, correctional institutions, fire stations, and oil and gas wells exploration and production. The Agriculture land use designation would allow for development of one dwelling unit per parcel and a minimum parcel size of 40 acres. Other uses could include greenhouses, as principal and accessory structures related to agriculture, and composting operations. Proposed policies of the 2040 General Plan addressing flaring and trucking associated with new discretionary oil and gas wells could result in the construction and operation of new pipelines for the conveyance of oil, gas, or produced water.

The last sentence of the second paragraph on page 4.12-14 in Section 4.12, "Mineral and Petroleum Resources," is revised as follows:

As shown in Figures 4.12-1 and 4.12-2, there are currently 21 ~~23~~ active and idle oil wells within 2,500 feet of existing schools and 715 active and idle oil wells within 1,500 feet of existing dwelling units in the unincorporated county.

Figure 4.12-1 on page 4.12-15 has been revised to remove Thomas Aquinas College and update the footnote, as shown below.

Source: Ventura County, 2016; CAL FIRE 2007 (State), 2008 (Local), and 2016 (Federal); USGS, 2013; DOGGR, 2019

Revised Figure 4.12-1 Oil and Gas Well 2,500-ft Setback from Schools Map

For consistency, the language of Policy COS 7.2 in Mitigation Measure PR-1 on page 4.12-18 has been revised to delete the reference to gas wells as follows:

Mitigation Measure PR-1: Revised Policy COS-7.2: Oil Well Distance Criteria

The County shall include the following revised policy in the 2040 General Plan.

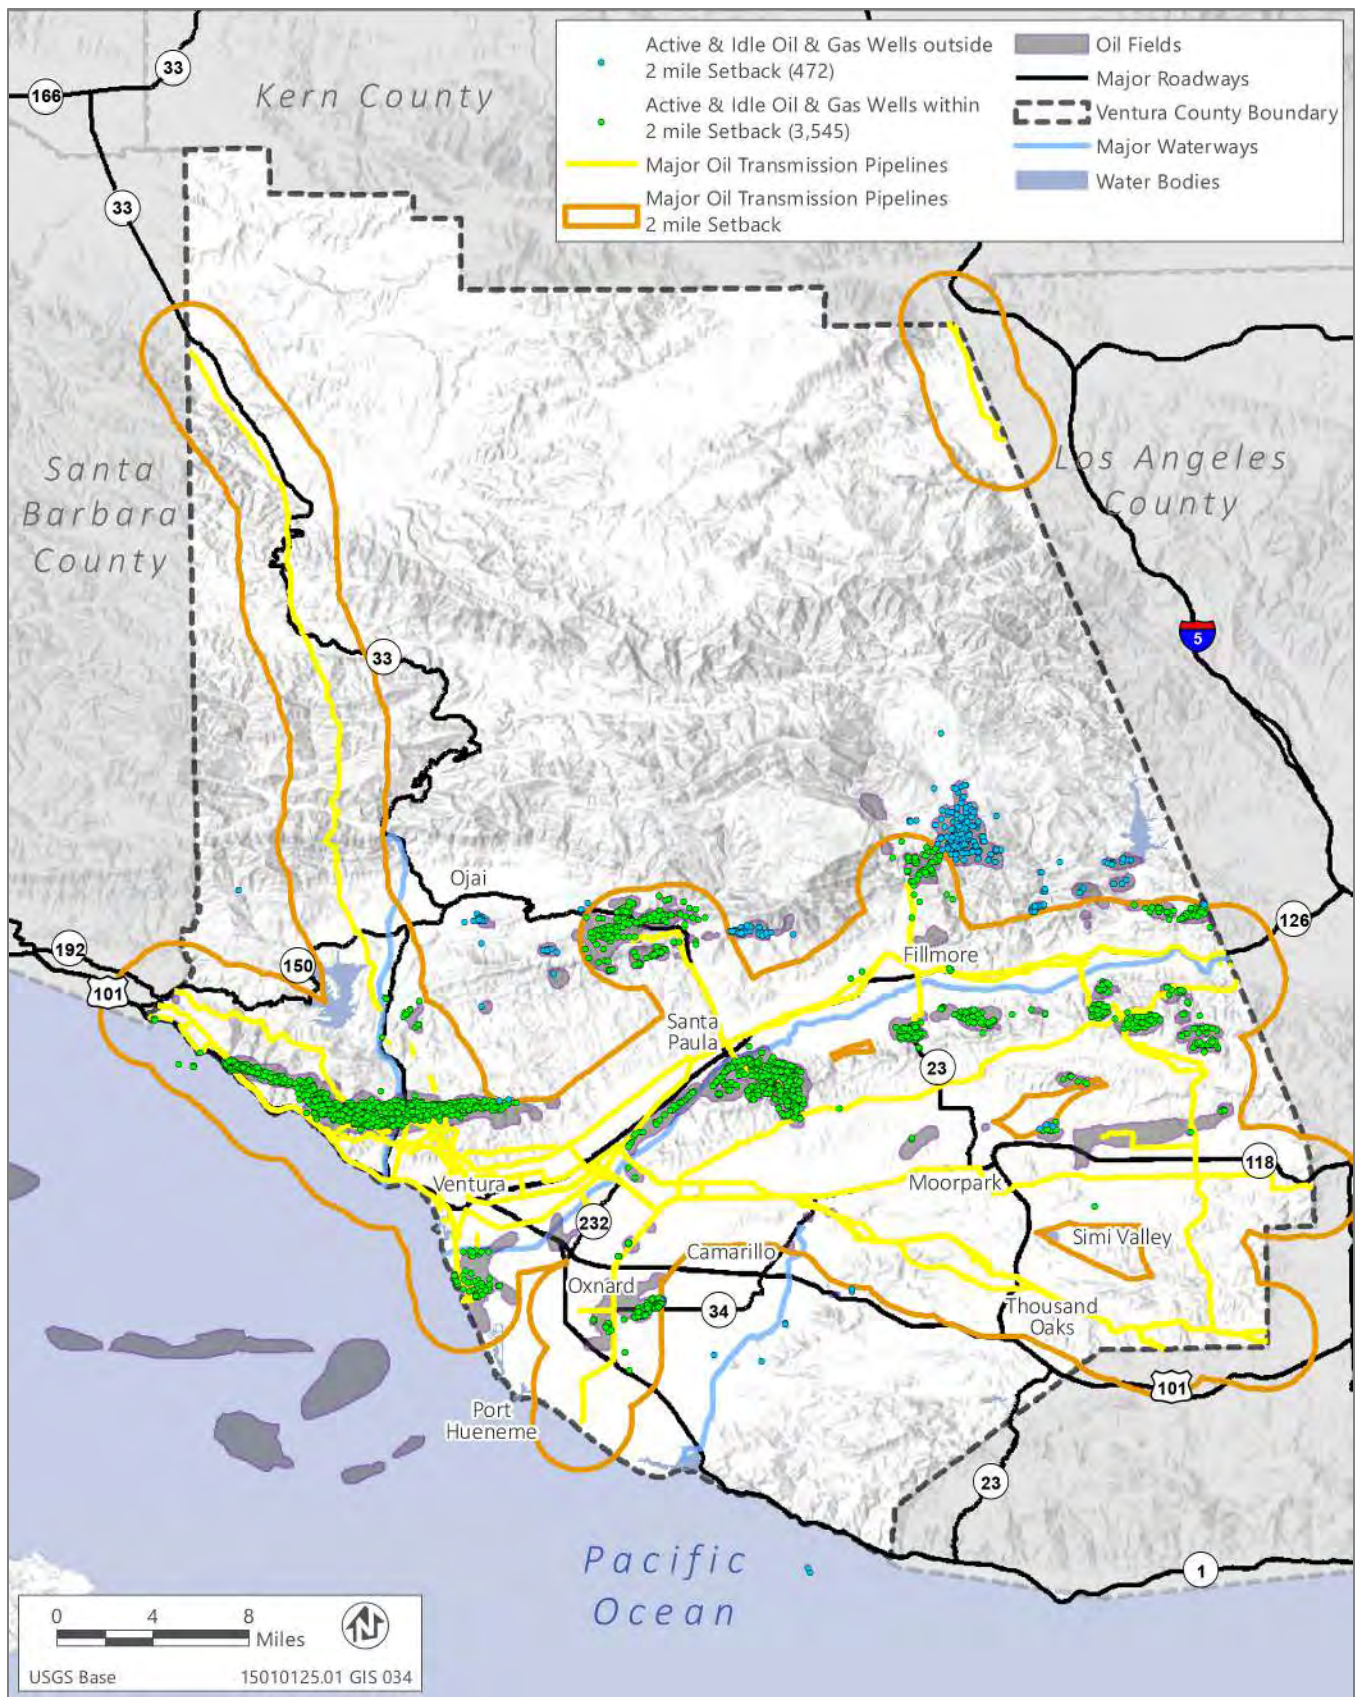

COS-7.2: Oil Well Distance Criteria

The County shall require that new discretionary oil ~~and gas wells to be located~~ be sited a minimum of 1,500 feet from the well head to residential dwellings, dwelling units, and 2,500 from any school, sensitive use structures which include dwellings, childcare facilities, hospitals, health clinics, and school property lines.

For clarity, the second paragraph on page 4.12-22 is revised to read:

As discussed above, Figure 4.12-3 depicts the oil fields within Ventura County, active and idle oil and gas wells, and the eleven zone classifications which allow for oil and gas exploration and production as a conditionally permitted land use that is potentially compatible with dwelling units and schools. Future oil and gas extraction within compatible zone classifications with minimum parcel sizes of 10,000 and 20,000 square feet may be hampered or access to petroleum reserves precluded as these zones have smaller minimum lot sizes which provide less flexibility in the siting of allowed uses and allow for greater maximum lot coverage which may inhibit compliance with the setback distances prescribed in Policy COS-7.2. Furthermore, as shown in Figures 4.12-1 and 4.12-2, there are currently 21 ~~23~~ active and idle oil wells within 2,500 feet of existing schools and 715 active and idle oil wells within 1,500 feet of existing dwellings in the unincorporated county. Future discretionary expansion of oil production within the setback distances depicted on Figures 4.12-1 and 4.12-2 would be prohibited pursuant to Policy COS-7.2. Policy COS-7.2 could theoretically affect local oil and gas exports and increase the reliance on imports from outside of the 2040 General Plan area. There are no actions or policies that the County could feasibly mandate to fully reduce the impact that Policy COS 7.2 would have on hampering or precluding access to petroleum resources. This impact would remain **significant and unavoidable**.

Figure 4.12-4 (Major Oil Transmission Pipeline Map) on page 4.12-25 has been revised, as shown below, to remove the incorporated cities layer that previously obscured the oil fields.

Revised Figure 4.12-4 Major Oil Transmission Pipelines Map

Mitigation Measure PR-2 and Mitigation Measure PR-3 on page 4.12-31 have been revised as shown below to provide a definition for the term “feasible:”

Mitigation Measure PR-2: Revised Policy COS-7.7: Limited Conveyance for Oil and Produced Water
The County shall include the following revised policy in the 2040 General Plan.

Policy COS-7.7: Limited Conveyance for Oil and Produced Water

The County shall require new discretionary oil wells to use pipelines to convey crude oil and produced water, if feasible.¹; oil and produced water shall not be trucked. Trucking of crude oil and produced water may only be allowed if the proponent demonstrates, subject to approval by the County, that conveying the oil and produced water via pipeline is infeasible. In addition, trucking of crude oil and produced water is allowed in cases of emergency and for testing purposes consistent with federal, state and local regulations.

1. “Feasible” means that this mitigation measure shall be applied to future discretionary projects under the 2040 General Plan when and to the extent it is “capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social, and technological factors” as determined by the County in the context of such future projects based on substantial evidence. This definition is consistent with the definition of “feasible” set forth in CEQA (Pub. Res. Code, § 21066.1) and the CEQA Guidelines (§ 15164). The County shall be solely responsible for making this feasibility determination in accordance with CEQA.

Mitigation Measure PR-3: Revised Policy COS-7.8: Limited Gas Collection, Use, and Disposal
The County shall include the following revised policy in the 2040 General Plan.

Revised Policy COS-7.8: Limited Gas Collection, Use, and Disposal

The County shall require that gases emitted from all new discretionary oil and gas wells be collected and used or removed for sale or proper disposal, if feasible.¹ Flaring or venting shall may only be allowed if the proponent demonstrates, subject to approval by the County, that conducting operations without flaring or venting is infeasible. In addition, flaring or venting is allowed in cases of emergency or and for testing purposes consistent with federal, State, and local regulations.

1. “Feasible” means that this mitigation measure shall be applied to future discretionary projects under the 2040 General Plan when and to the extent it is “capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social, and technological factors” as determined by the County in the context of such future projects based on substantial evidence. This definition is consistent with the definition of “feasible” set forth in CEQA (Pub. Res. Code, § 21066.1) and the CEQA Guidelines (§ 15164). The County shall be solely responsible for making this feasibility determination in accordance with CEQA.

3.17 REVISIONS TO SECTION 4.13: NOISE AND VIBRATION

For clarification, Mitigation Measure NOI-1 on page 4.13-23 is revised as follows to define the term “feasible:”

Mitigation Measure NOI-1: New Policy HAZ-X: Implement Noise Control Measures for Traffic Noise
The County shall include the following new policy in the 2040 General Plan.

Policy HAZ-X: Implement Noise Control Measures for Traffic Noise

The County shall require noise control measures to be implemented along roadways for new discretionary development generating traffic noise if either of the following circumstances would exist:

The discretionary development would result in traffic noise levels above a County noise compatibility standard stated in Policy HAZ-9.2 in an area where traffic noise levels, under existing conditions, do not exceed the County noise compatibility standard; or,

The discretionary development would result in an increase in traffic noise levels of 3 dBA or greater in an area where traffic noise levels under existing conditions exceed a County noise compatibility standard stated in Policy HAZ-9.2.

Noise control measures may include increased vegetation, roadway pavement improvements and maintenance, and site and building design features. If such measures are not sufficient to reduce a new discretionary development’s fair share of traffic-generated noise at sensitive receptors, a sound wall barrier may be constructed. All feasible¹ noise reduction measures shall be implemented to ensure the development’s fair share of traffic-generated noise is reduced, consistent with Policy HAZ-9.2.

1. “Feasible” means that this mitigation measure shall be applied to future discretionary projects under the 2040 General Plan when and to the extent it is “capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social, and technological factors” as determined by the County in the context of such future projects based on substantial evidence. This definition is consistent with the definition of “feasible” set forth in CEQA (Pub. Res. Code, § 21066.1) and the CEQA Guidelines (§ 15164). The County shall be solely responsible for making this feasibility determination in accordance with CEQA.

For clarification, Mitigation Measure NOI-3 beginning on page 4.13-27 is revised as follows to define the term “feasible:”

Mitigation Measure NOI-3: New Implementation Program HAZ-X: Revise the Construction Noise Threshold Criteria and Control Plan

The County shall include the following new implementation program in the 2040 General Plan.

Implementation Program HAZ-X: Revise the Construction Noise Threshold Criteria and Control Plan

The County shall revise the Construction Noise Threshold Criteria and Control Plan within one year of 2040 General Plan adoption to consider all potential vibration-inducing activities and include various measures, setback distances, precautions, monitoring programs, and alternative methods to traditional construction activities with the potential to result in structural damage or excessive groundborne noise. Items that shall be addressed in the plan include, but are not limited to, the following:

Ground vibration-producing activities, such as pile driving and blasting, shall be limited to the daytime hours between 7:00 a.m. to 7:00 p.m. on weekdays or 9:00 a.m. to 7:00 p.m. on weekends and holidays.

If pile driving is used, pile holes shall be predrilled to the maximum feasible¹ depth to reduce the number of blows required to seat a pile.

All construction equipment on construction sites shall be operated as far away from vibration-sensitive sites as reasonably possible.

Earthmoving, blasting and ground-impacting operations shall be phased so as not to occur simultaneously in areas close to sensitive receptors, to the extent feasible.¹ The total vibration level produced could be significantly less when each vibration source is operated at separate times.

Minimum setback requirements for different types of ground vibration-producing activities (e.g., pile driving and blasting) for the purpose of preventing damage to nearby structures shall be established. Factors to be considered include the specific nature of the vibration producing activity (e.g., type and duration of pile driving), local soil conditions, and the fragility/resiliency of the nearby structures. Established setback requirements (i.e., 100 feet) can be breached if a project-specific, site specific analysis is conducted by a qualified geotechnical engineer or ground vibration specialist that indicates that no structural damage would occur at nearby buildings or structures.

Minimum setback requirements for different types of ground vibration producing activities (e.g., pile driving and blasting) for the purpose of preventing negative human response shall be established based on the specific nature of the vibration producing activity (e.g., type and duration of pile driving), local soil conditions, and the type of sensitive receptor. Established setback requirements (i.e., 300 feet) can be breached only if a

project-specific, site-specific, technically adequate ground vibration study indicates that the buildings would not be exposed to ground vibration levels in excess of 80 VdB, and ground vibration measurements performed during the construction activity confirm that the buildings are not being exposed to levels in excess of 80 VdB.

All vibration-inducing activity within the distance parameters described above shall be monitored and documented for ground vibration noise and vibration noise levels at the nearest sensitive land use and associated recorded data submitted to Ventura County so as not to exceed the recommended FTA levels.

Alternatives to traditional pile driving (e.g., sonic pile driving, jetting, cast-in-place or auger cast piles, nondisplacement piles, pile cushioning, torque or hydraulic piles) shall be considered and implemented where feasible¹ to reduce vibration levels.

1. “Feasible” means that this mitigation measure shall be applied to future discretionary projects under the 2040 General Plan when and to the extent it is “capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social, and technological factors” as determined by the County in the context of such future projects based on substantial evidence. This definition is consistent with the definition of “feasible” set forth in CEQA (Pub. Res. Code, § 21066.1) and the CEQA Guidelines (§ 15164). The County shall be solely responsible for making this feasibility determination in accordance with CEQA.

3.18 REVISIONS TO SECTION 4.14: POPULATION AND HOUSING

No revisions have been made to this section of the draft EIR.

3.19 REVISIONS TO SECTION 4.15: PUBLIC SERVICES AND RECREATION

No revisions have been made to this section of the draft EIR.

3.20 REVISIONS TO SECTION 4.16: TRANSPORTATION AND TRAFFIC

Mitigation Measure CTM-1 on page is revised to define the term “feasible:”

Mitigation Measure CTM-1: New Implementation Program CTM-X: Interim Vehicle Miles Traveled CEQA Assessment Criteria

The County shall include the following new implementation program in the 2040 General Plan.

Implementation Program CTM-X: Interim Vehicle Miles Traveled CEQA Assessment Criteria

Following June 30, 2020 and prior to completion of Implementation Program CTM-B, all projects (not otherwise exempt from CEQA analysis) shall be evaluated for

potential environmental impacts relative to VMT using the State’s minimum reduction standards, as follows:

| <u>Project Type</u> | <u>Measurement Unit</u> | <u>Model Trip Types</u> | <u>Minimum Criteria</u> | <u>Baseline VMT</u> | <u>Threshold VMT</u> |
|--------------------------------|---------------------------|---------------------------------------------|------------------------------------------|---------------------|----------------------|
| <u>Residential</u> | <u>VMT/Capita</u> | <u>Average of all Home Based Trip Types</u> | <u>15% Reduction of Regional Average</u> | <u>9.66</u> | <u>8.21</u> |
| <u>Office</u> | <u>VMT/Employee</u> | <u>Home Based Work Trips</u> | <u>15% Reduction of Regional Average</u> | <u>13.52</u> | <u>11.49</u> |
| <u>Industrial</u> | <u>VMT/Employee</u> | <u>Home Based Work Trips</u> | <u>15% Reduction of Regional Average</u> | <u>13.52</u> | <u>11.49</u> |
| <u>Retail</u> | <u>Unincorporated VMT</u> | <u>All Trip Types</u> | <u>No Net Increase in Regional VMT</u> | <u>7,500,249</u> | <u>7,500,249</u> |
| <u>Agriculture</u> | <u>Unincorporated VMT</u> | <u>All Trip Types</u> | <u>No Net Increase in Regional VMT</u> | <u>7,500,249</u> | <u>7,500,249</u> |
| <u>Infrastructure</u> | <u>Unincorporated VMT</u> | <u>All Trip Types</u> | <u>No Net Increase in Regional VMT</u> | <u>7,500,249</u> | <u>7,500,249</u> |
| <u>All Other Project Types</u> | <u>Unincorporated VMT</u> | <u>All Trip Types</u> | <u>No Net Increase in Regional VMT</u> | <u>7,500,249</u> | <u>7,500,249</u> |

If a proposed project is found to have a significant impact on VMT, the impact must be reduced, as feasible,¹ by modifying the project’s VMT to a level below the established thresholds of significance and/or mitigating the impact through multimodal transportation improvements or mitigations to enhance transportation mode shift (use of alternative transportation modes). Following completion and adoption of VMT thresholds as part of the Ventura County ISAG, this implementation program shall no longer apply.

1. “Feasible” means that this mitigation measure shall be applied to future discretionary projects under the 2040 General Plan when and to the extent it is “capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social, and technological factors” as determined by the County in the context of such future projects based on substantial evidence. This definition is consistent with the definition of “feasible” set forth in CEQA (Pub. Res. Code, § 21066.1) and the CEQA Guidelines (§ 15164). The County shall be solely responsible for making this feasibility determination in accordance with CEQA.

To clarify the performance standards, Mitigation Measures CTM-2 and CTM-3 on draft EIR pages 4.16-27 and 4.16-28 are revised as follows:

Mitigation Measure CTM-2: Revised Implementation Program CTM-B: Initial Study Assessment Guidelines

The County shall include the following revised implementation program in the 2040 General Plan.

Implementation Program CTM-B: Initial Study Assessment Guidelines

The County shall update and adopt its’ Initial Study Assessment Guidelines (ISAG) no later than 2025 to address Vehicle Miles Traveled (VMT) and safety metrics

pursuant to CEQA Guidelines Section 15064.3. This program shall consider inclusion of the following components:

- ▶ Establishment of screening criteria to define projects not required to submit detailed VMT analysis, such as infill projects, inclusion of locally serving commercial, transit supportive projects, or transportation enhancements that reduce VMT;
- ▶ Establishment of thresholds of significance for identifying VMT related transportation impacts (to meet or exceed State requirements; at minimum the thresholds will be equivalent to the threshold values for different project types identified in Mitigation Measure CTM-1);
- ▶ Standard mitigation measures for significant transportation impacts; and
- ▶ Specify the County's procedures for reviewing projects with significant and unavoidable impacts, under CEQA, related to VMT.

Mitigation Measure CTM-3: Revised Implementation Program CTM-C: Vehicle Miles Traveled (VMT) Reduction Program

The County shall include the following revised implementation program in the 2040 General Plan.

Implementation Program CTM-C: Vehicle Miles Traveled (VMT) Reduction Program

To support climate change related goals and CEQA related VMT policies pursuant to SB 743 (2013), the County shall develop a VMT Reduction Program no later than 2025. This program ~~should~~ will contain a range of project- and program-level mitigation measures and VMT reduction strategies, that could include:

- ▶ Preparation of a Transportation Demand Management (TDM) program to promote mode shifts from single occupant vehicle use to transit, ridesharing, active transportation, telecommuting, etc.; and,
- ▶ Transportation System Management applications such as park-and-ride lots, intelligent transportation system (ITS) field deployment, pavement management, etc.

This program shall identify measures to achieve an additional five percent overall reduction in VMT by 2030, and 10 percent by 2040 (relative to 2030 and 2040 business as usual scenarios, respectively). During implementation of the 2040 General Plan, the County ~~shall~~ will review and update the VMT Reduction Program as warranted to provide additional mitigation measures and programs that achieve these levels of VMT reduction.

3.21 REVISIONS TO SECTION 4.17: UTILITIES

To provide clarification, the following text is added to Section 4.17.1, “Background Report Setting Updates,” under the subheading “Environmental Setting,” on page 4.17-1:

Water Purveyors – Calleguas Municipal Water District

Most of Ventura County residents (approximately three quarters) rely on Calleguas Municipal Water District (MWD) for at least a portion of their potable water supply. Calleguas MWD distributes high quality drinking water to 19 cities, local water agencies, and investor-owned and mutual water companies (listed below) throughout southeast Ventura County. These retail purveyors receive water through 140 miles of large-diameter pipeline operated and maintained by Calleguas MWD. In turn, these purveyors deliver water to area residents, businesses, and agricultural customers. Only a small portion of the water (approximately 5 percent) is used for agricultural purposes. Agricultural demands are generally met by other agencies or private entities using untreated surface water, recycled wastewater, and groundwater from various basins underlying the area (Calleguas MWD 2016).

The following water purveyors obtain all or a portion of their water from Calleguas MWD:

Berylwood Heights Mutual Water Company
Brandeis Mutual Water Company
Butler Ranch Mutual Water Company
California-American Water Company
California Water Service Company
Camrosa Water District
City of Camarillo
City of Oxnard
City of Port Hueneme
City of Thousand Oaks
Crestview Mutual Water Company
Golden State Water Company
Oak Park Water District
Pleasant Valley Mutual Water Company
Solano Verde Mutual Water Company
Ventura County Waterworks District No. 1 (VCWWD No. 1)
Ventura County Waterworks District No. 8 (VCWWD No. 8)
Ventura County Waterworks District No. 19 (VCWWD No. 19)
Ventura County Waterworks District No. 38 (VCWWD No. 38) – formerly
Lake Sherwood Community Services District (CSD)
Zone Mutual Water Company

Additionally, the following text is added to Section 4.17.1, “Background Report Setting Updates,” under the subheading “Environmental Setting,” on page 4.17-1:

Water Supply and Demand

In 2020, the Casitas Municipal Water District reported 99,836 acre-feet (AF) of available surface water supplies from Lake Casitas. The City of Ventura draws approximately 20 percent of its water resources from the Ventura River. The estimated annual water

supply in the Ventura River Watershed is 157,436 AF and the estimated annual demand is 14,508 AF.

The Calleguas Municipal Water District supplies the City of Oxnard with imported water from the Santa Clara River Watershed. In 2018, this water comprised 45 percent of the City's total supply.

To provide clarification, the average dry weather flow and level of treatment in the City of Oxnard presented in Table 4.17-1 on page 4.17-2 has been revised as shown below.

Table 4.17-1 Wastewater Treatment Capacity, Ventura County

| Agency | Total Number of Connections | Rated Capacity (MGD ¹) | ADWF ² (MGD) | Treatment Level |
|---------------------------------------------------|----------------------------------------------|------------------------------------|-------------------------|-----------------------------------------|
| County Service Area No. 29 | 307 | N/A | 0.085 | Tertiary |
| County Service Area No. 30 | 274 | N/A | 0.2 | Tertiary |

Note: AF=acre-feet.

1: Calleguas Municipal Water District imports water into the watershed through the State Water Project to meet basin demand in most years.

Source: Appendix B

Mitigation Measure UTL-1 on page 4.17-18 is revised as follows:

Implementation Program WR-X: Demonstrate Adequate Water Supply during Normal, Single-Dry, and Multiple-Dry Years

Water-demand projects (as defined in Section 15155 of the State CEQA Guidelines) that require service from a public water system shall prepare a water supply assessment prior to project approval. If the projected water demand associated with the project was not accounted for in the most recently adopted urban water management plan, or the public water system has no urban water management plan, the water supply assessment must address the public water system's total projected water supplies available during normal, single-dry, and multiple-dry water years for a 20-year projection. The assessment shall describe if the new water service will be sufficiently met under this 20-year projection. The water supply assessment shall be prepared to the satisfaction of and approved by the governing body of the affected public water system and the County. ~~If, as a result of its assessment, the public water system concludes that its water supplies are, or will be, insufficient, the public water system shall provide to the County its plans for acquiring additional water supplies.~~ A water-demand project that includes a new water service from a public water system shall not be approved unless adequate water supplies are demonstrated.

3.22 REVISIONS TO CHAPTER 5: CUMULATIVE IMPACTS

No revisions have been made to this chapter of the draft EIR.

3.23 REVISIONS TO CHAPTER 6: ALTERNATIVES

To provide clarification, the description of Alternative 2 in the third paragraph under in Section 6.5.2, "Alternative 2: Existing Community and Urban Area Designations Alternative," on page 6-15 is revised to read:

However, the land use diagram of this alternative would be different from the 2040 General Plan in the following ways. ~~Very Low Density or Low Density Residential lands outside of the Existing Community area designation (boundary) and Urban area designation (boundary) would remain the same as under the 2040 General Plan.~~ Very Low Density or Low Density Residential lands located within the Existing Community area designation (boundary) and Urban area designation (boundary) would be designated as Medium-Density Residential or Residential High-Density.

3.24 REVISIONS TO CHAPTER 7: OTHER CEQA CONSIDERATIONS

No revisions have been made to this chapter of the draft EIR.

Your Comment:

I am very concerned that Ventura County is not taking drastic enough steps to protect our drinking water, and air quality from contamination from the oil industry. In a time of drought we should have a moratorium on fracking. Flaring is contaminating our air and it's avoidable and there are solutions. Sadly it's business as usual even though our air quality and water quality are continually suffering from the oil industry. We need forward thinking in our general plan to tackle climate change and really make a measurable difference. Please phase out fossil fuel production, maintain policy COS-7.8 and protect our finite water supply, and our air quality. Thank you. Dawn Kuznkowski

New Draft Environmental Impact Report

Your Comment:

According to a recent study of data by the Washington Post Ventura County ranks as the fastest-warming county in the Lower 48 states.

It is critical that Ventura County gets its climate policies RIGHT in the General Plan Update. The draft plan as currently written fails to meet requirements for streamlined CEQA review.

Please take the following actions:

- 1. Buffers should be increased from the currently 1,500 feet to 2,500 feet
- 2. Maintain Policy COS-7.7 as recommended by the Board of Supervisors, so that all newly permitted discretionary oil wells are required to convey oil and produced water via pipelines instead of trucking
- 3. Maintain Policy COS-7.8 as recommended by the Board of Supervisors, so that all newly permitted discretionary oil wells are required to collect gases and use or remove them for sale or proper disposal instead of flaring or venting. Flaring should be allowed only in cases of emergency or for testing purposes.
- 4. Revise the Climate Action Plan and corresponding policies in the General Plan to achieve measurable, enforceable reductions in greenhouse gas emissions
- 5. The county should adopt the strongest possible measures to ensure that greenhouse gas emissions are curbed to protect air quality and to ensure a safe, sustainable future for all county residents

I2-1
I2-2
I2-3

Thank you for your time and attention to this most important issue.

Gen. Plan Update and DEIR

Your Comment:

The General Plan Update does not set strong enough goals to reduce GHG emissions, and should follow the example of the L.A. Sustainability Plan.

The DEIR should allow oil and water to be transported by pipelines instead of diesel trucks to reduce air pollution in vulnerable communities.

Flaring should no longer be allowed, except in emergencies or testing.

Oil and gas facilities in the county listed as "superemitters" should no longer be allowed to operate.

Ventura County is the fastest warming county in the lower 48 states. The provisions in the draft plan are inadequate to address this warming trend.

All of it

Your Comment:

I feel we should set policy driven by reducing climate change and the draft update does not provide enough emissions reduction.

We can and should do better.

The CAP addresses the consumption side by encouraging electric fuel vehicles and clean power for homes and businesses. It does not address the production side at all. Ventura County is the third largest oil and gas producing county in California. As such, we must do our part to reduce oil production through thoughtful, rigorous policy to phase out production.

This CAP will set the policies that will drive land use decisions and projects that affecting GHG emissions for the next 20 years. The planet depends on each county, municipality and country to do this right.

We need an expert team that will produce a plan that will meet the greenhouse gas emission reduction goals.

The General Plan needs to reduce emissions that harm people and the planet.

The Los Angeles Sustainability Plan, aimed at meeting the goals of the Paris Climate Agreement, has clear and bold goals: "By eliminating fossil fuel production in the county, including drilling, production and refining, the county will protect its residents from harmful local pollution that inequitably burdens low-income communities and communities of color."

And this comes from the second largest oil-producing county in California. We need a similar goal for Ventura County.

Another goal from the LA Plan: "Collaborate with DOGGR and unincorporated communities and affected cities to develop a sunset strategy for all oil and gas operations that prioritizes disadvantaged communities." Ventura County needs to do the same.

Climate change is caused by fossil fuel production and consumption.

Comment On:

Buffer Requirements, Trucking vs. Pipeline, Flaring, Climate Action Plan, Greenhouse Gas "Super- Emitters, Ojai

Your Comment:

- *Buffer Requirements – Buffers should be increased from the currently proposed 1,500 feet to 2,500 feet.
- *Trucking vs. Pipeline - Maintain Policy COS-7.7 as recommended by the Board of Supervisors, so that all newly permitted discretionary oil wells are required to convey oil and produced water via pipelines instead of trucking.
- *Flaring – Maintain Policy COS-7.8 as recommended by the Board of Supervisors, so that all newly permitted discretionary oil wells are required to collect gases and use or remove them for sale or proper disposal instead of flaring or venting. Flaring should be allowed only in cases of emergency or for testing purposes.
- *Climate Action Plan – Revise the Climate Action Plan and corresponding policies in the General Plan to achieve measurable, enforceable reductions in greenhouse gas emissions.
- *Greenhouse Gas “Super-Emitters” – The county should adopt the strongest possible measures to ensure that greenhouse gas emissions are curbed to protect air quality and to ensure a safe, sustainable future for all county residents.
- *For Ojai - The 2040 General Plan must include a strong defense of the five-pound air emissions limit for the Ojai Valley. All projects subject to CEQA review must include an evaluation of the totality of air emissions in order to understand and mitigate the impacts to local air quality.

Re: The 2040 General Plan Update's Draft Environmental
Impact Report's Public Review Period.

Dear Ms. Curtis:

The following comments, questions, and suggestions address Section 4.9(Hazards, Hazardous Materials and Wildfire) of the Draft EIR's Chapter 4(Environmental Setting, Impacts, and Mitigation Measures). My concerns come not from the study of or employment in these fields, but from life's experiences: years of attending Santa Susana Field Laboratory(Rocketdyne) meetings, addressing City, County, State and Federal government emergency plans, and following wildfire incidents since 2003 in the news on television, newspapers, and now the Internet. More devastating than the devastation left behind by the extraordinary disasters is the public's perception that first responders will always rise to the occasion to save lives, property, businesses, jobs, ecosystems, and California!!!! Nothing could be further from the truth!!!!

#1 - Pages 4.9-2 and 4.9-3, while the Thomas Fire(2017) and Woolsey Fire(2018) are mentioned, so should the the Hill Fire(2018), and the October 30, 2019 Easy Fire be included in the 2040 General Plan Update! Overwhelming stress on first responders has been attributed to the major incidents occurring: all at once, back-to-back, during hurricane strength winds, and in an all year fire season!!!!

#2 - Page 4.9-2, the Ventura County Fire Apparatus Access Code "establishes the minimum and cumulative design and maintenance standards for emergency fire access roads"!!!! First responders will be able to truly respond effectively to and keep people and property safe when maximum standards are the norm!!!!

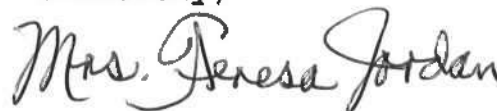

- #3 - Page 4.9-6, Policy HAZ-1.1, the City of Simi Valley back in the 1990's required a Fire Safety Plan for the Big Sky development project. The County must require similar planning documents for proposed development in high fire risk areas!!!!
- #4 - Page 4.9-6, Policy HAZ-1.2, the Ventura County Fire Department's defensible space clear zones is 100', in some cases 200'. Devastating fires show this does not limit the damage from flying embers!!!! In the California Governor's Office 2004 Blue Ribbon Fire Commission's Westlake Village hearing a more comprehensive defensible space was 400'!!!! The Ventura County Fire Department's Fire Hazard Reduction Program(FHRP) must be implemented twice or three times a year to be effective!!!! Are grants available to those property owners who cannot afford additional clean-ups? Include public donations made through Go Fund Me type programs, or by check!!!!
- #5 - Page 4.9-6, Policy HAZ-1.3, are controlled burns truly going to be undertaken? Such clearings would have limited the devastation from the Thomas Fire in Ventura County and Santa Barbara Counties!!!! Was this the same case with the Hill and Woolsey Fires?
- #6 - Page 4.9-6, Policy HAZ-1.4, while I concur with having a Notice of Fire Hazard recorded "with the County Recorder for all new discretionary entitlements(including subdivisions and land use permits) within areas designated as Hazardous Fire Areas by the Ventura County Fire Department or High Fire Hazard Severity Zones by the California Department of Forestry and Fire Protection(CAL FIRE)" more has to be done to inform the public of this! What information is contained in a Notice of Fire Hazard? What law makes the NOTICE a legal document?
- #7 - Page 4.9-6, Policy HAZ-1.5, see COMMENTS 2, 3 and 4! In updates of the County's EOP and the Multi-Hazard Mitigation Plan, the "Team" must include County Planning Commission, and SSFL representatives!!!! Require water trucks on large lots!!!! Such vehicle was instrumental during the 2003 Simi Fire in saving a family's life!!!! Is the County's Emergency Operations Plan truly updated on a tri-annual basis? Evacuation routes must never be second guessed!!!!

- #8 - Page 4.9-6, Policy HAZ-1.6, *New Policy*, I concur!
Because people think that "fire safe" means safety
the education programs and information must state
"fire wise"!!!!
- #9 - Page 4.9-6, Policy HAZ-1.7, *New Policy*, I concur!
- #10 - Page 4.9-6, Policy HAZ-1.8, *New Policy*, I concur!
Update of the Santa Monica Mountains Community
Wildfire Protection Plan adopted in 2013 was
supposed to be updated in 2018!!!! What is the
update status of this crucial document?
- #11 - Page 4.9-7, Policy HAZ-5.2, in January, I learned
about the closed Tierra Rejada Landfill's Easy Fire
damage to the gas extraction system(methane), flare
controls, etc.! I have not found the Landfill in
the 2040 General Plan Update and 2018 Background
Report! Because the Landfill's Consortium partners
(4) share costs equally for after closure permit
work, and now for the Easy Fire Emergency repairs
(\$548,554 each), the "66-acre site located 1 mile
west of Madera Road and north of Tierra Rejada Road
along the Arroyo Simi must be included in the 2040
General Plan Update!!!!
- #12 - Page 4.9-7, Policy HAZ-5.3, *New Policy*, I concur!
- #13 - Page 4.9-7, Policy HAZ-5.4, *New Policy*, I concur!
- #14 - Page 4.9-7, Policy HAZ-5.7, *modified*, I concur!
Because the Tierra Rejada Landfill's waste footprint
is 26 acres, it's quite possible that future
development could occur on the 66-acre site!!!!
- #15 - Page 4.9-9, Policy HAZ-12.1, *modified*, I concur with
two means of access! I do not concur with deviation
policy for a single proposed access road!!!!
- #16 - Page 4.9-9, Policy HAZ-12.2, *modified*, the update to
the Ventura County Emergency Operations Plan must
state "tri-annually"!!!! The update to the Ventura
County Hazard Mitigation Plan must state "every
five years"!!!!

- #17 - Page 4.9-9, Policy HAZ-12.3, *modified*, interesting that public safety or emergency service facilities should not be sited in the areas listed without hazard mitigation, yet there is no mention of Open Space areas in light of Page 4.9-11 (bottom of page) which allows fire stations in the Open Space land use designation!!!!
- #18 - Page 4.9-20, what is the status of the MHMP's "new vegetation management program that provides vegetation management services to elderly, disabled, or low-income property owners who lack the resources to remove flammable vegetation from around their homes" mitigation strategy? Do mobile homes qualify? First responders going door-to-door to alert people during a fire incident must always be utilized even in the age of technological communications!!!!
- #19 - Because the 2040 General Plan Update's January 2018 Background Report has been "Revised" for January 2020, the name "Santa Felica" (Dam) must be corrected to read "Santa Felicia" on Page 11-29, Figure 11-6, Individual Dam Failure Inundation Areas!!!!

Ms. Curtis, I kindly request a written response from County staff to my letter. Thank you.

Sincerely,

Mrs. Teresa Jordan

Simi Valley, CA 93063

Re: Agenda Item 8A (Approval of Funding for Emergency Work Performed and Planned at the Tierra Rejada Landfill and Approval of a Supplemental Budget Request).

Dear Members of the Council:

I am writing because I have concerns regarding the closed Tierra Rejada Landfill site's gas extraction system, and the flare controls!!!!

Members of the Council, shortly after the October 30, 2019 Easy Fire I heard from a constituent of yours, who had driven home on Tierra Rejada Road, that there was another fire!!!! Even though my family was mourning the death of a loved one, I Googled fires around Tierra Rejada Road but found no reports of any additional incidents!!!! While the Staff Report validates your constituent's story, the information paints a very shocking picture!!!!

It is stated on Page 6 (Staff Report) that "Following the Easy Fire, staff" "responded to several small surface fires that continued to burn on the site for a few days"!!!! "These surface fires were confined to small areas approximately eight feet by eight feet and to the upper six inches of the surface. Their behavior was more of a slow, smoldering event right at the surface rather than the active flames that consumed the brush onsite on the first day"!!!! "Staff, through the help of contractors, dug out the shallow surface fires, extinguishing them with water, and repaired the areas with moist conditioned soil"!!!! "Active monitoring continued around these hot spots for several days to verify that ground temperatures were normal. Environmental monitoring of the gas wells in the vicinity of these areas was conducted to verify that the fire had not entered the landfill's buried waste mass"!!!! Several small surface fires burning for a few days is alarming!!!!

QUESTIONS

1. Was the flare active before and during the Easy Fire?
2. Did the flare contribute to the Easy Fire's intensity from the closed Tierra Rejada Landfill and beyond?
3. Did the small flames, and surface fires pose any danger to the drivers and property owners in the vicinity of the Tierra Rejada Landfill's 66-acre site? How many small fires were there? How many days did this occur?
4. Does the flare pose any fire danger in and of itself?
5. Do we have a health problem because of the methane gas?
6. Can the flare system resist hurricane strength winds?
7. Where are the Tierra Rejada Landfill documents kept?

Members of the Council, the City should have alerted the public to the presence of these fires!!!!

Members of the Council, I kindly request that the Police Department's Emergency Services' Emergency Plan Website Page be updated ASAP to reflect the 2020 Tentative Schedule!!!!

Members of the Council, I kindly request a written response from City staff to this letter. Thank you.

Sincerely,

Teresa Jordan

Ventura, CA 93009

Re: Agenda Item Authorization for the Integrated Waste Management Division of the Public Works Agency to Pay the Ventura Regional Sanitation District \$548,554 from the Solid Waste Trust Fund for Easy Fire-Related Repair Costs at the Tierra Rejada Landfill; and Authorization for the Auditor-Controller to Process the Necessary Budgetary Transactions; Supervisorial District No.4.

Dear Members of the Board:

On January 27, 2020, I submitted a letter to the City of Simi Valley City Council for its January 27, 2020 meeting to fund the Tierra Rejada Landfill emergency work (Agenda Item 8A). The following is a list of topics discussed by the City Council members and City staff during the Agenda Item:

- City's fire insurance coverage.
- CAL OES and FEMA are not met.
- Causes of the Easy Fire.
- Fire Department's fire incident report.
- Letter submitted by Teresa Jordan.
- Health issues from methane gas.
- Location of Tierra Rejada Landfill records.
- Fire protection priority for the landfill.
- Fire response to the Reagan Presidential Library.
- The loss of family homes.
- Fire Department considered the site brush clearance.
- Fire Department probably not know landfill was there.
- Place signage on the landfill site.
- Visiting firefighters do not know landfill is there.
- Put fencing around the landfill site.
- Include the landfill on County maps.
- Notify the public regarding such activity.

Members of the Board, on January 29, 2020, I read the Ventura Regional Sanitation District's December 19, 2019 Special Meeting Staff Report for the Emergency Wildfire Response at the Closed Bailard and Tierra Rejada Landfills (Agenda Item 5). The information for the Bailard Landfill (Page 2) stated "In order to help fund the remediation work from this unexpected fire event, VRSD is pursuing potential funding from insurance" (Olivas Fire, October 11, 2019).

QUESTIONS

1. Why was no insurance information given for the Tierra Rejada Landfill?
2. Do each of the Consortium partners have to pursue potential funding from their own insurance carriers?
3. Is the landfill site on the Fire Department's mapping system (Robby to the Rescue's "Who sends resources when a fire breaks out?" video covers the computer based dispatch system in Camarillo)?
4. Is the computer based dispatch system the same as the Automated Vehicle Locating system (AVL), or is it one type of activity in the facility?
5. How many surface fires were on the Tierra Rejada Landfill?
6. How many days did it take to put out the small fires?
7. Does the methane gas pose a health risk?
8. Was the flare active before the Easy Fire?
9. Does the flare pose any fire danger in and of itself?
10. Can the flare system resist hurricane strength winds?
11. Would fencing around the landfill site impact the wildlife corridor?

Members of the Board, investigations must be conducted on the cause of: 1. the errors on the location of the 2017 Thomas Fire in your 2018 Resolutions, 2. the errors in the

November 9, 2018 Sheriff Office's Emergency Proclamation's Hill Fire location, and Hill and Woolsey Fires incident date, and 3. the Sheriff Office's November 1, 2019 Emergency Proclamation's misleading information for the Easy Fire's location!!!! Crucial legal documents must be error free!!!!

Members of the Board, I kindly request a written response to this letter from County staff. Thank you.

Sincerely,

Teresa Jordan

Enclosure:

January 27, 2020, Letter to the Simi Valley City Council.

Re: Agenda Items 39 (Receive and File the Hill and Woolsey Fires Emergency Response After-Action Review Report), and 40 (Receive and File the 2019 Hill and Woolsey Fire Recovery Review Report; Approve the Improvement Plan Contained Within the Report; and Provide Recommendations and Direction to Staff to Incorporate into the Improvement Plan).

Dear Members of the Board:

It is unfortunate that for the past 2 years my concerns, comments, and suggestions regarding wildfire incidents have fallen on deaf ears!!!!

It is offensive that fire incidents' after-action reports expect the people (homeowners, residents, and business and property owners) to do more to help fight "mega" fires when all populations throughout the Nation are unaware that:

- #1 - For decades, state and local governments were supposed to include in their emergency plans' updates "WORST CASE" scenarios!!!!
- #2 - For years, the Country has experienced drought conditions throughout the States!
- #3 - For years, the United States has been experiencing an unprecedented shortage of firefighters!!!!

Members of the Board, it is unfortunate that County staff never responded to my extremely crucial questions made in my letters on the County's 2018 General Plan Update's chapters mentioning "wildfires", "Ventura County Fire Department" and "Ventura County Fire Protection District"!!!!

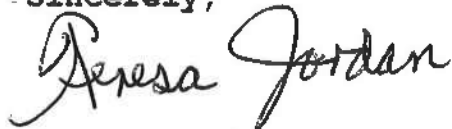

Members of the Board, it is unfortunate that the County never corrected the December 4, 2017 Thomas Fire incident location error in your Resolutions (brought to your attention in my many 2018 letters), because you approved major errors in the Sheriff Office's November 9, 2018 Hill and Woolsey Fires Emergency Proclamation which stated "the Hill Fire originated in the vicinity of Santa Susana Road and Hill Canyon on April 8, 2018 at 2:06 p.m., and the Woolsey Fire which originated in the unincorporated area of Simi Valley the same day at 2:26 p.m. at which time the Ventura County Board of Supervisors was not in session, and said conditions constitute a local emergency as defined in Government Code section 8558, subdivision (c)" (my January 4, 2019 letter, Agenda Item 39)!!!! The November 1, 2019 Sheriff Office's Emergency Proclamation for the Simi Valley Easy Fire incident location stated "that started in the vicinity of Tierra Rejada Park in Simi Valley at 6:10 a.m. on October 30, 2019, subsequently referred to as the Easy Fire" was misleading!!!! Because the City of Moorpark has a Tierra Rejada Park, the CAL FIRE incident information should have been provided!!!!

Members of the Board, answers to my questions, and corrections to the emergency related documents you approved would have been helpful in limiting the loss of jobs, lives, property, and ecosystems; and help limit the disruption that Ventura and Los Angeles counties' communities experienced!!!!

Members of the Board, please heed all recommendations in the November 11, 2019 City of Thousand Oaks, the November 17, 2019 County of Los Angeles, and the January 2020 Ventura County after-action response plans; in the January 2020 Ventura County Hill & Woolsey Fires Recovery After-Action Review; and in the December 2019 California Auditor's California Is Not Adequately Prepared to Protect Its Most Vulnerable Residents From Natural Disasters REPORT (#2019-103)!

Members of the Board, I kindly request that County staff respond to my April 29, 2019 letter (Agenda Item 24, the 2019 Ventura County Disaster Recovery Plan). Thank you.

Sincerely,

Teresa Jordan

RMA Planning Division, General Plan Update
800 So. Victoria Ave., L#1740
Ventura, CA 93009-1740

According to a recent study of data by the Washington Post, with an average temperature increase of 2.6 degrees Celsius since preindustrial times, **Ventura ranks as the fastest-warming county in the Lower 48 states.** The effects of climate change have impacted Ventura County profoundly — from the wildfires which have raged out of control to coastal infrastructure now threatened by sea-level rise.

We need to do better ... faster! Years of committee meetings must translate into action now. **The Climate Action Plan (CAP) is seriously incomplete** and lacks the technical and scientific input needed for a meaningful CAP. We are calling for a sense of urgency and an "all-hands-on-deck" effort to get it right. The county should contract immediately with a team like those employed by the city and county of Los Angeles in order to produce a robust plan capable of meeting the greenhouse Gas (GHG) emission reduction goals. At the same time, we must strengthen individual policies in the General Plan.

Climate change is caused by fossil fuel production and consumption. **Ventura County is the third largest oil and gas-producing county in California.** As such, we must do our part to reduce oil production through thoughtful, rigorous policy to phase out production.

This CAP will set the policies that will drive land use decisions and projects that affecting GHG emissions for the next 20 years. The planet depends on each county, municipality and country to do this right.

Climate Action Plan policies must result in measurable, enforceable reductions sufficient to meet California's climate goals. We've had enough of vague, inspirational slogans like "encouraging" or "supporting" green policies, but little to no actions on the ground.

A recent NASA study documents that several Ventura County facilities, including **oil and gas operations, are "super-emitters" of powerful climate pollutants.** Stationary source emissions, including those from oil and gas operations, make up approximately 26 percent of all emissions in California. The time for rubber-stamping oil and gas projects needs to end. We need to phase out these "super-emitters" fossil fuel operations in Ventura County. We have plenty of sun and wind to build energy grids upon, creating new green jobs.

The Ojai Valley, where I live, is known for airflow patterns that lock in airborne pollutants during the day, trapped in the Valley. The 2040 General Plan must strongly **defend the 5-pound air emissions limit for the Ojai Valley.** And buffers between oil and gas facilities and residential and schools should be increased from 1,500 to 2,500'.

805-640-1133 Fax: 805-640-7899 Cell: 805-798-0158
dulanie@sbcglobal.net

Dulanie Ellis-La Barre
206 So. Blanche St., Ojai, CA 93023

Flaring is another, frankly, insane practice in today's climate change crisis. It should be allowed only in case of emergencies or testing purposes. The new General Plan **MUST maintain Policy COS-7.8**, as recommended by the Board of Supervisors, so that wells are required to collect gases and use or remove them. The complaint about addressing this being "too costly" from the fossil fuel industry has always, and will always, be their excuse and failure to help right this self-caused crisis. ***Frankly, Ventura County should immediately begin phasing out all fossil fuel development and production, given that we are the fastest warming county in the entire country!***

Fracking must be abandoned in Ventura County - if for no other reasons than FRACKING REQUIRES ENORMOUS USE OF WATER and contaminates aquifers. The droughts are only going to get worse, we cannot afford to destroy our water sources because of fracking - not to mention the role fracking plays in prompting earthquakes. We have enough to worry about without encouraging more earthquakes in Southern California.

Ventura County, for all its beauty and fertility of land and sea, has been in bed with the oil and gas industry, in the drilling and agricultural pesticides, for far too long and at great cost to our home environment and the future of life as we know it in Ventura County.

For example:

- A 2-day 'heat bomb' last year wiped out the avocado and citrus harvests in Ojai
- Rivers are drying up: Ventura has been over-drafting their water supply from the Ventura River at Foster Park for years and is blaming Ojai (who cut their water use by 40%)
- With sea level rise, we can expect saltwater intrusion (already a problem) to inundate the Oxnard Plain and devastate food production.
- Oxnard and Ventura coastal residential areas and harbors will be flooded.
- The Navy base is already trying to prepare for sea rise and impact to military abilities
- Wildfire storms will continue to devastate wild lands and our communities

Climate change is no longer theory. Our General Plan must be a robust response. We must implement rigorous, measurable, immediate steps in our General Plan if we are to the very real challenges we face.

With great expectation that you will respond favorably, we remain,
Sincerely yours,

Dulanie & Douglas La Barre

Draft Environmental Impact Report

Your Comment:

Buffers should be increased from the currently proposed 1,500 feet to 2,500 feet.

Maintain Policy COS-7.7 as recommended by the Board of Supervisors, so that all newly permitted discretionary oil wells are required to convey oil and produced water via pipelines instead of trucking.

The DEIR would allow flaring if conveyance by pipeline is deemed infeasible, creating another loophole that could allow oil producers to simply claim that the cost is too high and continue with business as usual.

Revise the Climate Action Plan and corresponding policies in the General Plan to achieve measurable, enforceable reductions in greenhouse gas emissions.

The county should adopt the strongest possible measures to ensure that greenhouse gas emissions are curbed to protect air quality and to ensure a safe, sustainable future for all county residents.

Comment On:

Draft EIR

Your Comment:

The Climate Action Plan isn't good enough.

Ventura County needs a Climate Action Plan with measurable targets and outcomes, as a separate document.

Policies set in the GenPlan are not measurable or enforceable. Language used in the plan, such as policies that "encourage" and "support" action, are not sufficient to drive the kind of change necessary to meet greenhouse gas reduction targets.

I am calling for a separate Climate Action Plan to fill the gaps in the draft General Plan: The county decided not to have a separate Climate element of the General Plan, and instead integrated climate-related policies into the other elements, such as "Land Use" and "Housing." Climate policies are included among these different sections, and compiled in Appendix B of the Plan. Climate was not the primary focus or concern, and these groups lacked the expertise to put forward adequate, science-backed climate policy to guide the next 20 years.

Bigger Buffer Requirements

The current plan allows for oil and gas facilities to be located too close to schools and homes.

The current draft plan sets a 1500 ft minimum between oil & gas facilities and homes and schools. This is completely inadequate. The negative health impacts of emissions can be seen as much as a mile away from facilities. We are demanding a minimum 2500 ft. (~half a mile) distance from schools and homes for new oil & gas projects.

We must Stop Trucking Oil

All newly permitted oil wells should be required to transport oil & wastewater via pipelines, not trucks.

Most of the oil and wastewater produced from drilling is transported by trucks. These trucks go through or near our neighborhoods carrying hazardous materials, emitting toxic air pollution, and contributing significantly to the addition of greenhouse gases. The current plan protects oil companies by giving them the loophole to default to additional trucking, instead of installing pipelines if oil companies claim the cost of pipeline connection is too high.

The wasteful Flares must stop

I am calling for no new flares in Ventura County.

Flares waste a finite natural resource that can be used for energy production. Venting and flaring release toxic gases and powerful climate pollutants like methane into the atmosphere. Under the proposed general plan oil companies would

be allowed to continue venting and flaring without restrictions, if they claim the added cost of treating gas on-site or constructing pipeline connections is too high; this technicality lets oil companies carry on with business as usual. Instead, join us in insisting that flaring and venting in all new oil wells be prohibited, except in cases of emergency or testing purposes.

Thank you

Subject: watershed

In light of the litigation the city of Ventura has began as a counter suit against the Santa Barbara Channel Keepers, I am EXTREMELY concerned that the County of Ventura should also be very worried. I reside in the County of Ventura, work for the County of Ventura and was served by the City Of Ventura. With all the overlap of city and county PLEASE review any and all watershed documents that may have been proposed and placed on the "back burner" in anticipation that this issue will eventually include the County Of Ventura. Water rights, clean water availability, federal government, State and local ordinances do have to be considered as we look forward to the year 2040

Subject: One more thing

This preface by Oxnard resident Steve Nash sums up the feelings of many that the EIR is not sufficient:
“The entire assumption of a General Plan and its supporting documentation is to have a forward-looking plan to deal with land use, potential significant impacts and their mitigation measures within a geographical area.

It is my belief, and the belief of many others, that climate disruption caused by greenhouse gas emissions is the primary concern that has to be addressed in this type of document. Any plan that attempts to provide a framework for mitigating significant impacts that does not place climate change at the very forefront of significant impacts is a deeply flawed document and doomed to fulfill its “raison d’etre” which, ultimately, is to secure a safe and prosperous future for the residents and the environment under its jurisdiction.”

Get busy formulating a real climate action plan!

The responsibility of the Board decision to support the constituents not commerce.

Your Comment:

Sunday, February 16, 2020

Re: Draft General Plan and DEIR

Ventura County Board of Supervisors:

I am urging you to take meaningful action on the above documents coming before you that are schedule to have the public comments close this 27th.

Your physical and mental health and the health of your constituents as well as others in California, and indeed our global family are at stake when you make your decisions. Meaningful, measurable enforceable reductions to meet California's climate goals are necessary.

California's perspective, guidelines and procedures are antiquated as are our County's own. It is necessary for you as individuals and as a Board, to take serious and bold measures to reel in the oil industry. Oil has had its day and stockholders have benefitted nicely. Ventura County and its citizens have benefitted from the oil industry, also. But the County, State, and Nation have suffered the health and climate consequences of lax regulation. Even if technology finds a "clean burn" solution - the end of oil can be expected.

The Los Angeles Sustainability Plan, aimed at meeting the goals of the Paris Climate Agreement, has clear and bold goals: "By eliminating fossil fuel production in the county, including drilling, production and refining, the county will protect its residents from harmful local pollution that inequitably burdens low-income communities and communities of color." And this comes from the second largest oil-producing county in California. We need a similar goal for Ventura County.

I realize there are challenges you all face in this threading the needle legal world. It falls to you to do so for the sake of

those with lives on the line in a polluted world. We will all ultimately benefit from measurable, enforceable reductions sufficient to meet California's climate goals. It is clear to me, and I suspect to you in your personal quiet times of contemplation, that in the final analysis, there is an overriding benefit to the population of this county for the adoption of the strongest possible measures to insure that greenhouse gas emissions are curbed to protect air quality and to ensure a safe, sustainable future for all county residents.

All the best.

John

Susan Curtis,

Dear Ventura County Board of Supervisors and Planning Department,

Climate issues are something I feel worried about. Ventura County is warming faster than any county in the nation. Our ocean is acidifying faster. Drought and floods have hit us worse, and we can expect more extreme weather. I want strong climate policy and a goal to be carbon neutral by 2045.

My family and community are counting on you to make a strong plan that helps us mitigate climate impacts. With tipping points accelerating, we cannot go halfway! We want courageous leadership to set goals we can hang our hopes and efforts on.

First, it is necessary that all greenhouse gas emissions be counted based on the most current science.

I want policies like a sunset plan for oil and gas production, decarbonization of transportation and buildings, zero waste, incentives for regenerative agriculture and water management, and effective benchmarks for reducing emissions from tailpipes.

I want an EIR that covers major climate impacts and a systematic plan that will assure carbon neutrality no later than 2045.

Thank you—

Re: Comments on Ventura County General Plan DEIR

Dear Ms. Curtis:

On September 10, 2019, over the objection of the Ventura County Economic Development Association (VCEDA), your board voted 3-2 against taking a closer look at how new policies and programs proposed within the new General Plan will impact our regional economy and Ventura County residents. They voted to limit the economic analysis to only a handful of programs and solely on their impact to County departmental budgets – which is in no way a complete impact analysis.

In the months that have followed that decision, numerous additional policies and programs have found their way into the draft document – all proposed by members of the Board of Supervisors, and all without vetting through the advisory committees meant to provide oversight and input into revising the County's General Plan. As has been the case throughout this process, their impacts lack adequate study.

VCEDA had hoped that the draft General Plan's DEIR would address this lack of analysis. Unfortunately, that is not the case. Therefore, **we respectfully request that the DEIR be re-circulated so that further study and analysis might take place** to address the following comments:

3.0 Project Description

3-4 Proposed General Plan Organization

The DEIR explains that the GPU establishes 15 new land use designations, the DEIR states, without support or analysis, that these designations "would be consistent with land uses and densities/intensities allowed under the current (2018) zoning designations for each affected parcel." But what does this mean? That the existing zoning designations are at or below the densities and intensities allowed by the new GPU designations? Or that the new GPU designations would not permit any additional density or intensity than the existing zoning designations? These are two wholly different things and the project description is so vague that a reader cannot determine which is occurring.

Relatedly, on page 3-5, the DEIR states that “minimum” lot sizes permitted in the zoning code will be maintained, but makes no mention of maximum lot sizes.

There are statements throughout the DEIR that allude to the GPU permitting “relatively higher intensity residential, commercial, mixed use, and industrial land uses within the Existing Community area designation and the Urban area designation” – yet nowhere in the Project Description is this expressly explained. How intense and dense? Where? What amount additional buildout will be accommodated?

3-6 and 7 Land Use Planning and Growth Management

It is apparent that the County is seeking to look to its cities to accommodate growth. This approach will necessarily increase environmental impacts within the cities and no analysis of these reasonably foreseeable potential impacts is included in the DEIR.

3-11 Housing Element

The use of the existing Housing Element as a “placeholder” is a significant flaw in the Amendment and DEIR analysis. The County is well aware that the increase in the RHNA allocation that is known to occur will significantly affect most of the other elements of the General Plan and the environmental analysis.

Not only does the decision to exclude the pending housing element result in improper piecemealing (see comment above), inclusion of a “placeholder” element results in a meaningless, inaccurate, and incomplete Project Description.

3-19 Land Use Diagram

Project Description implies that the new General Plan designations will increase density and intensity, but provide no details as to where or by how much. The DEIR reads, “Under the 2040 General Plan relatively higher intensity residential [], commercial [], mixed use and industrial land use designations would apply to approximately 1.2 percent of land in the unincorporated county.” How much higher? Where? Figures 3-2a and 3-2b are at such a large scale, it is impossible to tell where the designations are, let alone how they differ from what currently exists or in what locations additional density and intensity will be permitted. How much more development can occur as a result of these changes and what will be the potential impacts of this change? A reader has no way of knowing.

4.0 Environmental Analysis

4-1 Approach to Environmental Analysis

CEQA does not permit an agency to bury required information, that forms the cornerstone of the analysis, in a 1,000+ page appendix. The DEIR says, “The reader is referred to the Background Report for all other setting information.” Yet the BR is more than 1,000 pages long, not counting any appendices, and is not organized in a way that coincides with the chapters of the DEIR.

Background Report 3-89 to 3-90 and 3-97

Improper segmentation. Concedes that the County cannot meet post 2020 housing growth needs and commercial growth needs (see also BR 3-134), concedes that “up-zoning” would be required to meet SCAG plan housing obligations. DEIR is devoid of any analysis regarding this apparent conflict. The “up-zoning” needs to be analyzed as part of this project and this analysis.

As noted elsewhere, the underlying development potential methodology utilizes outdated (2014) RHNA numbers which effectively masks the disparity between “potential” and actual development that will take place through horizon 2040. (Burying the magnitude of land use impact)

4.11 Land Use and Planning

4.11 Thresholds of Significance

Failure to analyze internal inconsistency, or consistency between the updated GP and the existing Area Plans that are not amended. The DEIR states that Threshold 25(1) of the ISAG asks whether the project is consistent with the community character policies and development standards in the Ventura County General Plan goals, policies and programs, or applicable Area Plan. The DEIR goes on to explain that this threshold will not be considered in this DEIR because “this draft EIR is an evaluation of an update to the Ventura County General Plan goals, policies and programs, and Area Plans under which future projects would be evaluated.” However, failing to analyze this threshold means that there is no analysis of internal consistency. The Project Description chapter of the DEIR explains that very few changes are made to the Area Plans, therefore the Land Use & Planning chapter of the DEIR should consider whether the changes in the land use designations are consistent with all policies that are unchanged. See comment above regarding the Ventura Avenue Plan’s protection and expansion of oil field uses.

4.11-3 Issues Not Discussed Further

Failure to analyze internal inconsistency, or consistency between the updated GP and the existing Area Plans that are not amended. Relatedly, regarding the unchanged Area Plans, the DEIR states, without support or analysis, that “[t]he Area Plan policies and implementation programs related to these issues are consistent with the 2040 General Plan policies and implementation programs, which are addressed in the following impact discussions. Therefore, the environmental effects of the Area Plan goals and policies are not addressed separately in this section.”

4.11-4 2040 General Plan Policies and Implementation Programs

Improper segmentation. Policy LU-1.3 states that the County will work with SCAG “to direct state regional housing needs allocations predominantly to cities...” What does this mean? The RHNA methodology is already available and estimates a significant number of new units to be accommodated within the unincorporated county. Further, cities are likely to push back on their significantly higher RHNA allocations, and push those units out to the County such that the final number will likely be even greater. For all these reasons, and the ones identified in our comments on the Project Description, the entirety of the GPU should be paused until the RHNA allocations are finalized.

See also comments above regarding Background Report pp. 3-89 to 3-90, 3-97.

4.11-18 Impact 4.11-1

Failure to analyze the land use impacts (and all other impacts) associated with the new land use designations. GP 2040 creates 13 new land use categories (or 15 – see below comment regarding inconsistency within the DEIR on the Project Description) with distinct development standards—yet there is no real analysis of how the installation of 13/15 new use classes that did not previously exist would not create a conflict with uses established pursuant to the previous 6 use classes under GP 2005. Notably, the DEIR concedes that the new land use classifications will result in development at a higher intensity in locations where residential, commercial, and industrial uses exist. Yet there is no explanation of how this intensification will be accomplished to avoid incompatibility. (As has been the case throughout the DEIR, Section 4.11 consists of a laundry list of LU policies, but, when it comes to explaining the role those policies play in avoiding or mitigating a potential impact (e.g. incompatible uses), the DEIR fails to provide that critical explanation/analysis)

4.11-19 Impact 4.11.1

Vague and inconsistent project description. The analysis describes the GPU as establishing 13 new land use designations, but the Project Description says there are 15 (see page 2-6).

4.11-21 Impact 4.11-1

Vague and inconsistent project description – unsupported conclusions in the analysis regarding compatibility. The DEIR states that “Policies LU-4.1 and LU-4.2 would reduce incompatible land uses by specifying densities and/or intensities of allowed uses within each land use designation and maintaining continuity with neighboring zoning, land uses, and parcel sizes.” But neither of these policies do this, or specify densities or intensities in any way.

4.11-22 Impact 4.11-3

DEIR cannot conclude that the GPU is consistent with the RHNA when the GPU includes only a “placeholder housing element” and improperly segments the Housing Element and accommodation of the RHNA from its Project Description and the analyses contained in the DEIR. The DEIR states that “Implementation of the 2040 General Plan policies and programs listed above, coordination of the RHNA with housing element updates, and compliance with applicable regulations would ensure that development under the 2040 General Plan is consistent with the RHNA.” This essentially argues that the GP is consistent with the RHNA because the County will change the GP in the very near future to accommodate the RHNA. This is nonsensical. For all the reasons provided in our comments on the Project Description, the RHNA, which is imminent and the County’s own estimate will be released while the DEIR is out for public review in the month of February, accommodating the RHNA may likely require changing the designations identified in the GPU and the analysis of the same provided in this DEIR. This is exactly why CEQA prohibits improper segmentation of related projects.

4.14 Population and Housing

4.14-1 Regulatory Setting, Environmental Setting

DEIR excludes all relevant discussion regarding both regulatory setting and environmental setting, and instead forces a reader to find the information buried in the BR.

No discussion is provided regarding SB 330 (Housing Crisis Act of 2019).

4.14-6 through 8, Impact 4.14-1

See piecemealing comments above. This impact addresses the County's ability to accommodate its imminent RHNA allocation. The discussion explains how "it is anticipated that the County will have to identify additional land that would meet state standards for lower-income inventory site requirements" and that "identifying sufficient sites for this next [RHNA] cycle will be a challenge."

But the draft RHNA numbers are already available, and per the DEIR's text, will be finalized while the DEIR is out for public review. The RHNA sites should be identified and considered as part of this DEIR. Knowing that land will be imminently re-designated in the near future, as part of the Housing Element Update, makes the analysis in the DEIR meaningless.

6.0 Alternatives

6.6 Environmentally Superior Alternative

The Dense Cores Alternative is selected as the environmentally superior alternative. The analysis fails to consider whether this alternative is feasible given the land available for development in the Existing Community and Urban land use categories. It also fails to address the impacts on surrounding cities. Significant concentration of population and housing adjacent to existing cities has the potential to create significant effects in those cities. This is not considered.

As noted in this letter's introduction, given the breadth of impacts not studied, nor impacts with suggested mitigation measures, VCEDA respectfully requests a re-circulation and distribution of the DEIR in the hopes that additional analysis will address these deficiencies.

You may contact me directly if you have questions specific to the comments listed above, or if you require a more detailed analysis.

Sincerely,

Sandy E. Smith
VCEDA Policy Chair

Oil and Gas buffer zone minimums

Your Comment:

2500 feet is still too close to people and shared spaces for these polluting and destroying entities but that is the minimum we can demand as a buffer zone for these oil and gas extractive and explorative practices.

No more oil.

draft plan

Your Comment:

The proposed 1500 ft minimum between oil & gas facilities, homes and schools is way too close for comfort and safety .
At least a mile is needed to outdistance the emissions.

EIR and draft plan

Your Comment:

Provide a computation of all GHG emissions in ONE EASY TO FIND LOCATION OF THE PLAN. Include everything! err on the side of overestimating and not omitting sources. CHANGE GOALS and MITIGATION MEASURE SO THE State reaches carbon neutrality by 2045. THE USA IS NOT A LEADER for climate change. CALIFORNIA has that role for our country and VENTURA COUNTY has the money and citizen support to fill that role. DO NOT weaken our state with a poor climate change element in the general plan.

Susan Curtis,

Dear Ventura County Board of Supervisors and Planning Department,

Ventura County is warming faster than any county in the nation. Our ocean is acidifying faster. We can also expect more extreme weather, producing both droughts (with associated wildfire risk) and floods.

My family and community are counting on you to ensure that the draft EIR addresses the full scope of environmental impacts and mitigations.

This means that all greenhouse gas emissions must be counted based on the most current science.

I favor using a wide variety of methods to mitigate climate impacts, like a sunset plan for oil and gas production, decarbonization of transportation and buildings, zero waste, incentives for regenerative agriculture and water management, and reducing emissions from tailpipes.

I want an EIR that covers major climate impacts via a comprehensive and systematic plan. This is important to me because I care about the world my grandchildren will inhabit. That world will be shaped by the planning you do now.

Thank you.

Greetings,

The County General Plan proposed does not address the conflict with CEQA, EIR, Fire Department, insurance companies, and Costal Plan regarding brush clearance for fire protection. Specifically, a house on a ridge requires much more, buy hundreds of feet, clearance than a house on the flat.

Ask the homeowners on Mipoloma Road that lost their houses.

Subject: Comment on future policies

Please consider that we are facing a much worse future for all our health if we continue to put profits for the petroleum industry before people's' health. That is not to say there is not room for plenty of income and profits to be made. Just please do it sensibly with renewable energy. Stop all fracking immediately. Push for electric vehicles. Improve public transportation. Encourage bicycle use, etc. You know how to do it. It will just take the political will to stand up to the petroleum industry that is harming everyone in Ventura County, let alone the entire planet.

Thank you for listening to reason.
Sincerely,
Mary Volpe

To: General Plan Update
Subject: Comments on new Draft Environmental Impact Report

CAUTION: If this email looks suspicious, DO NOT click. Forward to Spam.Manager@ventura.org

Ventura County must protect our quality of life with bold action on climate in its General Plan Update. This document sets the policies that drive all land-use decisions for the next 20 years, but the current draft is completely inadequate in addressing the climate crisis.

A recent [report](#) in the Washington Post confirmed that we are the fastest-warming county in the continental U.S.

We have seen the catastrophic effect of a warming world in the fierce winds that whipped the Thomas and Woolsey fires out of control and we will not forget the suffering it caused our families and neighbors.

Climate change is caused by fossil fuel production and consumption. We must do our part to reduce oil production through thoughtful, rigorous policy to phase it out.

Your written comments will let the Board of Supervisors know your concerns...if you don't write, they won't know.

Buffer Requirements – The proposed buffers for locating oil and gas facilities a safe distance from schools and homes are inadequate. Studies show adverse health impacts from oil and gas facilities at distances of at least half a mile.

Action Needed: Buffers should be increased from the currently proposed 1,500 feet to 2,500 feet.

Trucking vs. Pipeline – Currently, oil and produced water from local oil wells are mostly transported by truck. Trucking creates safety hazards on county roads, exposes residents to toxic diesel pollution, and causes substantial amounts of greenhouse gas emissions. Draft General Plan Policy COS-7.7 attempts to address this problem by requiring newly permitted oil wells to use pipelines instead of trucks to transport oil and produced water.

However, the DEIR attempts to undermine Policy COS-7.7, concluding that the added costs of constructing pipeline connections make this policy infeasible and may lead to a loss of petroleum resources. The DEIR proposes to allow trucking if pipelines are deemed infeasible. This would create a loophole allowing oil companies to simply claim that the cost of a pipeline connection is too high.

Action Needed: Maintain Policy COS-7.7 as recommended by the Board of Supervisors, so that all newly permitted discretionary oil wells are required to convey oil and produced water via pipelines instead of trucking.

Flaring – Draft General Plan Policy COS-7.8 requires gases from all new discretionary oil and gas wells to be collected and used, or removed for sale or proper disposal, instead of being flared or vented to the atmosphere. The policy would allow flaring only in cases of emergency or for testing purposes. This is important because venting and flaring release both toxic gases and powerful climate pollutants like methane to the atmosphere.

The DEIR tries to undermine this policy, too. It concludes that the added costs of treating the gas on site or constructing pipeline connections would make this requirement infeasible and may lead to a loss of petroleum resources. The DEIR instead would allow flaring if conveyance by pipeline is deemed infeasible, creating another loophole that could allow oil producers to simply claim that the cost is too high and continue with business as usual.

Action Needed: Maintain Policy COS-7.8 as recommended by the Board of Supervisors, so that all newly permitted discretionary oil wells are required to collect gases and use or remove them for sale or proper disposal instead of flaring or venting. Flaring should be allowed only in cases of emergency or for testing purposes.

Climate Action Plan – The draft General Plan and the DEIR conclude that the county’s greenhouse gas emissions would have significant impacts. However, the Climate Action Plan proposed as part of the General Plan is inadequate and will not reduce emissions in a meaningful way. Most proposed Climate Action Plan policies are vague and aspirational, relying on noncommittal assurances that the county will “encourage” and “support” change rather than clearly require measurable reductions in climate pollution.

Climate Action Plan policies must result in measurable, enforceable reductions sufficient to meet California’s climate goals. This is important because the General Plan and related Climate Action Plan can be used to streamline approval of future development projects. The county may not carefully analyze the climate consequences of future projects — including discretionary oil and gas development — if those projects claim they’re consistent with the Climate Action Plan. If the Climate Action Plan consists mostly of vague, voluntary, or otherwise unenforceable policies, future projects could easily be found consistent and could evade proper environmental review.

Action Needed: Revise the Climate Action Plan and corresponding policies in the General Plan to achieve measurable, enforceable reductions in greenhouse gas emissions.

Greenhouse Gas “Super-Emitters” – A recent NASA study documents that several Ventura County facilities, including oil and gas operations, are “super-emitters” of powerful climate pollutants. Stationary source emissions, including those from oil and gas operations, make up approximately 26 percent of all emissions in California. The General Plan must include strong policies to detect and curb emissions from these “super-emitters.”

Action Needed: The county should adopt the strongest possible measures to ensure that greenhouse gas emissions are curbed to protect air quality and to ensure a safe, sustainable future for all county residents.

Sincerely,

Harmony Eckberg

To: General Plan Update
Subject: My Comments Re: County's Draft Climate Action portion of the proposed County General Plan

To Whom It May Concern -

I must strongly express my objections to the latest draft of Ventura County's Draft Climate Action Plan part of the proposed new General Plan. Frankly - this draft is shockingly flawed given the ample input that has already been presented by countless non-profit organizations and citizens who have been participating in the meetings sponsored by the County in order to build and organize a broad consensus of agreement.

One of the most striking parts was a chart that illustrated where the County foresaw future oil & gas extraction projects but — tragically — omitted any similar chart/schematic for where foresaw significant set-aside spaces for where an ambitious (for example) Green Industrial Park might be developed to manufacture alternative, clean-green energy-producing jobs, i.e., wind-turbines and/or solar-panel manufacturing. That omission is preposterous given the level of alarm bells already sounding that warn us about climate change in general, and how Ventura County specifically has been “heating-up” faster than all the other California counties.

No where in the current draft has the “consumption side” of oil and gas and the necessity that significant reduction of same must be taken into account. It simply can't be “business as usual” when it comes to the future consumption and use of dangerous fossil fuels. And if significant consumption reduction is favored, then that goal should be reflected in the amount of future oil and gas production - which must also have significant reductions and certainly not maintain current levels or even worse — expand output. This is dangerous and unacceptable to any citizen who cares about combatting climate change.

Finally — no where did I read that the so-called FIVE POUND LIMIT for the Ojai Valley was being preserved. The health and welfare of the Ojai Valley depends on this limit to be maintained and enforced throughout the duration of any new 20-Year General Plan. To do otherwise could be considered criminal and would signal an obvious intentional effort to ignore the health and welfare of the County citizens that choose to reside in the greater Ojai Valley.

These above are but several of the deficiencies discovered in the latest County Draft of the new Twenty-Year General Plan. Your draft seems to me to be entirely incomplete and inadequate and it's painfully obvious that it greatly favors the oil and gas extraction industry when it comes to combatting adverse local and global climate changes now taking place at an alarmingly accelerating rate. We must do much-much better! Back to the drawing boards!

Sincerely -

Michael J. Shapiro

My family and community are counting on you to assure analysis of the full scope of environmental impacts and mitigations in the Draft EIR.

First, it is necessary that all greenhouse gas emissions be counted based on the most current science.

There are many ways to mitigate climate impacts, like a sunset plan for oil and gas production, decarbonization of transportation and buildings, zero waste, incentives for regenerative agriculture and water management, and reducing emissions from tailpipes.

I want an EIR that covers major climate impacts via a systematic plan.

Thank you—

Subject: General Plan 2040

To Whom It May Concern,

Climate change is here, its effects are already evident in our county. The General Plan update fails to provide enough emissions reduction to meet the state-mandated goals. A robust plan, with the help of technical and scientific input, needs to be included for the 2040 General Plan, including a strong defense of the five pound air emissions limit for the Ojai Valley.

Sincerely,
Michele DuPratt

Subject: P.LynMiddleton/Climate

As a ventura county resident, here below are what I copied and what I see that needs done. Cfrog says it all. I agree! See Below. We need to do everything to help our world.

Thank you, P. Lyn Middleton/ 204 N. Blanche Street / Ojai CA 93023

Buffer Requirements – The proposed buffers for locating oil and gas facilities a safe distance from schools and homes are inadequate. Studies show adverse health impacts from oil and gas facilities at distances of at least half a mile.

Action Needed: Buffers should be increased from the currently proposed 1,500 feet to 2,500 feet.

Trucking vs. Pipeline – Currently, oil and produced water from local oil wells are mostly transported by truck. Trucking creates safety hazards on county roads, exposes residents to toxic diesel pollution, and causes substantial amounts of greenhouse gas emissions. Draft General Plan Policy COS-7.7 attempts to address this problem by requiring newly permitted oil wells to use pipelines instead of trucks to transport oil and produced water.

However, the DEIR attempts to undermine Policy COS-7.7, concluding that the added costs of constructing pipeline connections make this policy infeasible and may lead to a loss of petroleum resources. The DEIR proposes to allow trucking if pipelines are deemed infeasible. This would create a loophole allowing oil companies to simply claim that the cost of a pipeline connection is too high.

Action Needed: Maintain Policy COS-7.7 as recommended by the Board of Supervisors, so that all newly permitted discretionary oil wells are required to convey oil and produced water via pipelines instead of trucking.

Flaring – Draft General Plan Policy COS-7.8 requires gases from all new discretionary oil and gas wells to be collected and used, or removed for sale or proper disposal, instead of being flared or vented to the atmosphere. The policy would allow flaring only in cases of emergency or for testing purposes. This is important because venting and flaring release both toxic gases and powerful climate pollutants like methane to the atmosphere.

The DEIR tries to undermine this policy, too. It concludes that the added costs of treating the gas on site or constructing pipeline connections would make this requirement infeasible and may lead to a loss of petroleum resources. The DEIR instead would allow flaring if conveyance by pipeline is deemed infeasible, creating another loophole that could allow oil producers to simply claim that the cost is too high and continue with business as usual.

Action Needed: Maintain Policy COS-7.8 as recommended by the Board of Supervisors, so that all newly permitted discretionary oil wells are required to collect gases and use or remove them for sale or proper disposal instead of flaring or venting. Flaring should be allowed only in cases of emergency or for testing purposes.

Climate Action Plan – The draft General Plan and the DEIR conclude that the county’s greenhouse gas emissions would have significant impacts. However, the Climate Action Plan proposed as part of the General Plan is inadequate and will not reduce emissions in a meaningful way. Most proposed Climate Action Plan policies are vague and aspirational,

relying on noncommittal assurances that the county will “encourage” and “support” change rather than clearly require measurable reductions in climate pollution.

Climate Action Plan policies must result in measurable, enforceable reductions sufficient to meet California’s climate goals. This is important because the General Plan and related Climate Action Plan can be used to streamline approval of future development projects. The county may not carefully analyze the climate consequences of future projects — including discretionary oil and gas development — if those projects claim they’re consistent with the Climate Action Plan. If the Climate Action Plan consists mostly of vague, voluntary, or otherwise unenforceable policies, future projects could easily be found consistent and could evade proper environmental review.

Action Needed: Revise the Climate Action Plan and corresponding policies in the General Plan to achieve measurable, enforceable reductions in greenhouse gas emissions.

Greenhouse Gas “Super-Emitters” – A recent NASA study documents that several Ventura County facilities, including oil and gas operations, are “super-emitters” of powerful climate pollutants. Stationary source emissions, including those from oil and gas operations, make up approximately 26 percent of all emissions in California. The General Plan must include strong policies to detect and curb emissions from these “super-emitters.”

Action Needed: The county should adopt the strongest possible measures to ensure that greenhouse gas emissions are curbed to protect air quality and to ensure a safe, sustainable future for all county residents.

For Ojai residents:

The 2040 General Plan must include a strong defense of the five-pound air emissions limit for the Ojai Valley. All projects subject to CEQA review must include an evaluation of the totality of air emissions in order to understand and mitigate the impacts to local air quality.

Comment On:

Appendix B. Climate Change

Your Comment:

NASA, working with the California Air Resources Board using InfraRed sensing while flying over California have determined that a third of California methane emissions can be traced to super emitters in the oil industry. In Ventura County, NASA has identified five methane super emitters at oil facilities. The General Plan must include regulation to eliminate methane emissions.

As a resident of Ventura County, I am very concerned about the future of our region and life on earth due to worsening climate change impacts.

Ventura County's General Plan is an opportunity to address these serious threats to human health and safety. If business as usual continues, impacts are bound to quicken the pace of becoming more and more severe. This is the time to make beneficial changes before conditions worsen – both locally and globally.

I agree with recommendations made by CFROG and the 350 Ventura County Climate Hub!

We need to muster our strength to shape a better future for generations to come. If we work together, I believe we can overcome the obstacles that block a thriving life-filled future.

Thank you for taking time to consider this matter carefully.

I am signing on to this letter because I care about the deteriorating condition of my County and planet. We must approve a plan that will provide a just and sustainable future. Please strengthen the climate aspects of the 2040 General Plan consistent with the following concerns:

With worsening climate change impacts, we reiterate and amplify the concerns the people expressed in January of last year about "climate change and GHGs, and the effects of continued oil and gas extraction including secondary effects related to climate change, air quality, water quality, water supply, traffic, noise, odors, aesthetics, and hazards."

Our county is warming faster than any other in the nation, our ocean is becoming more hostile to marine life, our last drought was the most intense and lasted longest, and our

history of costly floods will be dwarfed when future atmospheric rivers pour over our valleys. Our house is on fire. We need a thorough plan and environmental impacts analysis based on the latest science.

Ventura County's plan matters. Our larger cities are making climate action plans and look for your example of leadership. The environmental impact from what we do to mitigate climate impacts at the global scale is profoundly influential in trying to stop runaway climate change. This is explained in a new report Insights from the California Energy Policy Simulator about the role of the State of California in the world. Ventura County as a local government hit hardest by climate impacts must step up and meet serious goals. "Insights about California's climate policies are at the forefront of global efforts to battle climate change. The state's leadership and success so far have helped maintain momentum despite political headwinds. If California faltered, global efforts to reduce GHG emissions would be dealt a major setback. Meanwhile, the severe risks from runaway global warming are becoming more tangible as the state suffers from wildfires supercharged by climate change."

A. Four Overall Comments:

We are grateful for the expertise at the law firm of Shute, Mihaly and Wineberger retained by CFROG regarding CEQA. We have appreciated their past comments. We join them in continuing to request the following:

1. Count ALL GHGs that result from activity in our county: Count all burning of oil and gas originating in our county and count all fugitive methane from wells in our county and from methane entering our county that was not counted at the jurisdiction of origin. Do the math on the GHG footprint for heavy exports. We want to mitigate our fair share of all climate impacts from activities within Ventura County. We have to know what they are. Worrying about double counting is not acceptable. Just worry that you haven't counted every cause of climate impacts that we are morally and legally responsible to mitigate with a comprehensive inventory and a systematic plan.

2. Use the latest science to calculate GWP of methane: The global warming potential of GWP is nearly 40 percent greater than what you are using. The International Panel on Climate Change states that over a 20 year period, methane has a GWP of 84 compared to carbon dioxide (up from their previous estimate of 72). The US EPA estimates it at 87 and recent scientific experts put the estimate at 96. We must know the true environmental impact of methane emissions. A complete and scientifically valid GHG inventory is required for a CEQA-compliant Climate Action Plan.

3. Use the emissions reduction goal from Governor Brown's Executive Order B-18-55 "to achieve carbon neutrality as soon as possible, and no later than 2045, and achieve and maintain net negative emissions thereafter. This goal is in addition to the existing statewide targets of reducing greenhouse gas emissions." It is an inadequate compromise, but not as much as the SB 32 goal of 80% below 1990 levels by 2050. City of LA plans to stay within a net zero carbon budget between now and 2045. The

proposed GHG reductions in the VC2040 Draft of 41 percent below 2015 levels by 2030, 61 percent by 2040, and 80 percent by 2050 are not ambitious enough for us to do our part to mitigate the climate chaos happening faster than scientists have predicted.

4. Policies and programs must meet the goal: It does not take an in-depth analysis to see that this plan will not achieve the 2030 goal of 40% reduction in GHGs below 1990 levels. A new report Insights from the California Energy Policy Simulator shows that the State of California will fall short of that goal by at least 15 and as much as 45 MMT CO₂e. We have and continue to advocate for a goal aligned with Governor Brown's Executive Order to achieve carbon neutrality as soon as possible and no later than 2045.

B. Some Comments about Impacts and Mitigation

The environmental impacts that concern us are those resulting from governments not making and carrying out plans to mitigate climate change. Your draft analysis does not include most of them. Table B in the Executive Summary is not even half finished. Some of the more serious impacts are missing from the draft analysis. Here are a few of our concerns:

1. Aesthetics, Scenic Resources and Light Pollution and Agriculture and Forest Resources: Mitigation programs are needed to protect our resources from degradation from significant climate impacts. The loss of soil in particular is associated with the downfall of civilizations.

2. Air Quality: The emissions impacts from exceeding criteria pollutant thresholds and also greenhouse gases seem significant and can be mitigated.

3. Biological Resources: The new implementation program is a good start to "update the Initial Study Assessment Guidelines, Biological Resources Assessment report criteria and evaluate discretionary development that could potentially impact sensitive biological resources". Two kinds of impacts are missing. 1) Climate Change. A major mitigation is the restoration of wetlands which should be at a 2:1 or greater ratio. Stormwater management is another mitigation that reverses the loss of vegetation from drought and floods and supports the restoration of all of the indigenous biology that makes an ecosystem function to maintain the small water cycles. 2) Toxic Pesticide and Herbicide Use and Drift. This must be part of the agenda of a Program for Protection of Sensitive Biological Resources to promulgate the mitigations provided by Integrated Pest Management. Pest management policy must align with the recommendations of the California Department of Pesticide Regulation Roadmap for Integrated Pest Management some of which have climate mitigation co-benefits.

4. Energy: We want a workshop to learn how it is deemed less than significant to allow wasteful, inefficient, or unnecessary consumption of energy resources.

5. Greenhouse Gas Emissions: The climate change impacts are so dire that the mitigations need to be benchmarked to be achieved before it is too late to reverse runaway climate chaos. At minimum we demand a systematic plan for decarbonization of county facilities and electrification of the transportation system.

6. Hazards, Hazardous Materials, and Wildfire: The impacts of toxic explosions, leaks, and spills and the drift of regulated materials and the ignorance of the public about toxic impacts must be addressed where feasible through mitigations that regulate the use and transport of hazardous materials. We have recommended feasible mitigations for people being exposed to the risk of wildfires that have not been accepted by decision-makers.

7. Hydrology and Water Quality: Impacts from climate change and poor land management have led to grave threats to water supply and water quality. These are highly significant--ground water overdraft, overuse and degradation of water quality, erosion, flooding, and siltation. (Impact 4.10-12) The failure to restore small water cycles to keep stormwater in the uplands and maintain forest health is one of the most serious impacts being mitigated in many places through a paradigm shift about stormwater management. Mitigation is essential--water is life. It requires an integrated water management plan that involves every sector working on every mitigation of which we are aware.

8. Land Use and Planning We want an analysis of incompatible land uses and new development with negative health implications. Closing wells near sensitive sites is a mitigation. Environmental Justice is not examined in the draft EIR.

9. Mineral and Petroleum Resources: We want an analysis of the impact of the scenario in which wells have been put on hold and the operator cannot close the wells for lack of funds. We have no choice. The wells must be closed properly. Fields must be restored to functioning ecosystems to help mitigate climate change impacts. We need insurance as well as bigger bonds.

10. Traffic and Transportation: Tailpipe emissions is an extremely significant environmental impact. The mitigation aimed for in the CTM-C: Vehicle Miles Traveled (VMT) Reduction Program needs assurances of effectiveness via a clear description of what "conditions warrant providing additional mitigations and programs"? This is far too vague to be a mitigation for this significant impact. We have no alternative but to reliably cut GHGs in the transportation sector.

11. Utilities: Failure to develop wholesale and commercial scale renewable energy generation and microgrids is a significant environmental impact because it has forced us to have to get our electricity from fossil fuels via transmission lines that spark wildfires. Community microgrids are a feasible mitigation.

12. Waste Management: Failure to properly manage waste has a highly significant environmental impact, especially when it produces methane super-emitter landfills that

is driving climate change, but also the failure to reuse and recycle consumer goods and the materials and equipment discarded by commercial enterprises. We need a more comprehensive approach for mitigation of these impacts.

C. The following policy recommendations for the Draft Plan could help the Plan achieve the GHG reduction goals to mitigate climate change impacts and help the EIR be more relevant to the climate crisis.

Land Use and Community Character: We endorse the comments submitted by Bruce Smith to more firmly assure preservation of agricultural land and open space. We point out the lack of analysis of Environmental Justice policy issues.

Circulation, Transportation, and Mobility:

1. No overriding considerations should allow a project to NOT reduce VMT unless all of the vehicles have zero emissions that will use the proposed project.
2. CTM 3-9 to widen SR 118 has a significant environmental impact.
3. Benchmarks to reduce VMT need to be more clear and the plan needs a review with public input every two years until 2028 and then no longer than every five years.
4. Parking programs should be included in ways that reduce single-occupancy car trips.

Public Facilities, Services, and Infrastructure:

1. Enroll residents in a program to reduce CO2 emissions in their neighborhoods. Ex: Cool Block or Transition Streets.
2. PFS 2.1 must be revised to say include rather than encourage 'Sustainable Plans and Operations' in order to be considered a mitigation of climate change impacts from greenhouse gas emissions.
3. Policy PFS 7.1 should be revised to delete the need for access to gas. The environmental impact from use of natural gas requires carbonizing buildings beginning with no gas connections to new residences . It is therefore contradictory to ensure access to gas.
4. Local renewable energy generation must be part of the mitigation plan for reducing transmission facility fire hazard risk. This is not the same as "Smart Grid Technology". You need experts who know the cutting edge of this field to help write coherent policy on this topic.
5. Zero Waste The County shall achieve zero waste (via a suite of policies to reduce, reuse, and recycle) with no organic waste going to landfills by 2023
6. Zero Waste Policy for Meetings and Events Design and implement a zero waste policy for meetings and events sponsored or permitted by the County to minimize waste and rescue surplus edible food
7. Compostable Take-Out Foodware Require that take-out foodware be made with material compostable in solid waste processing facilities within 60 days
8. Reduce Solid Waste by Phasing Out Single-Use Plastic Evaluate how to best reduce solid waste generation per capita by at least 15% by 2030 including phasing out single-use plastics including but not limited to plastic straws, plastic utensils, plastic take-out containers, and expanded polystyrene
9. Ban Expanded Polystyrene

Conservation and Open Space:

1. Reduce oil and gas production by 40% by 2025 via higher monitoring standards and 2500 ft buffer zones near sensitive sites; reduce production to zero by no later than 2040.
2. Phase-Out of Oil and Gas Production The County shall prohibit new drilling and shall regulate existing wells to assure steady closing of wells beginning near residential and commercial areas.
3. Maintain Policy COS-7.8 as recommended by the Board of Supervisors, so that all newly permitted discretionary oil wells are required to collect gases and use or remove them for sale or proper disposal instead of flaring or venting. Flaring should be allowed only in cases of emergency or for testing purposes.
4. Maintain Policy COS-7.7 as recommended by the Board of Supervisors, so that all newly permitted discretionary oil wells are required to convey oil and produced water via pipelines instead of trucking.
5. Detect and curb methane emissions from "super-emitter" sites as identified by NASA.
6. Tax oil and gas production, and related uncaptured methane to raise the needed revenues to fund urgent climate programs to replace high-emission vehicles with a priority on trucking and freight companies, fishing businesses, general contractors and K-12 schools.
7. Require a fully accountable performance bond for all new wells to cover cost of closure Cite LAT article (maybe put on website and link to it).
8. Establish an insurance fund that oil and gas producers contribute to that will cover accidents and closing wells if the producer goes bankrupt.
9. Ban gas-fueled lawn and garden equipment. (Ex: City of Ojai)
10. Accelerate capture of legacy HFCs Enlist the public and private to find and destroy existing stocks of HFC's (refrigerant gases with extremely high Global Warming Potential).
11. Develop and adopt building codes based on best practices for use of low embodied carbon concrete and set targets for use of low GHG concrete alternatives. Ex: Bay Area Air Quality Management District and King Co, WA.
12. Encourage climate-safe and climate-resilient development through zoning reform and removal of limits on height, density, and minimum parking requirements to enable and promote walkability and a mix of uses for homes and businesses, parks and transit.
13. Create a master local clean energy siting and funding plan for wholesale distributed solar energy plus storage in commercial scale projects producing energy needs by 2030.
14. Provide energy efficiency benchmarking and rebates for low-income housing and renters as well as low-interest loans for small businesses to reduce energy use; assist owners of existing buildings to switch from natural gas to electricity.
15. Prepare sustainable building, siting, landscaping and passive heating and cooling practice guidelines, with a priority on low-income housing, that reduce consumption of non-renewable resources and that include climate and fire-safety in pre-approved plans.
16. Energy Efficiency to Reduce Electricity Use Use Energy Efficiency to Deliver 15% of Projected Needs for electricity in the county by 2023; and 30% by 2030.
17. Efficiency Building Standards for Retrofits Prioritize energy and water efficiency building standards and work to retrofit existing buildings.
18. Decarbonize County Buildings Develop a county building electrification plan eliminating natural gas use in County-owned facilities.
19. Decarbonize All Building Types Develop an electrification plan with goals for GHG

emission reductions through renewable energy that evaluates and prioritizes programs for local solar, energy storage and demand response (DR) that disconnects all buildings from gas service by 2050. Include incentives for deep retrofits of inefficient buildings.

Agriculture:

1. Integrated Pest Management where toxic pesticides are a last resort. Create a program that promotes the principles (systems approach, building trust, and effective communication) and pursues the recommendations of the Roadmap for Integrated Pest Management from the University of California and CA Department of Pesticide Regulation. Environmental impacts from toxic pesticides are not described in the Background Report. The Roadmap to an Organic California Policy Report by CCOF Foundation offers information for mitigations and climate action. A workshop is needed.
2. Inorganic Nitrogen Based Fertilizers Set benchmarks for reducing use of inorganic N fertilizer and encourage optimized use of organic and inorganic fertilizer for greatest efficiency in closed nutrient cycles, monitor for nutrient runoff from fields and encourage the use of cover crops and green manure crops to reduce or avoid nitrous oxide (N₂O) emissions and nutrient runoff.
3. Diversified Cropping Systems Encourage farmers to include 1 – 5% of beneficial insect attracting plants in a planted crop, and other methods, such as crop rotation, perennial mowed cover crop in orchards, and integrating multiple species or varieties to enhance the biological and economic stability by spreading economic risk and buffering against pest invasions and extreme weather events, and increase carbon sequestration.
4. Reward Regenerative Farmers with Digestate and Compost from Food Waste Research feasibility of a program for composting food waste for use by farmers and landscapers who use regenerative practices that sequester certified amounts of CO₂.

Water Resources:

1. At least 30,000 acre-feet per year must come from storm water capture by 2035
2. All rainfall must be retained onsite in soil and reservoirs.
3. Slow It. Spread It. Sink It! The County shall enforce Best Management Practices (BMP) and Low Impact Development (LID) for new developments.
4. Recycle all wastewater for beneficial reuse by 2035.
5. Reduce potable water use per capita by 22% by 2025 and 25% by 2035: Offer incentives for water conservation features, including drought tolerant landscaping, permeable materials in standard parkway design guidelines, street trees, infiltration, greywater, and water-saving plumbing.
6. Close oil and gas wells and injection wells near aquifers as a top priority.
7. Create a Master Plan to develop the full potential of integrated water management to infiltrate the ground and recharge aquifers; support reforestation and restoration of watershed ecosystems; conserve and protect groundwater resources, and clean up creeks, streams, and estuaries.
8. Support Santa Clara River Loop Trail and Ventura River Trail Development

Economic Vitality:

1. Agricultural Diversification should include reference to regenerative practices to create biodiversity with opportunities for community members to visit farms.
2. Small Business Promotion. Support approval of caretaker residential space on

- business property to reduce VMT and more financial strength for small businesses.
3. Green Economy. Prioritize youth and immigrants for workforce development in industries that promote and enhance environmental sustainability, including GHG reductions, climate adaptation, resiliency and local renewable energy generation, storage and distribution, including solar power, wind power, wave energy, regenerative organic farming and value-added agriculture-related activities, and other appropriate renewable sources.
 4. Maritime Economy. Facilitate a sustainable maritime economy using restorative aquaculture techniques that restore ocean health and biodiversity while reviving pre-human fisheries abundance. For example, restore sand-bottom kelp forests and increase kelp forests with flexible floating fishing reefs where the seafloor is otherwise too deep for kelp.
 5. Promote Fire-Resistant Infill and Revitalization. Encourage infill development that serves as firebreak rather than as additional fuel for wildfires.
 6. Create a Collaborative Structure for Innovation for a Resilient Future. The structure should be able to make decisions and create a way forward for zoning, building and materials and environmental health to allow options for a resilient future, include government officials, innovators and public as described in submissions from Sustainable Living Research Initiative.
 7. Parking Infrastructure. Develop parking policies to reduce single occupancy trips associated with employees and business activity to reduce Vehicle Miles Traveled.
 8. Master Plan for Distributed Energy Resources and Community Microgrids. Prepare a map of siting options for renewable energy generation and storage facilities and coordinate the identification of financing options for renewable energy resource development, including solar, wind, wave, storage and community microgrids both in front of and behind the meter.

In summary, with the accelerating tipping points, we cannot go half-way in our vision. We need extraordinary courage to set goals we can hang our hopes and efforts on. We want completeness and clarity so we can see how the emissions reduction plan adds up. We want respect for climate science to tell us the truth. We want more ambition. A 2016 decision of the state legislature in SB32 is just not good enough as a goal. We want to see a systematic plan that will assure carbon neutrality no later than 2045.

Simmons, Carrie

Subject: Climate Action Plan (CAP) is seriously incomplete

Buffers should be increased from the currently proposed 1,500 feet to 2,500 feet. Maintain Policy COS-7.7 as recommended by the Board of Supervisors, so that all newly permitted discretionary oil wells are required to convey oil and produced water via pipelines instead of trucking.

Maintain Policy COS-7.8 as recommended by the Board of Supervisors, so that all newly permitted discretionary oil wells are required to collect gases and use or remove them for sale or proper disposal instead of flaring or venting. Flaring should be allowed only in cases of emergency or for testing purposes.

Revise the Climate Action Plan and corresponding policies in the General Plan to achieve measurable, enforceable reductions in greenhouse gas emissions.

The county should adopt the strongest possible measures to ensure that greenhouse gas emissions are curbed to protect air quality and to ensure a safe, sustainable future for all county residents.

February 23, 2020

Dear Members of the Ventura County Board of Supervisors:

I write to you today on behalf of the 300 plus members of the Channel Islands Bicycle Club. My goal is twofold:

First, we wish to thank you for your leadership in multi-modal transportation. We cyclists are keenly aware and highly appreciative of the 29 miles of Class II bike lanes recently added to county roads and of the commitment of an unprecedented \$6 million in general funds designated new bike lanes on these same roads. Together, they support a healthier, safer, more active populace and reduce the need for car trips. Thank you.

Second, we wish both to applaud the robust, active transportation elements of the Draft General Plan 2040 and to encourage their implementation. In particular, we support the plan's commitment to policies that allow those who wish to travel on foot or by bike to do so safely, specifically:

- Encouraging bicycling, walking, public transportation and other forms of alternative transportation to reduce vehicle miles traveled, traffic congestion and greenhouse gas emissions.
- Expanding Safe Routes to School.
- Efficient land use patterns to reduce the need for single use car trips.
- Countywide bicycle lanes and trail systems connecting our community.
- Bicycle facility design that prioritizes cyclists' safety and visibility.
- Safe pedestrian crossings.
- Multi-modal choices that make driving alone an option rather than a necessity.
- Separated or buffered pedestrian and bicycle paths along County Road Networks that are designated Overweight Vehicle Corridors and STAA designated Terminal Access Routes.

- Constructing abandoned railroad rights-of-way for active transportation -- particularly the Santa Paula Branch Line Railroad Class 1 Bike Trail.
- Prioritizing an inclusive, regionally connected and consistently signed bicycle network such as that put forth in VCTC's Bicycle Wayfinding Plan. Such a network would connect our towns and important destinations within each community.

We thank you for progress made to date and look forward to a Ventura County that encourages healthier, less polluting living.

Sincerely,

Leslie Ogden

President, Channel Islands Bicycle Club

Subject: General plan /Environmental impact plan- comments

Hi,

I am a citizen that is deeply concerned about the impact of climate change on our county. I have noticed we have many oil wells in our county. I think our action plan should be aggressive like the LA plan and the Paris agreement. We need to have a goal of eliminating fossil fuel production in the county, including drilling, production and refining.

Also I agree with the following policies:

1. Maintain Policy COS-7.7 as recommended by the Board of Supervisors, so that all newly permitted discretionary oil wells are required to convey oil and produced water via pipelines instead of trucking.
2. Flaring should be allowed only in cases of emergency or for testing purposes.
3. Revise the Climate Action Plan and corresponding policies in the General Plan to achieve measurable, enforceable reductions in greenhouse gas emissions.

Thank you,

Re: Request for 90-Day Comment Deadline Extension on the Draft Environmental Impact Report for the County of Ventura Draft 2040 General Plan

Dear Ms. Curtis:

The Center for Biological Diversity respectfully requests an extension of the comment period for the Draft Environmental Impact Report for the County of Ventura Draft 2040 General Plan (State Clearinghouse No. 2019011026). The current 45 day comment period imposes a deadline of February 27, 2020, and is inadequate to allow full review of (1) the Draft EIR which covers complex issues in its 598 pages plus six appendices, including a 1034 page background report and (2) the Public Review Draft of the General Plan, which is 463 pages and includes four appendices.

It is simply not possible for the public to meaningfully review and comment on these documents in such a short timeframe. Due to the sheer volume and complexity of the materials, we believe an additional 90 days is required. Extending the deadline to May 27, 2020 would allow for a more comprehensive review and more useful comments. We therefore respectfully request that you consider extending the comment period an additional 90 days.

Thank you for your attention to this matter.

Sincerely,

J.P. Rose
Urban Wildlands Staff Attorney

Comments on Draft 2040 County General Plan and DEIR

Bruce Smith, AICP
3457 San Pablo St.
Ventura, CA 93003
February 24, 2020

The following are my comments based on my cursory review of the Draft 2040 General Plan and DEIR:

DRAFT 2040 COUNTY GENERAL PLAN:

Land Use and Community Character Element:

LU-3.3 Range of Uses in the Existing Community Designation (pg. 2-12):

This policy states in part: ...*"The County shall allow the appropriate zoning, population densities, and building intensities based on the adopted Area Plan or, where no Area Plan exists, by the applicable Existing Community Map contained in Appendix A.*

Because of the degree of specificity on the Existing Community Maps, the County shall require a General Plan amendment for any zone change within an Existing Community."

(Emphasis added)

It appears that the zoning maps and population density and building intensity tables for Existing Communities of the current General plan have not been included in Appendix A of the Draft General Plan. As such, the requirement for a General Plan amendment for any zone change within an Existing Community would be without legal basis, since there would be nothing to amend in the Draft General Plan. Although it could be argued that a zone change that is inconsistent with Table 2-1 of the proposed General Plan would require a General Plan Amendment, such zone changes could be potentially inconsistent with the Guidelines for Orderly Development (retain land uses and development at pre-established levels) and could cause potential impacts that have not been discussed in the DEIR.

Having no building intensity standards for Existing Communities would be inconsistent with the requirements of existing California General Plan law since these areas would have no building intensity standards (i.e., maximum lot coverage). (See comments regarding Table 2-2).

Table 2-1 General Plan Land Use Designations and Zoning Compatibility Matrix

(pg. 2-19):

As I stated in my May 2019 comments on the Preliminary Draft, the RA (Rural Agriculture) zone is not compatible with the Agricultural designation and should be eliminated therefrom. The RA zone predates the adoption of the Agricultural designation of the current General Plan, is listed under the heading of “Rural Residential Zones” in the Non-Coastal Zoning Ordinance, and allows many land uses that are incompatible with the purpose of the Agricultural designation. For example, the RA zone allows:

- Assembly Uses
- Intermediate and Residential Care of 7 or More Persons
- Cemeteries and Accessory Crematories, Columbaria and Mausoleums
- Cultural Heritage Sites with Historic Repository
- Colleges and universities
- Schools, elementary and secondary (boarding and nonboarding)
- Correctional Institutions
- Libraries
- Mobilehome Parks
- Camps
- Campgrounds
- Golf Courses and/or Driving Ranges
- Recreational Vehicle Parks
- Retreats
- Recyclables Collection Centers

Failure to eliminate the RA Zone from the Agricultural designation will potentially cause significant adverse impacts regarding the loss of agricultural soils/crops, is growth inducing, and is inconsistent with the purpose and intent of the SOAR Ordinance. The Draft EIR does not currently discuss or analyzed these impacts.

If for some reason the County seeks to allow the RA zone under the ECU-Agricultural designation (not subject to SOAR), then the purpose and intent should be clearly stated and any potential impacts discussed in the EIR.

Table 2-2 Land Use Designations and General Development Standards (Pg. 2-21)

As I stated in my May 2019 comments on the Preliminary Draft, this table contains no maximum lot coverage standards for the urban Residential Designations and contains a footnote stating: “*Maximum lot coverage is per appropriate County Zoning classification.*” However, the Non-Coastal Zoning Ordinance states that the Maximum Percentage of Building Coverage standard for each zone is: “*As determined by the General Plan or Applicable Area Plan.*” With the exception of the Saticoy Area Plan, all

Area Plans and Existing Communities not covered by an Area Plan currently contain maximum lot coverage standards. Moreover, this table fails to make reference to LU-10.3 Maximum Lot Coverage Nonconforming Lots (pg. 2-39). Therefore, this table needs to be corrected to make reference to maximum lot coverage standards contained in the Area Plans, Existing Community tables of the current countywide General Plan, and LU-10.3.

In addition, it appears that the zoning maps and population density and building intensity tables of each of the Existing Communities outside of an Area Plan of the current countywide General Plan have been eliminated in the proposed General Plan. This creates an inconsistency with State General Plan law since the Existing Community areas outside of an Area Plan would have no building intensity standards (see preceding comment regarding policy LU-3.3) and makes the Draft General Plan internally inconsistent. Therefore, these zoning maps and population density and building intensity tables should be added to either Appendix A, or an expanded Chapter 11 to address both Area Plans and Existing Communities.

ECU-Rural (ECU-R) (pg. 2-28), first paragraph is confusing and subject to misinterpretation, and should be modified to read:

This designation applies within the boundaries of an Existing Community designated area and provides a physical transition between the outer edges of an Existing Community or Urban Area and nearly adjacent ~~a~~Agricultural and ~~e~~Open ~~s~~Space designated areas and uses. ~~The ECU-Rural designation generally applies to the outer edges of Existing Community and Urban Areas and~~ around sensitive natural resources within the boundaries of an Existing Community designated area. Typical building types include large-lot single family homes in a rural setting.

PARKS & RECREATION LAND USE DESIGNATION (pg. 2-44) – *“This designation provides for parks and recreation facilities and associated recreation uses. The Parks and Recreation (PR) designation is only allowed in areas designated as Existing Community, Area Plans, or Areas of Interest under Policy LU-1.2.”* (Emphasis added)

This land use designation is apparently being created as a place saver for; 1) a future General Plan Amendment to actually designate specific properties with this designation and 2) a future Zoning Ordinance amendment to create a “REC” zone which would governing uses and development/operational standards.

Since the designation 1) only has a general description of allowed land uses (*parks and recreation facilities and associated recreation uses*), 2) the only development standard is *5% maximum lot coverage*, and 3) the designation is *allowed in areas designated Community, Area Plans, or Areas of Interest*, it is unclear how this designation is intended to be used. If the purpose is to change the land use designation of existing or planned parks and recreational facilities from Open Space, Agricultural, Rural, Existing Community and/or Urban designations to Parks and Recreation(PR), then that should be clearly stated. Moreover, the text of the Draft General Plan and Background Report should clearly state the current problem that the PR designation is intended to solve. In addition, it is unclear how the PR designation and the REC zoning would be consistent with the SOAR Ordinance on lands that are currently designated Open Space, Agricultural or Rural.

If the unstated purpose of the PR designation is that it should only be applied to lands that are currently designated Existing Community or Urban, then the reference to Area Plans should be qualified by Unincorporated Urban Center of said Plans. In addition, since the reference to Areas of Interest would mean that most of the south half of the County would be eligible for re-designation from Agricultural, Open Space and Rural to PR, such re-designations would generally require a countywide vote under the provisions of the SOAR Ordinance. Unless this is clearly the Board's intent, the reference to Areas of Interest should be eliminated.

LU-12.1 Parks and Recreational Facilities (pg. 2-46).

"The County shall support the development of parks and recreation facilities within areas designated as Existing Community, Area Plans, or Areas of Interest."

My comments regarding PARKS & RECREATION LAND USE DESIGNATION above, also apply to this policy. In addition, this policy seems overly broad in that a proposed park and recreational facility may have significant adverse, un-mitigatable impacts such as the loss of agricultural soils or the loss of natural resources. This policy, as worded, may prevent the County from denying such a project. The DEIR does not discuss these potential impacts.

Chapter 11 – Area Plans:

The last paragraph on page 11-1 states: *"Table 11-1 shows the compatibility between land use designations in the countywide General Plan and Area Plans. The solid squares indicate a directly compatible relationship between the two designations, and the empty square indicates limited compatibility because of a restriction from the development standards."*

State law requires that a General Plan (including Area Plans) be internally consistent. Table 11-1 is replete with errors and needs to be comprehensively reviewed and corrected, especially in light of the zoning compatibility matrix of each Area Plan and Table 2-1 of the Draft countywide General Plan. As an example, the table incorrectly shows several Urban Residential designations of the Area Plans to be directly compatible with the Rural, ECU-Rural, Agricultural, ECU Agricultural, Open Space, and ECU-Open Space designations of the countywide General Plan. In addition, the table incorrectly shows Rural Residential Designations of the Area Plans to be directly compatible with the Agricultural, ECU-Agricultural, Open Space, and ECU-Open Space designations of the countywide General Plan. Additionally, the Open Space designations of the Area Plans are incorrectly shown as being directly compatible with the Agricultural and ECU-Agricultural designations of the countywide General Plan. Other inconsistencies exist within the table as well.

Neither the text of Chapter 11 nor Table 11-2 explains what is generally or precisely meant by “...empty square indicates limited compatibility because of a restriction from the development standards.” Without explanation, this phrase is meaningless.”

Unless Table 2-1 is corrected, the proposed General Plan will be internally inconsistent, exposing the County to a significant legal challenge in court.

Appendices:

Appendix A - Area Plan and Existing Community Land Use Maps:

As I stated in my comments on Table 2-2, Appendix A should make reference to maximum lot coverage standards contained in the Area Plans, and include the maximum lot coverage standards of each of the Existing Communities in the current countywide General Plan.

General Comment regarding maps: Because of the scale of many of the maps, the Existing Community boundaries and land use designations within the Existing Community areas are unreadable and cannot be checked for accuracy. In addition, many of the land use designation labels on the maps are misplaced or unclear as to what parcels they apply to.

Figure A-2: General Plan Land Use Diagram - Lake Sherwood/Hidden Valley Area Plan: This map shows land use designations of some of the Existing Community areas that are within the Thousand Oaks Area Plan, which is confusing.

Figure A-8: General Plan Land Use Diagram - Thousand Oaks Area Plan: This map shows land use designations of some of the Existing Community areas that are within the Lake Sherwood/Hidden Valley Area Plan, which is confusing. In addition, the labels for land use designations within the Camarillo Area of Interest are unnecessary.

Figure A-21: General Plan Land Use Diagram - North Simi Valley: It is unclear what parcels the ECU-Open Space designation applies to since it is in an area that is outside of an Existing Community.

Figure A-23: General Plan Land Use Diagram - Santa Susana: The boundaries of the Existing Community along the north and northwest are confusing.

DRAFT ENVIRONMENTAL IMPACT REPORT:

6.5.2 Alternative 2: Existing Community and Urban Area Designations Alternative (pg. 6-15):

Third paragraph states in part that *“Very Low Density or Low Density Residential lands outside of the Existing Community area designation (boundary) and Urban area designation (boundary) would remain the same as under the 2040 General Plan.”* (emphasis added). This is incorrect since the Very Low Density and Low Density Residential designations are only consistent with the Existing Community and Urban area designations, and are inconsistent with Rural, Agricultural and Open Space designations. Therefore, this sentence should be removed.

Pg. 6-16, Second paragraph, first sentence:

This sentence states: *“In addition, this alternative would employ policy incentives and disincentives to focus future population, housing, and employment growth within the Urban and Existing Community area designations.”* The feasibility and effectiveness of these incentives and disincentives is highly questionable, especially the transfer of development rights from Rural, Agricultural and Open Space designated lands.

Pg. 6-16, Fourth paragraph, first sentence:

“Overall population growth, housing, and employment projections for this alternative would be the same as under the 2040 General Plan.” This sentence is confusing in light of the next sentence of the paragraph that states that this alternative: *“... would result in substantially higher rates of population and job growth within these area designations relative to the 2040 General Plan.”* Therefore, the first sentence should be deleted.

Comparison of Significant Environmental Effects (pg. 6-16)

First sentence states: *“This alternative would focus new development (e.g., more housing units, increase commercial square footage) anticipated to result from population growth that is forecast to occur over the life of the 2040 General Plan within a smaller disturbance footprint.”* (emphasis added). This statement is illogical since the Draft 2040 General Plan’s Very Low Density and Low Density Residential designated areas would be changed to more intense land use designations, which would result in greater disturbances to the existing physical and planned environment.

Many of the other positive effects of this alternative seem to be based on the expectation of transfer of development rights from Rural, Agricultural and Open Space designated lands; however, there is no quantification of impacts and the benefits are based on an incentive that is highly speculative.

6.5.3 Alternative 3: Dense Cores Alternative

This alternative suffers from the same deficiencies as the preceding alternative: there is no quantification of impacts and the benefits are based on an incentive that is highly speculative.

Re: Comments on Ventura County 2040 General Plan Draft Environmental Impact Report (State Clearinghouse No. #2019011026)

Dear Ms. Curtis:

On behalf of Aera Energy, LLC (“Aera”), we respectfully submit the enclosed comments on the Draft Environmental Impact Report (“DEIR”) prepared for the County of Ventura’s (“County”) proposed update to its existing General Plan (“GP 2040”).

As you may already know, Aera is the largest onshore oil and gas producer in the County, as well as its ninth largest tax-payer. Aera’s production operations within the County also generate significant downstream revenue for local businesses. In 2018, Aera’s local business expenditures exceeded forty million dollars. Aera’s daily production activities involve nearly one hundred full-time employees and several hundred contractors and vendors, all of whom in turn contribute to the long-term economic health and vitality of the County.

Our review of the DEIR has disclosed several categories of concern. As you are aware, the County must disclose and meaningfully evaluate all foreseeable direct and indirect physical consequences of its proposed action—the adoption of GP 2040. Based on our review of the DEIR, it is clear that the County has failed to fulfill its obligation in this regard. For example:

- In evaluating the consequences of adopting GP 2040, the DEIR relies on incomplete, erroneous or scientifically discredited information;
- In evaluating the consequences of adopting GP 2040, the DEIR ignores readily foreseeable impacts and/or misstates the severity of impacts;
- The DEIR proposes mitigation measures, the implementation of which is infeasible for a variety of known technological, legal and economic reasons;
- The DEIR and the Ventura County 2040 General Plan Update Background Report, Revised Public Review Draft January 2020 (hereinafter, “Background

Ventura County Resource Management Agency, Planning Division
Attn: Susan Curtis, Manager
February 24, 2020
Page 2

Report”) are incomplete with respect to their discussions of the environmental setting and regulatory setting; and

- The DEIR and Background Report fail to disclose and consider the fact that several proposed policies, implementing programs and mitigation measures are preempted by state and federal law and/or cannot be carried out without unlawfully impairing vested property rights.

We address these categories of concern in further detail in the Table of DEIR and Background Report Comments enclosed herewith and incorporated herein by reference.

In an effort to improve the technical and textual accuracy and adequacy of the DEIR and Background Report, as well as the GP 2040 Policies and Goals described therein, we have included several comments, proposed revisions and clarification requests in the enclosed Table of DEIR and Background Report Comments. We ask that this letter and all enclosed materials be included in the record of proceedings in this matter and carefully considered by the County.

Finally, it is our expectation that the extensive comments noted herein will be given the same careful consideration as comments submitted by others outside our industry, given the importance of this document to the current and future residents of Ventura County. It is our expectation that complete and thoughtful responses will be prepared for each of the comments enclosed herewith, and the DEIR will be revised and recirculated accordingly. A mere “comment noted or comment received” will not suffice. We look forward to working with County staff to resolve the issues addressed herein and we further look forward to recirculation of a DEIR that meets the applicable legal standards.

As requested, we are providing the name of our point of contact, mailing address and email address as follows:

William J. Spear III, Manager of Operations
3382 N. Ventura Avenue
Ventura, CA 93001

Sincerely,

William J. Spear III
Ventura Manager of Operations
Aera Energy, LLC

Table of DEIR and Background Report Comments

| Document & Page No. | Comment/Proposed Revision/Clarification Request |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DEIR: pg. 4.1-16 | Policy NV-1.12. The DEIR does not address the consequences of shifting the “scenic approach” designation to Canada Larga and Ventura Ave. Such a shift is expected to conflict with the long terms use objectives of the North Ventura Ave Area Plan, which are industrial in nature. |
| DEIR: pg. 4.1-23 | The DEIR does not disclose the impacts associated with implementation of Program J itself, nor does it disclose whether Program J implementation would adversely impact the existing built environment, foreseeable future development or introduce conflicting use pattern objectives. Additionally, the DEIR does not disclose which highways would be affected by implementation, which makes it impossible to evaluate the scope of impact. |
| DEIR: pg. 4.1-23 | The DEIR does not acknowledge or address the fact that certain facilities (such as oil and gas drill sites) cannot be sited so they are not readily seen, given known drilling and operational constraints. Such realities should be considered in the DEIR. |
| DEIR: pg. 4.1-25 | In its discussion of Open Space, the DEIR states that development is “to be sited and designed to prevent significant degradation of a scenic view or vista.” Again, the DEIR does not consider the fact that various authorized uses can only be installed in specific locations, which could foreseeably include installation in a location containing a scenic view or vista. |
| DEIR pg. 4.3-5 | Methodology. The DEIR utilizes various definitions of “sensitive receptors” in Section 4.3. The County states that “sensitive receptors are considered to be populations or uses that are more susceptible to the effects of air pollution than the general population”. Therefore, a residence would not be considered a “sensitive receptor”. The DEIR must explain why a typical residence would be excluded from any assessment of toxic air contaminants. |
| DEIR pg. 4.3-6 | Thresholds of Significance. The DEIR concludes that there are no known safe concentrations of toxic air contaminants (TAC). The DEIR should provide a reference to scientific studies that support this statement. Everyone in the County is exposed to TACs due to second-hand smoke, products of combustion, etc. Does this mean no one in the County is “safe”? Why would any additional development be allowed in the County under these conditions? |
| DEIR pg. 4.3-8 | Policy COS 7.8. The County is proposing a policy that requires gases from new discretionary oil and gas wells to be collected and used in order to minimize flaring. Landfills and wastewater treatment plants commonly employ flares to incinerate gas from those facilities. This policy should be expanded to include any flare associated with a discretionary project. If not, the DEIR should be revised to describe how the pollution from a flare at a landfill or wastewater treatment facility differs from a flare at an oil and gas well. |
| DEIR pg. 4.3-15 | Under Impact 4.3-2, the DEIR states that, “Further, as actual construction phasing is not known, it is possible that emissions may exceed or be below modeled emissions shown in Table 4.3-2. Nonetheless, based on conservative modeling, it is likely that emissions would exceed countywide and Ojai Valley thresholds at some point during buildout of the 2040 General Plan.” Yet, the DEIR provides no evidence to support the assumption that emissions would exceed countywide thresholds. Instead, the DEIR discloses that |

| | |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| | population growth for the County will be negligible through 2040, which contradicts the assumption that construction associated with such growth would exceed applicable thresholds. |
| DEIR: pg. 4.3-15 | Mitigation Measures AQ-1a and AQ-1b are duplicative. Measure AQ-1b does not provide any mitigation benefits over and above those stated in Measure AQ-1a. |
| DEIR pg. 4.3-16 | Mitigation Measure AQ-2a. This mitigation measure requires “[p]re-grading/excavation activities shall include watering the area to be graded or excavated before commencement of grading or excavation operations.” Although this mitigation measure will decrease fugitive dust emissions, no analysis is provided in the DEIR regarding the amount of water that will be needed or where the water will be obtained. The DEIR must analyze all potential impacts. This mitigation measure could have substantial impacts on water use and have the unintended consequence of increasing emissions of GHGs, PM2.5, and NOx by having to utilize water trucks. The DEIR needs to be revised and recirculated to analyze these potential impacts. |
| DEIR pg. 4.3-16 | Mitigation Measure AQ-2a. This mitigation measure requires “treatment” of various portions of future construction sites within the County to minimize fugitive dust. A treatment option listed is “periodic watering”. Again, this mitigation measure could have substantial impacts on water use and have the unintended consequence of increasing emissions of GHGs, PM2.5, and NOx by having to utilize water trucks. The DEIR needs to be revised and recirculated to analyze these potential impacts. |
| DEIR pg. 4.3-16 | Mitigation Measure AQ-2a. The DEIR concludes that after mitigation, “criteria air pollutants and precursors would be minimized through the use of the highest rate [sic] diesel engines available”. The highest rated diesel engines as determined by the U.S. Environmental Protection Agency are Tier 4 engines, which offer substantially reduced NOx emissions. Contrary to the statement in the DEIR, none of the mitigation measures listed in Section 4.3 require the use of Tier 4 engines for nonroad diesel-fired construction equipment. The DEIR must clarify whether Tier 4 engines are in fact required to mitigate NOx emissions at all discretionary construction projects. |
| DEIR pg. 4.3-17 | The NOx emissions listed in Table 4.3-3 can only be achieved using Tier 4 engines on all nonroad diesel-fired construction equipment. For example, NOx emissions are limited to less than 3.0 g/bhp-hr for a Tier 3 nonroad engine rated between 100 hp and 750 hp. It is not uncommon for construction companies to use diesel equipment rated at 250 hp. operating at a 50% load factor over an 8-hour day, this Tier 3 unit would emit around 7 lb/day of NOx, which is substantially higher than the NOx emissions estimated in Table 4.3-3. The DEIR should specify whether Table 4.3-3 is based on using Tier 4 engines exclusively. |
| DEIR pg. 4.3-21 | The DEIR relies on the 2005 Land Use Handbook that recommends 500 ft setbacks on highly used roads greater than 50,000 vehicles per day. This 2005 document is now outdated as CARB released their advisory Strategies to Reduce Air Pollution Exposure Near High-Volume Roadways in 2017. The more recent research concludes, “near-roadway pollution exposure had been previously underestimated and that people living as much as 1,000 feet from freeways were being adversely impacted by poor air quality”. The DEIR needs to be updated to reflect this more current research and recirculated to disclose that research to the public and decision makers. |
| DEIR pg. 4.3-21 | The DEIR proposes modifying policy COS-7.2 to require new discretionary oil wells be located a minimum of 1,500 ft from a residence and 2,500 ft from a school. As stated in |

| | |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| | <p>previous comments, the DEIR allows schools and residences to be sited within 500 ft of a high-traffic freeway. CARB routinely states that diesel exhaust is responsible for 70% of the cancer risk from airborne toxics in California (for example https://ww2.arb.ca.gov/resources/summary-diesel-particulate-matter-health-impacts). If 500 ft is sufficient to protect a person from diesel exhaust that accounts for 70% of the cancer risk, how can anyone justify a larger buffer zone around a discretionary oil well due to presumed toxic air contaminants? The existing zoning standards are adequate to protect the public from new oil wells; the imposition of the proposed new policy is not supported by scientific evidence.</p> |
| DEIR pg. 4.3-22 | <p>Policy HAZ-10.X. When describing setback requirements for transportation corridors, residences are included within the discussion of sensitive receptors. As stated above in a preceding comment, the County should more clearly identify when residences are considered sensitive receptors.</p> |
| DEIR: pg. 4.4-2 | <p>Recommended textual change shown in bold and underline: “Based on an updated review of the CNDDDB, as well as a search of the California Native Plant Society (CNPS), Inventory of Rare and Endangered Plants of California database, the U.S. Fish and Wildlife Service (USFWS), and the Information for Planning and Consultation database, there are 75 additional special-status plant species known or with potential to occur in Ventura County (Table 4.4-1) (CNDDDB 2019; CNPS 2019; USFWS 2019).”</p> |
| DEIR: pg. 4.4-10 | <p>Recommended textual change shown in bold and underline: “the County’s aerial imagery and other relevant biological GIS data layers such as wetlands, waterbodies, vegetation, habitat connectivity and wildlife corridors; and updated CNDDDB, CNPS, Inventory of Rare and Endangered Plants of California database, and USFWS Information for Planning and Consultation database search results (CNDDDB 2019; CNPS 2019; USFWS 2019).”</p> |
| DEIR: pg. 4.4-14 | <p>Recommended textual change shown in bold and underline: “Based on the review and recommendation of a qualified biologist the County shall identify sensitive biological resources as part of any land use designation change to the General Plan Land Use Diagram or zone designation change to the Zoning Ordinance that would intensify the uses in a given area. The County shall prioritize conservation of areas with sensitive biological resources. |-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| | 100-foot setbacks from wetland habitat, incorporation of protective design features to avoid impacts to riparian habitat.” |
| DEIR: pg. 4.7-3 | Policy Haz 4.2. The DEIR should disclose the location of known, active faults (this information is readily available) and examine the physical consequences of linear infrastructure around same. Since the location of anticipated development and the type of development in such locations is known and disclosed in the DEIR, the rerouting consequences can be considered, quantified and mitigated now. |
| DEIR: pg. 4.7-3 | Policy Haz 4.6. This policy potentially interferes with state water board regulations regarding storm water run-off pollution prevention. |
| DEIR: pg. 4.7-4 | Policy Haz 4-15. The DEIR assumes, without any credible supporting evidence, that “extraction wells” cause or contribute to land subsidence. It can be shown, by readily available substantial evidence, that rock matrices within the County are not susceptible to land subsidence with proper material balance. |
| DEIR: pg. 4.8-1 | Incomplete Regulatory Setting. There is no mention of the California Global Warming Solutions Act of 2006 (AB32), the Regulation for Mandatory Reporting of Greenhouse Gas Emissions (MRR), or State Cap and Trade program in the DEIR. It is imperative that these regulations be identified and discussed in the DEIR (as opposed to being discussed in passing in the 1000+ page Background Report). |
| DEIR pg 4.8-5 | The California Air Resources Board (CARB) partnered with Scientific Aviation Inc. to measure methane emissions within California. Their report Statewide Airborne Methane Emissions, Measurement Survey dated May 13, 2019 concludes, “landfill sites were found to be the largest methane emitters on a per site basis”. The report describes how an aircraft flew 18 times around the Toland Road Landfill in Ventura County on October 16, 2017 and another 16 laps on May 14, 2018 measuring methane emissions. Using this data, the report concludes that the methane emissions from the Toland Road Landfill averages 2,364.9 kg/hr, which equates to approximately 20,700 MT/yr of methane. The DEIR assigns methane a global warming potential of 28, so the Toland Road Landfill would average 580,000 MT/yr CO ₂ e based on this CARB sponsored study. The DEIR estimated the GHG emissions from the same landfill to be 22,591 MT CO ₂ e from waste generated from unincorporated Ventura County during 2015 and 74,701 MT CO ₂ e from “waste-in-place”; for a total of 97,292 MT/yr CO ₂ e from the Toland Road Landfill. The DEIR should evaluate the various methods of determining GHG emissions from landfills to inform the readers that the GHG emissions from solid waste could be significantly higher than the estimates provided in the DEIR. |
| DEIR pg. 4.8-5 | The GHG emissions from solid waste in the County are further underestimated by ignoring the composting operations within the County. Although a properly operated composting operation can decrease methane emissions from waste, the process is designed to create CO ₂ . The DEIR needs to be updated to account for waste diverted from landfills, which would include composting operations. |
| DEIR pg. 4.8-5 | The 2015 baseline GHG inventory for stationary sources is listed as 275,096 MT CO ₂ e in Table 4.8-1. This estimate is described in Appendix D as representing GHG from oil and gas operations and the source is “CARB Mandatory Reporting Rule – 2016 (Latest available as of 11/6/2017)”. Various entities report their GHG emissions to CARB via their Mandatory Reporting Regulation (MRR). The regulation requires that the reported GHG emissions be verified by a third-party approved by CARB. After verification, CARB publishes a list of all entities reporting under the MRR and posts on their website |

| | |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| | <p>(https://ww2.arb.ca.gov/mrr-data). This CARB published data shows that only three entities in the County reported in 2016 under the Oil and Gas Production industry sector. These three oil and gas production entities in Ventura County reported a total of 21,702 MT CO₂e. To put this in perspective, California State University, Channel Islands reported 84,042 MT CO₂e for the same timeframe. Nevertheless, the DEIR erroneously construes oil and gas operations as a major source of GHG emissions in the County. This misleads the public and the decision makers.</p> |
| DEIR 4.8-5 | <p>In lieu of focusing on GHG data specific to the County, the DEIR apparently applies data for the entire State to estimate GHG emissions from the County with no explanation as to why. Oil production and processing techniques vary throughout the State depending on the geologic formation being produced. CARB has recognized this variability and has developed carbon intensity values for the numerous crude oils needed to fuel California. As stated above, a total of three oil and gas production entities in Ventura County reported a total of 21,702 MT CO₂e. These three facilities produced approximately 6,570,000 bbls of crude oil in 2016 versus the total crude oil production of 7,729,845 bbls within the County. As such, these three facilities accounted for 85% of Ventura County's oil production. Applying the County's technique of estimating GHG emissions based on the amount of crude oil production, the oil and gas production and processing sector represented approximately 25,500 MT CO₂e emissions in 2016, which is significantly less than the GHG baseline estimate listed in the DEIR for stationary sources. The DEIR must explain why it is more accurate to ignore data specific to the County and rely on a generalized dataset.</p> |
| DEIR pg. 4.8-6 | <p>The projected GHG emissions from the "solid waste" sector as presented in Table 4.8-2 are more fully described in Appendix D. The methane emission projections for waste-in-place at in service landfills appear to be questionable. For example, the methane emissions from the Toland Road Landfill decreases from 74,701 MT CO₂e in 2015 to 66,248 MT CO₂e in 2020 for an 11% decrease in GHG emissions. Comparing the Simi Valley Landfill, which emitted 172,093 MT CO₂e in 2015 and dropping to 171,552 MT CO₂e in 2020 for only a 0.3% decrease. Considering that the Toland Road Landfill is scheduled to remain in service longer than any other landfill, please explain why the GHG emissions from the Toland Road Landfill decrease at much faster rate than the Simi Valley Landfill.</p> |
| DEIR pg. 4.8-6 | <p>The GHG projections from stationary sources provided in Table 4.8-2 appear to be based on the County's projections of increasing oil production. In Appendix D, the EIR utilizes a baseline oil production of 8,428,402 bbls/yr in 2015. By 2020, oil production in the County is forecasted to increase to 8,819,019 bbls/yr, accounting for a 4.6% increase in oil production over this five-year span. California provides annual summaries of oil production by county. The most recent report (www.conservation.ca.gov/calgem/pubs_stats/annual_reports/Pages/annual_reports.aspx) published by the Division of Oil, Gas and Geothermal Resources (DOGGR), now the California Geologic Energy Management Division, available is for 2018 and lists oil production in the County as 6,894,516 bbls/yr. Looking back to 2013, the same agency reported oil production from Ventura County as 8,973,076 bbls/yr. As reported by California, oil production in the County dropped 23% over a five-year span from 2013 to 2018, yet the DEIR projects oil production increasing 4.6% during a five-year span from 2015 to 2020. The DEIR needs to clearly describe why the County is projecting a drastic</p> |

| | |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| | <p>turnaround in County oil production starting in 2019 and continuing into the foreseeable future. This assumption directly impacts the GHG projections listed in Table 4.8-2 and is not consistent with historical data or commonly available market projections.</p> |
| DEIR pg. 4.8-6 | <p>In the DEIR analysis of Impact 4.12-3, the County concludes that the 2040 General Plan could hamper or preclude access to oil and gas resources. The DEIR considers this impact to be “potentially significant” even after considering available mitigation measures. Section 4.8 of the DEIR needs to be modified to describe how oil production in the County is projected to steadily increase into the foreseeable future, while the DEIR concludes in Section 4.12 that the General Plan could “preclude expansion of existing oil and gas operations, ... thereby hampering or precluding access to the resource.”</p> |
| DEIR pg. 4.8-6 | <p>The numerous errors made to overstate the GHG emissions from stationary sources are compounded when making projections in Table 4.8-2 to the point that these estimates cannot be taken seriously. First, the 2015 baseline emissions from stationary sources should be closer to 25,500 MT CO₂e using data from the County (as calculated above); not 275,096 MT CO₂e based on data from outside the County. Secondly, oil production is contracting in the County and not expanding as assumed in the DEIR. From 2013 through 2018, crude oil production in the County dropped on average 415,700 bbls/yr. Using this trajectory, crude oil production in the County should be closer to 6,100,000 bbls in 2020, as opposed to 8,819,019 bbls projected in the DEIR. Using the same method as utilized in the DEIR to project GHG emissions, the 2020 GHG emissions from stationary sources should be around 20,000 MT CO₂e (calculated as 25,500 MT CO₂e * 6,100,000 bbls / 7,729,845 bbls)</p> |
| DEIR 4.8-9 | <p>In describing the County’s obligation under CEQA, the DEIR states, “a lead agency shall make a good-faith effort, based to the extent possible on scientific and factual data, to describe, calculate or estimate the amount of GHG emission resulting from a project.” As the County has chosen to particularly focus on oil and gas production in this DEIR, the County has fallen short of its obligation to describe the impact on GHG emissions due to the 2040 General Plan. There is consensus that climate change is a global issue. GHG reductions are necessary and the County must play a part, but the County cannot by itself thwart the impacts of climate change. To measure global issues such as climate change, the DEIR should not be geographically confined to County. Crude oil is a worldwide commodity openly traded on exchanges. As the DEIR notes in Section 4.12, only 31% of the crude oil consumed in California is produced in State. Shutting down all oil production in the County will not decrease the market for crude oil. To the contrary, California will just import more crude oil from other countries, with the same portion of the refined products, including gasoline and diesel, being transported to the County’s consumers. Therefore, GHG impacts due to oil and gas production in the County is dependent on the amount of carbon associated with the crude oil produced within the County. CARB publishes Carbon Intensity values for the various crude oil sources under their Low Carbon Fuel Standard Regulation. The most recent published data is from 2018 (https://ww3.arb.ca.gov/fuels/lcfs/crude-oil/2018_crude_average_ci_value_final.pdf). In this report, CARB determined, on an annual average, the Carbon Intensity of the crude oil used in California during 2018 was 12.35 gCO₂e/MJ. According to the same report, the crude oil produced from the Ventura Field, the largest oil production field in the County, had a Carbon Intensity of 4.54 gCO₂e/MJ. As such, the crude oil from the Ventura Field results in 63% less GHG</p> |

| | |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| | emissions than the average crude oil used in California. The DEIR should be revised to describe the climate change benefits realized should the 2040 General Plan promote the continued use and expansion of crude oil produced within the County. |
| DEIR 4.8-23 | Policy COS 7.4. The County is proposing a policy to “require discretionary development for oil and gas exploration and production to use electrically-powered equipment from 100 percent renewable sources and cogeneration, where feasible”. Is it the County’s position that only oil and gas exploration and production development projects contribute GHG emissions? If not, then such a policy should be expanded to include all discretionary development projects. By limiting this policy to oil and gas exploration and production development projects, the County is making an arbitrary determination not based on any facts presented in the record. |
| DEIR 4.8-23 | Policy COS 7.7. The County is proposing a policy to “require new discretionary oil wells to use pipelines to convey oil and produced water; oil and produced water shall not be trucked.” Numerous development projects can result in increased trucking including warehouses, agricultural processing facilities, military installations, and distribution centers. If the County is concerned with GHG emissions from trucking, why would this proposed policy be limited to new discretionary oil wells? There is no data in the DEIR suggesting that new discretionary oil wells are anticipated to cause a significant increase in GHG emissions due to trucking. The proposed policy should be revised to address discretionary development projects that would actually increase trucking or the County is making an arbitrary determination not based on any facts presented in the record. |
| DEIR 4.8-25 | The County is proposing to evaluate the feasibility of establishing a local tax on oil and gas operations. Later in Section 4.8 the DEIR states that increased taxes on oil and gas facilities may reduce GHG emissions. SB32 designates “the State Air Resources Board as the state agency charged with monitoring and regulating sources of emissions of greenhouse gases.” CARB has established a cap-and-trade program to regulate GHG sources, including oil and gas operations. In fact, the County attempts to rely on a GHG emission inventory from CARB in the DEIR to estimate the GHG emissions from stationary sources in the County. These stationary sources purchase GHG allowances during CARB authorized auctions to mitigate their GHG emissions. CARB then invests the auction proceeds to reduce GHG emissions in California. The County cannot usurp authority designated to a State agency. |
| DEIR 4.8-25 | GP 2040 and the accompanying DEIR does not establish a nexus between county GHG emissions and potentially establishing a local tax on oil and gas operations. As demonstrated in the County’s own documents, the DEIR concludes that stationary sources only contribute 14.5% of the calculated GHG emissions countywide in 2015 (even while overstating stationary source emissions as discussed in other comments). Transportation accounted for 36.5%, solid waste handling was 17.6% and buildings attributed 17%; all greater than the dramatically overstated GHG emissions from stationary sources, while understating GHG emissions from County operated solid waste operations. Why would the County not consider establishing/increasing local taxes on transportation fuels or establishing/increasing gate fees at the County landfills? Both sectors contribute significantly more GHG emissions in the County than oil and gas operations. If taxing an activity reduces GHG emissions from that sector (a highly speculative position), then why would increased taxes/fees from transportation and solid waste disposal not decrease GHG emissions? The County appears to be arbitrarily |

| | |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| | burdening a single industry sector by increasing taxes with no regard to the data presented in the DEIR. |
| DEIR pgs. 4.8-11 through 4.8-37 | Multiple 2040 General Plan Policies and Implementation Programs are listed in this section (GHG). However, a significant number of these Policies and Programs have absolutely nothing to do with Greenhouse Gas Emissions or climate change (examples include Policies CTM-2.1, CTM-2.10, CTM-2.19, PFS-4.4, COS-2.10, WR-4.1, Implementation Program J, Implementation Program M, etc.) |
| DEIR pg. 4.8-23 | Policy COS 7.4. The DEIR does not consider the consequences of, defects of, or infeasibility of this policy. California and the County are net importers of energy—as an importer, the County cannot necessarily control whether imported energy is provided from 100 renewable sources. Thus, this policy is potentially infeasible to implement. |
| DEIR pg. Pg. 4.8-50 | Recommended textual change shown in bold and underline: “... the County cannot meaningfully quantify the effect of all its 2040 General Plan policies and programs on future GHG emissions, and <u>there therefore</u> , it cannot conclude, at this program level of analysis, that future GHG emissions in the county under the 2040 General Plan would be sufficiently reduced to meet the State’s 2030 or post-2030 targets.” |
| DEIR pg. Pg. 4.8-52 | Recommended textual change shown in bold and underline: “However, due to the County’s minimal growth, most of the forecast GHG emissions in 2030 and beyond are caused or influenced by <u>from</u> energy use in existing buildings, vehicle use and travel behavior on existing transportation systems, landfilled waste, and agricultural uses where the County has limited authority to enforce stringent actions resulting in GHG reductions beyond what have been already been included in the 2040 General Plan and the mitigation measures identified in Impact 4.8-2.” |
| DEIR pg. 4.9-7 | Policy HAZ – 5.5. The DEIR fails to define “alternative technology” for management of hazardous waste. It is unclear whether such technology even exists. Furthermore, the DEIR fails to disclose and evaluate the consequences of onsite treatment of hazardous waste. The location of future development is known, as is the location of future development expected to involve onsite use of hazardous materials (e.g. industrial uses). The foreseeable potential impacts of onsite waste treatment at these locations must be evaluated in the DEIR. |
| DEIR pg. 4.9-24 | The term “structure” is undefined for purposes of brush clearing. As a result, a reader of the DEIR cannot determine the scope of physical consequences associated with brush clearing (amount of soil disturbed, amount of vegetation disturbed, impacts to water quality from soil disturbance). Moreover, the DEIR fails to disclose and consider such physical consequences, which may be severe, depending on how the term “structure” is defined. |
| DEIR pg. 4.10-5 | <p>“Policy PFS-6.5. Stormwater Drainage Facilities. The County shall require that stormwater drainage facilities are properly designed, sited, constructed, and maintained to efficiently capture and convey runoff for flood protection and groundwater recharge. (RDR).”</p> <p>The DEIR does not define what constitutes “stormwater drainage facilities” (e.g. drain, basin, treatment plant). As such it is impossible to determine the scope of the policy and any associated physical consequences (such as construction disturbance).</p> |
| DEIR pg. 4.10-5 | “Policy PFS-6.7. Flood Control and Beach Sand Nourishment. The County shall include beach sand nourishment as an important factor in the design and maintenance of |

| | |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
